ring r = 0,(x(1..5)),dp;
ideal J=x(1)^2*x(2)*x(3)^5*x(4)^2*x(5)^3;
list L=data(J,1,5);
list G=Gamma(L[2][1][1],9,5); // critical value c=9
G[1]; // maximum exponents in the ideal
↳ [1]:
↳ 5
↳ [2]:

```

```

↳ 3
↳ [3]:
↳ 2
G[2]; // maximal value of Gamma function
↳ [1]:
↳ -3
↳ [2]:
↳ 10/9
↳ [3]:
↳ 3,5,4
G[3]; // center given by Gamma
↳ [1]:
↳ 3
↳ [2]:
↳ 5
↳ [3]:
↳ 4

```

D.5.5.18 convertdata

Procedure from library `resbinomial.lib` (see [Section D.5.5 \[resbinomial.lib\]](#), page 1121).

Usage: `convertdata(C,L,n,flaglist);`
 C, L, flaglist lists, n integer

Compute: Compute the ideal corresponding to the given lists C,L

Return: an ideal whose coefficients are given by C, exponents given by L

Example:

```

LIB "resbinomial.lib";
ring r = 0,(x(1..4),y(5)),dp;
list M=identifyvar();
ideal J=x(1)^2*y(5)^2-x(2)^2*x(3)^2,6*x(4)^2;
list L=data(J,2,5);
L[1]; // Coefficients
↳ [1]:
↳ [1]:
↳ -1
↳ [2]:
↳ 1
↳ [2]:
↳ [1]:
↳ 6
L[2]; // Exponents
↳ [1]:
↳ [1]:
↳ 0
↳ [2]:
↳ 2
↳ [3]:
↳ 2
↳ [4]:
↳ 0

```

```

↳      [5]:
↳      0
↳      [2]:
↳      [1]:
↳      2
↳      [2]:
↳      0
↳      [3]:
↳      0
↳      [4]:
↳      0
↳      [5]:
↳      2
↳ [2]:
↳ [1]:
↳ [1]:
↳ 0
↳ [2]:
↳ 0
↳ [3]:
↳ 0
↳ [4]:
↳ 2
↳ [5]:
↳ 0
ideal J2=convertdata(L[1],L[2],5,M);
J2;
↳ J2[1]=-x(2)^2*x(3)^2+x(1)^2*y(5)^2
↳ J2[2]=6*x(4)^2

```

D.5.5.19 lcmofall

Procedure from library `resbinomial.lib` (see [Section D.5.5 \[resbinomial.lib\]](#), page 1121).

Usage: `lcmofall(nchart,mobile);`
`nchart` integer, `mobile` list of lists

Compute: Compute the lcm of the denominators of the E-orders of all the charts

Return: an integer given the lcm

Note: CALL BEFORE `salida`

Example:

```

LIB "resbinomial.lib";
ring r = 0,(x(1..2)),dp;
ideal J=x(1)^3-x(1)*x(2)^3;
list L=Eresol(J);
L[4]; // 8 charts, rational exponents
↳ 8
L[8][2][2]; // E-orders at the first chart
↳ [1]:
↳ 3
↳ [2]:
↳ 9/2

```

```
lcmofall(8,L[8]);
↳ 2
```

D.5.5.20 computemcm

Procedure from library `resbinomial.lib` (see [Section D.5.5 \[resbinomial.lib\]](#), page 1121).

Usage: `computemcm(Eolist)`; Eolist list

Return: an integer, the least common multiple of the denominators of the E-orders

Note: Make the same as `lcmofall` but for one chart. NECESSARY BECAUSE THE E-ORDERS ARE OF TYPE NUMBER!!

Example:

```
LIB "resbinomial.lib";
ring r = 0,(x(1..2)),dp;
ideal J=x(1)^3-x(1)*x(2)^3;
list L=Eresol(J); // 8 charts, rational exponents
L[8][2][2]; // maximal E-order at the first chart
↳ [1]:
↳ 3
↳ [2]:
↳ 9/2
computemcm(L[8][2][2]);
↳ 2
```

D.5.5.21 constructH

Procedure from library `resbinomial.lib` (see [Section D.5.5 \[resbinomial.lib\]](#), page 1121).

Usage: `constructH(Hhist,n,flag)`;
Hhist intvec, n integer, flag list

Return: the list of exceptional divisors accumulated at this chart

Example:

```
LIB "resbinomial.lib";
ring r = 0,(x(1..3)),dp;
list flag=identifyvar();
ideal J=x(1)^4*x(2)^2, x(1)^2+x(3)^3;
list L=Eresol(J); // 7 charts
// history of the exceptional divisors at the 7-th chart
L[1][7][7]; // blow ups at x(3)-th, x(1)-th and x(1)-th charts
↳ 0,3,1,1
constructH(L[1][7][7],3,flag);
↳ [1]:
↳ _[1]=x(3)
↳ [2]:
↳ _[1]=1
↳ [3]:
↳ _[1]=x(1)
```

D.5.5.22 constructblwup

Procedure from library `resbinomial.lib` (see [Section D.5.5 \[resbinomial.lib\], page 1121](#)).

Usage: `constructblwup(blwhist,n,chy,flag);`
 `blwhist, flag lists, n integer, chy ideal`

Return: the ideal defining the map $K[W] \rightarrow K[W_i]$,
 which gives the composition map of all the blowing up leading to this chart

Note: NECESSARY START WITH COLUMNS

Example:

```
LIB "resbinomial.lib";
ring r = 0,(x(1..3)),dp;
list flag=identifyvar();
ideal chy=maxideal(1);
ideal J=x(1)^4*x(2)^2, x(1)^2+x(3)^3;
list L=Eresol(J); // 7 charts
// history of the blow ups at the 7-th chart, center {x(1)=x(3)=0} every time
L[1][7][8]; // blow ups at x(3)-th, x(1)-th and x(1)-th charts
⇒ [1]:
⇒ 0,3,0,0
⇒ [2]:
⇒ 0,0,0,0
⇒ [3]:
⇒ 0,0,1,1
constructblwup(L[1][7][8],3,chy,flag);
⇒ _[1]=x(1)^3*x(3)
⇒ _[2]=x(2)
⇒ _[3]=x(1)^2*x(3)
```

D.5.5.23 constructlastblwup

Procedure from library `resbinomial.lib` (see [Section D.5.5 \[resbinomial.lib\], page 1121](#)).

Usage: `constructlastblwup(blwhist,n,chy,flag);`
 `blwhist, flag lists, n integer, chy ideal`

Return: the ideal defining the last blow up

Note: NECESSARY START WITH COLUMNS

Example:

```
LIB "resbinomial.lib";
ring r = 0,(x(1..3)),dp;
list flag=identifyvar();
ideal chy=maxideal(1);
ideal J=x(1)^4*x(2)^2, x(1)^2+x(3)^3;
list L=Eresol(J); // 7 charts
// history of the blow ups at the 7-th chart, center {x(1)=x(3)=0} every time
L[1][7][8]; // blow ups at x(3)-th, x(1)-th and x(1)-th charts
⇒ [1]:
⇒ 0,3,0,0
⇒ [2]:
⇒ 0,0,0,0
⇒ [3]:
```

```

↳ 0,0,1,1
constructlastblwup(L[1][7][8],3,chy,flag);
↳ _[1]=x(1)
↳ _[2]=x(2)
↳ _[3]=x(1)*x(3)

```

D.5.5.24 genoutput

Procedure from library `resbinomial.lib` (see [Section D.5.5 \[resbinomial.lib\]](#), page 1121).

Usage: `genoutput(chart,mobile,nchart,nsons,n,q,p);`
`chart, mobile, nsons` lists, `nchart, n,q, p` integers

Return: two lists, the first one gives the rings corresponding to the final charts, the second one is the list of all rings corresponding to the affine charts of the resolution process

Example:

```

LIB "resbinomial.lib";
ring r = 0,(x(1..2)),dp;
ideal J=x(1)^3-x(1)*x(2)^3;
list L=Eresol(J); // 8 charts, rational exponents
list B=genoutput(L[1],L[8],L[4],L[6],2,2,0); // generates the output
presentTree(B);

D.5.5.25 salida

Procedure from library `resbinomial.lib` (see [Section D.5.5 \[resbinomial.lib\]](#), page 1121).

Usage: `salida(idchart,chart,mobile,numson,previous,a,n,q,p);`
`idchart, numson, n, q, p` integers, `chart, mobile`, lists, `previous` intvec

Compute: CONVERT THE OUTPUT OF A CHART IN A RING, WHERE DEFINE A BASIC OBJECT (BO)

Return: the ring corresponding to the chart

Example:

```

LIB "resbinomial.lib";
ring r = 0,(x(1..2)),dp;
ideal J=x(1)^2-x(2)^3;
list L=Eresol(J);
list B=salida(5,L[1][5],L[8][6],2,L[1][3][3],2,1,0); // chart 5
def RR=B[1];
setring RR;
BO;

"press return to see next example"; ~;
↳ press return to see next example
↳
↳ -- break point in ./examples/salida.sing --

```

D.5.5.26 iniD

Procedure from library `resbinomial.lib` (see [Section D.5.5 \[resbinomial.lib\]](#), page 1121).

Usage: `iniD(n)`; n integer

Return: list of lists of zeros of size n

Example:

```

LIB "resbinomial.lib";
iniD(3);
↳ [1]:
↳   [1]:
↳     0
↳   [2]:
↳     0
↳   [3]:
↳     0
↳ [2]:
↳   [1]:
↳     0
↳   [2]:
↳     0
↳   [3]:
↳     0
↳ [3]:
↳   [1]:
↳     0
↳   [2]:
↳     0
↳   [3]:
↳     0

```

D.5.5.27 sumlist

Procedure from library `resbinomial.lib` (see [Section D.5.5 \[resbinomial.lib\]](#), page 1121).

Usage: `sumlist(L1,L2)`; L1,L2 lists, (size(L1)==size(L2))

Return: a list, sum of L1 and L2

Example:

```

LIB "resbinomial.lib";
list L1=1,2,3;
list L2=5,9,7;
sumlist(L1,L2);

```

```

⇒ [1] :
⇒   6
⇒ [2] :
⇒  11
⇒ [3] :
⇒  10

```

D.5.5.28 reslist

Procedure from library `resbinomial.lib` (see [Section D.5.5 \[resbinomial.lib\]](#), page 1121).

Usage: `reslist(L1,L2)`; L1,L2 lists, (`size(L1)==size(L2)`)

Return: a list, subtraction of L1 and L2

Example:

```

LIB "resbinomial.lib";
list L1=1,2,3;
list L2=5,9,7;
reslist(L1,L2);
⇒ [1] :
⇒  -4
⇒ [2] :
⇒  -7
⇒ [3] :
⇒  -4

```

D.5.5.29 multiplylist

Procedure from library `resbinomial.lib` (see [Section D.5.5 \[resbinomial.lib\]](#), page 1121).

Usage: `multiplylist(L,a)`; L list, a number

Return: list of elements of type number, multiplication of L times a

Example:

```

LIB "resbinomial.lib";
ring r = 0,(x(1..3)),dp;
list L=1,2,3;
multiplylist(L,1/5);
⇒ [1] :
⇒ 1/5
⇒ [2] :
⇒ 2/5
⇒ [3] :
⇒ 3/5

```

D.5.5.30 dividelist

Procedure from library `resbinomial.lib` (see [Section D.5.5 \[resbinomial.lib\]](#), page 1121).

Usage: `dividelist(L1,L2)`; L1,L2 lists

Return: list of elements of type number, division of L1 by L2

Example:

```

LIB "resbinomial.lib";
ring r = 0, (x(1..3)), dp;
list L1=1,2,3;
list L2=5,9,7;
dividelist(L1,L2);
↪ [1]:
↪ 1/5
↪ [2]:
↪ 2/9
↪ [3]:
↪ 3/7

```

D.5.5.31 createlist

Procedure from library `resbinomial.lib` (see [Section D.5.5 \[resbinomial.lib\]](#), page 1121).

Usage: `createlist(L1,L2)`; L1,L2 lists, (`size(L1)==size(L2)`)

Return: list of lists of two elements, the first one of L1 and the second of L2

Example:

```

LIB "resbinomial.lib";
list L1=1,2,3;
list L2=5,9,7;
createlist(L1,L2);

↪ [2]:
↪ 7

```

D.5.6 resgraph_lib

Library: `resgraph.lib`

Purpose: Visualization of Resolution Data

Author: A. Fruehbis-Krueger, anne@mathematik.uni-kl.de,

Note: This library uses the external programs `surf`, `graphviz` and `imagemagick`.
Input data is assumed to originate from `resolve.lib` and `reszeta.lib`

Procedures:

D.5.6.1 InterDiv

Procedure from library `resgraph.lib` (see [Section D.5.6 \[resgraph.lib\], page 1168](#)).

Usage: InterDiv(M[,name]);
 M = matrix
 name = string

Assume: - M is first list entry of output of 'intersectionDiv'
 from library `reszeta.lib`
 - write permission in the current directory or in the
 directory in which the file with name 'name' resides

Create: file 'name.jpg' containing dual graph of resolution
 if filename is given

Note: only available on UNIX-type systems and programs
 'display' (imagemagick package) and 'dot' (Graphviz package) need to
 be in the standard search PATH

Return: nothing, only generating graphics output in separate window

D.5.6.2 ResTree

Procedure from library `resgraph.lib` (see [Section D.5.6 \[resgraph.lib\], page 1168](#)).

Usage: ResTree(L,M[,name][,mark]);
 L = list
 M = matrix
 name = string
 mark = intvec

Assume: - L is the output of 'resolve' from `resolve.lib`
 - M is first entry of output of 'collectDiv(L);' from `reszeta.lib`
 - write permission in the current directory or in the
 directory in which the file with name 'name' resides
 - mark intvec of size `size(L[2])`
 mark[i]=0 (default) border of box black
 mark[i]=1 border of box red

Create: file 'name.jpg' containing the tree of charts of L
 if filename is given

Note: only available on UNIX-type systems and programs
 'display' (imagemagick package) and 'dot' (Graphviz package) need to
 be in the standard search PATH

Return: nothing, only generating graphics output in separate window

D.5.6.3 finalCharts

Procedure from library `resgraph.lib` (see [Section D.5.6 \[resgraph.lib\], page 1168](#)).

Usage: finalCharts(L1,L2,iv[,name]);
 L1 = list
 L2 = list
 iv = intvec
 name = string

- Assume:**
- L1 is the output of 'resolve' from resolve.lib
 - L2 is the output of 'intersectionDiv(L1)' from rezeta.lib
 - iv is the first entry of the output of 'abstractR(L1)'
 - write permission in the current directory or in the directory in which the file with name 'name' resides
- Create:**
- new windows in which surf-images of the final charts are presented
 - several '.ras' files in the directory in which 'name' resides
- Note:** only available on UNIX-type systems
external programs 'surf' and 'display' (imagemagick package) need to be in the standard search PATH
- Return:** nothing, only generating graphics output in separate window

D.5.7 resjung_lib

- Library:** jung.lib
- Purpose:** Resolution of surface singularities (Desingularization) Algorithm of Jung
- Author:** Philipp Renner, philipp_renner@web.de
- Procedures:**

D.5.7.1 jungresolve

Procedure from library `resjung.lib` (see [Section D.5.7 \[resjung_lib\]](#), page 1170).

- Usage:** `jungresolve(ideal J[,is_noeth]);`
`J = ideal`
`i = int`
- Assume:** `J = two dimensional ideal`
- Return:** a list `l` of rings
`l[i]` is a ring containing two Ideals: `QIdeal` and `BMap`. `BMap` defines a birational morphism from $V(QIdeal) \rightarrow V(J)$, such that $V(QIdeal)$ is smooth. For this the algorithm computes first with `jungnormal` a representation of $V(J)$ with Hirzebruch-Jung singularities and then it uses Villamayor's algorithm to resolve these singularities. If `is_noeth=1` the algorithm assumes `J` is in noether position with respect to the last two variables. As a default or if `is_noeth = 0` the algorithm computes a coordinate change such that `J` is in noether position. NOTE: since the noether position algorithm is randomized the performance can vary significantly.

Example:

```
LIB "resjung.lib";
//Computing a resolution of singularities of the variety z2-x3-y3
ring r = 0,(x,y,z),dp;
ideal I = z2-x3-y3;
//The ideal is in noether position
list l = jungresolve(I,1);
def R1 = l[1];
def R2 = l[2];
setring R1;
QIdeal;
↪ QIdeal[1]=T(1)*x(2)^2*y(1)-T(2)*x
```

```

↳ QIdeal [2]=T(2)*x(2)^2*y(1)-x
↳ QIdeal [3]=x(2)^2*y(1)^2-x(2)^2*y(1)-T(1)*x
↳ QIdeal [4]=T(1)^2-T(2)*y(1)+T(2)
↳ QIdeal [5]=T(1)*T(2)-y(1)+1
↳ QIdeal [6]=T(2)^2-T(1)
↳ QIdeal [7]=x(2)^6*y(1)^4-x(2)^6*y(1)^3-x^3
BMap;
↳ BMap [1]=x
↳ BMap [2]=x(2)^2*y(1)
↳ BMap [3]=x(2)^3*y(1)^2
setring R2;
QIdeal;
↳ QIdeal [1]=T(2)*x(1)^2+x
↳ QIdeal [2]=T(1)*x(1)^2*y(0)-T(2)*x
↳ QIdeal [3]=x(1)^2*y(0)^2-x(1)^2*y(0)-T(1)*x
↳ QIdeal [4]=T(1)^2-T(2)*y(0)+T(2)
↳ QIdeal [5]=T(1)*T(2)+y(0)^2-y(0)
↳ QIdeal [6]=T(2)^2+T(1)*y(0)
↳ QIdeal [7]=x(1)^6*y(0)^3-x(1)^6*y(0)^2+x^3
BMap;
↳ BMap [1]=x
↳ BMap [2]=x(1)^2*y(0)
↳ BMap [3]=x(1)^3*y(0)

```

D.5.7.2 jungnormal

Procedure from library `resjung.lib` (see [Section D.5.7 \[resjung.lib\]](#), page 1170).

Usage: `jungnormal(ideal J[,is_noeth]);`
 `J = ideal`
 `i = int`

Assume: `J = two dimensional ideal`

Return: a list `l` of rings
`l[i]` is a ring containing two Ideals: `QIdeal` and `BMap`. `BMap` defines a birational morphism from $V(QIdeal) \rightarrow V(J)$, such that $V(QIdeal)$ has only singularities of Hizebuch-Jung type. If `is_noeth=1` the algorithm assumes `J` is in noether position with respect to the last two variables. As a default or if `is_noeth = 0` the algorithm computes a coordinate change such that `J` is in noether position. NOTE: since the noether position algorithm is randomized the performance can vary significantly.

Example:

```

LIB "resjung.lib";
//Computing a resolution of singularities of the variety z2-x3-y3
ring r = 0,(x,y,z),dp;
ideal I = z2-x3-y3;
//The ideal is in noether position
list l = jungnormal(I,1);
def R1 = l[1];
def R2 = l[2];
setring R1;
QIdeal;
↳ QIdeal [1]=T(1)*x(2)^2*y(1)-T(2)*x

```

```

↳ QIdeal [2]=T(2)*x(2)^2*y(1)-x
↳ QIdeal [3]=-T(1)*x+x(2)^2*y(1)^2-x(2)^2*y(1)
↳ QIdeal [4]=T(1)^2-T(2)*y(1)+T(2)
↳ QIdeal [5]=T(1)*T(2)-y(1)+1
↳ QIdeal [6]=T(2)^2-T(1)
↳ QIdeal [7]=x(2)^6*y(1)^4-x(2)^6*y(1)^3-x^3
BMap;
↳ BMap [1]=x
↳ BMap [2]=x(2)^2*y(1)
↳ BMap [3]=x(2)^3*y(1)^2
setring R2;
QIdeal;
↳ QIdeal [1]=T(2)*x(1)^2+x
↳ QIdeal [2]=T(1)*x(1)^2*y(0)-T(2)*x
↳ QIdeal [3]=-T(1)*x+x(1)^2*y(0)^2-x(1)^2*y(0)
↳ QIdeal [4]=T(1)^2-T(2)*y(0)+T(2)
↳ QIdeal [5]=T(1)*T(2)+y(0)^2-y(0)
↳ QIdeal [6]=T(2)^2+T(1)*y(0)
↳ QIdeal [7]=x(1)^6*y(0)^3-x(1)^6*y(0)^2+x^3
BMap;
↳ BMap [1]=x
↳ BMap [2]=x(1)^2*y(0)
↳ BMap [3]=x(1)^3*y(0)

```

D.5.7.3 jungfib

Procedure from library `resjung.lib` (see [Section D.5.7 \[resjung.lib\]](#), page 1170).

Usage: jungfib(J[,is_noeth]);
 J = ideal
 j = int

Assume: J = two dimensional ideal

Return: a list l of rings
 l[i] is a ring containing two Ideals: QIdeal and BMap. BMap defines a birational morphism from $V(\text{QIdeal}) \rightarrow V(J)$, such that $V(\text{QIdeal})$ has only quasi-ordinary singularities.

If `is_noeth=1` the algorithm assumes J is in noether position with respect to the last two variables. As a default or if `is_noeth = 0` the algorithm computes a coordinate change such that J is in noether position. NOTE: since the noether position algorithm is randomized the performance can vary significantly.

Example:

```

LIB "resjung.lib";
//Computing a resolution of singularities of the variety z2-x3-y3
ring r = 0,(x,y,z),dp;
ideal I = z2-x3-y3;
//The ideal is in noether position
list l = jungfib(I,1);
def R1 = l[1];
def R2 = l[2];
setring R1;
QIdeal;

```

```

↳ QIdeal[1]=x(2)^6*y(1)^4-x(2)^6*y(1)^3-x^3
BMap;
↳ BMap[1]=x
↳ BMap[2]=x(2)^2*y(1)
↳ BMap[3]=x(2)^3*y(1)^2
setring R2;
QIdeal;
↳ QIdeal[1]=x(1)^6*y(0)^3-x(1)^6*y(0)^2+x^3
BMap;
↳ BMap[1]=x
↳ BMap[2]=x(1)^2*y(0)
↳ BMap[3]=x(1)^3*y(0)

```

D.5.8 resolve_lib

Library: resolve.lib

Purpose: Resolution of singularities (Desingularization) Algorithm of Villamayor

Authors: A. Fruehbis-Krueger, anne@mathematik.uni-kl.de,
G. Pfister, pfister@mathematik.uni-kl.de

References:

- [1] J.Kollar: Lectures on Resolution of Singularities, Princeton University Press (2007) (contains large overview over various known methods for curves and surfaces as well as a detailed description of the approach in the general case)
- [2] A.Bravo, S.Encinas, O.Villamayor: A Simplified Proof of Desingularisation and Applications, Rev. Math. Iberoamericana 21 (2005), 349-458 (description of the algorithmic proof of desingularization in characteristic zero which underlies this implementation)
- [3] A.Fruehbis-Krueger: Computational Aspects of Singularities, in J.-P. Brasselet, J.Damon et al.: Singularities in Geometry and Topology, World Scientific Publishing, 253-327 (2007) (chapter 4 contains a detailed discussion on algorithmic desingularization and efficiency aspects thereof)

Procedures:

D.5.8.1 blowUp

Procedure from library `resolve.lib` (see [Section D.5.8 \[resolve_lib\]](#), page 1173).

Usage: blowUp(J,C[,W][,E]);
W,J,C = ideals,
E = list

Assume: J = ideal containing W (W = 0 if not specified)
C = ideal containing J
E = list of smooth hypersurfaces (e.g. exceptional divisors)

Note: W the ideal of the ambient space, C the ideal of the center of the blowup and J the ideal of the variety
Important difference to blowUp2:
- the ambient space $V(W)$ is blown up and $V(J)$ transformed in it
- $V(C)$ is assumed to be non-singular

Compute: the blowing up of W in C , the exceptional locus, the strict transform of J and the blowup map

Return: list, say l , of size at most $\text{size}(C)$,
 $l[i]$ is the affine ring corresponding to the i -th chart each $l[i]$ contains the ideals
 - aS , ideal of the blownup ambient space
 - sT , ideal of the strict transform
 - eD , ideal of the exceptional divisor
 - bM , ideal corresponding to the blowup map
 $l[i]$ also contains a list BO , which can best be viewed with `showBO(BO)` detailed information on the data type BO can be viewed via the command `showDataTypes()`;

Example:

```
LIB "resolve.lib";
ring R=0,(x,y),dp;
ideal J=x2-y3;
ideal C=x,y;
list blow=blowUp(J,C);
def Q=blow[1];
setring Q;
aS;
↪ aS[1]=0
sT;
↪ sT[1]=y(1)2-x(2)
eD;
↪ eD[1]=x(2)
bM;
↪ bM[1]=x(2)*y(1)
↪ bM[2]=x(2)
```

D.5.8.2 blowUp2

Procedure from library `resolve.lib` (see [Section D.5.8 \[resolve.lib\]](#), page 1173).

Usage: `blowUp2(J,C);`
 $J, C = \text{ideals}$,

Assume: $C = \text{ideal containing } J$

Note: C the ideal of the center of the blowup and J the ideal of the variety
 Important differences to `blowUp`:
 - $V(J)$ itself is blown up, not the ambient space
 - C is not assumed to be non-singular

Compute: the blowing up of J in C , the exceptional locus and the blow-up map

Return: list, say l , of size at most $\text{size}(C)$,
 $l[i]$ is the affine ring corresponding to the i -th chart each $l[i]$ contains the ideals
 - J_{new} , ideal of the blownup J
 - eD , ideal of the new exceptional divisor
 - bM , ideal corresponding to the blowup map

Example:

```
LIB "resolve.lib";
ring r=0,(x,y,z),dp;
```

```

ideal I=z2-x^3*y^2;
ideal C=z,xy;
list li=blowUp2(I,C);
size(li);           // number of charts
↳ 2
def S1=li[1];
setring S1;         // chart 1
basing;
↳ // coefficients: QQ
↳ // number of vars : 3
↳ //      block  1 : ordering dp
↳ //      : names  x(1) x(3) y(2)
↳ //      block  2 : ordering C
Jnew;
↳ Jnew[1]=x(1)*y(2)^2-1
eD;
↳ eD[1]=x(3)
↳ eD[2]=x(1)*y(2)^2-1
bM;
↳ bM[1]=x(1)
↳ bM[2]=x(3)*y(2)^3
↳ bM[3]=x(3)
def S2=li[2];
setring S2;         // chart 2
basing;
↳ // coefficients: QQ
↳ // number of vars : 2
↳ //      block  1 : ordering dp
↳ //      : names  x(2) y(1)
↳ //      block  2 : ordering C
Jnew;
↳ Jnew[1]=0
eD;
↳ eD[1]=x(2)*y(1)^2
bM;
↳ bM[1]=y(1)^2
↳ bM[2]=x(2)
↳ bM[3]=x(2)*y(1)^3

```

D.5.8.3 Center

Procedure from library `resolve.lib` (see [Section D.5.8 \[resolve.lib\]](#), page 1173).

Usage: Center(J,W[,E])
 J,W = ideals
 E = list

Assume: J = ideal containing W (W = 0 if not specified)
 E = list of smooth hypersurfaces (e.g. exceptional divisors)

Compute: the center of the blow-up of J for the resolution algorithm of [Bravo,Encinas,Villamayor]

Return: ideal, describing the center

Example:

```
LIB "resolve.lib";
ring R=0,(x,y),dp;
ideal J=x2-y3;
Center(J);
↪ _[1]=y
↪ _[2]=x
```

D.5.8.4 resolve

Procedure from library `resolve.lib` (see [Section D.5.8 \[resolve.lib\]](#), page 1173).

Usage: `resolve (J);` or `resolve (J,i[,k]);`
 `J` ideal
 `i,k` int

Compute: a resolution of `J`,
 if `i > 0` debugging is turned on according to the following switches:
`j1`: value 0 or 1; turn off or on correctness checks in all steps
`j2`: value 0 or 2; turn off or on `debugCenter`
`j3`: value 0 or 4; turn off or on `debugBlowUp`
`j4`: value 0 or 8; turn off or on `debugCoeff`
`j5`: value 0 or 16; turn off or on debugging of Intersection with E^{\wedge} -
`j6`: value 0 or 32; turn off or on stop after pass through the loop
`i=j1+j2+j3+j4+j5+j6`

Return: a list `l` of 2 lists of rings
`l[1][i]` is a ring containing a basic object `BO`, the result of the resolution.
`l[2]` contains all rings which occurred during the resolution process

Note: result may be viewed in a human readable form using `presentTree()`

Example:

```
LIB "resolve.lib";
ring R=0,(x,y,z),dp;
ideal J=x3+y5+yz2+xy4;
list L=resolve(J,0);
def Q=L[1][7];
setring Q;
showBO(BO);
↪
↪ ===== Ambient Space:
↪ _[1]=0
↪
↪ ===== Ideal of Variety:
↪ _[1]=x(1)4*x(3)2*y(1)+x(1)2+y(1)+1
↪
↪ ===== Exceptional Divisors:
↪ [1]:
↪     _[1]=1
↪ [2]:
↪     _[1]=y(1)
↪ [3]:
↪     _[1]=1
↪ [4]:
↪     _[1]=x(1)
```

```

↳ [5]:
↳   _[1]=x(3)
↳
↳ ===== Images of variables of original ring:
↳   _[1]=x(1)^6*x(3)^5*y(1)^2
↳   _[2]=x(1)^4*x(3)^3*y(1)
↳   _[3]=x(1)^7*x(3)^6*y(1)^2
↳

```

D.5.8.5 showBO

Procedure from library `resolve.lib` (see [Section D.5.8 \[resolve.lib\], page 1173](#)).

Usage: `showBO(BO);`
 `BO`=basic object, a list: ideal `W`,
 ideal `J`,
 intvec `b` (already truncated for `Coeff`),
 list `Ex` (already truncated for `Coeff`),
 ideal `ab`,
 intvec `v`,
 intvec `w` (already truncated for `Coeff`),
 matrix `M`

Return: nothing, only pretty printing

D.5.8.6 presentTree

Procedure from library `resolve.lib` (see [Section D.5.8 \[resolve.lib\], page 1173](#)).

Usage: `presentTree(L);`
 `L`=list, output of `resolve`

Return: nothing, only pretty printing of the output data of `resolve()`

D.5.8.7 showDataTypes

Procedure from library `resolve.lib` (see [Section D.5.8 \[resolve.lib\], page 1173](#)).

Usage: `showDataTypes();`

Return: nothing, only pretty printing of extended version of help text

D.5.8.8 blowUpBO

Procedure from library `resolve.lib` (see [Section D.5.8 \[resolve.lib\], page 1173](#)).

Usage: `blowUpBO (BO,C,e);`
 `BO` = basic object, a list: ideal `W`,
 ideal `J`,
 intvec `b`,
 list `Ex`,
 ideal `ab`,
 intvec `v`,
 intvec `w`,
 matrix `M`
 `C` = ideal

e = integer (0 usual blowing up, 1 deleting extra charts, 2 deleting no charts)

Assume: R = basering, a polynomial ring, W an ideal of R,
J = ideal containing W,
C = ideal containing J

Compute: the blowing up of BO[1] in C, the exceptional locus, the strict transform of BO[2]

Note: blowUpBO may be applied to basic objects in the sense of [Bravo, Encinas, Villamayor] in the following referred to as BO and to presentations in the sense of [Bierstone, Milman] in the following referred to as BM.

Return: a list l of length at most size(C),
l[i] is a ring containing an object BO resp. BM:
BO[1]=BM[1] an ideal, say W_i , defining the ambient space of the i-th chart of the blowing up
BO[2]=BM[2] an ideal defining the strict transform
BO[3] intvec, the first integer b such that in the original object $(\Delta^b(\text{BO}[2]))=1$ the subsequent integers have the same property for Coeff-Objects of BO[2] used when determining the center
BM[3] intvec, BM[3][i] is the assigned multiplicity of BM[2][i]
BO[4]=BM[4] the list of exceptional divisors
BO[5]=BM[5] an ideal defining the map $K[W] \rightarrow K[W_i]$
BO[6]=BM[6] an intvec BO[6][j]=1 indicates that $\langle \text{BO}[4][j], \text{BO}[2] \rangle = 1$, i.e. the strict transform does not meet the j-th exceptional divisor
BO[7] intvec, the index of the first blown-up object in the resolution process leading to this object for which the value of b was BO[3] the subsequent ones are the indices for the Coeff-Objects of BO[2] used when determining the center
BM[7] intvec, BM[7][i] is the index at which the $(2i-1)$ st entry of the invariant first reached its current maximal value
BO[8]=BM[8] a matrix indicating that BO[4][i] meets BO[4][j] by BO[8][i,j]=1 for $i < j$
BO[9] empty
BM[9] the invariant

Example:

```
LIB "resolve.lib";
ring R=0,(x,y),dp;
ideal W;
ideal J=x2-y3;
intvec b=1;
list E;
ideal abb=maxideal(1);
intvec v;
intvec w=-1;
matrix M;
intvec ma;
list BO=W,J,b,E,abb,v,w,M,ma;
ideal C=CenterBO(BO)[1];
list blow=blowUpBO(BO,C,0);
def Q=blow[1];
setring Q;
BO;
```

```

↳ [1] :
↳   _[1]=0
↳ [2] :
↳   _[1]=y(1)^2-x(2)
↳ [3] :
↳   1
↳ [4] :
↳   [1] :
↳     _[1]=x(2)
↳ [5] :
↳   _[1]=x(2)*y(1)
↳   _[2]=x(2)
↳ [6] :
↳   0
↳ [7] :
↳   -1
↳ [8] :
↳   _[1,1]=0
↳ [9] :
↳   0

```

D.5.8.9 createBO

Procedure from library `resolve.lib` (see [Section D.5.8 \[resolve.lib\]](#), page 1173).

Usage: `createBO(J[,W][,E]);`
 J, W = ideals
 E = list

Assume: J = ideal containing W ($W = 0$ if not specified)
 E = list of smooth hypersurfaces (e.g. exceptional divisors)

Return: list BO representing a basic object :
BO[1] ideal W , if W has been specified; ideal(0) otherwise
BO[2] ideal J
BO[3] intvec
BO[4] the list E of exceptional divisors if specified; empty list otherwise
BO[5] an ideal defining the identity map
BO[6] an intvec
BO[7] intvec
BO[8] a matrix
entries 3,5,6,7,8 are initialized appropriately for use of `CenterBO` and `blowUpBO`

Example:

```

LIB "resolve.lib";
ring R=0,(x,y,z),dp;
ideal J=x2-y3;
createBO(J,ideal(z));
↳ [1] :
↳   _[1]=z
↳ [2] :
↳   _[1]=-y3+x2
↳ [3] :
↳   0
↳ [4] :

```

```

↳ empty list
↳ [5]:
↳  _[1]=x
↳  _[2]=y
↳  _[3]=z
↳ [6]:
↳  0
↳ [7]:
↳  -1
↳ [8]:
↳  _[1,1]=0

```

D.5.8.10 CenterBO

Procedure from library `resolve.lib` (see [Section D.5.8 \[resolve.lib\]](#), page 1173).

Usage: CenterBO(BO);
 BO = basic object, a list: ideal W,
 ideal J,
 intvec b,
 list Ex,
 ideal ab,
 intvec v,
 intvec w,
 matrix M

Assume: R = basering, a polynomial ring, W an ideal of R,
 J = ideal containing W

Compute: the center of the next blow-up of BO in the resolution algorithm of [Bravo,Encinas,Villamayor]

Return: list l,
 l[1]: ideal describing the center
 l[2]: intvec w obtained in the process of determining l[1]
 l[3]: intvec b obtained in the process of determining l[1]
 l[4]: intvec inv obtained in the process of determining l[1]

Example:

```

LIB "resolve.lib";
ring R=0,(x,y),dp;
ideal W;
ideal J=x2-y3;
intvec b=1;
list E;
ideal abb=maxideal(1);
intvec v;
intvec w=-1;
matrix M;
list BO=W,J,b,E,abb,v,w,M,v;
CenterBO(BO);
↳ [1]:
↳  _[1]=y
↳  _[2]=x
↳ [2]:

```

```

↳ -1
↳ [3]:
↳ 2
↳ [4]:
↳ 0

```

D.5.8.11 Delta

Procedure from library `resolve.lib` (see [Section D.5.8 \[resolve.lib\]](#), page 1173).

Usage: Delta (BO);
 BO = basic object, a list: ideal W,
 ideal J,
 intvec b,
 list Ex,
 ideal ab,
 intvec v,
 intvec w,
 matrix M

Assume: R = basering, a polynomial ring, W an ideal of R,
 J = ideal containing W

Compute: Delta-operator applied to J in the notation of
 [Bravo,Encinas,Villamayor]

Return: ideal

Example:

```

LIB "resolve.lib";
ring R=0,(x,y,z),dp;
ideal W=z^2-x;
ideal J=x*y^2+x^3;
intvec b=1;
list E;
ideal abb=maxideal(1);
intvec v;
intvec w=-1;
matrix M;
list BO=W,J,b,E,abb,v,w,M;
Delta(BO);
↳ _[1]=z2-x
↳ _[2]=xy
↳ _[3]=3x2z+y2z
↳ _[4]=x3

```

D.5.8.12 DeltaList

Procedure from library `resolve.lib` (see [Section D.5.8 \[resolve.lib\]](#), page 1173).

Usage: DeltaList (BO);
 BO = basic object, a list: ideal W,
 ideal J,
 intvec b,
 list Ex,

ideal ab,
 intvec v,
 intvec w,
 matrix M

Assume: R = basering, a polynomial ring, W an ideal of R,
 J = ideal containing W

Compute: Delta-operator iteratively applied to J in the notation of [Bravo,Encinas,Villamayor]

Return: list l of length ((max w-ord) * b),
 $l[i+1]=\Delta^i(J)$

Example:

```
LIB "resolve.lib";
ring R=0,(x,y,z),dp;
ideal W=z^2-x;
ideal J=x*y^2+x^3;
intvec b=1;
list E;
ideal abb=maxideal(1);
intvec v;
intvec w=-1;
matrix M;
list B0=W,J,b,E,abb,v,w,M;
DeltaList(B0);
⇒ [1]:
⇒  _[1]=x3+xy2
⇒ [2]:
⇒  _[1]=z2-x
⇒  _[2]=xy
⇒  _[3]=3x2z+y2z
⇒  _[4]=x3
⇒ [3]:
⇒  _[1]=x
⇒  _[2]=z2
⇒  _[3]=yz
⇒  _[4]=y2
⇒ [4]:
⇒  _[1]=z
⇒  _[2]=y
⇒  _[3]=x
```

D.5.9 reszeta.lib

Library: reszeta.lib

Purpose: topological Zeta-function and some other applications of desingularization

Authors: A. Fruehbis-Krueger, anne@mathematik.uni-kl.de,
 G. Pfister, pfister@mathematik.uni-kl.de

References:

Procedures:

D.5.9.1 intersectionDiv

Procedure from library `reszeta.lib` (see [Section D.5.9 \[reszeta.lib\]](#), page 1182).

Usage: `intersectionDiv(L);`
 `L = list of rings`

Assume: `L` is output of resolution of singularities
 (only case of isolated surface singularities)

Compute: intersection matrix and genera of the exceptional divisors (considered as curves on the
 strict transform)

Return: list `l`, where
 `l[1]`: intersection matrix of exceptional divisors
 `l[2]`: intvec, genera of exceptional divisors
 `l[3]`: divisorList, encoding the identification of the divisors

Example:

```
LIB "reszeta.lib";
ring r = 0, (x(1..3)), dp(3);
ideal J=x(3)^5+x(2)^4+x(1)^3+x(1)*x(2)*x(3);
list re=resolve(J);
list di=intersectionDiv(re);
di;

```

D.5.9.2 spectralNeg

Procedure from library `reszeta.lib` (see [Section D.5.9 \[reszeta.lib\]](#), page 1182).

Usage: `spectralNeg(L);`
 `L = list of rings`

Assume: `L` is output of resolution of singularities

Return: list of numbers, each a spectral number in $(-1,0]$

Example:

```

LIB "reszeta.lib";
ring R=0,(x,y,z),dp;
ideal I=x3+y4+z5;
list L=resolve(I,"K");
spectralNeg(L);
↳ [1]:
↳ -13/60

D.5.9.5 collectDiv

Procedure from library `reszeta.lib` (see [Section D.5.9 \[reszeta.lib\]](#), page 1182).

Usage: `collectDiv(L);`
 `L = list of rings`

Assume: `L` is output of resolution of singularities

Compute: list representing the identification of the exceptional divisors in the various charts

Return: list `l`, where
 `l[1]`: intmat, entry `k` in position `i,j` implies `BO[4][j]` of chart `i` is divisor `k` (if `k!=0`)
 if `k==0`, no divisor corresponding to `i,j`
 `l[2]`: list `ll`, where each entry of `ll` is a list of intvecs entry `i,j` in list `ll[k]` implies `BO[4][j]`
 of chart `i`
 is divisor `k`
 `l[3]`: list `L`

Example:

```

LIB "reszeta.lib";
ring R=0,(x,y,z),dp;
ideal I=xyz+x4+y4+z4;
//we really need to blow up curves even if the generic point of
//the curve the total transform is n.c.
//this occurs here in r[2][5]

D.5.9.6 prepEmbDiv

Procedure from library `reszeta.lib` (see [Section D.5.9 \[reszeta.lib\]](#), page 1182).

Usage: `prepEmbDiv(L[,a]);`
`L` = list of rings
`a` = integer

Assume: `L` is output of resolution of singularities

Compute: if `a` is not present: exceptional divisors including components of the strict transform
otherwise: only exceptional divisors

Return: list of \mathbb{Q} -irreducible exceptional divisors (embedded case)

Example:

```

LIB "reszeta.lib";
ring R=0,(x,y,z),dp;
ideal I=x2+y2+z11;
list L=resolve(I);
prepEmbDiv(L);

D.5.9.7 abstractR

Procedure from library `reszeta.lib` (see [Section D.5.9 \[reszeta.lib\]](#), page 1182).

Usage: `abstractR(L);`
 `L = list of rings`

Assume: `L` is output of resolution of singularities

Note: currently only implemented for isolated surface singularities

Return: `list l`
 `l[1]`: intvec, where
 `l[1][i]=1` if the corresponding ring is a final chart
 of non-embedded resolution
 `l[1][i]=0` otherwise
 `l[2]`: intvec, where
 `l[2][i]=1` if the corresponding ring does not occur
 in the non-embedded resolution
 `l[2][i]=0` otherwise
 `l[3]`: list `L`

Example:

```
LIB "reszeta.lib";
ring r = 0, (x,y,z), dp;
ideal I=x2+y2+z11;
list L=resolve(I);
list absR=abstractR(L);
absR[1];
↪ 0,0,1,1,0,1,0,1,0,1,1,0,0,0,0,0,0
absR[2];
↪ 0,0,0,0,0,0,0,0,0,0,0,0,1,1,1,1,1
```

D.5.9.8 computeV

Procedure from library `reszeta.lib` (see [Section D.5.9 \[reszeta.lib\]](#), page 1182).

Usage: `computeV(L,DL);`
 `L = list of rings`
 `DL = divisor list`

Assume: `L` has structure of output of `resolve`
 `DL` has structure of output of `prepEmbDiv`

Return: intvec,
 `i`-th entry is multiplicity of `i`-th divisor in
 pullback of volume form

Example:

```
LIB "reszeta.lib";
ring R=0, (x,y,z), dp;
ideal I=(x-y)*(x-z)*(y-z)-z4;
list re=resolve(I,1);

list iden=prepEmbDiv(re);
intvec v=computeV(re, iden);
v;
↳  3,5,8,11,1

```

D.5.9.9 computeN

Procedure from library `reszeta.lib` (see [Section D.5.9 \[reszeta.lib\], page 1182](#)).

Usage: `computeN(L,DL);`
 `L` = list of rings
 `DL` = divisor list

Assume: `L` has structure of output of `resolve`
 `DL` has structure of output of `prepEmbDiv`

Return: `intvec`, `i`-th entry is multiplicity of `i`-th divisor
 in total transform under resolution

Example:

```

LIB "reszeta.lib";
ring R=0,(x,y,z),dp;
ideal I=(x-y)*(x-z)*(y-z)-z4;
list re=resolve(I,1);

D.5.10 sheafcoh_lib

Library: sheafcoh.lib

Purpose: Procedures for Computing Sheaf Cohomology

Authors: Wolfram Decker, decker@mathematik.uni-kl.de
 Christoph Lossen, lossen@mathematik.uni-kl.de
 Gerhard Pfister, pfister@mathematik.uni-kl.de
 Oleksandr Motsak, U@D, where U={motsak}, D={mathematik.uni-kl.de}

Procedures:

D.5.10.1 truncate

Procedure from library `sheafcoh.lib` (see [Section D.5.10 \[sheafcoh_lib\]](#), page 1231).

Usage: `truncate(M,d)`; M module, d int

Assume: M is graded, and it comes assigned with an admissible degree vector as an attribute

Return: module

Note: Output is a presentation matrix for the truncation of `coker(M)` at degree d.

Example:

```

LIB "sheafcoh.lib";
ring R=0,(x,y,z),dp;
module M=maxideal(3);
homog(M);
↳ 1
// compute presentation matrix for truncated module (R/<x,y,z>^3)_(>=2)
module M2=truncate(M,2);
print(M2);
↳ z,0,0,0,0,0,y, 0, 0,0, 0,0,x, 0, 0, 0, 0, 0,
↳ 0,z,0,0,0,0,-z,y, 0,0, 0,0,0, x, 0, 0, 0, 0,
↳ 0,0,z,0,0,0,0, -z,y,0, 0,0,0, 0, x, 0, 0, 0,
↳ 0,0,0,z,0,0,0, 0, 0,y, 0,0,-z,0, 0, x, 0, 0,
↳ 0,0,0,0,z,0,0, 0, 0,-z,y,0,0, -z,-y,0, x, 0,

```

```

↳ 0,0,0,0,0,z,0, 0, 0,0, 0,y,0, 0, 0, -z,-y,x
dimGradedPart(M2,1);
↳ 0
dimGradedPart(M2,2);
↳ 6
// this should coincide with:
dimGradedPart(M,2);
↳ 6
// shift grading by 1:
intvec v=1;
attrib(M,"isHomog",v);
M2=truncate(M,2);
print(M2);
↳ 0, -y,-z,z2,0, 0, yz,0, xz,y2,0, xy,x2,
↳ -z,x, 0, 0, z2,0, 0, yz,0, 0, y2,0, 0,
↳ y, 0, x, 0, 0, z2,0, 0, 0, 0, 0, 0, 0
dimGradedPart(M2,3);
↳ 6

```

D.5.10.2 truncateFast

Procedure from library `sheafcoh.lib` (see [Section D.5.10 \[sheafcoh.lib\]](#), page 1231).

Usage: `truncateFast(M,d)`; M module, d int

Assume: M is graded, and it comes assigned with an admissible degree vector as an attribute 'isHomog'

Return: module

Note: Output is a presentation matrix for the truncation of `coker(M)` at d.
Fast + experimental version. M should be a SB!

Display: If `printlevel`>=1, step-by step timings will be printed. If `printlevel`>=2 we add progress debug messages if `printlevel`>=3, even all intermediate results...

Example:

```

LIB "sheafcoh.lib";
ring R=0,(x,y,z,u,v),dp;
module M=maxideal(3);
homog(M);
↳ 1
// compute presentation matrix for truncated module (R/<x,y,z,u>^3)_(>=2)
int t=timer;
module M2t=truncate(M,2);
t = timer - t;
"// Simple truncate: ", t;
↳ // Simple truncate: 0
t=timer;
module M2=truncateFast(std(M),2);
t = timer - t;
"// Fast truncate: ", t;
↳ // Fast truncate: 0
print(M2);
↳ v,0,0,0,0,0,0,0,0,0,0,0,0,u, 0, 0, 0, 0, 0,0,0,0,0,0,0,0,0,z, 0, 0,\

D.5.10.3 CM_regularity

Procedure from library `sheafcoh.lib` (see [Section D.5.10 \[sheafcoh.lib\]](#), page 1231).

Usage: `CM_regularity(M)`; M module

Assume: M is graded, and it comes assigned with an admissible degree vector as an attribute

Return: integer, the Castelnuovo-Mumford regularity of `coker(M)`

Note: procedure calls `mres`

Example:

```

LIB "sheafcoh.lib";
ring R=0,(x,y,z,u),dp;
resolution T1=mres(maxideal(1),0);
module M=T1[3];
intvec v=2,2,2,2,2,2;
attrib(M,"isHomog",v);
CM_regularity(M);
↪ 2

```

D.5.10.4 sheafCohBGG

Procedure from library `sheafcoh.lib` (see [Section D.5.10 \[sheafcoh.lib\]](#), page 1231).

Usage: `sheafCohBGG(M,l,h)`; M module, l,h int

Assume: M is graded, and it comes assigned with an admissible degree vector as an attribute, $h \geq 1$, and the basering has $n+1$ variables.

Return: intmat, cohomology of twists of the coherent sheaf F on P^n associated to `coker(M)`. The range of twists is determined by l, h.

Display: The intmat is displayed in a diagram of the following form:

	l	l+1	h
n:	$h^n(F(l))$	$h^n(F(l+1))$	$h^n(F(h))$
1:	$h^1(F(l))$	$h^1(F(l+1))$	$h^1(F(h))$
0:	$h^0(F(l))$	$h^0(F(l+1))$	$h^0(F(h))$
chi:	$chi(F(l))$	$chi(F(l+1))$	$chi(F(h))$

A '-' in the diagram refers to a zero entry; a '*' refers to a negative entry (= dimension not yet determined). refers to a not computed dimension.

Note: This procedure is based on the Bernstein-Gel'fand-Gel'fand correspondence and on Tate resolution (see [Eisenbud, Floystad, Schreyer: Sheaf cohomology and free resolutions over exterior algebras, Trans AMS 355 (2003)]).

`sheafCohBGG(M,l,h)` does not compute all values in the above table. To determine all values of $h^i(F(d))$, $d=1..h$, use `sheafCohBGG(M,l-n,h+n)`.

Example:

```
LIB "sheafcoh.lib";
// cohomology of structure sheaf on P^4:
//-----
ring r=0,x(1..5),dp;
module M=0;
def A=sheafCohBGG(M,-9,4);
↳          -9  -8  -7  -6  -5  -4  -3  -2  -1  0  1  2  3  4
↳ -----
↳ 4:  70  35  15  5  1  -  -  -  -  -  *  *  *  *
↳ 3:   *  -  -  -  -  -  -  -  -  -  -  *  *  *
↳ 2:   *  *  -  -  -  -  -  -  -  -  -  -  *  *
↳ 1:   *  *  *  -  -  -  -  -  -  -  -  -  -  *
↳ 0:   *  *  *  *  -  -  -  -  -  1  5  15  35  70
↳ -----
↳ chi:  *  *  *  *  1  0  0  0  0  1  *  *  *  *
// cohomology of cotangential bundle on P^3:
//-----
ring R=0,(x,y,z,u),dp;
resolution T1=mres(maxideal(1),0);
module M=T1[3];
intvec v=2,2,2,2,2,2;
attrib(M,"isHomog",v);
def B=sheafCohBGG(M,-8,4);
↳          -8  -7  -6  -5  -4  -3  -2  -1  0  1  2  3  4
↳ -----
↳ 3:  189  120  70  36  15  4  -  -  -  -  *  *  *
↳ 2:   *  -  -  -  -  -  -  -  -  -  -  *  *
↳ 1:   *  *  -  -  -  -  -  -  1  -  -  -  *
↳ 0:   *  *  *  -  -  -  -  -  -  -  -  6  20  45
↳ -----
↳ chi:  *  *  *  -36  -15  -4  0  0  -1  0  *  *  *
```

See also: [Section D.5.10.7 \[dimH\], page 1241](#); [Section D.5.10.6 \[sheafCoh\], page 1240](#).

D.5.10.5 sheafCohBGG2

Procedure from library `sheafcoh.lib` (see [Section D.5.10 \[sheafcoh_lib\], page 1231](#)).

Usage: `sheafCohBGG2(M,l,h)`; M module, l,h int

Assume: M is graded, and it comes assigned with an admissible degree vector as an attribute, $h \geq 1$, and the basering has $n+1$ variables.

Return: intmat, cohomology of twists of the coherent sheaf F on P^n associated to `coker(M)`. The range of twists is determined by l, h.

Display: The intmat is displayed in a diagram of the following form:

	l	l+1	h
n:	$h^n(F(l))$	$h^n(F(l+1))$	$h^n(F(h))$
			
1:	$h^1(F(l))$	$h^1(F(l+1))$	$h^1(F(h))$
0:	$h^0(F(l))$	$h^0(F(l+1))$	$h^0(F(h))$
chi:	$chi(F(l))$	$chi(F(l+1))$	$chi(F(h))$

A '-' in the diagram refers to a zero entry; a '*' refers to a negative entry (= dimension not yet determined). refers to a not computed dimension.

If `printlevel>=1`, step-by step timings will be printed. If `printlevel>=2` we add progress debug messages if `printlevel>=3`, even all intermediate results...

Note: This procedure is based on the Bernstein-Gel'fand-Gel'fand correspondence and on Tate resolution (see [Eisenbud, Floystad, Schreyer: Sheaf cohomology and free resolutions over exterior algebras, Trans AMS 355 (2003)]).

`sheafCohBGG(M,l,h)` does not compute all values in the above table. To determine all values of $h^i(F(d))$, $d=1..h$, use `sheafCohBGG(M,l-n,h+n)`. Experimental version. Should require less memory.

Example:

```
LIB "sheafcoh.lib";
int pl = printlevel;
int l,h, t;
//-----
// cohomology of structure sheaf on P^4:
//-----
ring r=32001,x(1..5),dp;
=> // ** 32001 is invalid as characteristic of the ground field. 32003 is used.
module M= getStructureSheaf(); // OO_P^4
l = -12; h = 12; // range of twists: l..h
printlevel = 0;
////////////////////////////////////

See also: [Section D.5.10.4 \[sheafCohBGG\], page 1235](#).

D.5.10.6 sheafCoh

Procedure from library `sheafcoh.lib` (see [Section D.5.10 \[sheafcoh.lib\], page 1231](#)).

- Usage:** `sheafCoh(M,l,h)`; M module, l,h int
- Assume:** M is graded, and it comes assigned with an admissible degree vector as an attribute, $h \geq 1$. The basering S has $n+1$ variables.
- Return:** intmat, cohomology of twists of the coherent sheaf F on P^n associated to `coker(M)`. The range of twists is determined by l, h.
- Display:** The intmat is displayed in a diagram of the following form:

A '-' in the diagram refers to a zero entry.

- Note:** The procedure is based on local duality as described in [Eisenbud: Computing cohomology. In Vasconcelos: Computational methods in commutative algebra and algebraic geometry. Springer (1998)].
By default, the procedure uses `mres` to compute the Ext modules. If called with the additional parameter "`sres`", the `sres` command is used instead.

Example:

```

LIB "sheafcoh.lib";
//
// cohomology of structure sheaf on P^4:
//-----
ring r=0,x(1..5),dp;
module M=0;
def A=sheafCoh(0,-7,2);
↳      -7  -6  -5  -4  -3  -2  -1  0  1  2
↳ -----
↳ 4:  15  5  1  -  -  -  -  -  -  -
↳ 3:   -  -  -  -  -  -  -  -  -  -
↳ 2:   -  -  -  -  -  -  -  -  -  -
↳ 1:   -  -  -  -  -  -  -  -  -  -
↳ 0:   -  -  -  -  -  -  -  1  5  15
↳ -----
↳ chi: 15  5  1  0  0  0  0  1  5  15
//
// cohomology of cotangential bundle on P^3:
//-----

D.5.10.7 dimH

Procedure from library `sheafcoh.lib` (see [Section D.5.10 \[sheafcoh.lib\]](#), page 1231).

Usage: `dimH(i,M,d)`; M module, i,d int

Assume: M is graded, and it comes assigned with an admissible degree vector as an attribute, $h \geq 1$, and the basering S has $n+1$ variables.

Return: int, vector space dimension of $H^i(F(d))$ for F the coherent sheaf on P^n associated to $\text{coker}(M)$.

Note: The procedure is based on local duality as described in [Eisenbud: Computing cohomology. In Vasconcelos: Computational methods in commutative algebra and algebraic geometry. Springer (1998)].

Example:

```

LIB "sheafcoh.lib";
ring R=0,(x,y,z,u),dp;
resolution T1=mres(maxideal(1),0);

```

```

module M=T1[3];
intvec v=2,2,2,2,2,2;
attrib(M,"isHomog",v);
dimH(0,M,2);
↳ 6
dimH(1,M,0);
↳ 1
dimH(2,M,1);
↳ 0
dimH(3,M,-5);
↳ 36

```

See also: [Section D.5.10.6 \[sheafCoh\]](#), page 1240; [Section D.5.10.4 \[sheafCohBGG\]](#), page 1235.

D.5.10.8 dimGradedPart

Procedure from library `sheafcoh.lib` (see [Section D.5.10 \[sheafcoh.lib\]](#), page 1231).

Usage: `dimGradedPart(M,d)`; M module, d int

Assume: M is graded, and it comes assigned with an admissible degree vector as an attribute

Return: int

Note: Output is the vector space dimension of the graded part of degree d of `coker(M)`.

Example:

```

LIB "sheafcoh.lib";
ring R=0,(x,y,z),dp;
module M=maxideal(3);
// assign compatible weight vector (here: 0)
homog(M);
↳ 1
// compute dimension of graded pieces of R/<x,y,z>^3 :
dimGradedPart(M,0);
↳ 1
dimGradedPart(M,1);
↳ 3
dimGradedPart(M,2);
↳ 6
dimGradedPart(M,3);
↳ 0
// shift grading:
attrib(M,"isHomog",intvec(2));
dimGradedPart(M,2);
↳ 1

```

D.5.10.9 displayCohom

Procedure from library `sheafcoh.lib` (see [Section D.5.10 \[sheafcoh.lib\]](#), page 1231).

Usage: `displayCohom(data,l,h,n)`; data intmat, l,h,n int

Assume: $h \geq 1$, data is the return value of `sheafCoh(M,l,h)` or of `sheafCohBGG(M,l,h)`, and the basering has $n+1$ variables.

Return: none

Note: The intmat is displayed in a diagram of the following form:

$$\begin{array}{cccc}
 & 1 & l+1 & h \\
 \hline
 n: & h^n(F(1)) & h^n(F(l+1)) & \dots & h^n(F(h)) \\
 & \dots & \dots & \dots & \dots \\
 1: & h^1(F(1)) & h^1(F(l+1)) & \dots & h^1(F(h)) \\
 0: & h^0(F(1)) & h^0(F(l+1)) & \dots & h^0(F(h)) \\
 \hline
 \text{chi:} & \text{chi}(F(1)) & \text{chi}(F(l+1)) & \dots & \text{chi}(F(h))
 \end{array}$$

where F refers to the associated sheaf of M on P^n .

A '–' in the diagram refers to a zero entry, a '*' refers to a negative entry (= dimension not yet determined).

D.5.11 JMBTest_lib

Library: JMBTest.lib

Purpose: A library for Singular which performs JM basis test.

Author: Michela Ceria, email: michela.ceria@unito.it

Overview: The library performs the J-marked basis test, as described in [CR], [BCLR]. Such a test is performed via the criterion explained in [BCLR], concerning Eliahou-Kervaire polynomials (EK from now on). We point out that all the polynomials are homogeneous and they must be arranged by degree.

The fundamental steps are the following:

- construct the V_m polynomials, via the algorithm VConstructor explained in [CR];
- construct the Eliahou-Kervaire polynomials defined in [BCLR];
- reduce the Eliahou-Kervaire polynomials using the V_m 's;
- if it exist an Eliahou-Kervaire polynomial such that its reduction mod V_m is different from zero, the given one is not a J-Marked basis.

The algorithm terminates only if the ordering is rp. Anyway, the number of reduction steps is bounded.

(2012), <http://dx.doi.org/10.1016/j.jsc.2012.07.006>

Procedures: See also: [Section D.5.12 \[JMSSConst_lib\]](#), page 1246.

D.5.11.1 Minimus

Procedure from library JMBTest.lib (see [Section D.5.11 \[JMBTest_lib\]](#), page 1243).

Usage: Minimus(L); G list, c int

Return: list: V

Notes: it returns the minimal variable generating the ideal L.
The input must be an ideal generated by variables.

Example:

```
LIB "JMBTest.lib";
ring r=0, (x,y,z), rp;
ideal I=y,x,z;
Minimus(I);
↳ x
```

D.5.11.2 Maximus

Procedure from library `JMBTest.lib` (see [Section D.5.11 \[JMBTest.lib\]](#), page 1243).

Usage: Maximus(L); G list, c int

Return: list: V

Notes: it returns the maximal variable generating the ideal L.
The input must be an ideal generated by variables.

Example:

```
LIB "JMBTest.lib";
ring r=0, (x,y,z), rp;
ideal I=y,x,z;
Maximus(I);
↳ z
```

D.5.11.3 StartOrderingV

Procedure from library `JMBTest.lib` (see [Section D.5.11 \[JMBTest.lib\]](#), page 1243).

Usage: StartOrdina(V,G); V list, G list

Return: list: R

Note: Input Vm,G. This procedure uses `OrderingV` to get the ordered polynomials as in [BCLR].

Example:

```
LIB "JMBTest.lib";
ring r=0, (x,y,z), rp;
jmp r1;
r1.h=z^3;
r1.t=poly(0);
jmp r2;
r2.h=z^2*y;
r2.t=poly(0);
jmp r3;
r3.h=z*y^2;
r3.t=-x^2*y;
jmp r4;
r4.h=y^5;
r4.t=poly(0);
list G2F=list(list(r1,r2,r3),list(r4));
StartOrderingV(VConst(G2F,4,basing)[1],G2F);
↳ [1]:
```

```

↳ [1]:
↳ 1
↳ [2]:
↳ 1
↳ [3]:
↳ 3
↳ [2]:
↳ [1]:
↳ 1
↳ [2]:
↳ 1
↳ [3]:
↳ 2
↳ [3]:
↳ [1]:
↳ 1
↳ [2]:
↳ 1
↳ [3]:
↳ 1
↳ 1

```

D.5.11.4 TestJMark

Procedure from library `JMBTest.lib` (see [Section D.5.11 \[JMBTest.lib\]](#), page 1243).

Usage: TestJMark(G); G list

Return: int: i

Note: This procedure performs J-marked basis test.
 The input is a list of J-marked polynomials (jmp) arranged by degree, so G1 is a list of list.
 The output is a boolean evaluation:
 True=1/False=0

Example:

```

LIB "JMBTest.lib";
ring r=0, (x,y,z), rp;
jmp r1;
r1.h=z^3;
r1.t=poly(0);
jmp r2;
r2.h=z^2*y;
r2.t=poly(0);
jmp r3;
r3.h=z*y^2 ;
r3.t=-x^2*y;
jmp r4;
r4.h=y^5;
r4.t=poly(0);
list G2F=list(list(r1,r2,r3),list(r4));
TestJMark(G2F,r);
↳ NOT A BASIS
↳ 0

```

D.5.12 JMSTest.lib

Library: JMSTest.lib

Purpose: A library for Singular which constructs J-Marked Schemes.

Author: Michela Ceria, email: michela.ceria@unito.it

Overview: The library performs the J-marked computation, as described in [BCLR]. As in JMBTest.lib we construct the V polynomials and we reduce the EK polynomials w.r.t. them, putting the coefficients as results.

The algorithm terminates only if the ordering is rp. Anyway, the number of reduction steps is bounded.

References:

[CR] Francesca Cioffi, Margherita Roggero, Flat Families by Strongly Stable Ideals and a Generalization of Groebner Bases, *J. Symbolic Comput.* 46, 1070-1084, (2011).

Procedures: See also: [Section D.5.11 \[JMBTest.lib\], page 1243](#); [Section D.5.12 \[JMSTest.lib\], page 1246](#).

D.5.12.1 BorelCheck

Procedure from library JMSTest.lib (see [Section D.5.12 \[JMSTest.lib\], page 1246](#)).

Usage: BorelCheck(Borid,r); Borid ideal, r ring

Return: int: d

Note: Input must be a monomial ideal.

The procedure checks whether the Borel moves produce elements belonging to Borid.

Example:

```
LIB "JMSTest.lib";
ring r=0, (x,y,z),rp;
ideal Borid=y^2*z,y*z^2,z^3,y^5;
BorelCheck(Borid,r);
↪ 1
```

D.5.12.2 JMarkedScheme

Procedure from library JMSTest.lib (see [Section D.5.12 \[JMSTest.lib\], page 1246](#)).

Usage: JMarkedScheme(Borid, r); Borid ideal, r ring

Return: list: Jms

Note: This procedure performs automatically the whole construction of the J-marked scheme.

Example:

```

LIB "JMSConst.lib";
ring r=0, (x,y,z),rp;
ideal Borid=y^2*z,y*z^2,z^3,y^5;
JMarkedScheme(Borid,r);

D.6 Singularities

D.6.1 alexpoly_lib

Library: alexpoly.lib

Purpose: Resolution Graph and Alexander Polynomial

Author: Fernando Hernando Carrillo, hernando@agt.uva.es
Thomas Keilen, keilen@mathematik.uni-kl.de

Overview: A library for computing the resolution graph of a plane curve singularity f , the total multiplicities of the total transforms of the branches of f along the exceptional divisors of a minimal good resolution of f , the Alexander polynomial of f , and the zeta function of its monodromy operator.

Procedures:

D.6.1.1 resolutiongraph

Procedure from library `alexpoly.lib` (see [Section D.6.1 \[alexpoly_lib\], page 1249](#)).

Usage: `resolutiongraph(INPUT)`; INPUT poly or list

Assume: INPUT is either a REDUCED bivariate polynomial defining a plane curve singularity, or the output of `hnexpansion(f[, "ess"])`, or the list `hne` in the ring created by `hnexpansion(f[, "ess"])`, or the output of `develop(f)` resp. of `extdevelop(f,n)`, or a list containing the contact matrix and a list of integer vectors with the characteristic exponents of the branches of a plane curve singularity, or an integer vector containing the characteristic exponents of an irreducible plane curve singularity.

Return: `intmat`, the incidence matrix of the resolution graph of the plane curve defined by INPUT, where the entries on the diagonal are the weights of the vertices of the graph and a negative entry corresponds to the strict transform of a branch of the curve.

Note: In case the Hamburger-Noether expansion of the curve f is needed for other purposes as well it is better to calculate this first with the aid of `hnexpansion` and use it as input instead of the polynomial itself.
If you are not sure whether the INPUT polynomial is reduced or not, use `squarefree(INPUT)` as input instead.

Example:

```
LIB "alexpoly.lib";
ring r=0,(x,y),ls;
poly f1=(y2-x3)^2-4x5y-x7;
poly f2=y2-x3;
poly f3=y3-x2;
resolutiongraph(f1*f2*f3);
↪ 1,0,1,0,0,0,0,0,1,0,
↪ 0,2,1,0,0,0,0,0,0,0,
↪ 1,1,3,0,1,0,0,0,0,0,
↪ 0,0,0,4,1,0,1,0,0,0,
↪ 0,0,1,1,5,1,0,0,0,0,

See also: [Section D.6.1.3 \[alexanderpolynomial\]](#), page 1251; [Section D.6.11.2 \[develop\]](#), page 1312; [Section D.6.11.1 \[hnexpansion\]](#), page 1310; [Section D.6.1.2 \[totalmultiplicities\]](#), page 1250.

D.6.1.2 totalmultiplicities

Procedure from library `alexpoly.lib` (see [Section D.6.1 \[alexpoly-lib\]](#), page 1249).

Usage: `totalmultiplicities(INPUT)`; INPUT poly or list

Assume: INPUT is either a REDUCED bivariate polynomial defining a plane curve singularity, or the output of `hnexpansion(f[,"ess"])`, or the list `hne` in the ring created by `hnexpansion(f[,"ess"])`, or the output of `develop(f)` resp. of `extdevelop(f,n)`, or a list containing the contact matrix and a list of integer vectors with the characteristic exponents of the branches of a plane curve singularity, or an integer vector containing the characteristic exponents of an irreducible plane curve singularity.

Return: list L of three integer matrices. L[1] is the incidence matrix of the resolution graph of the plane curve defined by INPUT, where the entries on the diagonal are the weights of the vertices of the graph and a negative entry corresponds to the strict transform of a branch of the curve. L[2] is an integer matrix, which has for each vertex in the graph a row and for each branch of the curve a column. The entry in position [i,j] contains the total multiplicity of the j-th branch (i.e. the branch with weight -j in L[1]) along the exceptional divisor corresponding to the i-th row in L[1]. In particular, the i-th row contains the total multiplicities of the branches of the plane curve (defined by INPUT) along the exceptional divisor which corresponds to the i-th row in the incidence matrix L[1]. L[3] is an integer matrix which contains the (strict) multiplicities of the branches of the curve along the exceptional divisors in the same way as L[2] contains the total multiplicities.

Note: The total multiplicity of a branch along an exceptional divisor is the multiplicity with which this exceptional divisor occurs in the total transform of this branch under the resolution corresponding to the resolution graph.

In case the Hamburger-Noether expansion of the curve f is needed for other purposes as well it is better to calculate this first with the aid of `hnexpansion` and use it as input instead of the polynomial itself.

If you are not sure whether the INPUT polynomial is reduced or not, use `squarefree(INPUT)` as input instead.

Example:

```

LIB "alexpoly.lib";
ring r=0,(x,y),ls;
poly f1=(y2-x3)^2-4x5y-x7;
poly f2=y2-x3;
poly f3=y3-x2;
totalmultiplicities(f1*f2*f3);

D.6.1.3 alexanderpolynomial

Procedure from library `alexpoly.lib` (see [Section D.6.1 \[alexpoly_lib\]](#), page 1249).

Usage: `alexanderpolynomial(INPUT)`; INPUT poly or list

Assume: INPUT is either a REDUCED bivariate polynomial defining a plane curve singularity, or the output of `hnexpansion(f[,"ess"])`, or the list `hne` in the ring created by `hnexpansion(f[,"ess"])`, or the output of `develop(f)` resp. of `extdevelop(f,n)`, or a list containing the contact matrix and a list of integer vectors with the characteristic exponents of the branches of a plane curve singularity, or an integer vector containing the characteristic exponents of an irreducible plane curve singularity.

Create: a ring with variables `t`, `t(1)`, ..., `t(r)` (where `r` is the number of branches of the plane curve singularity `f` defined by INPUT) and ordering `ls` over the ground field of the basering.

Moreover, the ring contains the Alexander polynomial of `f` in variables `t(1)`, ..., `t(r)` (`alexpoly`), the zeta function of the monodromy operator of `f` in the variable `t` (`zeta_monodromy`), and a list containing the factors of the Alexander polynomial with multiplicities (`alexfactors`).

Return: a list, say `ALEX`, where `ALEX[1]` is the created ring

Note: to use the ring type: `def ALEXring=ALEX[i]; setring ALEXring;`
 Alternatively you may use the procedure `sethnering` and type: `sethnering(ALEX,"ALEXring");`
 To access the Alexander polynomial resp. the zeta function resp. the factors of the Alexander polynomial type: `alexpoly` resp. `zeta_monodromy` resp. `alexfactors`.
 In case the Hamburger-Noether expansion of the curve `f` is needed for other purposes as well it is better to calculate this first with the aid of `hnexpansion` and use it as input instead of the polynomial itself.
 If you are not sure whether the INPUT polynomial is reduced or not, use `squarefree(INPUT)` as input instead.

Example:

```
LIB "alexpoly.lib";
ring r=0,(x,y),ls;
poly f1=(y2-x3)^2-4x5y-x7;
poly f2=y2-x3;
poly f3=y3-x2;
list ALEX=alexanderpolynomial(f1*f2*f3);

```

See also: [Section D.6.1.1 \[resolutiongraph\]](#), page 1249; [Section D.6.1.2 \[totalmultiplicities\]](#), page 1250.

D.6.1.4 semigroup

Procedure from library `alexpoly.lib` (see [Section D.6.1 \[alexpoly_lib\]](#), page 1249).

Usage: `semigroup(INPUT)`; INPUT poly or list

Assume: INPUT is either a REDUCED bivariate polynomial defining a plane curve singularity, or the output of `hnexpansion(f, "ess")`, or the list `hne` in the ring created by `hnexpansion(f, "ess")`, or the output of `develop(f)` resp. of `extdevelop(f, n)`, or a list containing the contact matrix and a list of integer vectors with the characteristic exponents of the branches of a plane curve singularity, or an integer vector containing the characteristic exponents of an irreducible plane curve singularity.

Return: a list with three entries. The first and the second are lists v_1, \dots, v_s and w_1, \dots, w_r respectively of integer vectors such that the semigroup of the plane curve defined by the INPUT is generated by the vectors $v_1, \dots, v_s, w_1+k*e_1, \dots, w_r+k*e_r$, where e_i denotes the i -th standard basis vector and k runs through all non-negative integers. The third entry is the conductor of the plane curve singularity. Note that r is the number of branches of the plane curve singularity and integer vectors thus have size r .

Note: If the output is zero this means that the curve has one branch and is regular. In the reducible case the set of generators may not be minimal. If you are not sure whether the INPUT polynomial is reduced or not, use `squarefree(INPUT)` as input instead.

Example:

```
LIB "alexpoly.lib";
ring r=0,(x,y),ls;
// Irreducible Case
semigroup((x2-y3)^2-4x5y-x7);
⇒ [1]:
⇒ [1]:
⇒ 4
⇒ [2]:
⇒ 6
⇒ [3]:
⇒ 17
⇒ [2]:
⇒ empty list
⇒ [3]:
⇒ 20
// In the irreducible case, invariants() also calculates a minimal set of
// generators of the semigroup.
invariants((x2-y3)^2-4x5y-x7) [1] [2];
⇒ 4,6,17
// Reducible Case
poly f=(y2-x3)*(y2+x3)*(y4-2x3y2-4x5y+x6-x7);
semigroup(f);
⇒ [1]:
⇒ [1]:
⇒ 2,4,2
```

↳      [1]:
↳      7,13,6
↳      [2]:
↳      13,26,12
↳      [3]:
↳      6,12,6
↳ [3]:
↳      21,41,20

```

See also: [Section D.6.1.1 \[resolutiongraph\], page 1249](#); [Section D.6.1.2 \[totalmultiplicities\], page 1250](#).

D.6.1.5 proximitymatrix

Procedure from library `alexpoly.lib` (see [Section D.6.1 \[alexpoly_lib\], page 1249](#)).

Usage: `proximitymatrix(INPUT)`; INPUT poly or list or intmat

Assume: INPUT is either a REDUCED bivariate polynomial defining a plane curve singularity, or the output of `hnexpansion(f[, "ess"])`, or the list `hne` in the ring created by `hnexpansion(f[, "ess"])`, or the output of `develop(f)` resp. of `extdevelop(f,n)`, or a list containing the contact matrix and a list of integer vectors with the characteristic exponents of the branches of a plane curve singularity, or an integer vector containing the characteristic exponents of an irreducible plane curve singularity, or the resolution graph of a plane curve singularity (i.e. the output of `resolutiongraph` or the first entry in the output of `totalmultiplicities`).

Return: list, of three integer matrices. The first one is the proximity matrix of the plane curve defined by the INPUT, i.e. the entry i,j is 1 if the infinitely near point corresponding to row i is proximate to the infinitely near point corresponding to row j . The second integer matrix is the incidence matrix of the resolution graph of the plane curve. The entry on the diagonal in row i is $-s-1$ if s is the number of points proximate to the infinitely near point corresponding to the i th row in the matrix. The third integer matrix is the incidence matrix of the Enriques diagram of the plane curve singularity, i.e. each row corresponds to an infinitely near point in the minimal standard resolution, including the strict transforms of the branches, the diagonal element gives the level of the point, and the entry i,j is -1 if row i is proximate to row j .

Note: In case the Hamburger-Noether expansion of the curve f is needed for other purposes as well it is better to calculate this first with the aid of `hnexpansion` and use it as input instead of the polynomial itself.

If you are not sure whether the INPUT polynomial is reduced or not, use `squarefree(INPUT)` as input instead.

If the input is a smooth curve, then the output will consist of three one-by-one zero matrices.

For the definitions of the computed objects see e.g. the book Eduardo Casas-Alvero, *Singularities of Plane Curves*.

Example:

```

LIB "alexpoly.lib";
ring r=0,(x,y),ls;
poly f1=(y2-x3)^2-4x5y-x7;

```

```

poly f2=y2-x3;
poly f3=y3-x2;

D.6.1.6 multseq2charexp

Procedure from library `alexpoly.lib` (see [Section D.6.1 \[alexpoly_lib\]](#), page 1249).

Assume: The input is an intvec, which contains the mutiplicity sequence of an irreducible plane curve singularity .

Return: An intvec, which contains the sequence of characteristic exponents of the irreducible plane curve singularity defined by v .

Example:

```

LIB "alexpoly.lib";
intvec v=2,1,1;
multseq2charexp(v);
↳ 2,3
intvec v1=4,2,2,1,1;
multseq2charexp(v1);
↳ 4,6,7

```

D.6.1.7 charexp2multseq

Procedure from library `alexpoly.lib` (see [Section D.6.1 \[alexpoly_lib\]](#), page 1249).

Usage: `charexp2multseq(v)`, `v` intvec

Assume: `v` contains the characteristic exponents of an irreducible plane curve singularity

Return: intvec, the multiplicity sequence of the plane curve singularity

Note: If the curve singularity is smooth, then the multiplicity sequence is empty. This is expressed by returning zero.

Example:

```
LIB "alexpoly.lib";
charexp2multseq(intvec(28,64,66,77));
↪ 28,28,8,8,8,4,4,2,2,2,2,2,2,2,1,1
```

See also: [Section D.6.1.3 \[alexanderpolynomial\]](#), page 1251; [Section D.6.11.6 \[invariants\]](#), page 1317; [Section D.6.1.1 \[resolutiongraph\]](#), page 1249; [Section D.6.1.2 \[totalmultiplicities\]](#), page 1250.

D.6.1.8 charexp2generators

Procedure from library `alexpoly.lib` (see [Section D.6.1 \[alexpoly.lib\]](#), page 1249).

Usage: `charexp2generators(v)`, `v` intvec

Assume: `v` contains the characteristic exponents of an irreducible plane curve singularity

Return: intvec, the minimal set of generators of the semigroup of the plane curve singularity

Example:

```
LIB "alexpoly.lib";
charexp2generators(intvec(28,64,66,77));
↪ 28,64,450,911
```

See also: [Section D.6.1.3 \[alexanderpolynomial\]](#), page 1251; [Section D.6.11.6 \[invariants\]](#), page 1317; [Section D.6.1.1 \[resolutiongraph\]](#), page 1249; [Section D.6.1.2 \[totalmultiplicities\]](#), page 1250.

D.6.1.9 charexp2inter

Procedure from library `alexpoly.lib` (see [Section D.6.1 \[alexpoly.lib\]](#), page 1249).

Usage: `charexp2inter(contact,charexp)`, contact matrix, charexp list

Assume: `charexp` contains the integer vectors of characteristic exponents of the branches of a plane curve singularity, and `contact` is their contact matrix

Return: intmat, the matrix intersection multiplicities of the branches

Example:

```
LIB "alexpoly.lib";
ring r=0,(x,y),ds;
list INV=invariants((x2-y3)*(x3-y2)*((x2-y3)^2-4x5y-x7));
intmat contact=INV[4][1];
list charexp=INV[1][1],INV[2][1],INV[3][1];
// The intersection matrix is INV[4][2].
print(INV[4][2]);
↪      0      4      8
↪      4      0     17
↪      8     17      0
// And it is calculated as ...
print(charexp2inter(contact,charexp));
```

```

↳      0      4      8
↳      4      0     17
↳      8     17      0

```

See also: [Section D.6.11.6 \[invariants\]](#), page 1317; [Section D.6.1.1 \[resolutiongraph\]](#), page 1249; [Section D.6.1.4 \[semigroup\]](#), page 1253; [Section D.6.1.2 \[totalmultiplicities\]](#), page 1250.

D.6.1.10 charexp2conductor

Procedure from library `alexpoly.lib` (see [Section D.6.1 \[alexpoly_lib\]](#), page 1249).

Assume: `v` contains the characteristic exponents of an irreducible plane curve singularity

Return: `int`, the conductor of the plane curve singularity

Note: If the curve singularity is smooth, the conductor is zero.

Example:

```

LIB "alexpoly.lib";
charexp2conductor(intvec(2,3)); // A1-Singularity
↳ 2
charexp2conductor(intvec(28,64,66,77));
↳ 1718

```

See also: [Section D.6.11.6 \[invariants\]](#), page 1317; [Section D.6.1.1 \[resolutiongraph\]](#), page 1249; [Section D.6.1.4 \[semigroup\]](#), page 1253; [Section D.6.1.2 \[totalmultiplicities\]](#), page 1250.

D.6.1.11 charexp2poly

Procedure from library `alexpoly.lib` (see [Section D.6.1 \[alexpoly_lib\]](#), page 1249).

Assume: `v` an `intvec` containing the characteristic exponents of an irreducible plane curve singularity. `a` a vector containing the coefficients of a parametrization given by $x(t)=x^v[1]$, $y(t)=a[1]t^v[2]+\dots+a[n-1]t^v[n]$, i.e. the entries of `a` are of type number.

Return: A polynomial `f` in the first two variables of the basering, such that `f` defines an irreducible plane curve singularity with characteristic exponents `v`.

Note: The entries in `a` should be of type number and the vector `v` should be the sequence of characteristic exponents of an irreducible plane curve singularity in order to get a sensible result,

Example:

```

LIB "alexpoly.lib";
ring r=0,(x,y),dp;
intvec v=8,12,14,17;
vector a=[1,1,1];
poly f=charexp2poly(v,a);
f;
↳ -x17+8x16-20x15+17x14-16x13y+12x12y2-2x13+32x12y-16x11y2-8x10y3+x12-8x11y\
+20x10y2-16x9y3-4x9y2+16x8y3-2x7y4-8x6y5+6x6y4-8x5y5-4x3y6+y8
invariants(f)[1][1]; // The characteristic exponents of f.
↳ 8,12,14,17

```

See also: [Section D.6.1.7 \[charexp2multseq\]](#), page 1256; [Section D.6.1.6 \[multseq2charexp\]](#), page 1256.

D.6.1.12 tau_es2

Procedure from library `alexpoly.lib` (see [Section D.6.1 \[alexpoly.lib\], page 1249](#)).

Usage: `tau_es2(INPUT)`; INPUT poly or list

Assume: INPUT is either a REDUCED bivariate polynomial defining a plane curve singularity, or the output of `hnexpansion(f, "ess")`, or the list `hne` in the ring created by `hnexpansion(f, "ess")`, or the output of `develop(f)` resp. of `extdevelop(f, n)`, or a list containing the contact matrix and a list of integer vectors with the characteristic exponents of the branches of a plane curve singularity, or an integer vector containing the characteristic exponents of an irreducible plane curve singularity.

Return: int, the equisingular Tjurina number of `f`, i. e. the codimension of the mu-constant stratum in the semiuniversal deformation of `f`, where mu is the Milnor number of `f`.

Note: The equisingular Tjurina number is calculated with the aid of a Hamburger-Noether expansion, which is the hard part of the calculation.

In case the Hamburger-Noether expansion of the curve `f` is needed for other purposes as well it is better to calculate this first with the aid of `hnexpansion` and use it as input instead of the polynomial itself.

If you are not sure whether the INPUT polynomial is reduced or not, use `squarefree(INPUT)` as input instead.

Example:

```
LIB "alexpoly.lib";
ring r=0,(x,y),ls;

D.6.2 arcpoint_lib

Library: `arcpoint.lib`

Purpose: Truncations of arcs at a singular point

Author: Nadine Cremer `cremer@mathematik.uni-kl.de`

Overview: An arc is given by a power series in one variable, say `t`, and truncating it at a positive integer `i` means cutting the `t`-powers $> i$. The set of arcs truncated at order `<bound>` is denoted `Tr(i)`. An algorithm for computing these sets (which happen to be constructible) is given in [Lejeune-Jalabert, M.: *Courbes tracées sur un germe d'hypersurface*, American Journal of Mathematics, 112 (1990)]. Our procedures for computing the locally closed sets contributing to the set of truncations rely on this algorithm.

Procedures:

D.6.2.1 nashmult

Procedure from library `arcpoint.lib` (see [Section D.6.2 \[arcpoint.lib\]](#), page 1259).

Usage: `nashmult(f,bound)`; `f` polynomial, `bound` positive integer

Create: `allsteps`:
 a list containing all relevant locally closed sets
 up to order `<bound>` and their sequences of
 Nash Multiplicities

`setstep`:
 list of relevant locally closed sets
 obtained from sequences of length `bound+1`

Return: ring, original basering with additional
 variables `t` and coefficients up to $t^{<bound>}$

Example:

```
LIB "arcpoint.lib";
ring r=0,(x,y,z),dp;
poly f=z4+y3-x2;
def R=nashmult(f,2);
setring R;
allsteps;

↳       2,2
↳     [2]:
↳       _[1]=a(1)
↳       _[2]=b(1)
↳     [3]:
↳       _[1]=1
↳ [2]:
↳   [1]:
↳     [1]:
↳       2,2,1
↳     [2]:
↳       _[1]=a(1)
↳       _[2]=b(1)
↳       _[3]=c(1)^4-a(2)^2
↳     [3]:
↳       _[1]=a(1)
↳       _[2]=b(1)
↳       _[3]=c(1)
↳       _[4]=a(2)
↳   [2]:
↳     [1]:
↳       2,2,2
↳     [2]:
↳       _[1]=a(1)
↳       _[2]=b(1)
↳       _[3]=c(1)
↳       _[4]=a(2)
```

```

↳      [3]:
↳      _[1]=1

```

D.6.2.2 removepower

Procedure from library `arcpoint.lib` (see [Section D.6.2 \[arcpoint.lib\], page 1259](#)).

Usage: `removepower(I);` I ideal

Return: ideal defining the same zeroset as I: if any generator of I is a power of one single variable, replace it by the respective variable

Example:

```

LIB "arcpoint.lib";
ring r=0,(x,y,z),dp;
ideal I = x3,y+z2-x2;
I;
↳ I[1]=x3
↳ I[2]=-x2+z2+y
removepower(I);
↳ _[1]=x
↳ _[2]=-x2+z2+y

```

See also: [Section D.6.2.3 \[idealsimplify\], page 1261](#).

D.6.2.3 idealsimplify

Procedure from library `arcpoint.lib` (see [Section D.6.2 \[arcpoint.lib\], page 1259](#)).

Usage: `idealsimplify(I,m);` I ideal, m int

Assume: procedure is stable for sufficiently large m

Return: ideal defining the same zeroset as I: replace generators of I by the generator modulo other generating elements

Example:

```

LIB "arcpoint.lib";
ring r=0,(x,y,z),dp;
ideal I = x3,y+z2-x2;
I;
↳ I[1]=x3
↳ I[2]=-x2+z2+y
idealsimplify(I,10);
↳ _[1]=x
↳ _[2]=z2+y

```

D.6.2.4 equalJinI

Procedure from library `arcpoint.lib` (see [Section D.6.2 \[arcpoint.lib\], page 1259](#)).

Usage: `equalJinI(I,J);` (I,J ideals)

Assume: J contained in I and both I and J have been processed with `idealsimplify` before

Return: 1, if I=J, 0 otherwise

Example:

```
LIB "arcpoint.lib";
ring r=0,(x,y,z),dp;
ideal I = x,y+z2;
ideal J1= x;
ideal J2= x,y+z2;
equalJinI(I,J1);
↪ 0
equalJinI(I,J2);
↪ 1
```

See also: [Section D.6.2.3 \[idealsimplify\]](#), page 1261.

D.6.3 classify_lib

Library: classify.lib

Purpose: Arnold Classifier of Singularities

Author: Kai Krueger, krueger@mathematik.uni-kl.de

Overview: A library for classifying isolated hypersurface singularities w.r.t. right equivalence, based on the determinant of singularities by V.I. Arnold.

Procedures: See also: [Section D.15.31 \[realclassify_lib\]](#), page 2199.

D.6.3.1 basicinvariants

Procedure from library `classify.lib` (see [Section D.6.3 \[classify_lib\]](#), page 1262).

Usage: basicinvariants(f); f = poly

Compute: Compute basic invariants of f: an upper bound d for the determinacy, the milnor number mu and the corank c of f

Return: intvec: d, mu, c

Example:

```
LIB "classify.lib";
ring r=0,(x,y,z),ds;
basicinvariants((x2+3y-2z)^2+xyz-(x-y3+x2*z3)^3);
↪ 5,4,2
```

D.6.3.2 classify

Procedure from library `classify.lib` (see [Section D.6.3 \[classify_lib\]](#), page 1262).

Usage: classify(f); f=poly

Compute: normal form and singularity type of f with respect to right equivalence, as given in the book "Singularities of differentiable maps, Volume I" by V.I. Arnold, S.M. Gusein-Zade, A.N. Varchenko

Return: normal form of f, of type poly

Remark: This version of classify is only beta. Please send bugs and comments to: "Kai Krueger" <krueger@mathematik.uni-kl.de>
Be sure to have at least Singular version 1.0.1.

Note: type `init_debug(n)`; ($0 \leq n \leq 10$) in order to get intermediate information, higher values of n give more information.
The proc creates several global objects with names all starting with `@`, hence there should be no name conflicts.

Example:

```
LIB "classify.lib";
ring r=0,(x,y,z),ds;
poly f=(x2+3y-2z)2+xyz-(x-y3+x2*z3)3;
classify(f);
↳ About the singularity :

↳ 2z2+x2y+y3

```

D.6.3.3 corank

Procedure from library `classify.lib` (see [Section D.6.3 \[classify.lib\], page 1262](#)).

Usage: `corank(f); f=poly`

Return: the corank of the Hessian matrix of `f`, of type `int`

Remark: `corank(f)` is the number of variables occurring in the residual singularity after applying 'morsesplit' to `f`

Example:

```

LIB "classify.lib";
ring r=0,(x,y,z),ds;
poly f=(x2+3y-2z)^2+xyz-(x-y3+x2*z3)^3;
corank(f);
↳ 2

```

D.6.3.4 Hcode

Procedure from library `classify.lib` (see [Section D.6.3 \[classify.lib\], page 1262](#)).

Usage: `Hcode(v); v=intvec`

Return: `intvec`, coding `v` according to the number of successive repetitions of an entry

Example:

```

LIB "classify.lib";
intvec v1 = 1,3,5,5,2;
Hcode(v1);
↳ 1,0,1,0,2,0,0,1,0
intvec v2 = 1,2,3,4,4,4,4,4,4,4,3,2,1;
Hcode(v2);
↳ 1,1,1,7,1,1,1

```

D.6.3.5 init_debug

Procedure from library `classify.lib` (see [Section D.6.3 \[classify.lib\], page 1262](#)).

Usage: `init_debug([level]); level=int`

Compute: Set the global variable `@DeBug` to `level`. The variable `@DeBug` is used by the function `debug_log(level, list of strings)` to know when to print the list of strings. `init_debug()` reports only changes of `@DeBug`.

Note: The procedure `init_debug(n)`; is usefull as trace-mode. `n` may range from 0 to 10, higher values of `n` give more information.

Example:

```
LIB "classify.lib";
init_debug();
debug_log(1,"no trace information printed");
init_debug(1);
↳ Debugging level change from 0 to 1
debug_log(1,"some trace information");
↳ some trace information
init_debug(2);
↳ Debugging level change from 1 to 2
debug_log(2,"nice for debugging scripts");
↳ Debug:(2): nice for debugging scripts
init_debug(0);
↳ Debugging switched off.
```

D.6.3.6 internalfunctions

Procedure from library `classify.lib` (see [Section D.6.3 \[classify.lib\]](#), page 1262).

Usage: `internalfunctions()`;

Return: nothing, display names of internal procedures of `classify.lib`

Example:

```
LIB "classify.lib";
internalfunctions();
↳ Internal functions for the classification using Arnold's method,
↳ the function numbers correspond to numbers in Arnold's classifier:
↳ Klassifiziere(poly f); //determine the type of the singularity f
↳ Funktion1bis (poly f, list cstn)
↳ Funktion3 (poly f, list cstn)
↳ Funktion6 (poly f, list cstn)
↳ Funktion13 (poly f, list cstn)

D.6.3.7 milnorcode

Procedure from library `classify.lib` (see [Section D.6.3 \[classify.lib\], page 1262](#)).

Usage: `milnorcode(f[,e]);` f =poly, e =int

Return: intvec, coding the Hilbert function of the e -th Milnor algebra of f , i.e. of $\text{basering}/(\text{jacob}(f)^e)$ (default $e=1$), according to proc `Hcode`

Example:

```

LIB "classify.lib";
ring r=0,(x,y,z),ds;
poly f=x2y+y3+z2;
milnorcode(f);
⇒ 1,1,1
milnorcode(f,2); // a big second argument may result in memory overflow
⇒ 1,0,1,0,2,0,0,1,0

```

D.6.3.8 morsesplit

Procedure from library `classify.lib` (see [Section D.6.3 \[classify.lib\], page 1262](#)).

Usage: morsesplit(f); f=poly

Return: Normal form of f in M^3 after application of the splitting lemma

Compute: apply the splitting lemma (generalized Morse lemma) to f

Example:

```
LIB "classify.lib";
ring r=0,(x,y,z),ds;
export r;
↪ // ** 'r' is already global
init_debug(1);
↪ Debugging level is set to 1
poly f=(x2+3y-2z)^2+xyz-(x-y3+x2*z3)^3;
poly g=morsesplit(f);
↪ Residual singularity f= -x3+3/2xy2+1/2x3y-1/16x2y2+3x2y3
g;
↪ -x3+3/2xy2+1/2x3y-1/16x2y2+3x2y3
```

D.6.3.9 quickclass

Procedure from library `classify.lib` (see [Section D.6.3 \[classify.lib\]](#), page 1262).

Usage: quickclass(f); f=poly

Return: Normal form of f in Arnold's list

Remark: try to determine the normal form of f by invariants, mainly by computing the Hilbert function of the Milnor algebra, no coordinate change is needed (see also proc 'milnor-code').

Example:

```
LIB "classify.lib";
ring r=0,(x,y,z),ds;
poly f=(x2+3y-2z)^2+xyz-(x-y3+x2*z3)^3;
quickclass(f);
↪ Singularity R-equivalent to : D[k]=D[4]
↪ normal form : z2+x2y+y3
↪ z2+x2y+y3
```

D.6.3.10 singularity

Procedure from library `classify.lib` (see [Section D.6.3 \[classify.lib\]](#), page 1262).

Usage: singularity(t, l); t=string (name of singularity),
l=list of integers/polynomials (indices/parameters of singularity)

Compute: get the singularity named by type t from the database. list l is as follows:
l= k [r [s [a [b [c [d]..]: k,r,s=int a,b,c,d=poly.
The name of the dbm-databasefile is: NFlist.[dir,pag]. The file is found in the current directory. If it does not exist, please run the script MakeDBM first.

Return: Normal form and corank of the singularity named by type t and its index (indices) l.

Example:

```

LIB "classify.lib";
ring r=0,(x,y,z),(c,ds);
init_debug(0);
singularity("E[6k]",6);
↳ [1]:
↳ x3+xy13+y19
↳ [2]:
↳ 2
singularity("T[k,r,s]", 3, 7, 5);
↳ [1]:
↳ x3+xyz+z5+y7
↳ [2]:
↳ 3
poly f=y;
singularity("J[k,r]", 4, 0, 0, f);
↳ [1]:
↳ x3+x2y4+y13
↳ [2]:
↳ 2

```

D.6.3.11 A_L

Procedure from library `classify.lib` (see [Section D.6.3 \[classify.lib\], page 1262](#)).

Usage: `A_L(f)`; `f` poly
`A_L(s)`; `s` string, the name of the singularity

Compute: the normal form of `f` in Arnold's list of singularities in case 1, in case 2 nothing has to be computed.

Return: `A_L(f)`: compute via 'milnorcode' the class of `f` and return the normal form of `f` found in the database.
`A_L("name")`: get the normal form from the database for the singularity given by its name.

Example:

```

LIB "classify.lib";
ring r=0,(a,b,c),ds;
poly f=A_L("E[13]");
f;
↳ c2+a3+ab5+b8
A_L(f);
↳ Singularity R-equivalent to : E[6k+1]=E[13]
↳ normal form : c2+a3+ab5+b8
↳ c2+a3+ab5+b8

```

D.6.3.12 normalform

Procedure from library `classify.lib` (see [Section D.6.3 \[classify.lib\], page 1262](#)).

Usage: `normalform(s)`; `s`=string

Return: Arnold's normal form of singularity with name `s`

Example:

```
LIB "classify.lib";
ring r=0,(a,b,c),ds;
normalform("E[13]");
↳ c2+a3+ab5+b8
```

D.6.3.13 debug_log

Procedure from library `classify.lib` (see [Section D.6.3 \[classify_lib\], page 1262](#)).

Usage: `debug_log(level,li)`; level=int, li=comma separated "message" list

Compute: print "messages" if level>=@DeBug.
useful for user-defined trace messages.

Example:

```
LIB "classify.lib";
example init_debug;
↳ // proc init_debug from lib classify.lib
↳ EXAMPLE:
↳ init_debug();
↳ debug_log(1,"no trace information printed");
↳ init_debug(1);
↳ Debugging level change from 0 to 1
↳ debug_log(1,"some trace information");
↳ some trace information
↳ init_debug(2);
↳ Debugging level change from 1 to 2
↳ debug_log(2,"nice for debugging scripts");
↳ Debug:(2): nice for debugging scripts
↳ init_debug(0);
↳ Debugging switched off.
↳
```

See also: [Section D.6.3.5 \[init_debug\], page 1264](#).

D.6.3.14 swap

Procedure from library `classify.lib` (see [Section D.6.3 \[classify_lib\], page 1262](#)).

Usage: `swap(a,b)`;

Return: b,a if a,b is the input (any type)

Example:

```
LIB "classify.lib";
swap("variable1","variable2");
↳ variable2 variable1
```

D.6.3.15 modality

Procedure from library `classify.lib` (see [Section D.6.3 \[classify_lib\], page 1262](#)).

Usage: `modality(f)`; f poly

Return: the modality of the singularity

Example:

```
LIB "classify.lib";
ring r = 0, (x,y,z), ds;
poly f = (x2+3y-2z)^2+xyz-(x-y3+x2z3)^3;
modality(f);
↳ 0
```

D.6.3.16 complexSingType

Procedure from library `classify.lib` (see [Section D.6.3 \[classify.lib\], page 1262](#)).

Usage: `complexSingType(f); f poly`

Return: the type of the singularity as a string

Example:

```
LIB "classify.lib";
ring r = 0, (x,y,z), ds;
poly f = (x2+3y-2z)^2+xyz-(x-y3+x2z3)^3;
complexSingType(f);
↳ D[4]
```

D.6.3.17 prepRealclassify

Procedure from library `classify.lib` (see [Section D.6.3 \[classify.lib\], page 1262](#)).

Usage: `prepRealclassify(f); f poly`

Return: a list, containing the modality of the singularity and the type of the singularity as a string

This procedure is needed in `realclassify.lib` in order to avoid `classify()` being called more than once.

Example:

```
LIB "classify.lib";
ring r = 0, (x,y,z), ds;
poly f = (x2+3y-2z)^2+xyz-(x-y3+x2z3)^3;
prepRealclassify(f);
↳ [1]:
↳ 0
↳ [2]:
↳ D[4]
```

D.6.4 classifyceq_lib

Library: `classifyCeq.lib`

Purpose: simple hypersurface singularities in characteristic $p > 0$

Authors: Deeba Afzal deebafzal@gmail.com
Faira Kanwal Janjua fairakanwaljanjua@gmail.com

Overview: A library for classifying the simple singularities with respect to contact equivalence in characteristic $p > 0$. Simple hypersurface singularities in characteristic $p > 0$ were classified by Greuel and Kroening [1] with respect to contact equivalence. The classifier we use has been proposed in [2].

References:

- [1] Greuel, G.-M.; Kroening, H.: Simple singularities in positive characteristic. *Math.Z.* 203, 339-354 (1990).
 [2] Afzal,D.;Binyamin,M.A.;Janjua,F.K.: On the classification of simple singularities in positive characteristic.

Procedures:**D.6.4.1 classifyCeq**

Procedure from library `classifyceq.lib` (see [Section D.6.4 \[classifyceq_lib\]](#), page 1270).

Usage: `classifyCeq(f)`; f poly

Return: string including the Tjurina number of f and its type in the classification of Greuel and Kroening

Example:

```
LIB "classifyceq.lib";
ring R=3,(x,y,z,u,v,w),ds;
classifyCeq(-x2+xy+y2+xz-yz-z2+w2+u3+v4);
↳ The given function defines a simple singularity.
↳ The tjurina number is 9.
↳ E0[6]:x3+y4
```

D.6.5 classifyci_lib

Library: `classifyci.lib`

Purpose: Isolated complete intersection singularities in characteristic 0

Authors: Gerhard Pfister `pfister@mathematik.uni-kl.de`
 Deeba Afzal `deebafzal@gmail.com`

Overview: A library for classifying isolated complete intersection singularities for the base field of characteristic 0 and for computing weierstrass semigroup of the space curve. Isolated complete intersection singularities were classified by M.Giusti [1] for the base field of characteristic 0. Algorithm for the semigroup of a space curve singularity is given in [2].

Procedures:**D.6.5.1 classifyicis**

Procedure from library `classifyci.lib` (see [Section D.6.5 \[classifyci_lib\]](#), page 1271).

Usage: `classifyicis(I)`; I ideal

Assume: I is given by two generators

Purpose: Check whether the ideal defines a complete intersection singularity or not

Return: String type in the classification of Giusti,M
or The given singularity is not simple

Example:

```
LIB "classifyci.lib";
ring R=0,(x,y,z),ds;
ideal I=x2+yz,xy+z4;
classifycis(I);
↳ // ** dim(_) may be wrong because the mixed monomial ordering
↳ // ** dim(_) may be wrong because the mixed monomial ordering
↳ // ** dim(I) may be wrong because the mixed monomial ordering
↳ // ** dim(I) may be wrong because the mixed monomial ordering
↳ U_9: (x2+yz,xy+z4)
```

D.6.5.2 Semigroup

Procedure from library `classifyci.lib` (see [Section D.6.5 \[classifyci.lib\]](#), page 1271).

Usage: Semigroup(I); I is an ideal

Purpose: Computes the semigroup of the ideal I corresponding to each branch

Return: list of semigroup of ideal I corresponding to each branch

Example:

```
LIB "classifyci.lib";
ring R=0,(x,y,z),ds;
ideal I=x2+y3+z5,yz;
Semigroup(I);
↳ [1]:
↳ 2,3
↳ [2]:
↳ 2,5
```

D.6.6 curvepar.lib

Library: curvepar.lib

Purpose: Resolution of space curve singularities, semi-group

Author: Gerhard Pfister email: pfister@mathematik.uni-kl.de Nil Sahin email:
e150916@metu.edu.tr
Maryna Viazovska email: viazovsk@mathematik.uni-kl.de

Procedures: See also: [Section D.6.16 \[spcurve.lib\]](#), page 1347.

D.6.6.1 BlowingUp

Procedure from library `curvepar.lib` (see [Section D.6.6 \[curvepar.lib\]](#), page 1272).

Usage: BlowingUp(f,I,l);
f=poly
b=ideal
l=list

Assume: The basering is $r=0,(x(1..n),a),dp$
f is an irreducible polynomial in $k[a]$,
I is an ideal of a curve(if we consider a as a parameter)

Compute: Blowing-up of the curve at point 0.

Return: list C of charts.

Each chart C[i] is a list of size 5 (reps. 6 in case of plane curves) C[i][1] is an integer j. It shows, which standard chart do we consider. C[i][2] is an irreducible poly g in k[a].

It is a minimal polynomial for the new parameter.

C[i][3] is an ideal H in k[a].

c_i=F_i(a_new) for i=1..n,

a_old=H[n+1](a_new).

C[i][4] is a map teta:k[x(1)..x(n),a]→k[x(1)..x(n),a] from the new curve to the old one.

$x(1) \rightarrow x(j) * x(1) \dots x(j) \rightarrow x(j) \dots x(n) \rightarrow x(j) * (c_n + x(n))$

C[i][5] is an ideal J of a new curve. J=teta(I).

C[i][6] is the list of exceptional divisors in the chart

Example:

```
LIB "curvepar.lib";
ring r=0,(x(1..3),a),dp;
poly f=a^2+1;
ideal i=x(1)^2+a*x(2)^3,x(3)^2-x(2);
list l=1,3,2;
list B=BlowingUp(f,i,l);
B;
↳ [1]:
↳   [1]:
↳     3
↳   [2]:
↳     a^2+1
↳   [3]:
↳     _[1]=0
↳     _[2]=0
↳     _[3]=1
↳   [4]:
↳     _[1]=x(1)*x(3)
↳     _[2]=x(2)*x(3)
↳     _[3]=x(3)
↳     _[4]=a
↳   [5]:
↳     _[1]=x(2)-x(3)
↳     _[2]=x(2)^3*x(3)*a+x(1)^2
```

D.6.6.2 CurveRes

Procedure from library `curvepar.lib` (see [Section D.6.6 \[curvepar.lib\]](#), page 1272).

Usage: CurveRes(I);
I ideal

Assume: The basering is $r=0,(x(1..n))$
V(I) is a curve with a singular point 0.

Compute: Resolution of the curve V(I).

Return: a ring $R=\text{basering}+k[a]$
Ring R contains a list Resolve
Resolve is a list of charts

Each `Resolve[i]` is a list of size 6
`Resolve[i][1]` is an ideal J of a new curve. $J = \text{teta}(I)$. `Resolve[i][2]` ideal which represents the map $\text{teta}: k[x(1)..x(n), a] \rightarrow k[x(1)..x(n), a]$ from the new curve to the old one.
`Resolve[i][3]` is an irreducible poly g in $k[a]$. It is a minimal polynomial for the new parameter a . $\text{deg}(g)$ gives the number of branches in `Resolve[i]` `Resolve[i][4]` sequence of multiplicities (sum over all branches in `Resolve` as long as they intersect each other !)
`Resolve[i][5]` is a list of integers l . It shows, which standard charts we considered.
`Resolve[i][6]` HN matrix
`Resolve[i][7]` (only for plane curves) the development of exceptional divisors the entries correspond to the i -th blowing up. The first entry is an intvec. The first negative entry gives the splitting of the (over \mathbb{Q} irreducible) branches. The second entry is a list of the exceptional divisors. If the entry is an integer i , it says that the divisor is not visible in this chart after the i -th blowing up.

Example:

```
LIB "curvepar.lib";
ring r=0,(x,y,z),dp;
ideal i=x2-y3,z2-y5;
def s=CurveRes(i);
setring s;
Resolve;

↳      _[3]=-1

```

D.6.6.3 CurveParam

Procedure from library `curvepar.lib` (see [Section D.6.6 \[curvepar.lib\]](#), page 1272).

Usage: CurveParam(I);
I ideal

Assume: I is an ideal of a curve C with a singular point 0.

Compute: Parametrization for algebraic branches of the curve C.

Return: list L of size 1.
L[1] is a ring ring $rt=0,(t,a),ds$;
Ring R contains a list Param
Param is a list of algebraic branches
Each Param[i] is a list of size 3
Param[i][1] is a list of polynomials
Param[i][2] is an irreducible polynomial $f \in k[a]$. It is a minimal polynomial for the parameter a.
Param[i][3] is an integer b-upper bound for the conductor of Weierstrass semigroup

Example:

```

LIB "curvepar.lib";
ring r=0,(x,y,z),dp;
ideal i=x2-y3,z2-y5;
def s=CurveParam(i);
setring s;
Param;
↳ [1]:
↳   [1]:
↳     t3
↳   [2]:
↳     t2
↳   [3]:
↳     -t5
↳ [2]:
↳   a
↳ [3]:
↳   38
↳ [2]:

```

```

↳      [1]:
↳      [1]:
↳      t3
↳      [2]:
↳      t2
↳      [3]:
↳      t5
↳      [2]:
↳      a
↳      [3]:
↳      38

```

D.6.6.4 WSemigroup

Procedure from library `curvepar.lib` (see [Section D.6.6 \[curvepar.lib\], page 1272](#)).

Usage: `WSemigroup(X,b0);`
 X a list of polynomials in one variable, say t .
 $b0$ an integer

Compute: Weierstrass semigroup of space curve C , which is given by a parametrization $X[1](t), \dots, X[k](t)$, till the bound $b0$.

Assume: $b0$ is greater than conductor

Return: list M of size 5.
 $M[1]$ = list of integers, which are minimal generators set of the Weierstrass semigroup.
 $M[2]$ = integer, conductor of the Weierstrass semigroup. $M[3]$ = intvec, all elements of the Weierstrass semigroup till some bound b , which is greater than conductor.

Warning: works only over the ring with one variable with ordering ds

Example:

```

LIB "curvepar.lib";
ring r=0,(t),ds;
list X=t4,t5+t11,t9+2*t7;
list L=WSemigroup(X,30);
L;
↳ [1]:
↳ 4,5,7
↳ [2]:
↳ 7
↳ [3]:
↳ 4,5,7,8,9,10

```

D.6.6.5 primparam

Procedure from library `curvepar.lib` (see [Section D.6.6 \[curvepar.lib\], page 1272](#)).

Usage: `MultiplicitySequence(x,y,c);` x poly, y poly, c integer

Assume: x and y are polynomials in $k(a)[t]$ such that (x,y) is a primitive parametrization of a plane curve branch and $\text{ord}(x) < \text{ord}(y)$.

Return: Hamburger-Noether Matrix of the curve branch given parametrically by (x,y) .

Example:

```
LIB "curvepar.lib";
ring r=(0,a),t,ds;
poly x=t6;
poly y=t8+t11;
int c=15;
primparam(x,y,c);
↳ _[1,1]=0
↳ _[1,2]=t
↳ _[1,3]=0
↳ _[1,4]=0
↳ _[1,5]=0
↳ _[1,6]=0
↳ _[1,7]=0
↳ _[1,8]=0
↳ _[1,9]=0
↳ _[1,10]=0
↳ _[1,11]=0
↳ _[1,12]=0
↳ _[1,13]=0
↳ _[1,14]=0
↳ _[1,15]=0
↳ _[2,1]=0
↳ _[2,2]=0
↳ _[2,3]=1
↳ _[2,4]=0
↳ _[2,5]=t
↳ _[2,6]=0
↳ _[2,7]=0
↳ _[2,8]=0
↳ _[2,9]=0
↳ _[2,10]=0
↳ _[2,11]=0
↳ _[2,12]=0
↳ _[2,13]=0
↳ _[2,14]=0
↳ _[2,15]=0
↳ _[3,1]=0
↳ _[3,2]=1/9
↳ _[3,3]=0
↳ _[3,4]=0
↳ _[3,5]=-7/243
↳ _[3,6]=0
↳ _[3,7]=0
↳ _[3,8]=250/19683
↳ _[3,9]=0
↳ _[3,10]=0
↳ _[3,11]=-3625/531441
↳ _[3,12]=0
↳ _[3,13]=0
↳ _[3,14]=58351/14348907
↳ _[3,15]=0
```

D.6.6.6 MultiplicitySequence

Procedure from library `curvepar.lib` (see [Section D.6.6 \[curvepar.lib\], page 1272](#)).

Usage: `MultiplicitySequence(i); i ideal`

Assume: `i` is the defining ideal of a (reducible) plane curve singularity.

Return: list `X` of charts. Each chart contains the multiplicity sequence of the corresponding branch.

Example:

```
LIB "curvepar.lib";
ring r=0,(x,y),ds;
ideal i=x14-x4y7-y11;
MultiplicitySequence(i);
↳ [1]:
↳ 7,3,3,1,1,1
↳ [2]:
↳ 1
↳ [3]:
↳ 1
↳ [4]:
↳ 1
↳ [5]:
↳ 1
```

D.6.6.7 CharacteristicExponents

Procedure from library `curvepar.lib` (see [Section D.6.6 \[curvepar.lib\], page 1272](#)).

Usage: `CharacteristicExponents(i); i ideal`

Assume: `i` is the defining ideal of a (reducible) plane curve singularity.

Return: list `X` of charts. Each chart contains the characteristic exponents of the corresponding branch.

Example:

```
LIB "curvepar.lib";
ring r=0,(x,y),ds;
ideal i=x14-x4y7-y11;
CharacteristicExponents(i);
↳ [1]:
↳ 7,10
↳ [2]:
↳ 1
↳ [3]:
↳ 1
↳ [4]:
↳ 1
↳ [5]:
↳ 1
```

D.6.6.8 IntersectionMatrix

Procedure from library `curvepar.lib` (see [Section D.6.6 \[curvepar.lib\], page 1272](#)).

Usage: `IntersectionMatrix(i)`; i ideal

Assume: i is the defining ideal of a (reducible) plane curve singularity.

Return: `intmat` of the intersection multiplicities of the branches.

Example:

```
LIB "curvepar.lib";
ring r=0,(x,y),ds;
ideal i=x14-x4y7-y11;
IntersectionMatrix(i);
⇒ 0,7,7,7,7,
⇒ 0,0,1,1,1,
⇒ 0,0,0,1,1,
⇒ 0,0,0,0,1,
⇒ 0,0,0,0,0
```

D.6.6.9 ContactMatrix

Procedure from library `curvepar.lib` (see [Section D.6.6 \[curvepar.lib\], page 1272](#)).

Usage: `ContactMatrix(I)`; I ideal

Assume: i is the defining ideal of a (reducible) plane curve singularity.

Return: `intmat` N of the contact matrix of the braches of the curve.

Example:

```
LIB "curvepar.lib";
ring r=0,(x,y),ds;
ideal i=x14-x4y7-y11;
ContactMatrix(i);
⇒ 0,1,1,1,1,
⇒ 1,0,1,1,1,
⇒ 1,1,0,1,1,
⇒ 1,1,1,0,1,
⇒ 1,1,1,1,0
```

D.6.6.10 plainInvariants

Procedure from library `curvepar.lib` (see [Section D.6.6 \[curvepar.lib\], page 1272](#)).

Usage: `plainInvariants(i)`; i ideal

Assume: i is the defining ideal of a (reducible) plane curve singularity.

Return: list L of charts. $L[j]$ is the invariants of the j th branch and the last entry of L is a list containing the intersection matrix, contact matrix, resolution graph of the curve.

$L[j][1]$: `intvec` (characteristic exponents of the j th branch) $L[j][2]$: `intvec` (generators of the semigroup of the j th branch) $L[j][3]$: `intvec` (first components of the puiseux pairs of the j th branch) $L[j][4]$: `intvec` (second components of the puiseux pairs of the j th branch) $L[j][5]$: `int` (degree of conductor of the j th branch) $L[j][6]$: `intvec` (multiplicity sequence of the j th branch. $L[\text{last}][1]$: `intmat` (intersection matrix of the branches) $L[\text{last}][2]$: `intmat` (contact matrix of the branches) $L[\text{last}][3]$: `intmat` (resolution graph of the curve)

Example:

```

LIB "curvepar.lib";
ring r=0,(x,y),ds;
ideal i=x14-x4y7-y11;
plainInvariants(i);

D.6.7 deform_lib

Library: deform.lib

Purpose: Miniversal Deformation of Singularities and Modules

Author: Bernd Martin, email: martin@math.tu-cottbus.de

Procedures:

D.6.7.1 versal

Procedure from library `deform.lib` (see [Section D.6.7 \[deform.lib\], page 1282](#)).

Usage: `versal(Fo[d,any]);` Fo=ideal, d=int, any=list

Compute: miniversal deformation of Fo up to degree d (default d=100),

Return: list L of 4 rings:

L[1] extending the basering Po by new variables given by "A,B,.." (deformation parameters); the new variables precede the old ones, the ordering is the product of "ls" and "ord(Po)"

L[2] = L[1]/Fo extending Qo=Po/Fo,

L[3] = the embedding ring of the versal base space,

L[4] = L[1]/Js extending L[3]/Js.

In the ring L[1] the following matrices are stored:

Js = giving the versal base space (obstructions),

Fs = giving the versal family of Fo,

Rs = giving the lifting of Ro=syz(Fo).

If d is defined ($\neq 0$), it computes up to degree d.

If 'any' is defined and any[1] is no string, interactive version.

Otherwise 'any' is interpreted as a list of predefined strings:

"my","param","order","out":

("my" internal prefix, "param" is a letter (e.g. "A") for the name of the first parameter or (e.g. "A(" for index parameter variables, "order" ordering string for ring extension), "out" name of output file).

Note: `printlevel < 0` no additional output,
`printlevel >=0,1,2,..` informs you, what is going on;
 this proc uses 'execute'.

Example:

```
LIB "deform.lib";
int p          = printlevel;
printlevel    = 0;
ring r1       = 0, (x,y,z,u,v), ds;
matrix m[2][4] = x,y,z,u,y,z,u,v;
ideal Fo      = minor(m,2);
// cone over rational normal curve of degree 4

D.6.7.2 mod_versal

Procedure from library `deform.lib` (see [Section D.6.7 \[deform.lib\]](#), page 1282).

Usage: `mod_versal(Mo,Io[,d,any]);` Io=ideal, Mo=module, d=int, any =list

Compute: miniversal deformation of `coker(Mo)` over $Q_0=Po/I_0$, P_0 =basing;

Return: list L of 4 rings:

L[1] extending the basing P_0 by new variables given by "A,B,.." (deformation parameters); the new variables precede the old ones, the ordering is the product of "ls" and "ord(P_0)"

L[2] = L[1]/Io extending Q_0 ,

L[3] = the embedding ring of the versal base space,

L[4] = L[1]/(Io+Js) ring of the versal deformation of `coker(Ms)`.

In the ring L[1] the following matrices are stored:

Js = giving the versal base space (obstructions),

Fs = giving the versal family of Mo,

Rs = giving the lifting of syzygies $Lo=syz(Mo)$. If d is defined ($\neq 0$), it computes up to degree d.

If 'any' is defined and any[1] is no string, interactive version.

Otherwise 'any' is interpreted as a list of predefined strings: "my","param","order","out":

("my" internal prefix, "param" is a letter (e.g. "A") for the name of the first parameter or (e.g. "A(") for index parameter variables, "order" ordering string for ring extension), "out" name of output file).

Note: `printlevel < 0` no additional output,
`printlevel >=0,1,2,..` informs you, what is going on,
 this proc uses 'execute'.

Example:

```
LIB "deform.lib";
int p = printlevel;
printlevel = 1;
ring Ro = 0,(x,y),wp(3,4);
ideal Io = x4+y3;
matrix Mo[2][2] = x2,y,-y2,x2;
list L = mod_versal(Mo,Io);
↳ // vdim (Ext^2) = 4
↳ // vdim (Ext^1) = 4
↳ // ready: Ext1 and Ext2
↳ // Ext1 is quasi-homogeneous represented: 3,6,1,4
↳ // infinitesimal extension
↳ x2-Ax-B, y+Cx+D,
↳ -y2+Cxy+Dy,x2+Ax+B
↳ // start deg = 2
↳ // start deg = 3
↳ // start deg = 4
↳ // start deg = 5
↳ // finished in degree
↳ 5
↳ // quasi-homogeneous weights of miniversal base
↳ 3,
```

```

↳ 6,
↳ 1,
↳ 4
↳
↳ // 'mod_versal' returned a list, say L, of four rings. In L[2] are stored\
:
↳ // as matrix Ms: presentation matrix of the deformed module,
↳ // as matrix Ls: lifted syzygies,
↳ // as matrix Js: Equations of total space of miniversal deformation
↳ // To access these data, type
↳ def Qx=L[2]; setring Qx; print(Ms); print(Ls); print(Js);
↳

printlevel = p;
if (defined(Px)) {kill Px,Qx,So;}

```

D.6.7.3 lift_kbase

Procedure from library `deform.lib` (see [Section D.6.7 \[deform.lib\]](#), page 1282).

Usage: `lift_kbase(N,M)`; $N,M = \text{poly/ideal/vector/module}$

Return: matrix A , coefficient matrix expressing N as linear combination of k -basis of M . Let the k -basis have k elements and $\text{size}(N)=c$ columns. Then A satisfies:
 $\text{matrix}(\text{reduce}(N,\text{std}(M)),k,c) = \text{matrix}(\text{kbase}(\text{std}(M))) * A$

Assume: $\dim(M)=0$ and the monomial ordering is a well ordering or the last block of the ordering is c or C

Example:

```

LIB "deform.lib";
ring R=0,(x,y),ds;
module M=[x2,xy],[y2,xy],[0,xx],[0,yy];
module N=[x3+xy,x],[x,x+y2];
print(M);
↳ x2,y2,0, 0,
↳ xy,xy,x2,y2
module kb=kbase(std(M));
print(kb);
↳ y2,xy,y,x,1,0,0,0,
↳ 0, 0, 0,0,0,y,x,1
print(N);
↳ xy+x3,x,
↳ x, x+y2

```

```

matrix A=lift_kbase(N,M);
print(A);
↳ 0,0,
↳ 1,0,
↳ 0,0,
↳ 0,1,
↳ 0,0,
↳ 0,0,
↳ 1,1,
↳ 0,0
matrix(reduce(N,std(M)),nrows(kb),ncols(A)) - matrix(kbase(std(M)))*A;
↳ _[1,1]=0
↳ _[1,2]=0
↳ _[2,1]=0
↳ _[2,2]=0

```

D.6.7.4 lift_rel_kb

Procedure from library `deform.lib` (see [Section D.6.7 \[deform.lib\]](#), page 1282).

Usage: `lift_rel_kb(N,M[,kbaseM,p]);`

Assume: [p a monomial] or the product of all variables
 N, M modules of same rank, M depending only on variables not in p and $\text{vdim}(M)$ is finite in this ring,
 [kbaseM the kbase of M in the subring given by variables not in p]
 warning: these assumptions are not checked by the procedure

Return: matrix A, whose j-th columns present the coeff's of $N[j]$ in kbaseM, i.e. $\text{kbaseM} * A = \text{reduce}(N, \text{std}(M))$

Example:

```

LIB "deform.lib";
ring r=0,(A,B,x,y),dp;
module M      = [x2,xy],[xy,y3],[y2],[0,x];
module kbaseM = [1],[x],[xy],[y],[0,1],[0,y],[0,y2];
poly f=xy;
module N = [AB,BBy],[A3xy+x4,AB*(1+y2)];
matrix A = lift_rel_kb(N,M,kbaseM,f);
print(A);
↳ AB,0,
↳ 0, 0,
↳ 0, A3,
↳ 0, 0,
↳ 0, AB,
↳ B2,0,
↳ 0, AB
"TEST:";
↳ TEST:
print(matrix(kbaseM)*A-matrix(reduce(N,std(M))));
↳ 0,0,
↳ 0,0

```

D.6.8 equising_lib

Library: equising.lib

Purpose: Equisingularity Stratum of a Family of Plane Curves

Author: Christoph Lossen, lossen@mathematik.uni-kl.de
 Andrea Mindnich, mindnich@mathematik.uni-kl.de

Procedures:

D.6.8.1 tau_es

Procedure from library `equising.lib` (see [Section D.6.8 \[equising_lib\]](#), page 1287).

Usage: `tau_es(f); f poly`

Assume: `f` is a reduced bivariate polynomial, the basering has precisely two variables, is local and no `qring`.

Return: `int`, the codimension of the μ -const stratum in the semi-universal deformation base.

Note: `printlevel>=1` displays additional information.
 When called with any additional parameter, the computation of the Milnor number is avoided (no check for NND).

Example:

```
LIB "equising.lib";
ring r=32003,(x,y),ds;
poly f=(x4-y4)^2-x10;
tau_es(f);
↳ 42
```

See also: [Section D.6.8.2 \[esIdeal\]](#), page 1288; [Section D.6.11.6 \[invariants\]](#), page 1317; [Section D.6.15.15 \[tjurina\]](#), page 1344.

D.6.8.2 esIdeal

Procedure from library `equising.lib` (see [Section D.6.8 \[equising_lib\]](#), page 1287).

Usage: `esIdeal(f[,any]); f poly`

Assume: `f` is a reduced bivariate polynomial, the basering has precisely two variables, is local and no `qring`, and the characteristic of the ground field does not divide `mult(f)`.

Return: if called with only one parameter: list of two ideals,
 `_[1]`: equisingularity ideal of `f` (in sense of Wahl),
 `_[2]`: ideal of equisingularity with fixed position of the singularity;
 if called with more than one parameter: list of three ideals,
 `_[1]`: equisingularity ideal of `f` (in sense of Wahl)
 `_[2]`: ideal of equisingularity with fixed position of the singularity;
 `_[3]`: ideal of all `g` such that the deformation defined by `f+eg` (`e^2=0`) is isomorphic to an equisingular deformation of `V(f)` with all equimultiple sections being trivial.

Note: if some of the above condition is not satisfied then return value is `list(0,0)`.

Example:

```

LIB "equising.lib";
ring r=0,(x,y),ds;
poly f=x7+y7+(x-y)^2*x2y2;
list K=esIdeal(f);
↳ polynomial is Newton degenerate !
↳
↳ //
↳ // versal deformation with triv. section
↳ // =====
↳ //
↳ //
↳ // Compute equisingularity Stratum over Spec(C[t]/t^2)
↳ // =====
↳ //
↳ // finished
↳ //
option(redSB);
// Wahl's equisingularity ideal:
std(K[1]);
↳ _[1]=4x4y-10x2y3+6xy4+21x6+14y6
↳ _[2]=4x3y2-6x2y3+2xy4+7x6
↳ _[3]=x2y4-xy5
↳ _[4]=x7
↳ _[5]=xy6
↳ _[6]=y7
ring rr=0,(x,y),ds;
poly f=x4+4x3y+6x2y2+4xy3+y4+2x2y15+4xy16+2y17+xy23+y24+y30+y31;
list K=esIdeal(f);
↳ polynomial is Newton degenerate !
↳
↳ //
↳ // versal deformation with triv. section
↳ // =====
↳ //
↳ //
↳ // Compute equisingularity Stratum over Spec(C[t]/t^2)
↳ // =====
↳ //
↳ // finished
↳ //
vdim(std(K[1]));
↳ 68
// the latter should be equal to:
tau_es(f);
↳ 68

```

See also: [Section D.6.8.3 \[esStratum\]](#), page 1289; [Section D.6.8.1 \[tau_es\]](#), page 1288.

D.6.8.3 esStratum

Procedure from library `equising.lib` (see [Section D.6.8 \[equising_lib\]](#), page 1287).

Usage: `esStratum(F[,m,L]);` F poly, m int, L list

- Assume:** F defines a deformation of a reduced bivariate polynomial f and the characteristic of the basering does not divide $\text{mult}(f)$.
 If nv is the number of variables of the basering, then the first $\text{nv}-2$ variables are the deformation parameters.
 If the basering is a qring, $\text{ideal}(\text{basing})$ must only depend on the deformation parameters.
- Compute:** equations for the stratum of equisingular deformations with fixed (trivial) section.
- Return:** list l : either consisting of a list and an integer, where
 $l[1][1]=\text{ideal}$ defining the equisingularity stratum
 $l[1][2]=\text{ideal}$ defining the part of the equisingularity stratum where all equimultiple sections through the non-nodes of the reduced total transform are trivial sections
 $l[2]=1$ if some error has occurred, $l[2]=0$ otherwise;
 or consisting of a ring and an integer, where
 $l[1]=\text{ESSring}$ is a ring extension of basering containing the ideal ES (describing the ES-stratum), the ideal ES_all_triv (describing the part with trival equimultiple sections) and the polynomial $p_F=F$,
 $l[2]=1$ if some error has occurred, $l[2]=0$ otherwise.
- Note:** L is supposed to be the output of hnexpansion (with the given ordering of the variables appearing in f).
 If m is given, the ES Stratum over $A/\text{maxideal}(m)$ is computed.
 This procedure uses `execute` or calls a procedure using `execute`. `printlevel>=2` displays additional information.

Example:

```
LIB "equising.lib";
int p=printlevel;
printlevel=1;
ring r = 0, (a,b,c,d,e,f,g,x,y), ds;
poly F = (x2+2xy+y2+x5)+ax+by+cx2+dxy+ey2+fx3+gx4;
list M = esStratum(F);
M[1][1];
  ↳ _[1]=g
  ↳ _[2]=f
  ↳ _[3]=b
  ↳ _[4]=a
  ↳ _[5]=-4c+4d-4e+d2-4ce
printlevel=3; // displays additional information
esStratum(F,2) ; // ES-stratum over Q[a,b,c,d,e,f,g] / <a,b,c,d,e,f,g>^2
  ↳ //
  ↳ // Compute HN expansion
  ↳ // -----
  ↳ // finished
  ↳ //
  ↳ // Blowup Step 1 completed
  ↳ // Blowup Step 2 completed
  ↳ // Blowup Step 3 completed
  ↳ // 1 branch finished
  ↳ //
  ↳ // Elimination starts:
  ↳ // -----
```

```

↳ //
↳ // Remove superfluous equations:
↳ // -----
↳ // finished
↳ //
↳ // output of 'esStratum' is a list consisting of:
↳ //   _[1][1] = ideal defining the equisingularity stratum
↳ //   _[1][2] = ideal defining the part of the equisingularity stratum

↳      _[5]=a
↳ [2]:
↳      0
printlevel=p;

```

See also: [Section D.6.8.2 \[esIdeal\], page 1288](#); [Section D.6.8.4 \[isEquisising\], page 1292](#).

D.6.8.4 isEquisising

Procedure from library `equisising.lib` (see [Section D.6.8 \[equisising_lib\], page 1287](#)).

Usage: `isEquisising(F[,m,L]);` F poly, m int, L list

Assume: F defines a deformation of a reduced bivariate polynomial f and the characteristic of the basering does not divide `mult(f)`.

If `nv` is the number of variables of the basering, then the first `nv-2` variables are the deformation parameters.

If the basering is a qring, `ideal(basing)` must only depend on the deformation parameters.

Compute: tests if the given family is equisingular along the trivial section.

Return: int: 1 if the family is equisingular, 0 otherwise.

Note: L is supposed to be the output of `hnexpansion` (with the given ordering of the variables appearing in f).

If m is given, the family is considered over $A/\text{maxideal}(m)$.

This procedure uses `execute` or calls a procedure using `execute`. `printlevel>=2` displays additional information.

Example:

```

LIB "equisising.lib";
ring r = 0, (a,b,x,y), ds;
poly F = (x2+2xy+y2+x5)+ay3+bx5;
isEquisising(F);
↳ 0
ideal I = ideal(a);
qring q = std(I);
poly F = imap(r,F);
isEquisising(F);
↳ 1
ring rr=0, (A,B,C,x,y), ls;
poly f=x7+y7+(x-y)^2*x2y2;
poly F=f+A*y*diff(f,x)+B*x*diff(f,x);
isEquisising(F);
↳ 0

```

```
isEquisig(F,2); // computation over  $\mathbb{Q}[a,b] / \langle a,b \rangle^2$ 
↳ 1
```

D.6.8.5 control_Matrix

Procedure from library `equisig.lib` (see [Section D.6.8 \[equisig_lib\]](#), page 1287).

Assume: L is the output of `multsequence(hnexpansion(f))`.

Return: list M of 4 intmat's:

M[1] contains the multiplicities at the respective infinitely near points $p[i,j]$ (i =step of blowup+1, j =branch) – if branches $j=k, \dots, k+m$ pass through the same $p[i,j]$ then the multiplicity is stored in $M[1][k,j]$, while $M[1][k+1]=\dots=M[1][k+m]=0$.

M[2] contains the number of branches meeting at $p[i,j]$ (again, the information is stored according to the above rule)

M[3] contains the information about the splitting of $M[1][i,j]$ with respect to different tangents of branches at $p[i,j]$ (information is stored only for minimal $j \geq k$ corresponding to a new tangent direction).

The entries are the sum of multiplicities of all branches with the respective tangent.

M[4] contains the maximal sum of higher multiplicities for a branch passing through $p[i,j]$ (= degree Bound for blowing up)

Note: the branches are ordered in such a way that only consecutive branches can meet at an infinitely near point.

the final rows of the matrices $M[1], \dots, M[3]$ is $(1, 1, 1, \dots, 1)$, and correspond to infinitely near points such that the strict transforms of the branches are smooth and intersect the exceptional divisor transversally.

See also: [Section D.6.11.8 \[multsequence\]](#), page 1318.

D.6.9 gmssing_lib

Library: gmssing.lib

Purpose: Gauss-Manin System of Isolated Singularities

Author: Mathias Schulze, mschulze at mathematik.uni-kl.de

Overview: A library for computing invariants related to the Gauss-Manin system of an isolated hypersurface singularity.

References:

[Sch04] M. Schulze: A normal form algorithm for the Brieskorn lattice. *J. Symb. Comp.* 38,4 (2004), 1207-1225.

Procedures: See also: [Section 7.7.4 \[dmod_lib\]](#), page 400; [Section D.6.10 \[gmssing_lib\]](#), page 1308; [Section D.6.13 \[monodromy_lib\]](#), page 1328; [Section D.6.17 \[spectrum_lib\]](#), page 1352.

D.6.9.1 gmsring

Procedure from library `gmssing.lib` (see [Section D.6.9 \[gmssing.lib\]](#), page 1293).

Usage: `gmsring(t,s);` poly `t`, string `s`

Assume: characteristic 0; local degree ordering;
isolated critical point 0 of `t`

Return:

ring `G`; Gauss-Manin system of `t` with variable `s`
poly `gmspoly=t`;
ideal `gmsjacob`; Jacobian ideal of `t`
ideal `gmsstd`; standard basis of Jacobian ideal
matrix `gmsmatrix`; `matrix(gmsjacob)*gmsmatrix==matrix(gmsstd)`
ideal `gmsbasis`; monomial vector space basis of Jacobian algebra
int `Gmssing::gmsmaxdeg`; maximal weight of variables

Note: `gmsbasis` is a $C[[s]]$ -basis of H^1 and $[t,s]=s^2$

Example:

```
LIB "gmssing.lib";
ring @R=0,(x,y),ds;
poly t=x5+x2y2+y5;
def G=gmsring(t,"s");
setring(G);
gmspoly;
  ↳ x2y2+x5+y5
print(gmsjacob);
  ↳ 2xy2+5x4,
  ↳ 2x2y+5y4
print(gmsstd);
  ↳ 2x2y+5y4,
  ↳ 5x5-5y5,
  ↳ 2xy2+5x4,
  ↳ 10y6+25x3y4
print(gmsmatrix);
  ↳ 0,x, 1,-2xy,
  ↳ 1,-y,0,2y2+5x3
print(gmsbasis);
  ↳ y5,
  ↳ y4,
  ↳ y3,
  ↳ y2,
  ↳ xy,
  ↳ y,
  ↳ x4,
  ↳ x3,
  ↳ x2,
  ↳ x,
  ↳ 1
Gmssing::gmsmaxdeg;
  ↳ 1
```

D.6.9.2 gmsnf

Procedure from library `gmssing.lib` (see [Section D.6.9 \[gmssing_lib\]](#), page 1293).

Usage: `gmsnf(p,K)`; poly p , int K

Assume: basering returned by `gmsring`

Return: list nf ;
ideal $nf[1]$; projection of p to $\langle gmsbasis \rangle C[[s]] \bmod s^{(K+1)}$ ideal $nf[2]$; $p == nf[1] + nf[2]$

Note: computation can be continued by setting $p = nf[2]$

Example:

```
LIB "gmssing.lib";
ring R=0,(x,y),ds;
poly t=x5+x2y2+y5;
def G=gmsring(t,"s");
setring(G);
list l0=gmsnf(gmspoly,0);
print(l0[1]);
 $\mapsto -1/2y^5$ 
list l1=gmsnf(gmspoly,1);
print(l1[1]);
 $\mapsto -1/2y^5 + 1/2s$ 
list l=gmsnf(l0[2],1);
print(l[1]);
 $\mapsto 1/2s$ 
```

D.6.9.3 gmscoeffs

Procedure from library `gmssing.lib` (see [Section D.6.9 \[gmssing_lib\]](#), page 1293).

Usage: `gmscoeffs(p,K)`; poly p , int K

Assume: basering constructed by `gmsring`

Return:

list l ;
matrix $l[1]$; $C[[s]]$ -basis representation of $p \bmod s^{(K+1)}$
ideal $l[2]$; $p == \text{matrix}(gmsbasis) * l[1] + l[2]$

Note: computation can be continued by setting $p = l[2]$

Example:

```
LIB "gmssing.lib";
ring R=0,(x,y),ds;
poly t=x5+x2y2+y5;
def G=gmsring(t,"s");
setring(G);
list l0=gmscoeffs(gmspoly,0);
print(l0[1]);
 $\mapsto -1/2,$ 
 $\mapsto 0,$ 
 $\mapsto 0,$ 
 $\mapsto 0,$ 
 $\mapsto 0,$ 
```

```

↳ 0,
↳ 0,
↳ 0,
↳ 0,
↳ 0,
↳ 0,
↳ 0
list l1=gmscoeffs(gmspoly,1);
print(l1[1]);
↳ -1/2,
↳ 0,

↳ 0,
↳ 0,
↳ 0,
↳ 1/2s

```

D.6.9.4 bernstein

Procedure from library `gmssing.lib` (see [Section D.6.9 \[gmssing.lib\]](#), page 1293).

Usage: `bernstein(t); poly t`

Assume: characteristic 0; local degree ordering;
isolated critical point 0 of t

Return:

```

list bs; Bernstein-Sato polynomial b(s) of t
ideal bs[1];
number bs[1][i]; i-th root of b(s)
intvec bs[2];
int bs[2][i]; multiplicity of i-th root of b(s)

```

Example:

```

LIB "gmssing.lib";
ring R=0,(x,y),ds;
poly t=x5+x2y2+y5;
bernstein(t);
↳ [1]:

```

```

↳  _[1]=-13/10
↳  _[2]=-11/10
↳  _[3]=-1
↳  _[4]=-9/10
↳  _[5]=-7/10
↳  _[6]=-1/2
↳  [2]:
↳  1,1,2,1,1,2

```

D.6.9.5 monodromy

Procedure from library `gmssing.lib` (see [Section D.6.9 \[gmssing.lib\]](#), page 1293).

Usage: `monodromy(t); poly t`

Assume: characteristic 0; local degree ordering;
isolated critical point 0 of `t`

Return:

```

list l; Jordan data jordan(M) of monodromy matrix exp(-2*pi*i*M)
ideal l[1];
number l[1][i]; eigenvalue of i-th Jordan block of M
intvec l[2];
int l[2][i]; size of i-th Jordan block of M
intvec l[3];
int l[3][i]; multiplicity of i-th Jordan block of M

```

Example:

```

LIB "gmssing.lib";
ring R=0,(x,y),ds;
poly t=x5+x2y2+y5;
monodromy(t);
↳ [1]:
↳  _[1]=1/2
↳  _[2]=7/10
↳  _[3]=9/10
↳  _[4]=1
↳  _[5]=11/10
↳  _[6]=13/10
↳ [2]:
↳  2,1,1,1,1,1
↳ [3]:
↳  1,2,2,1,2,2

```

See also: [Section D.3.2 \[linalg.lib\]](#), page 863; [Section D.6.13 \[mondromy.lib\]](#), page 1328.

D.6.9.6 spectrum

Procedure from library `gmssing.lib` (see [Section D.6.9 \[gmssing.lib\]](#), page 1293).

Usage: `spectrum(t); poly t`

Assume: characteristic 0; local degree ordering;
isolated critical point 0 of `t`

Return:

```
list sp; singularity spectrum of t
ideal sp[1];
number sp[1][i]; i-th spectral number
intvec sp[2];
int sp[2][i]; multiplicity of i-th spectral number
```

Example:

```
LIB "gmssing.lib";
ring R=0,(x,y),ds;
poly t=x5+x2y2+y5;
spprint(spectrum(t));
↪ (-1/2,1),(-3/10,2),(-1/10,2),(0,1),(1/10,2),(3/10,2),(1/2,1)
```

See also: [Section D.6.17 \[spectrum_lib\], page 1352](#).

D.6.9.7 sppairs

Procedure from library `gmssing.lib` (see [Section D.6.9 \[gmssing_lib\], page 1293](#)).

Usage: sppairs(t); poly t

Assume: characteristic 0; local degree ordering;
isolated critical point 0 of t

Return:

```
list spp; spectral pairs of t
ideal spp[1];
number spp[1][i]; V-filtration index of i-th spectral pair
intvec spp[2];
int spp[2][i]; weight filtration index of i-th spectral pair
intvec spp[3];
int spp[3][i]; multiplicity of i-th spectral pair
```

Example:

```
LIB "gmssing.lib";
ring R=0,(x,y),ds;
poly t=x5+x2y2+y5;
sppprint(sppairs(t));
↪ ((-1/2,2),1),((-3/10,1),2),((-1/10,1),2),((0,1),1),((1/10,1),2),((3/10,1)\
,2),((1/2,0),1)
```

See also: [Section D.6.17 \[spectrum_lib\], page 1352](#).

D.6.9.8 vfilt

Procedure from library `gmssing.lib` (see [Section D.6.9 \[gmssing_lib\], page 1293](#)).

Usage: vfilt(t); poly t

Assume: characteristic 0; local degree ordering;
isolated critical point 0 of t

Return:

```
list v; V-filtration on  $H''/s^*H''$ 
ideal v[1];
number v[1][i]; V-filtration index of i-th spectral number
intvec v[2];
```

int v[2][i]; multiplicity of i-th spectral number
 list v[3];
 module v[3][i]; vector space of i-th graded part in terms of v[4]
 ideal v[4]; monomial vector space basis of H''/s^*H''
 ideal v[5]; standard basis of Jacobian ideal

Example:

```

LIB "gmssing.lib";
ring R=0,(x,y),ds;
poly t=x5+x2y2+y5;
vfilt(t);
↳ [1]:
↳   _[1]=-1/2
↳   _[2]=-3/10
↳   _[3]=-1/10
↳   _[4]=0
↳   _[5]=1/10
↳   _[6]=3/10
↳   _[7]=1/2
↳ [2]:
↳   1,2,2,1,2,2,1
↳ [3]:
↳   [1]:
↳     _[1]=gen(11)
↳   [2]:
↳     _[1]=gen(10)
↳     _[2]=gen(6)
↳   [3]:
↳     _[1]=gen(9)
↳     _[2]=gen(4)
↳   [4]:
↳     _[1]=gen(5)
↳   [5]:
↳     _[1]=gen(3)
↳     _[2]=gen(8)
↳   [6]:
↳     _[1]=gen(2)
↳     _[2]=gen(7)
↳   [7]:
↳     _[1]=gen(1)
↳ [4]:
↳   _[1]=y5
↳   _[2]=y4
↳   _[3]=y3
↳   _[4]=y2
↳   _[5]=xy
↳   _[6]=y
↳   _[7]=x4
↳   _[8]=x3
↳   _[9]=x2
↳   _[10]=x
↳   _[11]=1
↳ [5]:

```

```

↳   _[1]=2x2y+5y4
↳   _[2]=5x5-5y5
↳   _[3]=2xy2+5x4
↳   _[4]=10y6+25x3y4

```

See also: [Section D.6.17 \[spectrum.lib\]](#), page 1352.

D.6.9.9 vwfilt

Procedure from library `gmssing.lib` (see [Section D.6.9 \[gmssing.lib\]](#), page 1293).

Usage: `vwfilt(t); poly t`

Assume: characteristic 0; local degree ordering;
isolated critical point 0 of t

Return:

```

list vw; weighted V-filtration on  $H''/s^*H''$ 
ideal vw[1];
number vw[1][i]; V-filtration index of i-th spectral pair
intvec vw[2];
int vw[2][i]; weight filtration index of i-th spectral pair
intvec vw[3];
int vw[3][i]; multiplicity of i-th spectral pair
list vw[4];
module vw[4][i]; vector space of i-th graded part in terms of vw[5]
ideal vw[5]; monomial vector space basis of  $H''/s^*H''$ 
ideal vw[6]; standard basis of Jacobian ideal

```

Example:

```

LIB "gmssing.lib";
ring R=0,(x,y),ds;
poly t=x5+x2y2+y5;
vwfilt(t);
↳ [1]:
↳   _[1]=-1/2
↳   _[2]=-3/10
↳   _[3]=-1/10
↳   _[4]=0
↳   _[5]=1/10
↳   _[6]=3/10
↳   _[7]=1/2
↳ [2]:
↳   2,1,1,1,1,1,0
↳ [3]:
↳   1,2,2,1,2,2,1
↳ [4]:
↳   [1]:
↳     _[1]=gen(11)
↳   [2]:
↳     _[1]=gen(10)
↳     _[2]=gen(6)
↳   [3]:
↳     _[1]=gen(9)
↳     _[2]=gen(4)

```

```

↳ [4]:
↳   _[1]=gen(5)
↳ [5]:
↳   _[1]=gen(3)
↳   _[2]=gen(8)
↳ [6]:
↳   _[1]=gen(2)
↳   _[2]=gen(7)
↳ [7]:
↳   _[1]=gen(1)
↳ [5]:
↳   _[1]=y5
↳   _[2]=y4
↳   _[3]=y3
↳   _[4]=y2
↳   _[5]=xy
↳   _[6]=y
↳   _[7]=x4
↳   _[8]=x3
↳   _[9]=x2
↳   _[10]=x
↳   _[11]=1
↳ [6]:
↳   _[1]=2x2y+5y4
↳   _[2]=5x5-5y5
↳   _[3]=2xy2+5x4
↳   _[4]=10y6+25x3y4

```

See also: [Section D.6.17 \[spectrum_lib\]](#), page 1352.

D.6.9.10 tmatrix

Procedure from library `gmssing.lib` (see [Section D.6.9 \[gmssing_lib\]](#), page 1293).

Usage: `tmatrix(t); poly t`

Assume: characteristic 0; local degree ordering;
isolated critical point 0 of t

Return:

list $l=A_0,A_1,T,M$;
matrix A_0,A_1 ; $t=A_0+s*A_1+s^2*(d/ds)$ on H'' w.r.t. $C[[s]]$ -basis $M*T$
module T ; C -basis of C^μ
ideal M ; monomial C -basis of H''/sH''

Example:

```

LIB "gmssing.lib";
ring R=0,(x,y),ds;
poly t=x5+x2y2+y5;
list l=tmatrix(t);
print(l[1]);
↳ 0,0,0,0,0,0,0,0,0,0,0,
↳ 0,0,0,0,0,0,0,0,0,0,0,
↳ 0,0,0,0,0,0,0,0,0,0,0,
↳ 0,0,0,0,0,0,0,0,0,0,0,

```

```

↳ 0,0,0,0,0,0,0,0,0,0,0,0,
↳ 0,0,0,0,0,0,0,0,0,0,0,0,

↳ xy,
↳ y,
↳ x4,
↳ x3,
↳ x2,
↳ x,
↳ 1

```

D.6.9.11 endvfilt

Procedure from library `gmssing.lib` (see [Section D.6.9 \[gmssing_lib\]](#), page 1293).

Usage: `endvfilt(v); list v`

Assume: `v` returned by `vfilt`

Return:

list `ev`; V-filtration on Jacobian algebra

```

ideal ev[1];
  number ev[1][i]; i-th V-filtration index
intvec ev[2];
  int ev[2][i]; i-th multiplicity
list ev[3];
  module ev[3][i]; vector space of i-th graded part in terms of ev[4]
ideal ev[4]; monomial vector space basis of Jacobian algebra
ideal ev[5]; standard basis of Jacobian ideal

```

Example:

```

LIB "gmssing.lib";
ring R=0,(x,y),ds;
poly t=x5+x2y2+y5;
endvfilt(vfilt(t));
↳ [1]:
↳   _[1]=0
↳   _[2]=1/5
↳   _[3]=2/5
↳   _[4]=1/2
↳   _[5]=3/5
↳   _[6]=4/5
↳   _[7]=1
↳ [2]:
↳   1,2,2,1,2,2,1
↳ [3]:
↳   [1]:
↳     _[1]=gen(11)
↳   [2]:
↳     _[1]=gen(10)
↳     _[2]=gen(6)
↳   [3]:
↳     _[1]=gen(9)
↳     _[2]=gen(4)
↳   [4]:
↳     _[1]=gen(5)
↳   [5]:
↳     _[1]=gen(8)
↳     _[2]=gen(3)
↳   [6]:
↳     _[1]=gen(7)
↳     _[2]=gen(2)
↳   [7]:
↳     _[1]=gen(1)
↳ [4]:
↳   _[1]=y5
↳   _[2]=y4
↳   _[3]=y3
↳   _[4]=y2
↳   _[5]=xy
↳   _[6]=y
↳   _[7]=x4
↳   _[8]=x3
↳   _[9]=x2

```

```

↳   _[10]=x
↳   _[11]=1
↳ [5]:
↳   _[1]=2x2y+5y4
↳   _[2]=5x5-5y5
↳   _[3]=2xy2+5x4
↳   _[4]=10y6+25x3y4

```

D.6.9.12 sppnf

Procedure from library `gmssing.lib` (see [Section D.6.9 \[gmssing_lib\], page 1293](#)).

Usage: `sppnf(list(a,w[,m]));` ideal `a`, intvec `w`, intvec `m`

Assume: `ncols(a)==size(w)==size(m)`

Return: order `(a[i][,w[i]])` with multiplicity `m[i]` lexicographically

Example:

```

LIB "gmssing.lib";
ring R=0,(x,y),ds;
list sp=list(ideal(-1/2,-3/10,-3/10,-1/10,-1/10,0,1/10,1/10,3/10,3/10,1/2),
intvec(2,1,1,1,1,1,1,1,1,1,0));
sppprint(sppnf(sp));
↳ ((-1/2,2),1),((-3/10,1),2),((-1/10,1),2),((0,1),1),((1/10,1),2),((3/10,1)\
,2),((1/2,0),1)

```

D.6.9.13 spprint

Procedure from library `gmssing.lib` (see [Section D.6.9 \[gmssing_lib\], page 1293](#)).

Usage: `spprint(spp);` list `spp`

Return: string `s`; spectral pairs `spp`

Example:

```

LIB "gmssing.lib";
ring R=0,(x,y),ds;
list spp=list(ideal(-1/2,-3/10,-1/10,0,1/10,3/10,1/2),intvec(2,1,1,1,1,1,0),
intvec(1,2,2,1,2,2,1));
spprint(spp);
↳ ((-1/2,2),1),((-3/10,1),2),((-1/10,1),2),((0,1),1),((1/10,1),2),((3/10,1)\
,2),((1/2,0),1)

```

D.6.9.14 spadd

Procedure from library `gmssing.lib` (see [Section D.6.9 \[gmssing_lib\], page 1293](#)).

Usage: `spadd(sp1,sp2);` list `sp1`, list `sp2`

Return: list `sp`; sum of spectra `sp1` and `sp2`

Example:

```

LIB "gmssing.lib";
ring R=0,(x,y),ds;
list sp1=list(ideal(-1/2,-3/10,-1/10,0,1/10,3/10,1/2),intvec(1,2,2,1,2,2,1));
spprint(sp1);

```

```

⇒ (-1/2,1),(-3/10,2),(-1/10,2),(0,1),(1/10,2),(3/10,2),(1/2,1)
list sp2=list(ideal(-1/6,1/6),intvec(1,1));
spprint(sp2);
⇒ (-1/6,1),(1/6,1)
spprint(spadd(sp1,sp2));
⇒ (-1/2,1),(-3/10,2),(-1/6,1),(-1/10,2),(0,1),(1/10,2),(1/6,1),(3/10,2),(1/\
2,1)

```

D.6.9.15 spsub

Procedure from library `gmssing.lib` (see [Section D.6.9 \[gmssing_lib\], page 1293](#)).

Usage: `spsub(sp1,sp2); list sp1, list sp2`

Return: `list sp`; difference of spectra `sp1` and `sp2`

Example:

```

LIB "gmssing.lib";
ring R=0,(x,y),ds;
list sp1=list(ideal(-1/2,-3/10,-1/10,0,1/10,3/10,1/2),intvec(1,2,2,1,2,2,1));
spprint(sp1);
⇒ (-1/2,1),(-3/10,2),(-1/10,2),(0,1),(1/10,2),(3/10,2),(1/2,1)
list sp2=list(ideal(-1/6,1/6),intvec(1,1));
spprint(sp2);
⇒ (-1/6,1),(1/6,1)
spprint(spsub(sp1,sp2));
⇒ (-1/2,1),(-3/10,2),(-1/6,-1),(-1/10,2),(0,1),(1/10,2),(1/6,-1),(3/10,2),(\
1/2,1)

```

D.6.9.16 spmul

Procedure from library `gmssing.lib` (see [Section D.6.9 \[gmssing_lib\], page 1293](#)).

Usage: `spmul(sp0,k); list sp0, int[vec] k`

Return: `list sp`; linear combination of spectra `sp0` with coefficients `k`

Example:

```

LIB "gmssing.lib";
ring R=0,(x,y),ds;
list sp=list(ideal(-1/2,-3/10,-1/10,0,1/10,3/10,1/2),intvec(1,2,2,1,2,2,1));
spprint(sp);
⇒ (-1/2,1),(-3/10,2),(-1/10,2),(0,1),(1/10,2),(3/10,2),(1/2,1)
spprint(spmul(sp,2));
⇒ (-1/2,2),(-3/10,4),(-1/10,4),(0,2),(1/10,4),(3/10,4),(1/2,2)
list sp1=list(ideal(-1/6,1/6),intvec(1,1));
spprint(sp1);
⇒ (-1/6,1),(1/6,1)
list sp2=list(ideal(-1/3,0,1/3),intvec(1,2,1));
spprint(sp2);
⇒ (-1/3,1),(0,2),(1/3,1)
spprint(spmul(list(sp1,sp2),intvec(1,2)));
⇒ (-1/3,2),(-1/6,1),(0,4),(1/6,1),(1/3,2)

```

D.6.9.17 spissemicont

Procedure from library `gmssing.lib` (see [Section D.6.9 \[gmssing_lib\], page 1293](#)).

Usage: `spissemicont(sp[1]);` list sp, int opt

Return:

```
int k=
  1; if sum of sp is positive on all intervals [a,a+1] [and (a,a+1)]
  0; if sum of sp is negative on some interval [a,a+1] [or (a,a+1)]
```

Example:

```
LIB "gmssing.lib";
ring R=0,(x,y),ds;
list sp1=list(ideal(-1/2,-3/10,-1/10,0,1/10,3/10,1/2),intvec(1,2,2,1,2,2,1));
spprint(sp1);
↪ (-1/2,1),(-3/10,2),(-1/10,2),(0,1),(1/10,2),(3/10,2),(1/2,1)
list sp2=list(ideal(-1/6,1/6),intvec(1,1));
spprint(sp2);
↪ (-1/6,1),(1/6,1)
spissemicont(spsub(sp1,spmul(sp2,3)));
↪ 1
spissemicont(spsub(sp1,spmul(sp2,4)));
↪ 0
```

D.6.9.18 spsemicont

Procedure from library `gmssing.lib` (see [Section D.6.9 \[gmssing_lib\], page 1293](#)).

Usage: `spsemicont(sp0,sp,k[1]);` list sp0, list sp

Return:

```
list l;
  intvec l[i]; if the spectra sp0 occur with multiplicities k
                in a deformation of a [quasihomogeneous] singularity
                with spectrum sp then k<=l[i]
```

Example:

```
LIB "gmssing.lib";
ring R=0,(x,y),ds;
list sp0=list(ideal(-1/2,-3/10,-1/10,0,1/10,3/10,1/2),intvec(1,2,2,1,2,2,1));
spprint(sp0);
↪ (-1/2,1),(-3/10,2),(-1/10,2),(0,1),(1/10,2),(3/10,2),(1/2,1)
list sp1=list(ideal(-1/6,1/6),intvec(1,1));
spprint(sp1);
↪ (-1/6,1),(1/6,1)
list sp2=list(ideal(-1/3,0,1/3),intvec(1,2,1));
spprint(sp2);
↪ (-1/3,1),(0,2),(1/3,1)
list sp=sp1,sp2;
list l=spsemicont(sp0,sp);
l;
↪ [1]:
↪ 3
↪ [2]:
```

```

↳ 2,1
spissemicont(spsub(sp0,spmuls(sp,l[1])));
↳ 1
spissemicont(spsub(sp0,spmuls(sp,l[1]-1)));
↳ 1
spissemicont(spsub(sp0,spmuls(sp,l[1]+1)));
↳ 0

```

D.6.9.19 spmilnor

Procedure from library `gmssing.lib` (see [Section D.6.9 \[gmssing.lib\], page 1293](#)).

Usage: `spmilnor(sp); list sp`

Return: `int mu`; Milnor number of spectrum `sp`

Example:

```

LIB "gmssing.lib";
ring R=0,(x,y),ds;
list sp=list(ideal(-1/2,-3/10,-1/10,0,1/10,3/10,1/2),intvec(1,2,2,1,2,2,1));
spprint(sp);
↳ (-1/2,1),(-3/10,2),(-1/10,2),(0,1),(1/10,2),(3/10,2),(1/2,1)
spmilnor(sp);
↳ 11

```

D.6.9.20 spgeomgenus

Procedure from library `gmssing.lib` (see [Section D.6.9 \[gmssing.lib\], page 1293](#)).

Usage: `spgeomgenus(sp); list sp`

Return: `int g`; geometrical genus of spectrum `sp`

Example:

```

LIB "gmssing.lib";
ring R=0,(x,y),ds;
list sp=list(ideal(-1/2,-3/10,-1/10,0,1/10,3/10,1/2),intvec(1,2,2,1,2,2,1));
spprint(sp);
↳ (-1/2,1),(-3/10,2),(-1/10,2),(0,1),(1/10,2),(3/10,2),(1/2,1)
spgeomgenus(sp);
↳ 6

```

D.6.9.21 spgamma

Procedure from library `gmssing.lib` (see [Section D.6.9 \[gmssing.lib\], page 1293](#)).

Usage: `spgamma(sp); list sp`

Return: `number gamma`; gamma invariant of spectrum `sp`

Example:

```

LIB "gmssing.lib";
ring R=0,(x,y),ds;
list sp=list(ideal(-1/2,-3/10,-1/10,0,1/10,3/10,1/2),intvec(1,2,2,1,2,2,1));
spprint(sp);
↳ (-1/2,1),(-3/10,2),(-1/10,2),(0,1),(1/10,2),(3/10,2),(1/2,1)
spgamma(sp);
↳ 1/240

```

D.6.10 gmspoly_lib

Library: gmspoly.lib

Purpose: Gauss-Manin System of Tame Polynomials

Author: Mathias Schulze, mschulze at mathematik.uni-kl.de

Overview: A library for computing the Gauss-Manin system of a cohomologically tame polynomial f . Schulze's algorithm [Sch05], based on Sabbah's theory [Sab98], is used to compute a good basis of (the Brieskorn lattice of) the Gauss-Manin system and the differential operation of f in terms of this basis. In addition, there is a test for tameness in the sense of Broughton. Tame polynomials can be considered as an affine algebraic analogue of local analytic isolated hypersurface singularities. They have only finitely many critical points, and those at infinity do not give rise to atypical values in a sense depending on the precise notion of tameness considered. Well-known notions of tameness like tameness, M-tameness, Malgrange-tameness, and cohomological tameness, and their relations, are reviewed in [Sab98,8]. For ordinary tameness, see Broughton [Bro88,3]. Sabbah [Sab98] showed that the Gauss-Manin system, the D-module direct image of the structure sheaf, of a cohomologically tame polynomial carries a similar structure as in the isolated singularity case, coming from a Mixed Hodge structure on the cohomology of the Milnor (typical) fibre (see gmssing.lib). The data computed by this library encodes the differential structure of the Gauss-Manin system, and the Mixed Hodge structure of the Milnor fibre over the complex numbers. As a consequence, it yields the Hodge numbers, spectral pairs, and monodromy at infinity.

Procedures: See also: [Section D.6.9 \[gmssing_lib\]](#), [page 1293](#).

D.6.10.1 isTame

Procedure from library gmspoly.lib (see [Section D.6.10 \[gmspoly_lib\]](#), [page 1308](#)).

Usage: isTame(f); poly f

Assume: basering has no variables named w(1),w(2),...

Return:

```
int k=
  1; if f is tame in the sense of Broughton [Bro88,3]
  0; if f is not tame
```

Remarks: procedure implements Proposition 3.1 in [Bro88]

Example:

```
LIB "gmspoly.lib";
ring R=0,(x,y),dp;
isTame(x2y+x);
↳ 0
isTame(x3+y3+xy);
↳ 1
```

D.6.10.2 goodBasis

Procedure from library `gmspoly.lib` (see [Section D.6.10 \[gmspoly_lib\]](#), page 1308).

Usage: `goodBasis(f); poly f`

Assume: `f` is cohomologically tame in the sense of Sabbah [Sab98,8]

Return:

ring `R`; basering with new variable `s`
 ideal `b`; `[matrix(b)]` is a good basis of the Brieskorn lattice
 matrix `A`; $A(s)=A_0+s*A_1$ and $t[matrix(b)]=[matrix(b)](A(s)+s^2*(d/ds))$

Remarks: procedure implements Algorithm 6 in [Sch05]

Example:

```
LIB "gmspoly.lib";
ring R=0,(x,y,z),dp;
poly f=x+y+z+x2y2z2;
def Rs=goodBasis(f);
setring(Rs);
b;
⇒ b[1]=1
⇒ b[2]=s2x-3sx2+x3
⇒ b[3]=5/2x
⇒ b[4]=10s2x2-25/2sx3+5/2x4
⇒ b[5]=-25/4sx+25/4x2
print(jet(A,0));
⇒ 0,0,0,-25/8,0,
⇒ 0,0,0,0, 125/8,
⇒ 1,0,0,0, 0,
⇒ 0,1,0,0, 0,
⇒ 0,0,1,0, 0
print(jet(A/var(1),0));
⇒ 1/2,0,0, 0,0,
⇒ 0, 1,0, 0,0,
⇒ 0, 0,3/2,0,0,
⇒ 0, 0,0, 2,0,
⇒ 0, 0,0, 0,5/2
```

See also: [Section D.6.9 \[gmssing_lib\]](#), page 1293.

D.6.11 hnoether_lib

Library: `hnoether.lib`

Purpose: Hamburger-Noether (Puiseux) Expansion

Authors: Martin Lamm, lamm@mathematik.uni-kl.de
 Christoph Lossen, lossen@mathematik.uni-kl.de

Overview: A library for computing the Hamburger-Noether expansion (analogue of Puiseux expansion over fields of arbitrary characteristic) of a reduced plane curve singularity following [Campillo, A.: Algebroid curves in positive characteristic, Springer LNM 813 (1980)].

The library contains also procedures for computing the (topological) numerical invariants of plane curve singularities.

Procedures:

D.6.11.1 hnexpansion

Procedure from library `hnoether.lib` (see [Section D.6.11 \[hnoether.lib\]](#), page 1309).

Usage: `hnexpansion(f, "ess");` `f` poly

Assume: `f` is a bivariate polynomial (in the first 2 ring variables)

Return: list `L`, containing Hamburger-Noether data of `f`: If the computation of the HNE required no field extension, `L` is a list of lists `L[i]` (corresponding to the output of `develop`, applied to a branch of `f`, but the last entry being omitted):

`L[i][1]`; matrix:

Each row contains the coefficients of the corresponding line of the Hamburger-Noether expansion (HNE) for the `i`-th branch. The end of the line is marked in the matrix by the first ring variable (usually `x`).

`L[i][2]`; intvec:

indicating the length of lines of the HNE

`L[i][3]`; int:

0 if the 1st ring variable was transversal (with respect to the `i`-th branch),
1 if the variables were changed at the beginning of the computation,
-1 if an error has occurred.

`L[i][4]`; poly:

the transformed equation of the `i`-th branch to make it possible to extend the Hamburger-Noether data a posteriori without having to do all the previous calculation once again (0 if not needed).

If the computation of the HNE required a field extension, the first entry `L[1]` of the list is a ring, in which a list `hne` of lists (the HN data, as above) and a polynomial `f` (image of `f` over the new field) are stored.

If called with an additional input parameter, `hnexpansion` computes only one representative for each class of conjugate branches (over the ground field active when calling the procedure). In this case, the returned list `L` always has only two entries: `L[1]` is either a list of lists (the HN data) or a ring (as above), and `L[2]` is an integer vector (the number of branches in the respective conjugacy classes).

Note: If `f` is known to be irreducible as a power series, `develop(f)` could be chosen instead to avoid a change of basering during the computations.

Increasing `printlevel` leads to more and more comments.

Having defined a variable `HNDebugOn` leads to a maximum number of comments.

Example:

```
LIB "hnoether.lib";
ring r=0,(x,y),dp;
// First, an example which requires no field extension:
list Hne=hnexpansion(x4-y6);
⇒ // No change of ring necessary, return value is HN expansion.
size(Hne);           // number of branches
⇒ 2
displayHNE(Hne);     // HN expansion of branches
⇒ // Hamburger-Noether development of branch nr.1:
⇒ x = z(1)*y
⇒ y = z(1)^2
⇒
```

```

⇒ // Hamburger-Noether development of branch nr.2:
⇒ x = z(1)*y
⇒ y = -z(1)^2
⇒
param(Hne[1]); // parametrization of 1st branch
⇒ _[1]=x3
⇒ _[2]=x2
param(Hne[2]); // parametrization of 2nd branch
⇒ _[1]=-x3
⇒ _[2]=-x2
// An example which requires a field extension:
list L=hnexpansion((x4-y6)*(y2+x4));
⇒
⇒ // 'hnexpansion' created a list of one ring.
⇒ // To see the ring and the data stored in the ring, type (if you assigned
⇒ // the name L to the list):
⇒ show(L);
⇒ // To display the computed HN expansion, type
⇒ def HNring = L[1]; setring HNring; displayHNE(hne);
def R=L[1]; setring R; displayHNE(hne);
⇒ // Hamburger-Noether development of branch nr.1:
⇒ y = (a)*x^2
⇒
⇒ // Hamburger-Noether development of branch nr.2:
⇒ y = (-a)*x^2
⇒
⇒ // Hamburger-Noether development of branch nr.3:
⇒ x = z(1)*y
⇒ y = z(1)^2
⇒
⇒ // Hamburger-Noether development of branch nr.4:
⇒ x = z(1)*y
⇒ y = -z(1)^2
⇒
basing;
⇒ // coefficients: QQ[a]/(a2+1)
⇒ // number of vars : 2
⇒ // block 1: ordering ls
⇒ // : names x y
⇒ // block 2 : ordering C
setring r; kill R;
// Computing only one representative per conjugacy class:
L=hnexpansion((x4-y6)*(y2+x4),"ess");
⇒
⇒ // 'hnexpansion' created a list of one ring.
⇒ // To see the ring and the data stored in the ring, type (if you assigned
⇒ // the name L to the list):
⇒ show(L);
⇒ // To display the computed HN expansion, type
⇒ def HNring = L[1]; setring HNring; displayHNE(hne);
⇒ // As second entry of the returned list L, you obtain an integer vector,
⇒ // indicating the number of conjugates for each of the computed branches.
def R=L[1]; setring R; displayHNE(hne);

```

```

↳ // Hamburger-Noether development of branch nr.1:
↳ y = (a)*x^2
↳
↳ // Hamburger-Noether development of branch nr.2:
↳ x = z(1)*y
↳ y = z(1)^2
↳
↳ // Hamburger-Noether development of branch nr.3:
↳ x = z(1)*y
↳ y = -z(1)^2
↳
L[2]; // number of branches in respective conjugacy classes
↳ 2,1,1

```

See also: [Section D.6.11.2 \[develop\]](#), page 1312; [Section D.6.11.5 \[displayHNE\]](#), page 1316; [Section D.6.11.3 \[extdevelop\]](#), page 1313; [Section D.6.11.4 \[param\]](#), page 1314.

D.6.11.2 develop

Procedure from library `hnoether.lib` (see [Section D.6.11 \[hnoether.lib\]](#), page 1309).

Usage: `develop(f [,n]);` f poly, n int

Assume: f is a bivariate polynomial (in the first 2 ring variables) and irreducible as power series (for reducible f use `hnexpansion`).

Return: list L with:

$L[1]$; matrix:

Each row contains the coefficients of the corresponding line of the Hamburger-Noether expansion (HNE). The end of the line is marked in the matrix by the first ring variable (usually x).

$L[2]$; intvec:

indicating the length of lines of the HNE

$L[3]$; int: 0 if the 1st ring variable was transversal (with respect to f),
1 if the variables were changed at the beginning of the computation,
-1 if an error has occurred.

$L[4]$; poly:

the transformed polynomial of f to make it possible to extend the Hamburger-Noether development a posteriori without having to do all the previous calculation once again (0 if not needed)

$L[5]$; int: 1 if the curve has exactly one branch (i.e., is irreducible),
0 else (i.e., the curve has more than one HNE, or f is not valid).

Display: The (non zero) elements of the HNE (if not called by another proc).

Note: The optional parameter n affects only the computation of the LAST line of the HNE. If it is given, the HN-matrix $L[1]$ will have at least n columns. Otherwise, the number of columns will be chosen minimal such that the matrix contains all necessary information (i.e., all lines of the HNE but the last (which is in general infinite) have place).

If n is negative, the algorithm is stopped as soon as the computed information is sufficient for `invariants(L)`, but the HN-matrix $L[1]$ may still contain undetermined elements, which are marked with the 2nd variable (of the basering).

For time critical computations it is recommended to use `ring ..., (x,y), ls` as basering - it increases the algorithm's speed.

If `printlevel>=0` comments are displayed (default is `printlevel=0`).

Example:

```
LIB "hnoether.lib";
ring exring = 7, (x,y), ds;
list Hne=develop(4x98+2x49y7+x11y14+2y14);
print(Hne[1]);
↳ 0,0, 0,0,0,0,3,x,
↳ 0,x, 0,0,0,0,0,0,
↳ 0,0, 0,x,0,0,0,0,
↳ 0,x, 0,0,0,0,0,0,
↳ 0,-1,0,0,0,0,0,0
// therefore the HNE is:
// z(-1)= 3*z(0)^7 + z(0)^7*z(1),
// z(0) = z(1)*z(2),          (there is 1 zero in the 2nd row before x)
// z(1) = z(2)^3*z(3),       (there are 3 zeroes in the 3rd row)
// z(2) = z(3)*z(4),
// z(3) = -z(4)^2 + 0*z(4)^3 +...+ 0*z(4)^8 + ?*z(4)^9 + ...
// (the missing x in the last line indicates that it is not complete.)
Hne[2];
↳ 7,1,3,1,-1
param(Hne);
↳ // ** Warning: result is exact up to order 20 in x and 104 in y !
↳ _[1]=-x14
↳ _[2]=-3x98-x109
// parametrization:  x(t)= -t^14+0(t^21),  y(t)= -3t^98+0(t^105)
// (the term -t^109 in y may have a wrong coefficient)
displayHNE(Hne);
↳ y = 3*x^7+z(1)*x^7
↳ x = z(1)*z(2)
↳ z(1) = z(2)^3*z(3)
↳ z(2) = z(3)*z(4)
↳ z(3) = -z(4)^2 + ..... (terms of degree >=9)
```

See also: [Section D.6.11.5 \[displayHNE\]](#), page 1316; [Section D.6.11.3 \[extdevelop\]](#), page 1313; [Section D.6.11.1 \[hnexpansion\]](#), page 1310.

D.6.11.3 extdevelop

Procedure from library `hnoether.lib` (see [Section D.6.11 \[hnoether.lib\]](#), page 1309).

Usage: `extdevelop(L,N)`; list L, int N

Assume: L is the output of `develop(f)`, or of `extdevelop(l,n)`, or one entry in the list `hne` in the ring created by `hnexpansion(f[, "ess"])`.

Return: an extension of the Hamburger-Noether development of `f` as a list in the same format as L has (up to the last entry in the output of `develop(f)`).
Type `help develop;`, resp. `help hnexpansion;` for more details.

Note: The new HN-matrix will have at least N columns (if the HNE is not finite). In particular, if `f` is irreducible then (in most cases) `extdevelop(develop(f),N)` will produce the same result as `develop(f,N)`.
If the matrix M of L has n columns then, compared with `parametrization(L)`,

`parametrize(extdevelop(L,N))` will increase the exactness by at least $(N-n)$ more significant monomials.

Example:

```
LIB "hnoether.lib";
ring exring=0,(x,y),dp;
list Hne=hnexpansion(x14-3y2x11-y3x10-y2x9+3y4x8+y5x7+3y4x6+x5*(-y6+y5)
-3y6x3-y7x2+y8);
↳ // No change of ring necessary, return value is HN expansion.
displayHNE(Hne); // HNE of 1st,3rd branch is finite
↳ // Hamburger-Noether development of branch nr.1:
↳ y = z(1)*x
↳ x = z(1)^2
↳
↳ // Hamburger-Noether development of branch nr.2:
↳ y = z(1)*x
↳ x = z(1)^2+z(1)^2*z(2)
↳ z(1) = z(2)^2-z(2)^3 + ..... (terms of degree >=4)
↳
↳ // Hamburger-Noether development of branch nr.3:
↳ y = z(1)*x^2
↳ x = z(1)^2
↳
print(extdevelop(Hne[1],5)[1]);
↳ No extension is possible
↳ 0,x,0,
↳ 0,1,x
list ehne=extdevelop(Hne[2],5);
displayHNE(ehne);
↳ y = z(1)*x
↳ x = z(1)^2+z(1)^2*z(2)
↳ z(1) = z(2)^2-z(2)^3+z(2)^4-z(2)^5 + ..... (terms of degree >=6)
param(Hne[2]);
↳ // ** Warning: result is exact up to order 5 in x and 7 in y !
↳ _[1]=x7-x6-x5+x4
↳ _[2]=-x10+2x9-2x7+x6
param(ehne);
↳ // ** Warning: result is exact up to order 7 in x and 9 in y !
↳ _[1]=x11-x10+x9-x8-x7+x6-x5+x4
↳ _[2]=-x16+2x15-3x14+4x13-2x12+2x10-4x9+3x8-2x7+x6
```

See also: [Section D.6.11.2 \[develop\]](#), page 1312; [Section D.6.11.1 \[hnexpansion\]](#), page 1310; [Section D.6.11.4 \[param\]](#), page 1314.

D.6.11.4 param

Procedure from library `hnoether.lib` (see [Section D.6.11 \[hnoether.lib\]](#), page 1309).

Usage: `param(L [,s]);` L list, s any type (optional)

Assume: L is the output of `develop(f)`, or of `extdevelop(develop(f),n)`, or (one entry in) the list of HN data created by `hnexpansion(f,["ess"])`.

Return: If L are the HN data of an irreducible plane curve singularity f: a parametrization for f in the following format:

- if only the list L is given, the result is an ideal of two polynomials $p[1], p[2]$: if the HNE was finite then $f(p[1], p[2])=0$; if not, the true parametrization will be given by two power series, and $p[1], p[2]$ are truncations of these series.

- if the optional parameter s is given, the result is a list l : $l[1]=\text{param}(L)$ (ideal) and $l[2]=\text{intvec}$ with two entries indicating the highest degree up to which the coefficients of the monomials in $l[1]$ are exact (entry -1 means that the corresponding parametrization is exact).

If L collects the HN data of a reducible plane curve singularity f , the return value is a list of parametrizations in the respective format.

Note: If the basering has only 2 variables, the first variable is chosen as indefinite. Otherwise, the 3rd variable is chosen.

Example:

```
LIB "hnoether.lib";
ring exring=0, (x,y,t), ds;
poly f=x3+2xy2+y2;
list Hne=develo(f);
list hne_extended=extdevelo(Hne,10);
// compare the HNE matrices ...
print(Hne[1]);
  => 0,x,
  => 0,-1
print(hne_extended[1]);
  => 0,x, 0,0,0,0, 0,0,0,0,
  => 0,-1,0,2,0,-4,0,8,0,-16
// ... and the resulting parametrizations:
param(Hne);
  => // ** Warning: result is exact up to order 2 in x and 3 in y !
  => _[1]=-t2
  => _[2]=-t3
param(hne_extended);
  => // ** Warning: result is exact up to order 10 in x and 11 in y !
  => _[1]=-t2+2t4-4t6+8t8-16t10
  => _[2]=-t3+2t5-4t7+8t9-16t11
param(hne_extended,0);
  => // ** Warning: result is exact up to order 10 in x and 11 in y !
  => [1]:
  =>   _[1]=-t2+2t4-4t6+8t8-16t10
  =>   _[2]=-t3+2t5-4t7+8t9-16t11
  => [2]:
  =>   10,11
// An example with more than one branch:
list L=hnexpansion(f*(x2+y4));
  =>
  => // 'hnexpansion' created a list of one ring.
  => // To see the ring and the data stored in the ring, type (if you assigned
  => // the name L to the list):
  =>   show(L);
  => // To display the computed HN expansion, type
  =>   def HNring = L[1]; setring HNring; displayHNE(hne);
def HNring = L[1]; setring HNring;
param(hne);
```

```

⇒ // Parametrization of branch number 1 computed.
⇒ // ** Warning: result is exact up to order 4 in x and 5 in y !
⇒ // Parametrization of branch number 2 computed.
⇒ // Parametrization of branch number 3 computed.
⇒ [1]:
⇒   _[1]=-x2+2*x4
⇒   _[2]=-x3+2*x5
⇒ [2]:
⇒   _[1]=(a)*x2
⇒   _[2]=x
⇒ [3]:
⇒   _[1]=(-a)*x2
⇒   _[2]=x
    
```

See also: [Section D.6.11.2 \[develop\], page 1312](#); [Section D.6.11.3 \[extdevelop\], page 1313](#).

D.6.11.5 displayHNE

Procedure from library `hnoether.lib` (see [Section D.6.11 \[hnoether.lib\], page 1309](#)).

Usage: `displayHNE(L[,n]);` L list, n int

Assume: L is the output of `develop(f)`, or of `exdevelop(f,n)`, or of `hnexpansion(f[, "ess"])`, or (one entry in) the list `hne` in the ring created by `hnexpansion(f[, "ess"])`.

Return: - if only one argument is given and if the input are the HN data of an irreducible plane curve singularity, no return value, but display an ideal HNE of the following form:

$$\begin{aligned}
 y &= [] * x^1 + [] * x^2 + \dots + x^{<>} * z(1) \\
 x &= [] * z(1)^2 + \dots + z(1)^{<>} * z(2) \\
 z(1) &= [] * z(2)^2 + \dots + z(2)^{<>} * z(3) \\
 &\dots\dots\dots \\
 z(r-1) &= [] * z(r)^2 + [] * z(r)^3 + \dots\dots\dots
 \end{aligned}$$

where x,y are the first 2 variables of the basering. The values of `[]` are the coefficients of the Hamburger-Noether matrix, the values of `<>` are represented by `x` in the HN matrix.

- if a second argument is given and if the input are the HN data of an irreducible plane curve singularity, return a ring containing an ideal HNE as described above.
- if L corresponds to the output of `hnexpansion(f)` or to the list of HN data computed by `hnexpansion(f[, "ess"])`, `displayHNE(L[,n])` shows the HNE's of all branches of f in the format described above. The optional parameter is then ignored.

Note: The 1st line of the above ideal (i.e., `HNE[1]`) means that $y = [] * z(0)^1 + \dots$, the 2nd line (`HNE[2]`) means that $x = [] * z(1)^2 + \dots$, so you can see which indeterminate corresponds to which line (it's also possible that x corresponds to the 1st line and y to the 2nd).

Example:

```

LIB "hnoether.lib";
ring r=0,(x,y),dp;
poly f=x3+2xy2+y2;
list hn=develop(f);
displayHNE(hn);
⇒ y = z(1)*x
⇒ x = -z(1)^2 + ..... (terms of degree >=3)
    
```

See also: [Section D.6.11.2 \[develop\], page 1312](#); [Section D.6.11.1 \[hnexpansion\], page 1310](#).

D.6.11.6 invariants

Procedure from library `hnoether.lib` (see [Section D.6.11 \[hnoether.lib\]](#), page 1309).

Usage: `invariants(INPUT)`; INPUT list or poly

Assume: INPUT is the output of `develop(f)`, or of `extdevelop(develop(f),n)`, or one entry of the list of HN data computed by `hnexpansion(f[, "ess"])`.

Return: list INV of the following format:

```

INV[1]: intvec   (characteristic exponents)
INV[2]: intvec   (generators of the semigroup)
INV[3]: intvec   (Puisseux pairs, 1st components)
INV[4]: intvec   (Puisseux pairs, 2nd components)
INV[5]: int      (degree of the conductor)
INV[6]: intvec   (sequence of multiplicities)

```

If INPUT contains no valid HN expansion, the empty list is returned.

Assume: INPUT is a bivariate polynomial `f`, or the output of `hnexpansion(f)`, or the list of HN data computed by `hnexpansion(f [, "ess"])`.

Return: list INV, such that `INV[i]` coincides with the output of `invariants(develop(f[i]))`, where `f[i]` is the `i`-th branch of `f`, and the last entry of INV contains further invariants of `f` in the format:

```

INV[last][1] : intmat   (contact matrix of the branches)
INV[last][2] : intmat   (intersection multiplicities of the branches)
INV[last][3] : int      (delta invariant of f)

```

Note: In case the Hamburger-Noether expansion of the curve `f` is needed for other purposes as well it is better to calculate this first with the aid of `hnexpansion` and use it as input instead of the polynomial itself.

Example:

```

LIB "hnoether.lib";
ring exring=0,(x,y),dp;
list Hne=develop(y4+2x3y2+x6+x5y);
list INV=invariants(Hne);
INV[1]; // the characteristic exponents
↳ 4,6,7
INV[2]; // the generators of the semigroup of values
↳ 4,6,13
INV[3],INV[4]; // the Puisseux pairs in packed form
↳ 3,7 2,2
INV[5] div 2; // the delta-invariant
↳ 8
INV[6]; // the sequence of multiplicities
↳ 4,2,2,1,1
// To display the invariants more 'nicely':
displayInvariants(Hne);
↳ characteristic exponents : 4,6,7
↳ generators of semigroup : 4,6,13
↳ Puisseux pairs : (3,2)(7,2)
↳ degree of the conductor : 16
↳ delta invariant : 8
↳ sequence of multiplicities: 4,2,2,1,1

```

```

////////////////////////////////////
INV=invariants((x2-y3)*(x3-y5));
INV[1][1];           // the characteristic exponents of the first branch
↳ 2,3
INV[2][6];           // the sequence of multiplicities of the second branch
↳ 3,2,1,1
print(INV[size(INV)][1]);           // the contact matrix of the branches
↳      0      3
↳      3      0
print(INV[size(INV)][2]);           // the intersection numbers of the branches
↳      0      9
↳      9      0
INV[size(INV)][3];           // the delta invariant of the curve
↳ 14

```

See also: [Section D.6.11.2 \[develop\]](#), page 1312; [Section D.6.11.7 \[displayInvariants\]](#), page 1318; [Section D.6.11.1 \[hnexpansion\]](#), page 1310; [Section D.6.11.10 \[intersection\]](#), page 1321; [Section D.6.11.8 \[multsequence\]](#), page 1318.

D.6.11.7 displayInvariants

Procedure from library `hnoether.lib` (see [Section D.6.11 \[hnoether.lib\]](#), page 1309).

Usage: `displayInvariants(INPUT)`; INPUT list or poly

Assume: INPUT is a bivariate polynomial, or the output of `develop(f)`, resp. of `extdevelop(develop(f),n)`, or (one entry of) the list of HN data computed by `hnexpansion(f, "ess")`.

Return: none

Display: invariants of the corresponding branch, resp. of all branches, in a better readable form.

Note: If the Hamburger-Noether expansion of the curve `f` is needed for other purposes as well it is better to calculate this first with the aid of `hnexpansion` and use it as input instead of the polynomial itself.

Example:

```

LIB "hnoether.lib";
ring exring=0,(x,y),dp;
list Hne=develop(y4+2x3y2+x6+x5y);
displayInvariants(Hne);
↳ characteristic exponents : 4,6,7
↳ generators of semigroup : 4,6,13
↳ Puiseux pairs : (3,2)(7,2)
↳ degree of the conductor : 16
↳ delta invariant : 8
↳ sequence of multiplicities: 4,2,2,1,1

```

See also: [Section D.6.11.2 \[develop\]](#), page 1312; [Section D.6.11.1 \[hnexpansion\]](#), page 1310; [Section D.6.11.10 \[intersection\]](#), page 1321; [Section D.6.11.6 \[invariants\]](#), page 1317.

D.6.11.8 multsequence

Procedure from library `hnoether.lib` (see [Section D.6.11 \[hnoether.lib\]](#), page 1309).

Usage: `multsequence(INPUT)`; INPUT list or poly

Assume: INPUT is the output of `develop(f)`, or of `extdevelop(develop(f),n)`, or one entry of the list of HN data computed by `hnexpansion(f[, "ess"])`.

Return: `intvec` corresponding to the multiplicity sequence of the irreducible plane curve singularity described by the HN data (return value coincides with `invariants(INPUT)` [6]).

Assume: INPUT is a bivariate polynomial `f`, or the output of `hnexpansion(f)`, or the list of HN data computed by `hnexpansion(f[, "ess"])`.

Return: list of two integer matrices:

`multsequence(INPUT)[1][i,*]`
contains the multiplicities of the branches at their infinitely near point of 0 in its (i-1) order neighbourhood (i.e., i=1: multiplicity of the branches themselves, i=2: multiplicity of their 1st quadratic transform, etc., Hence, `multsequence(INPUT)[1][*,j]` is the multiplicity sequence of branch j.

`multsequence(INPUT)[2][i,*]`
contains the information which of these infinitely near points coincide.

Note: The order of the elements of the list of HN data obtained from `hnexpansion(f[, "ess"])` must not be changed (because otherwise the coincident infinitely near points couldn't be grouped together, see the meaning of the 2nd `intmat` in the example).

Hence, it is not wise to compute the HN expansion of polynomial factors separately, put them into a list INPUT and call `multsequence(INPUT)`.

Use `displayMultsequence` to produce a better readable output for reducible curves on the screen.

In case the Hamburger-Noether expansion of the curve `f` is needed for other purposes as well it is better to calculate this first with the aid of `hnexpansion` and use it as input instead of the polynomial itself.

Example:

```
LIB "hnoether.lib";
ring r=0,(x,y),dp;
list Hne=hnexpansion((x6-y10)*(x+y2-y3)*(x+y2+y3));
⇨ // No change of ring necessary, return value is HN expansion.
multsequence(Hne[1])," | ",multsequence(Hne[2])," | ",
multsequence(Hne[3])," | ",multsequence(Hne[4]);
⇨ 3,2,1,1 | 3,2,1,1 | 1 | 1
multsequence(Hne);
⇨ [1]:
⇨ 3,3,1,1,
⇨ 2,2,1,1,
⇨ 1,1,1,1,
⇨ 1,1,1,1,
⇨ 1,1,1,1
⇨ [2]:
⇨ 4,0,0,0,
⇨ 4,0,0,0,
⇨ 2,2,0,0,
⇨ 2,1,1,0,
⇨ 1,1,1,1
// The meaning of the entries of the 2nd matrix is as follows:
displayMultsequence(Hne);
```

```

⇒ [(3,3,1,1)],
⇒ [(2,2,1,1)],
⇒ [(1,1),(1,1)],
⇒ [(1,1),(1),(1)],
⇒ [(1),(1),(1),(1)]

```

See also: [Section D.6.11.2 \[develop\]](#), page 1312; [Section D.6.11.9 \[displayMultsequence\]](#), page 1320; [Section D.6.11.1 \[hnexpansion\]](#), page 1310; [Section D.6.11.17 \[separateHNE\]](#), page 1324.

D.6.11.9 displayMultsequence

Procedure from library `hnoether.lib` (see [Section D.6.11 \[hnoether.lib\]](#), page 1309).

Usage: `displayMultsequence(INPUT)`; INPUT list or poly

Assume: INPUT is a bivariate polynomial, or the output of `develop(f)`, resp. of `extdevelop(develop(f),n)`, or (one entry of) the list of HN data computed by `hnexpansion(f[,"ess"])`, or the output of `hnexpansion(f)`.

Return: nothing

Display: the sequence of multiplicities:

```

- if INPUT=develop(f) or INPUT=extdevelop(develop(f),n) or INPUT=hne[i]:
    a , b , c , ..... , 1
- if INPUT=f or INPUT=hnexpansion(f) or INPUT=hne:
    [(a_1, ... , b_1 , ... , c_1)],
    [(a_2, ... ), ... , (... , c_2)],
    ..... ,
    [(a_n),(b_n), ..... , (c_n)]

```

with:

```

a_1 , ... , a_n the sequence of multiplicities of the 1st branch,
[...] the multiplicities of the j-th transform of all branches,
(...) indicating branches meeting in an infinitely near point.

```

Note: The Same restrictions as in `multsequence` apply for the input.

In case the Hamburger-Noether expansion of the curve `f` is needed for other purposes as well it is better to calculate this first with the aid of `hnexpansion` and use it as input instead of the polynomial itself.

Example:

```

LIB "hnoether.lib";
ring r=0,(x,y),dp;
// Example 1: Input = output of develop
displayMultsequence(develop(x3-y5));
⇒ The sequence of multiplicities is 3,2,1,1
// Example 2: Input = bivariate polynomial
displayMultsequence((x6-y10)*(x+y2-y3)*(x+y2+y3));
⇒ [(3,3,1,1)],
⇒ [(2,2,1,1)],
⇒ [(1,1),(1,1)],
⇒ [(1,1),(1),(1)],
⇒ [(1),(1),(1),(1)]

```

See also: [Section D.6.11.2 \[develop\]](#), page 1312; [Section D.6.11.1 \[hnexpansion\]](#), page 1310; [Section D.6.11.8 \[multsequence\]](#), page 1318; [Section D.6.11.17 \[separateHNE\]](#), page 1324.

D.6.11.10 intersection

Procedure from library `hnoether.lib` (see [Section D.6.11 \[hnoether.lib\]](#), page 1309).

Usage: `intersection(hne1,hne2)`; hne1, hne2 lists

Assume: hne1, hne2 represent an HN expansion of an irreducible plane curve singularity (that is, are the output of `develop(f)`, or of `extdevelop(develop(f),n)`, or one entry of the list of HN data computed by `hnexpansion(f[, "ess"])`).

Return: int, the intersection multiplicity of the irreducible plane curve singularities corresponding to hne1 and hne2.

Example:

```
LIB "hnoether.lib";
ring r=0,(x,y),dp;
list Hne=hnexpansion((x2-y3)*(x2+y3));
↪ // No change of ring necessary, return value is HN expansion.
intersection(Hne[1],Hne[2]);
↪ 6
```

See also: [Section D.6.11.7 \[displayInvariants\]](#), page 1318; [Section D.6.11.1 \[hnexpansion\]](#), page 1310.

D.6.11.11 is_irred

Procedure from library `hnoether.lib` (see [Section D.6.11 \[hnoether.lib\]](#), page 1309).

Usage: `is_irred(f)`; f poly

Assume: f is a squarefree bivariate polynomial (in the first 2 ring variables).

Return: int (0 or 1):
 - `is_irred(f)=1` if f is irreducible as a formal power series over the algebraic closure of its coefficient field (f defines an analytically irreducible curve at zero),
 - `is_irred(f)=0` otherwise.

Note: 0 and units in the ring of formal power series are considered to be not irreducible.

Example:

```
LIB "hnoether.lib";
ring exring=0,(x,y),ls;
is_irred(x2+y3);
↪ 1
is_irred(x2+y2);
↪ 0
is_irred(x2+y3+1);
↪ 0
```

D.6.11.12 delta

Procedure from library `hnoether.lib` (see [Section D.6.11 \[hnoether.lib\]](#), page 1309).

Usage: `delta(INPUT)`; INPUT a polynomial defining an isolated plane curve singularity at 0, or the Hamburger-Noether expansion thereof, i.e. the output of `develop(f)`, or the output of `hnexpansion(f)`, or the list of HN data computed by `hnexpansion(f)`.

Return: int, the delta invariant of the singularity at 0, that is, the vector space dimension of \tilde{R}/R , (\tilde{R} the normalization of the local ring of the singularity).

Note: In case the Hamburger-Noether expansion of the curve f is needed for other purposes as well it is better to calculate this first with the aid of `hnexpansion` and use it as input instead of the polynomial itself.

Example:

```
LIB "hnoether.lib";
ring r = 32003, (x,y), ds;
poly f = x25+x24-4x23-1x22y+4x22+8x21y-2x21-12x20y-4x19y2+4x20+10x19y
+12x18y2-24x18y-20x17y2-4x16y3+x18+60x16y2+20x15y3-9x16y
-80x14y3-10x13y4+36x14y2+60x12y4+2x11y5-84x12y3-24x10y5
+126x10y4+4x8y6-126x8y5+84x6y6-36x4y7+9x2y8-1y9;
delta(f);
↳ 96
```

See also: [Section D.4.18.9 \[deltaLoc\]](#), page 1026; [Section D.6.11.6 \[invariants\]](#), page 1317.

D.6.11.13 newtonpoly

Procedure from library `hnoether.lib` (see [Section D.6.11 \[hnoether.lib\]](#), page 1309).

Usage: `newtonpoly(f); f poly`

Assume: basering has exactly two variables;
 f is convenient, that is, $f(x,0) \neq 0 \neq f(0,y)$.

Return: list of intvecs (= coordinates x,y of the Newton polygon of f).

Note: Procedure uses `execute`; this can be avoided by calling `newtonpoly(f,1)` if the ordering of the basering is `ls`.

Example:

```
LIB "hnoether.lib";
ring r=0, (x,y), ls;
poly f=x5+2x3y-x2y2+3xy5+y6-y7;
newtonpoly(f);
↳ [1]:
↳ 0,6
↳ [2]:
↳ 2,2
↳ [3]:
↳ 3,1
↳ [4]:
↳ 5,0
```

D.6.11.14 is_NND

Procedure from library `hnoether.lib` (see [Section D.6.11 \[hnoether.lib\]](#), page 1309).

Usage: `is_NND(f[,mu,NP]); f poly, mu int, NP list of intvecs`

Assume: f is convenient, that is, $f(x,0) \neq 0 \neq f(0,y)$;
 μ (optional) is Milnor number of f .
 NP (optional) is output of `newtonpoly(f)`.

Return: int: 1 if f is Newton non-degenerate, 0 otherwise.

Example:

```

LIB "hnoether.lib";
ring r=0,(x,y),ls;
poly f=x5+y3;
is_NND(f);
↳ 1
poly g=(x-y)^5+3xy5+y6-y7;
is_NND(g);
↳ 0
// if already computed, one should give the Minor number and Newton polygon
// as second and third input:
int mu=milnor(g);
list NP=newtonpoly(g);
is_NND(g,mu,NP);
↳ 0

```

See also: [Section D.6.11.13 \[newtonpoly\]](#), page 1322.

D.6.11.15 stripHNE

Procedure from library `hnoether.lib` (see [Section D.6.11 \[hnoether.lib\]](#), page 1309).

Usage: stripHNE(L); L list

Assume: L is the output of `develop(f)`, or of `extdevelop(develop(f),n)`, or (one entry of) the list `hne` in the ring created by `hnexpansion(f, "ess")`.

Return: list in the same format as L, but all polynomials `L[4]`, resp. `L[i][4]`, are set to zero.

Note: The purpose of this procedure is to remove huge amounts of data no longer needed. It is useful, if one or more of the polynomials in L consume much memory. It is still possible to compute invariants, parametrizations etc. with the stripped HNE(s), but it is not possible to use `extdevelop` with them.

Example:

```

LIB "hnoether.lib";
ring r=0,(x,y),dp;
list Hne=develop(x2+y3+y4);
Hne;
↳ [1]:
↳  _[1,1]=0
↳  _[1,2]=x
↳  _[2,1]=0
↳  _[2,2]=-1
↳ [2]:
↳  1,-1
↳ [3]:
↳  1
↳ [4]:
↳  x4-2x2y+y2+y
↳ [5]:
↳  1
stripHNE(Hne);
↳ [1]:
↳  _[1,1]=0
↳  _[1,2]=x
↳  _[2,1]=0

```

```

↳   _[2,2]==-1
↳ [2]:
↳   1,-1
↳ [3]:
↳   1
↳ [4]:
↳   0
↳ [5]:
↳   1

```

See also: [Section D.6.11.2 \[develop\]](#), page 1312; [Section D.6.11.3 \[extdevelop\]](#), page 1313; [Section D.6.11.1 \[hnexpansion\]](#), page 1310.

D.6.11.16 puiseux2generators

Procedure from library `hnoether.lib` (see [Section D.6.11 \[hnoether.lib\]](#), page 1309).

Usage: `puiseux2generators(m,n)`; `m,n` intvec

Assume: `m`, resp. `n`, represent the 1st, resp. 2nd, components of Puiseux pairs (e.g., `m=invariants(L)[3]`, `n=invariants(L)[4]`).

Return: intvec of the generators of the semigroup of values.

Example:

```

LIB "hnoether.lib";
// take (3,2),(7,2),(15,2),(31,2),(63,2),(127,2) as Puiseux pairs:
puiseux2generators(intvec(3,7,15,31,63,127),intvec(2,2,2,2,2,2));
↳ 64,96,208,424,852,1706,3413

```

See also: [Section D.6.11.6 \[invariants\]](#), page 1317.

D.6.11.17 separateHNE

Procedure from library `hnoether.lib` (see [Section D.6.11 \[hnoether.lib\]](#), page 1309).

Usage: `separateHNE(hne1,hne2)`; `hne1, hne2` lists

Assume: `hne1, hne2` are HNEs (=output of `develop(f)`, `extdevelop(develop(f),n)`, or one entry in the list `hne` in the ring created by `hnexpansion(f[,"ess"])`).

Return: number of quadratic transformations needed to separate both curves (branches).

Example:

```

LIB "hnoether.lib";
int p=printlevel; printlevel=-1;
ring r=0,(x,y),dp;
list hne1=develop(x);
list hne2=develop(x+y);
list hne3=develop(x+y^2);
separateHNE(hne1,hne2); // two transversal lines
↳ 1
separateHNE(hne1,hne3); // one quadratic transform. gives 1st example
↳ 2
printlevel=p;

```

See also: [Section D.6.11.2 \[develop\]](#), page 1312; [Section D.6.11.9 \[displayMultsequence\]](#), page 1320; [Section D.6.11.1 \[hnexpansion\]](#), page 1310; [Section D.6.11.8 \[multsequence\]](#), page 1318.

D.6.11.18 squarefree

Procedure from library `hnoether.lib` (see [Section D.6.11 \[hnoether.lib\], page 1309](#)).

Usage: `squarefree(f); f poly`

Assume: `f` is a bivariate polynomial (in the first 2 ring variables).

Return: `poly`, a squarefree divisor of `f`.

Note: Usually, the return value is the greatest squarefree divisor, but there is one exception: factors with a p -th root, p the characteristic of the basering, are lost.

Example:

```
LIB "hnoether.lib";
ring exring=3,(x,y),dp;
squarefree((x3+y)^2);
↳ x3+y
squarefree((x+y)^3*(x-y)^2); // Warning: (x+y)^3 is lost
↳ x-y
squarefree((x+y)^4*(x-y)^2); // result is (x+y)*(x-y)
↳ x2-y2
```

See also: [Section D.6.11.19 \[allsquarefree\], page 1325](#).

D.6.11.19 allsquarefree

Procedure from library `hnoether.lib` (see [Section D.6.11 \[hnoether.lib\], page 1309](#)).

Usage : `allsquarefree(f,g); f,g poly`

Assume: `g` is the output of `squarefree(f)`.

Return: the greatest squarefree divisor of `f`.

Note : This proc uses `factorize` to get the missing factors of `f` not in `g` and, therefore, may be slow.

Example:

```
LIB "hnoether.lib";
ring exring=7,(x,y),dp;
poly f=(x+y)^7*(x-y)^8;
poly g=squarefree(f);
g; // factor x+y lost, since characteristic=7
↳ x-y
allsquarefree(f,g); // all factors (x+y)*(x-y) found
↳ x2-y2
```

See also: [Section D.6.11.18 \[squarefree\], page 1325](#).

D.6.11.20 further_hn_proc

Procedure from library `hnoether.lib` (see [Section D.6.11 \[hnoether.lib\], page 1309](#)).

Usage: `further_hn_proc();`

Note: The library `hnoether.lib` contains some more procedures which are not shown when typing `help hnoether.lib`;. They may be useful for interactive use (e.g. if you want to do the calculation of an HN development "by hand" to see the intermediate results), and they can be enumerated by calling `further_hn_proc()`.

Use `help <procedure>`; for detailed information about each of them.

Example:

```
LIB "hnoether.lib";
further_hn_proc();
⇒
⇒ The following procedures are also part of 'hnoether.lib':
⇒
⇒ getnm(f);           intersection pts. of Newton polygon with axes
⇒ T_Transform(f,Q,N); returns f(y,xy^Q)/y^NQ (f: poly, Q,N: int)
⇒ T1_Transform(f,d,M); returns f(x,y+d*x^M) (f: poly,d:number,M:int)
⇒ T2_Transform(f,d,M,N,ref); a composition of T1 & T
⇒ koeff(f,I,J);      gets coefficient of indicated monomial of polynomial\
  f
⇒ redleit(f,S,E);    restriction of monomials of f to line (S-E)
⇒ leit(f,n,m);       special case of redleit (for irred. polynomials)
⇒ testreducible(f,n,m); tests whether f is reducible
⇒ charPoly(f,M,N);   characteristic polynomial of f
⇒ find_in_list(L,p); find int p in list L
⇒ get_last_divisor(M,N); last divisor in Euclid's algorithm
⇒ factorfirst(f,M,N); try to factor f without 'factorize'
⇒ factorlist(L);     factorize a list L of polynomials
⇒ referencepoly(D);  a polynomial f s.t. D is the Newton diagram of f
```

D.6.12 kskernel_lib**Library:** kskernel.lib**Purpose:** procedures for computing the kernel of the kodaira-spencer map**Author:** Tetyana Povalyaeva, povalyae@mathematik.uni-kl.de**Procedures:****D.6.12.1 KSkker**Procedure from library kskernel.lib (see [Section D.6.12 \[kskernel_lib\]](#), page 1326).**Usage:** KSkker(int p,q); p,q relatively prime integers**Return:** nothing; exports ring KSring, matrix KSkkernel and list 'weights'; KSkkernel is a matrix of coefficients of the generators of the kernel of Kodaira-Spencer map, 'weights' is a list of degrees for variables T**Example:**

```
LIB "kskernel.lib";
int p=6;
int q=7;
KSkker(p,q);
setring Kskkernel::KSring;
print(KSkkernel);
⇒ 0,      0,      0,      0,      0,      2*T(1),
⇒ 0,      0,      0,      0,      0,      3*T(2),
⇒ 0,      0,      0,      0,      0,      4*T(3),
⇒ 0,      0,      0,      2*T(1),  3*T(2),  9*T(4),
⇒ 0,      0,      0,      3*T(2),  KSkkernel[5,5],10*T(5),
⇒ 2*T(1),3*T(2),KSkkernel[6,3],KSkkernel[6,4],KSkkernel[6,5],16*T(6)
```

D.6.12.2 KSconvert

Procedure from library `kskernel.lib` (see [Section D.6.12 \[kskernel.lib\], page 1326](#)).

- Usage:** `KSconvert(matrix M);`
`M` is a matrix of coefficients of the generators of the kernel of Kodaira-Spencer map in variables `T(i)` from the basering. To be called after the procedure `KSkker(p,q)`
- Return:** nothing; exports ring `KSring2` and matrix `KSKernel2` within it, such that `KSring2` resp. `KSKernel2` are in variables `T(w)` with weights `-w`. These weights are computed in the procedure `KSkker(p,q)`

Example:

```
LIB "kskernel.lib";
int p=6;
int q=7;
KSkker(p,q);
setring Kskernel::KSring;
KSconvert(KSKernel);
⇒ // ** 'KSring2' is already global
setring Kskernel::KSring2;
print(KSKernel2);
⇒ 0,      0,      0,      0,      0,      2*T(2),
⇒ 0,      0,      0,      0,      0,      3*T(3),
⇒ 0,      0,      0,      0,      0,      4*T(4),
⇒ 0,      0,      0,      2*T(2),  3*T(3),  9*T(9),
⇒ 0,      0,      0,      3*T(3),  KSKernel2[5,5], 10*T(10),
⇒ 2*T(2), 3*T(3), KSKernel2[6,3], KSKernel2[6,4], KSKernel2[6,5], 16*T(16)
```

D.6.12.3 KSlinear

Procedure from library `kskernel.lib` (see [Section D.6.12 \[kskernel.lib\], page 1326](#)).

- Usage:** `KSlinear(matrix M);`
computes matrix of linear terms of the kernel of the Kodaira-Spencer map. To be called after the procedure `KSkker(p,q)`
- Return:** nothing; but replaces elements of the matrix `KSKernel` in the ring `Ksring` with their leading monomials w.r.t. the local ordering `(ls)`

Example:

```
LIB "kskernel.lib";
int p=6;
int q=7;
KSkker(p,q);
setring Kskernel::KSring;
KSlinear(KSKernel);
print(KSKernel);
⇒ 0,      0,      0,      0,      0,      2*T(1),
⇒ 0,      0,      0,      0,      0,      3*T(2),
```

```

↳ 0,      0,      0,      0,      0,      4*T(3),
↳ 0,      0,      0,      2*T(1),3*T(2), 9*T(4),
↳ 0,      0,      0,      3*T(2),4*T(3), 10*T(5),
↳ 2*T(1),3*T(2),4*T(3),9*T(4),10*T(5),16*T(6)

```

D.6.12.4 KScoef

Procedure from library `kskernel.lib` (see [Section D.6.12 \[kskernel.lib\], page 1326](#)).

Return: exports ring `RC` and number `C` within it. `C` is the coefficient of the word defined in the list `qq`, being a part of $C[i,j]$ for x^p+y^q

Example:

```

LIB "kskernel.lib";
int p=5; int q=14;
int i=2; int j=9;
list L;
ring r=0,x,dp;
number c;
L[1]=3; L[2]=1; L[3]=3; L[4]=2;
KScoef(i,j,p,q,L);
c=imap(RC,C);
c;
↳ 27/8575
L[1]=3; L[2]=1; L[3]=2; L[4]=3;
KScoef(i,j,p,q,L);
↳ // ** redefining S ( export S;)
↳ // ** redefining u ( export u;)
↳ // ** redefining l ( export l;)
↳ // ** redefining RC ( export RC;exportto(Top,RC);)
c=c+imap(RC,C);
c; // it is a coefficient of T1*T2*T3^2 in C[2,9] for x^5+y^14
↳ 99/8575

```

D.6.12.5 StringF

Procedure from library `kskernel.lib` (see [Section D.6.12 \[kskernel.lib\], page 1326](#)).

Usage: `StringF(int i,j,p,q);`

Return: nothing; exports string `F` which contains an expression in variables $T(i)$ with non-resolved brackets

Example:

```

LIB "kskernel.lib";
int p=5; int q=14;
int i=2; int j=9;
StringF(i,j,p,q);
F;
↳ T(7)+T(3)*(T(4)*(T(1))+T(1)*(T(4)+T(3)*(T(2))+T(2)*(T(3)+T(1)*(T(1))))))

```

D.6.13 mondromy_lib

Library: `mondromy.lib`

Purpose: Monodromy of an Isolated Hypersurface Singularity

Author: Mathias Schulze, email: mschulze@mathematik.uni-kl.de

Overview: A library to compute the monodromy of an isolated hypersurface singularity. It uses an algorithm by Brieskorn (manuscripta math. 2 (1970), 103-161) to compute a connection matrix of the meromorphic Gauss-Manin connection up to arbitrarily high order, and an algorithm of Gerard and Levelt (Ann. Inst. Fourier, Grenoble 23,1 (1973), pp. 157-195) to transform it to a simple pole.

Procedures: See also: [Section D.6.10 \[gmspoly_lib\], page 1308](#); [Section D.6.9 \[gmssing_lib\], page 1293](#).

D.6.13.1 detadj

Procedure from library `mondromy.lib` (see [Section D.6.13 \[mondromy_lib\], page 1328](#)).

Usage: `detadj(U)`; U matrix

Assume: U is a square matrix with non zero determinant.

Return: The procedure returns a list with at most 2 entries.

If U is not a square matrix, the list is empty.

If U is a square matrix, then the first entry is the determinant of U. If U is a square matrix and the determinant of U not zero, then the second entry is the adjoint matrix of U.

Display: The procedure displays comments if `printlevel` \geq 1.

Example:

```
LIB "mondromy.lib";
ring R=0,x,dp;
matrix U[2][2]=1,1+x,1+x2,1+x3;
list daU=detadj(U);
daU[1];
 $\mapsto$  -x2-x
print(daU[2]);
 $\mapsto$  x3+1, -x-1,
 $\mapsto$  -x2-1,1
```

D.6.13.2 invunit

Procedure from library `mondromy.lib` (see [Section D.6.13 \[mondromy_lib\], page 1328](#)).

Usage: `invunit(u,n)`; u poly, n int

Assume: The polynomial u is a series unit.

Return: The procedure returns the series inverse of u up to order n or a zero polynomial if u is no series unit.

Display: The procedure displays comments if `printlevel` \geq 1.

Example:

```
LIB "mondromy.lib";
ring R=0,(x,y),dp;
invunit(2+x3+xy4,10);
 $\mapsto$  1/8x2y8-1/16x9+1/4x4y4+1/8x6-1/4xy4-1/4x3+1/2
```

D.6.13.3 jacoblift

Procedure from library `mondromy.lib` (see [Section D.6.13 \[mondromy.lib\], page 1328](#)).

Usage: `jacoblift(f); f poly`

Assume: The polynomial f in a series ring (local ordering) defines an isolated hypersurface singularity.

Return: The procedure returns a list with entries κ , ξ , u of type `int`, `vector`, `poly` such that κ is minimal with f^κ in $\text{jacob}(f)$, u is a unit, and $u \cdot f^\kappa = (\text{matrix}(\text{jacob}(f)) \cdot \xi)[1,1]$.

Display: The procedure displays comments if `printlevel` ≥ 1 .

Example:

```
LIB "mondromy.lib";
ring R=0,(x,y),ds;
poly f=x2y2+x6+y6;
jacoblift(f);
↳ [1]:
↳ 2
↳ [2]:
↳ 1/2x2y3*gen(2)+1/6x7*gen(1)+5/6x6y*gen(2)-2/3xy6*gen(1)+1/6y7*gen(2)-4\
x4y5*gen(2)-3/2x9y2*gen(1)-15/2x8y3*gen(2)+9/2x3y8*gen(1)-3/2x2y9*gen(2)
↳ [3]:
↳ 1-9x2y2
```

D.6.13.4 monodromyB

Procedure from library `mondromy.lib` (see [Section D.6.13 \[mondromy.lib\], page 1328](#)).

Usage: `monodromyB(f[,opt]); f poly, opt int`

Assume: The polynomial f in a series ring (local ordering) defines an isolated hypersurface singularity.

Return: The procedure returns a residue matrix M of the meromorphic Gauss-Manin connection of the singularity defined by f or an empty matrix if the assumptions are not fulfilled. If `opt=0` (default), $\exp(-2\pi i M)$ is a monodromy matrix of f , else, only the characteristic polynomial of $\exp(-2\pi i M)$ coincides with the characteristic polynomial of the monodromy of f .

Display: The procedure displays more comments for higher `printlevel`.

Example:

```
LIB "mondromy.lib";
ring R=0,(x,y),ds;
poly f=x2y2+x6+y6;
matrix M=monodromyB(f);
print(M);
↳ 7/6,0, 0,0, 0, 0,0, 0,-1/2,0, 0, 0, 0,
↳ 0, 7/6,0,0, 0, 0,-1/2,0,0, 0, 0, 0, 0,
↳ 0, 0, 1,0, 0, 0,0, 0,0, 0, 0, 0, 0,
↳ 0, 0, 0,4/3,0, 0,0, 0,0, 0, 0, 0, 0,
↳ 0, 0, 0,0, 4/3,0,0, 0,0, 0, 0, 0, 0,
↳ 0, 0, 0,0, 0, 1,0, 0,0, 0, 0, 0, 0,
```

```

↳ 0, 0, 0,0, 0, 0,5/6, 0,0, 0, 0, 0, 0,
↳ 0, 0, 0,0, 0, 0,0, 1,0, 0, 0, 0, 0,
↳ 0, 0, 0,0, 0, 0,0, 0,5/6, 0, 0, 0, 0,
↳ 0, 0, 0,0, 0, 0,0, 0,0, 2/3,0, 0, 0,
↳ 0, 0, 0,0, 0, 0,0, 0,0, 0, 2/3,0, 0,
↳ 0, 0, 0,0, 0, 0,0, 0,0, 0, 0, 1, -1/3,
↳ 0, 0, 0,0, 0, 0,0, 0,0, 0, 0, 3/4,0

```

D.6.13.5 H2basis

Procedure from library `mondromy.lib` (see [Section D.6.13 \[mondromy.lib\]](#), page 1328).

Usage: H2basis(f); f poly

Assume: The polynomial f in a series ring (local ordering) defines an isolated hypersurface singularity.

Return: The procedure returns a list of representatives of a $C\{f}$ -basis of the Brieskorn lattice $H'' = \Omega^{(n+1)}/df \wedge d\Omega^{(n-1)}$.

Theory: H'' is a free $C\{f}$ -module of rank $\text{milnor}(f)$.

Display: The procedure displays more comments for higher `printlevel`.

Example:

```

LIB "mondromy.lib";
ring R=0,(x,y),ds;
poly f=x2y2+x6+y6;
H2basis(f);
↳ [1]:
↳ x4
↳ [2]:
↳ x2y2
↳ [3]:
↳ y4
↳ [4]:
↳ x3
↳ [5]:
↳ x2y
↳ [6]:
↳ xy2
↳ [7]:
↳ y3
↳ [8]:
↳ x2
↳ [9]:
↳ xy
↳ [10]:
↳ y2
↳ [11]:
↳ x
↳ [12]:
↳ y
↳ [13]:
↳ 1

```

D.6.14 qhmoduli.lib

Library: qhmoduli.lib

Purpose: Moduli Spaces of Semi-Quasihomogeneous Singularities

Author: Thomas Bayer, email: bayert@in.tum.de

Procedures:

D.6.14.1 ArnoldAction

Procedure from library `qhmoduli.lib` (see [Section D.6.14 \[qhmoduli.lib\], page 1332](#)).

Usage: `ArnoldAction(f, [Gf, B]);` poly `f`; list `Gf, B`;
'`Gf`' is a list of two rings (coming from '`StabEqn`')

Purpose: compute the induced action of the stabilizer `G` of `f` on `T_`, where `T_` is given by the upper monomials `B` of the Milnor algebra of `f`.

Assume: `f` is quasihomogeneous

Return: polynomial ring over the same ground field, containing the ideals '`actionid`' and '`stabid`'.

- '`actionid`' is the ideal defining the induced action of `Gf` on `T_`

- '`stabid`' is the ideal of the stabilizer `Gf` in the new ring

Example:

```
LIB "qhmoduli.lib";
ring B = 0, (x,y,z), ls;
poly f = -z5+y5+x2z+x2y;
def R = ArnoldAction(f);
setring R;
actionid;
↪ actionid[1]=-s(2)*t(1)+s(3)*t(1)
↪ actionid[2]=-s(2)^2*t(2)+2*s(2)^2*t(3)^2+s(3)^2*t(2)
↪ actionid[3]=s(2)*t(3)+s(3)*t(3)
stabid;
↪ stabid[1]=s(2)*s(3)
↪ stabid[2]=s(1)^2*s(2)+s(1)^2*s(3)-1
↪ stabid[3]=s(1)^2*s(3)^2-s(3)
↪ stabid[4]=s(1)^2+s(2)^4-s(3)^4
↪ stabid[5]=s(1)^4+s(2)^3-s(3)^3
↪ stabid[6]=-s(1)^2*s(3)+s(3)^5
```

D.6.14.2 ModEqn

Procedure from library `qhmoduli.lib` (see [Section D.6.14 \[qhmoduli.lib\], page 1332](#)).

Usage: `ModEqn(f [, opt]);` poly `f`; int `opt`;

Purpose: compute equations of the moduli space of semiquasihomogenous hypersurface singularity with principal part `f` w.r.t. right equivalence

Assume: `f` quasihomogeneous polynomial with an isolated singularity at 0

Return: polynomial ring, possibly a simple extension of the ground field of the basering, containing the ideal '`modid`'

- 'modid' is the ideal of the moduli space if opt is even (> 0). otherwise it contains generators of the coordinate ring R of the moduli space (note : $\text{Spec}(R)$ is the moduli space)

Options: 1 compute equations of the mod. space,
2 use a primary decomposition,
4 compute E_{f0} , i.e., the image of G_{f0} ,
to combine options, add their value, default: opt =7

Example:

```
LIB "qhmoduli.lib";
ring B = 0,(x,y), ls;
poly f = -x4 + xy5;
def R = ModEqn(f);
setring R;
modid;
↳ modid[1]=Y(5)^2-Y(4)*Y(6)
↳ modid[2]=Y(4)*Y(5)-Y(3)*Y(6)
↳ modid[3]=Y(3)*Y(5)-Y(2)*Y(6)
↳ modid[4]=Y(2)*Y(5)-Y(1)*Y(6)
↳ modid[5]=Y(4)^2-Y(3)*Y(5)
↳ modid[6]=Y(3)*Y(4)-Y(2)*Y(5)
↳ modid[7]=Y(2)*Y(4)-Y(1)*Y(5)
↳ modid[8]=Y(3)^2-Y(2)*Y(4)
↳ modid[9]=Y(2)*Y(3)-Y(1)*Y(4)
↳ modid[10]=Y(2)^2-Y(1)*Y(3)
```

D.6.14.3 QuotientEquations

Procedure from library `qhmoduli.lib` (see [Section D.6.14 \[qhmoduli.lib\]](#), page 1332).

Usage: QuotientEquations(G,action,emb [, opt]); ideal G,action,emb;int opt

Purpose: compute the quotient of the variety given by the parameterization 'emb' by the linear action 'action' of the algebraic group G.

Assume: 'action' is linear, G must be finite if the Reynolds operator is needed (i.e., `NullCone(G,action)` returns some non-invariant polys)

Return: polynomial ring over a simple extension of the ground field of the basering, containing the ideals 'id' and 'embedid'.
- 'id' contains the equations of the quotient, if opt = 1; if opt = 0, 2, 'id' contains generators of the coordinate ring R of the quotient ($\text{Spec}(R)$ is the quotient)
- 'embedid' = 0, if opt = 1;
if opt = 0, 2, it is the ideal defining the equivariant embedding

Options: 1 compute equations of the quotient,
2 use a primary decomposition when computing the Reynolds operator,
to combine options, add their value, default: opt =3.

D.6.14.4 StabEqn

Procedure from library `qhmoduli.lib` (see [Section D.6.14 \[qhmoduli.lib\]](#), page 1332).

Usage: StabEqn(f); f polynomial

Purpose: compute the equations of the isometry group of f.

Assume: f semiquasihomogeneous polynomial with an isolated singularity at 0

Return: list of two rings 'S1', 'S2'
 - 'S1' contains the equations of the stabilizer (ideal 'stabid')
 - 'S2' contains the action of the stabilizer (ideal 'actionid')

Global: varSubsList, contains the index j s.t. $x(i) \rightarrow x(i)t(j) \dots$

Example:

```
LIB "qhmoduli.lib";
ring B = 0,(x,y,z), ls;
poly f = -z5+y5+x2z+x2y;
list stab = StabEqn(f);
def S1 = stab[1]; setring S1; stabid;
  ↪ stabid[1]=s(2)*s(3)
  ↪ stabid[2]=s(1)^2*s(2)+s(1)^2*s(3)-1
  ↪ stabid[3]=s(1)^2*s(3)^2-s(3)
  ↪ stabid[4]=s(2)^4-s(3)^4+s(1)^2
  ↪ stabid[5]=s(1)^4+s(2)^3-s(3)^3
  ↪ stabid[6]=s(3)^5-s(1)^2*s(3)
def S2 = stab[2]; setring S2; actionid;
  ↪ actionid[1]=s(1)*x
  ↪ actionid[2]=s(3)*y+s(2)*z
  ↪ actionid[3]=s(2)*y+s(3)*z
```

D.6.14.5 StabEqnId

Procedure from library `qhmoduli.lib` (see [Section D.6.14 \[qhmoduli.lib\]](#), page 1332).

Usage: `StabEqn(I, w)`; I ideal, w intvec

Purpose: compute the equations of the isometry group of the ideal I , each generator of I is fixed by the stabilizer.

Assume: I semiquasihomogeneous ideal w.r.t. 'w' with an isolated singularity at 0

Return: list of two rings 'S1', 'S2'
 - 'S1' contains the equations of the stabilizer (ideal 'stabid')
 - 'S2' contains the action of the stabilizer (ideal 'actionid')

Global: varSubsList, contains the index j s.t. $t(i) \rightarrow t(i)t(j) \dots$

Example:

```
LIB "qhmoduli.lib";
ring B = 0,(x,y,z), ls;
ideal I = x2,y3,z6;
intvec w = 3,2,1;
list stab = StabEqnId(I, w);
def S1 = stab[1]; setring S1; stabid;
  ↪ stabid[1]=s(1)^2-1
  ↪ stabid[2]=s(2)^3-1
  ↪ stabid[3]=s(3)^6-1
def S2 = stab[2]; setring S2; actionid;
  ↪ actionid[1]=s(1)*x
  ↪ actionid[2]=s(2)*y
  ↪ actionid[3]=s(3)*z
```

D.6.14.6 StabOrder

Procedure from library `qhmoduli.lib` (see [Section D.6.14 \[qhmoduli.lib\], page 1332](#)).

Usage: `StabOrder(f); poly f`

Purpose: compute the order of the stabilizer group of f .

Assume: f quasihomogeneous polynomial with an isolated singularity at 0

Return: `int`

Global: `varSubsList`

D.6.14.7 UpperMonomials

Procedure from library `qhmoduli.lib` (see [Section D.6.14 \[qhmoduli.lib\], page 1332](#)).

Usage: `UpperMonomials(poly f, [intvec w])`

Purpose: compute the upper monomials of the milnor algebra of f .

Assume: f is quasihomogeneous (w.r.t. w)

Return: `ideal`

Example:

```
LIB "qhmoduli.lib";
ring B = 0, (x,y,z), ls;
poly f = -z5+y5+x2z+x2y;
UpperMonomials(f);
↪ _[1]=y3z3
↪ _[2]=x2y3
↪ _[3]=x2y2
```

D.6.14.8 Max

Procedure from library `qhmoduli.lib` (see [Section D.6.14 \[qhmoduli.lib\], page 1332](#)).

Usage: `Max(data); intvec/list of integers`

Purpose: find the maximal integer contained in 'data'

Return: `list`

Assume: 'data' contains only integers and is not empty

Example:

```
LIB "qhmoduli.lib";
Max(list(1,2,3));
↪ 3
```

D.6.14.9 Min

Procedure from library `qhmoduli.lib` (see [Section D.6.14 \[qhmoduli.lib\], page 1332](#)).

Usage: `Min(data); intvec/list of integers`

Purpose: find the minimal integer contained in 'data'

Return: `list`

Assume: 'data' contains only integers and is not empty

Example:

```
LIB "qhmoduli.lib";
Min(intvec(1,2,3));
↳ 1
```

D.6.15 sing_lib

Library: sing.lib

Purpose: Invariants of Singularities

Authors: Gert-Martin Greuel, email: greuel@mathematik.uni-kl.de
Bernd Martin, email: martin@math.tu-cottbus.de

Procedures:

D.6.15.1 codim

Procedure from library `sing.lib` (see [Section D.6.15 \[sing_lib\], page 1336](#)).

Usage: `codim(id1,id2)`; `id1,id2` ideal or module, both must be standard bases

Return: int, which is:

1. the vectorspace dimension of `id1/id2` if `id2` is contained in `id1` and if this number is finite
2. -1 if the dimension of `id1/id2` is infinite
3. -2 if `id2` is not contained in `id1`

Compute: consider the Hilbert series $iv_1(t)$ of `id1` and $iv_2(t)$ of `id2`. If $\text{codim}(id_1, id_2)$ is finite, $q(t) = (iv_2(t) - iv_1(t)) / (1-t)^n$ is rational, and the codimension is the sum of the coefficients of $q(t)$ ($n = \text{dimension of basering}$).

Example:

```
LIB "sing.lib";
ring r = 0, (x,y), dp;
ideal j = y6, x4;
ideal m = x, y;
attrib(m, "isSB", 1); //let Singular know that ideals are a standard basis
attrib(j, "isSB", 1);
codim(m, j); // should be 23 (Milnor number -1 of y7-x5)
↳ 23
```

D.6.15.2 deform

Procedure from library `sing.lib` (see [Section D.6.15 \[sing_lib\], page 1336](#)).

Usage: `deform(id)`; `id`=ideal or poly

Return: matrix, columns are kbase of infinitesimal deformations

Example:

```
LIB "sing.lib";
ring r = 32003, (x,y,z), ds;
ideal i = xy, xz, yz;
matrix T = deform(i);
```

```

print(T);
↳ x,0,0,
↳ 0,0,z,
↳ 0,y,0
print(deform(x3+y5+z2));
↳ xy3,y3,xy2,y2,xy,y,x,1

```

D.6.15.3 dim_slocus

Procedure from library `sing.lib` (see [Section D.6.15 \[sing.lib\], page 1336](#)).

Usage: `dim_slocus(i)`; i ideal or poly

Return: dimension of singular locus of i

Example:

```

LIB "sing.lib";
ring r = 32003, (x,y,z), ds;
ideal i = x5+y6+z6, x2+2y2+3z2;
dim_slocus(i);
↳ 0

```

D.6.15.4 is_active

Procedure from library `sing.lib` (see [Section D.6.15 \[sing.lib\], page 1336](#)).

Usage: `is_active(f,id)`; f poly, id ideal or module

Return: 1 if f is an active element modulo id (i.e. $\dim(id) = \dim(id + f \cdot R^n) + 1$, if id is a submodule of R^n) resp. 0 if f is not active. The basering may be a quotient ring

Note: regular parameters are active but not vice versa (id may have embedded components). `proc is_reg` tests whether f is a regular parameter

Example:

```

LIB "sing.lib";
ring r = 32003, (x,y,z), ds;
ideal i = yx3+y, yz3+y3z;
poly f = x;
is_active(f,i);
↳ 1
qring q = std(x4y5);
poly f = x;
module m = [yx3+x, yx3+y3x];
is_active(f,m);
↳ 0

```

D.6.15.5 is_ci

Procedure from library `sing.lib` (see [Section D.6.15 \[sing.lib\], page 1336](#)).

Usage: `is_ci(i)`; i ideal

Return: `intvec` = sequence of dimensions of ideals $(j[1], \dots, j[k])$, for $k=1, \dots, \text{size}(j)$, where j is minimal base of i . i is a complete intersection if last number equals $\text{nvars} - \text{size}(i)$

Note: $\dim(0\text{-ideal}) = -1$. You may first apply `simplify(i,10)`; in order to delete zeroes and multiples from set of generators
`printlevel >=0`: display comments (default)

Example:

```
LIB "sing.lib";
int p      = printlevel;
printlevel = 1;           // display comments
ring r     = 32003,(x,y,z),ds;
ideal i    = x4+y5+z6,xyz,yx2+xz2+zy7;
is_ci(i);
⇒ // complete intersection of dim 0
⇒ // dim-sequence:
⇒ 2,1,0
i         = xy,yz;
is_ci(i);
⇒ // no complete intersection
⇒ // dim-sequence:
⇒ 2,2
printlevel = p;
```

D.6.15.6 is_is

Procedure from library `sing.lib` (see [Section D.6.15 \[sing_lib\], page 1336](#)).

Usage: `is_is(id)`; id ideal or poly

Return: `intvec` = sequence of dimensions of singular loci of ideals generated by `id[1]..id[i]`, $k = 1..size(id)$;
 $\dim(0\text{-ideal}) = -1$;
id defines an isolated singularity if last number is 0

Note: `printlevel >=0`: display comments (default)

Example:

```
LIB "sing.lib";
int p      = printlevel;
printlevel = 1;
ring r     = 32003,(x,y,z),ds;
ideal i    = x2y,x4+y5+z6,yx2+xz2+zy7;
is_is(i);
⇒ // dim of singular locus = 0
⇒ // isolated singularity if last number is 0 in dim-sequence:
⇒ 2,1,0
poly f     = xy+yz;
is_is(f);
⇒ // dim of singular locus = 1
⇒ // isolated singularity if last number is 0 in dim-sequence:
⇒ 1
printlevel = p;
```

D.6.15.7 is_reg

Procedure from library `sing.lib` (see [Section D.6.15 \[sing_lib\], page 1336](#)).

Usage: `is_reg(f,id)`; f poly, id ideal or module

Return: 1 if multiplication with f is injective modulo id , 0 otherwise

Note: Let R be the basering and id a submodule of R^n . The procedure checks injectivity of multiplication with f on R^n/id . The basering may be a quotient ring.

Example:

```
LIB "sing.lib";
ring r = 32003,(x,y),ds;
ideal i = x8,y8;
ideal j = (x+y)^4;
i      = intersect(i,j);
poly f = xy;
is_reg(f,i);
↳ 0
```

D.6.15.8 is_regs

Procedure from library `sing.lib` (see [Section D.6.15 \[sing_lib\], page 1336](#)).

Usage: `is_regs(i[,id]);` i poly, id ideal or module (default: $\text{id}=0$)

Return: 1 if generators of i are a regular sequence modulo id , 0 otherwise

Note: Let R be the basering and id a submodule of R^n . The procedure checks injectivity of multiplication with $i[k]$ on $R^n/\text{id}+i[1..k-1]$. The basering may be a quotient ring.
`printlevel >=0`: display comments (default)
`printlevel >=1`: display comments during computation

Example:

```
LIB "sing.lib";
int p = printlevel;
printlevel = 1;
ring r1 = 32003,(x,y,z),ds;
ideal i = x8,y8,(x+y)^4;
is_regs(i);
↳ // checking whether element 1 is regular mod 1 .. 0
↳ // checking whether element 2 is regular mod 1 .. 1
↳ // checking whether element 3 is regular mod 1 .. 2
↳ // elements 1..2 are regular, 3 is not regular mod 1..2
↳ 0
module m = [x,0,y];
i = x8,(x+z)^4;;
is_regs(i,m);
↳ // checking whether element 1 is regular mod 1 .. 0
↳ // checking whether element 2 is regular mod 1 .. 1
↳ // elements are a regular sequence of length 2
↳ 1
printlevel = p;
```

D.6.15.9 locstd

Procedure from library `sing.lib` (see [Section D.6.15 \[sing_lib\], page 1336](#)).

Usage: `locstd (id);` id = ideal

Return: a standard basis for a local degree ordering

Note: the procedure homogenizes id w.r.t. a new 1st variable $@t@$, computes a SB w.r.t. $(dp(1), dp)$ and substitutes $@t@$ by 1.
Hence the result is a SB with respect to an ordering which sorts first w.r.t. the order and then refines it with dp . This is a local degree ordering.
This is done in order to avoid cancellation of units and thus be able to use `option(contentSB)`;

Example:

```
LIB "sing.lib";
ring R = 0, (x,y,z), ds;
ideal i = xyz+z5, 2x2+y3+z7, 3z5+y5;
locstd(i);
↳ _[1]=y5+3z5
↳ _[2]=3x4y3z8-4x3y3z9+6x2y4z9+3y5z10
↳ _[3]=3x4z13-4x3z14+6x2yz14+3y2z15
↳ _[4]=3x4yz12-4x3yz13+6x2y2z13+3y3z14
↳ _[5]=2x2z9+x2y2z8+y3z9
↳ _[6]=2x2y4z5+y7z5-3x2yz9
↳ _[7]=6y2z10-3x2y3z8+4xy3z9-3y4z9
↳ _[8]=3x2y2z8+3y3z9+2xy4z8
↳ _[9]=18z14-4xy6z8+3y7z8-9x2yz12
↳ _[10]=xyz+z5
↳ _[11]=3xz6-y4z5
↳ _[12]=3y3z6+2xy4z5-3xyz9
↳ _[13]=y4z5-2xz9-xy2z8
↳ _[14]=3z10+2xyz9+xy3z8
↳ _[15]=2x2z5+y3z5-xyz8
↳ _[16]=y4z-2xz5+yz8
↳ _[17]=3z6+2xyz5-y2z8
↳ _[18]=2x2+y3+z7
```

D.6.15.10 milnor

Procedure from library `sing.lib` (see [Section D.6.15 \[sing.lib\]](#), page 1336).

Usage: `milnor(i)`; i ideal or poly

Return: Milnor number of i , if i is ICIS (isolated complete intersection singularity) in generic form, resp. -1 if not

Note: use `proc nficis` to put generators in generic form
`printlevel >=1`: display comments

Example:

```
LIB "sing.lib";
int p = printlevel;
printlevel = 2;
ring r = 32003, (x,y,z), ds;
ideal j = x5+y6+z6, x2+2y2+3z2, xyz+yx;
milnor(j);
↳ //sequence of discriminant numbers: 100,149,70
↳ 21
poly f = x7+y7+(x-y)^2*x2y2+z2;
milnor(f);
↳ 28
printlevel = p;
```

D.6.15.11 nf_icis

Procedure from library `sing.lib` (see [Section D.6.15 \[sing_lib\], page 1336](#)).

Usage: `nf_icis(i); i ideal`

Return: `ideal = generic linear combination of generators of i if i is an ICIS (isolated complete intersection singularity), return i if not`

Note: this proc is useful in connection with proc `milnor`
`printlevel >=0: display comments (default)`

Example:

```
LIB "sing.lib";
int p      = printlevel;
printlevel = 1;
ring r      = 32003,(x,y,z),ds;
ideal i     = x3+y4,z4+yx;
nf_icis(i);
↳ // complete intersection of dim 1
↳ // dim-sequence:
↳ // dim of singular locus = 0
↳ // isolated singularity if last number is 0 in dim-sequence:
↳ // dim of singular locus = 0
↳ // isolated singularity if last number is 0 in dim-sequence:
↳ // ICIS in generic form after 1 genericity loop(s)
↳ _[1]=2xy+x3+y4+2z4
↳ _[2]=xy+z4
ideal j     = x3+y4,xy,yz;
nf_icis(j);
↳ // no complete intersection
↳ // dim-sequence:
↳ // no complete intersection
↳ _[1]=x3+y4
↳ _[2]=xy
↳ _[3]=yz
printlevel = p;
```

D.6.15.12 slocus

Procedure from library `sing.lib` (see [Section D.6.15 \[sing_lib\], page 1336](#)).

Usage: `slocus(i); i ideal`

Return: `ideal of singular locus of i. Quotient rings and rings with integer coefficients are currently not supported.`

Example:

```
LIB "sing.lib";
ring r      = 0,(u,v,w,x,y,z),dp;
ideal i     = wx,wy,wz,vx,vy,vz,ux,uy,uz,y3-x2;;
slocus(i);
↳ _[1]=x
↳ _[2]=w
↳ _[3]=v
↳ _[4]=u
↳ _[5]=y2
```

D.6.15.13 qhspectrum

Procedure from library `sing.lib` (see [Section D.6.15 \[sing_lib\], page 1336](#)).

Usage: `qhspectrum(f,w); f=poly, w=intvec`

Assume: `f` is a weighted homogeneous isolated singularity w.r.t. the weights given by `w`; `w` must consist of as many positive integers as there are variables of the basering

Compute: the spectral numbers of the `w`-homogeneous polynomial `f`, computed in a ring of characteristic 0

Return: `intvec d,s1,...,su` where:
`d = w-degree(f)` and `si/d = i-th spectral-number(f)`
 No return value if basering has parameters or if `f` is no isolated singularity, displays a warning in this case.

Example:

```
LIB "sing.lib";
ring r;
poly f=x3+y5+z2;
intvec w=10,6,15;
qhspectrum(f,w);
↪ 30,1,7,11,13,17,19,23,29
// the spectrum numbers are:
// 1/30,7/30,11/30,13/30,17/30,19/30,23/30,29/30
```

D.6.15.14 Tjurina

Procedure from library `sing.lib` (see [Section D.6.15 \[sing_lib\], page 1336](#)).

Usage: `Tjurina(id[,<any>]); id=ideal or poly`

Assume: `id=ICIS` (isolated complete intersection singularity)

Return: standard basis of Tjurina-module of `id`,
 of type `module` if `id=ideal`, resp. of type `ideal` if `id=poly`. If a second argument is present (of any type) return a list:
 [1] = Tjurina number,
 [2] = `k`-basis of miniversal deformation,
 [3] = SB of Tjurina module,
 [4] = Tjurina module

Display: Tjurina number if `printlevel >= 0` (default)

Note: Tjurina number = -1 implies that `id` is not an ICIS

Example:

```
LIB "sing.lib";
int p      = printlevel;
printlevel = 1;
ring r      = 0,(x,y,z),ds;
poly f      = x5+y6+z7+xyz;           // singularity T[5,6,7]
list T      = Tjurina(f,"");
↪ // Tjurina number = 16
show(T[1]);           // Tjurina number, should be 16
↪ // int, size 1
```

```

↳ 16
show(T[2]); // basis of miniversal deformation
↳ // ideal, 16 generator(s)
↳ z6,
↳ z5,
↳ z4,
↳ z3,
↳ z2,
↳ z,
↳ y5,
↳ y4,
↳ y3,
↳ y2,
↳ y,
↳ x4,
↳ x3,
↳ x2,
↳ x,
↳ 1
show(T[3]); // SB of Tjurina ideal
↳ // ideal, 6 generator(s)
↳ xy+7z6,
↳ xz+6y5,
↳ yz+5x4,
↳ 5x5-6y6,
↳ y6,
↳ z7
show(T[4]); ""; // Tjurina ideal
↳ // ideal, 4 generator(s)
↳ yz+5x4,
↳ xz+6y5,
↳ xy+7z6,
↳ xyz+x5+y6+z7
↳
ideal j = x2+y2+z2,x2+2y2+3z2;
show(kbase(Tjurina(j))); // basis of miniversal deformation
↳ // Tjurina number = 5
↳ // module, 5 generator(s)
↳ [z]
↳ [y]
↳ [x]
↳ [1]
↳ [0,1]
hilb(Tjurina(j)); // Hilbert series of Tjurina module
↳ // Tjurina number = 5
↳ // 2 t^0
↳ // -3 t^1
↳ // -3 t^2
↳ // 7 t^3
↳ // -3 t^4
↳
↳ // 2 t^0
↳ // 3 t^1

```

```

↳ // dimension (local)   = 0
↳ // multiplicity = 5
printlevel = p;

```

D.6.15.15 tjurina

Procedure from library `sing.lib` (see [Section D.6.15 \[sing.lib\], page 1336](#)).

Usage: `tjurina(id)`; `id=ideal` or `poly`

Assume: `id=ICIS` (isolated complete intersection singularity)

Return: `int` = Tjurina number of `id`

Note: Tjurina number = -1 implies that `id` is not an ICIS

Example:

```

LIB "sing.lib";
ring r=32003,(x,y,z),(c,ds);
ideal j=x2+y2+z2,x2+2y2+3z2;
tjurina(j);
↳ 5

```

D.6.15.16 T_1

Procedure from library `sing.lib` (see [Section D.6.15 \[sing.lib\], page 1336](#)).

Usage: `T_1(id[,<any>])`; `id = ideal` or `poly`

Return: `T_1(id)`: of type `module/ideal` if `id` is of type `ideal/poly`. We call `T_1(id)` the `T_1`-module of `id`. It is a `std` basis of the presentation of 1st order deformations of `P/id`, if `P` is the basering. If a second argument is present (of any type) return a list of 3 modules:

```

[1]= T_1(id)
[2]= generators of normal bundle of id, lifted to P
[3]= module of relations of [2], lifted to P
(note: transpose[3]*[2]=0 mod id)

```

The list contains all non-easy objects which must be computed to get `T_1(id)`.

Display: `k`-dimension of `T_1(id)` if `printlevel >= 0` (default)

Note: `T_1(id)` itself is usually of minor importance. Nevertheless, from it all relevant information can be obtained. The most important are probably `vdim(T_1(id))`; (which computes the Tjurina number), `hilb(T_1(id))`; and `kbase(T_1(id))`.

If `T_1` is called with two arguments, then `matrix([2])*(kbase([1]))` represents a basis of 1st order semiuniversal deformation of `id` (use `proc 'deform'`, to get this in a direct way).

For a complete intersection the `proc Tjurina` is faster.

Example:

```

LIB "sing.lib";
int p      = printlevel;
printlevel = 1;
ring r      = 32003,(x,y,z),(c,ds);
ideal i     = xy,xz,yz;
module T    = T_1(i);
↳ // dim T_1 = 3

```

```

vdim(T); // Tjurina number = dim_K(T_1), should be 3
↳ 3
list L=T_1(i,"");
↳ // dim T_1 = 3
module kB = kbase(L[1]);
print(L[2]*kB); // basis of 1st order miniversal deformation
↳ 0,0,0,
↳ z,0,0,
↳ 0,y,z
show(L[2]); // presentation of normal bundle
↳ // module, 6 generator(s)
↳ [x]
↳ [y,z]
↳ [0,x,y]
↳ [0,z]
↳ [0,0,y]
↳ [0,0,z]
print(L[3]); // relations of i
↳ z, 0,
↳ -y,y,
↳ 0, -x
print(transpose(L[3])*L[2]); // should be 0 (mod i)
↳ xz,0, -xy,-yz,0, 0,
↳ 0, yz,0, yz, -xy,-xz
printlevel = p;

```

D.6.15.17 T_2

Procedure from library `sing.lib` (see [Section D.6.15 \[sing_lib\]](#), page 1336).

Usage: `T_2(id[,<any>]);` id = ideal

Return: `T_2(id)`: `T_2`-module of id . This is a std basis of a presentation of the module of obstructions of $R=P/id$, if P is the basering. If a second argument is present (of any type) return a list of 4 modules and 1 ideal:

```

[1]= T_2(id)
[2]= standard basis of id (ideal)
[3]= module of relations of id (=1st syzygy module of id)
[4]= presentation of syz/kos
[5]= relations of Hom_P([3]/kos,R), lifted to P

```

The list contains all non-easy objects which must be computed to get `T_2(id)`.

Display: k-dimension of `T_2(id)` if `printlevel >= 0` (default)

Note: The most important information is probably `vdim(T_2(id))`. Use `proc miniversal` to get equations of the miniversal deformation.

Example:

```

LIB "sing.lib";
int p = printlevel;
printlevel = 1;
ring r = 32003, (x,y), (c,dp);
ideal j = x6-y4,x6y6,x2y4-x5y2;
module T = T_2(j);
↳ // dim T_2 = 6

```

```

vdim(T);
↳ 6
hilb(T);"";
↳ //      1 t^0
↳ //      -1 t^2
↳ //      -1 t^3
↳ //      1 t^5
↳
↳ //      1 t^0
↳ //      2 t^1
↳ //      2 t^2
↳ //      1 t^3
↳ // dimension (affine) = 0
↳ // degree (affine) = 6
↳
ring r1 = 0,(x,y,z),dp;
ideal id = xy,xz,yz;
list L = T_2(id,"");
↳ // dim T_2 = 0
vdim(L[1]); // vdim of T_2
↳ 0
print(L[3]); // syzygy module of id
↳ -z,-z,
↳ y, 0,
↳ 0, x
printlevel = p;

```

D.6.15.18 T_12

Procedure from library `sing.lib` (see [Section D.6.15 \[sing_lib\]](#), page 1336).

Usage: `T_12(i[,any]);` i = ideal

Return: `T_12(i)`: list of 2 modules:

* standard basis of T_1 -module = `T_1(i)`, 1st order deformations

* standard basis of T_2 -module = `T_2(i)`, obstructions of $R=P/i$

If a second argument is present (of any type) return a list of 9 modules, matrices, integers:

[1]= standard basis of T_1 -module

[2]= standard basis of T_2 -module

[3]= `vdim` of T_1

[4]= `vdim` of T_2

[5]= matrix, whose cols present infinitesimal deformations

[6]= matrix, whose cols are generators of relations of i (= `syz(i)`)

[7]= matrix, presenting $\text{Hom}_P(\text{syz}/\text{kos}, R)$, lifted to P

[8]= presentation of T_1 -module, no std basis

[9]= presentation of T_2 -module, no std basis

Display: k -dimension of T_1 and T_2 if `printlevel` ≥ 0 (default)

Note: Use proc `miniversal` from `deform.lib` to get miniversal deformation of i , the list contains all objects used by proc `miniversal`.

Example:

```

LIB "sing.lib";
int p      = printlevel;
printlevel = 1;
ring r      = 199, (x,y,z,u,v), (c, ws(4,3,2,3,4));
ideal i     = xz-y2,yz2-xu,xv-yzu,yu-z3,z2u-yv,zv-u2;
//a cyclic quotient singularity
list L      = T_12(i,1);
↳ // dim T_1 = 5
↳ // dim T_2 = 3
print(L[5]);           //matrix of infin. deformations
↳ 0, 0, 0, 0, 0,
↳ yz, y, z2, 0, 0,
↳ -z3,-z2,-zu,yz, yu,
↳ -z2,-z, -u, 0, 0,
↳ zu, u, v, -z2,-zu,
↳ 0, 0, 0, u, v
printlevel = p;

```

D.6.15.19 tangentcone

Procedure from library `sing.lib` (see [Section D.6.15 \[sing.lib\]](#), page 1336).

Usage: `tangentcone(id [,n]);` id = ideal, n = int

Return: the tangent cone of id

Note: The procedure works for any monomial ordering.
If n=0 use std w.r.t. local ordering ds, if n=1 use locstd.

Example:

```

LIB "sing.lib";
ring R = 0, (x,y,z), ds;
ideal i = 7xyz+z5,x2+y3+z7,5z5+y5;
tangentcone(i);
↳ _[1]=x2
↳ _[2]=7xyz
↳ _[3]=y5+5z5
↳ _[4]=7y4z
↳ _[5]=35z6

```

D.6.16 spcurve_lib

Library: `spcurve.lib`

Purpose: Deformations and Invariants of CM-codim 2 Singularities

Author: Anne Fruehbis-Krueger, anne@mathematik.uni-kl.de

Procedures:

D.6.16.1 isCMcod2

Procedure from library `spcurve.lib` (see [Section D.6.16 \[spcurve.lib\]](#), page 1347).

Usage: `isCMcod2(i);` i an ideal

Return: presentation matrix of i, if i is Cohen-Macaulay of codimension 2
a zero matrix otherwise

Example:

```
LIB "spcurve.lib";
ring r=32003,(x,y,z),ds;
ideal i=xz,yz,x^3-y^4;
print(isCMcod2(i));
↳ -y,-x2,
↳ x, y3,
↳ 0, z
```

D.6.16.2 CMtype

Procedure from library `spcurve.lib` (see [Section D.6.16 \[spcurve.lib\]](#), page 1347).

Usage: `CMtype(i)`; i an ideal, CM of codimension 2

Return: Cohen-Macaulay type of i (integer)
(-1, if i is not Cohen-Macaulay of codimension 2)

Example:

```
LIB "spcurve.lib";
ring r=32003,(x,y,z),ds;
ideal i=xy,xz,yz;
CMtype(i);
↳ 2
```

D.6.16.3 matrixT1

Procedure from library `spcurve.lib` (see [Section D.6.16 \[spcurve.lib\]](#), page 1347).

Usage: `matrixT1(M,n)`; M matrix, n integer

Assume: M is a presentation matrix of an ideal i , CM of codimension 2; consider i as a family of ideals in a ring in the first n variables where the remaining variables are considered as parameters

Return: list consisting of the $k \times (k+1)$ matrix M and a module K_M such that $T1 = \text{Mat}(k,k+1;R)/K_M$ is the space of first order deformations of i

Example:

```
LIB "spcurve.lib";
ring r=32003,(x(1),x(2),x(3)),ds;
ideal curve=x(1)*x(2),x(1)*x(3),x(2)*x(3);
matrix M=isCMcod2(curve);
matrixT1(M,3);
↳ [1]:
↳   _[1,1]=0
↳   _[1,2]=-x(3)
↳   _[2,1]=-x(2)
↳   _[2,2]=x(2)
↳   _[3,1]=x(1)
↳   _[3,2]=0
↳ [2]:
↳   _[1]=gen(5)
↳   _[2]=gen(4)-gen(3)
↳   _[3]=-gen(2)
↳   _[4]=x(1)*gen(5)-x(2)*gen(3)
```

```

↳  _[5]=x(1)*gen(6)-x(2)*gen(4)
↳  _[6]=x(2)*gen(3)-x(3)*gen(1)
↳  _[7]=x(2)*gen(4)-x(3)*gen(2)
↳  _[8]=-x(3)*gen(2)
↳  _[9]=x(2)*gen(2)-x(2)*gen(1)
↳  _[10]=x(1)*gen(1)
↳  _[11]=-x(3)*gen(4)
↳  _[12]=x(2)*gen(4)-x(2)*gen(3)
↳  _[13]=x(1)*gen(3)
↳  _[14]=-x(3)*gen(6)
↳  _[15]=x(2)*gen(6)-x(2)*gen(5)
↳  _[16]=x(1)*gen(5)

```

D.6.16.4 semiCMcod2

Procedure from library `spcurve.lib` (see [Section D.6.16 \[spcurve.lib\]](#), page 1347).

Usage: `semiCMcod2(M,t1[,s]);` M matrix, t1 module, s any

Assume: M is a presentation matrix of an ideal i, CM of codimension 2, and t1 is a presentation of the space of first order deformations of i ((M,t1) as returned by the procedure `matrixT1`)

Return: new ring in which the ideal semi describing the semiuniversal deformation of i; if the optional third argument is given, the perturbation matrix of the semiuniversal deformation is returned instead of the ideal.

Note: The current basering should not contain any variables named A(j) where j is some integer!

Example:

```

LIB "spcurve.lib";
ring r=32003,(x(1),x(2),x(3)),ds;
ideal curve=x(1)*x(2),x(1)*x(3),x(2)*x(3);
matrix M=isCMcod2(curve);
list l=matrixT1(M,3);
def rneu=semiCMcod2(l[1],std(l[2]));
setring rneu;
semi;
↳ semi[1]=A(2)*A(3)-x(2)*A(3)-x(1)*x(2)
↳ semi[2]=A(1)*A(3)+x(1)*x(3)
↳ semi[3]=-x(2)*A(1)-x(3)*A(2)+x(2)*x(3)

```

D.6.16.5 discr

Procedure from library `spcurve.lib` (see [Section D.6.16 \[spcurve.lib\]](#), page 1347).

Usage: `discr(sem,n);` sem ideal, n integer

Assume: sem is the versal deformation of an ideal of codimension 2.
The first n variables of the ring are treated as variables all the others as parameters.

Return: ideal describing the discriminant

Note: This is not a powerful algorithm!

Example:

```

LIB "spcurve.lib";
ring r=32003,(x(1),x(2),x(3)),ds;
ideal curve=x(1)*x(2),x(1)*x(3),x(2)*x(3);
matrix M=isCMcod2(curve);
list l=matrixT1(M,3);
def rneu=semiCMcod2(l[1],std(l[2]));
setring rneu;
discr(semi,3);
↪ _[1]=A(1)*A(2)*A(3)

```

D.6.16.6 qhmatrix

Procedure from library `spcurve.lib` (see [Section D.6.16 \[spcurve.lib\]](#), page 1347).

Usage: `qhmatrix(M)`; M a $k \times (k+1)$ matrix

Return: list, consisting of an integer vector containing the weights of the variables of the basering and an integer matrix giving the weights of the entries of M , if M is quasihomogeneous; zero integer vector and zero integer matrix, if M is not quasihomogeneous, i.e. does not allow row and column weights

Example:

```

LIB "spcurve.lib";
ring r=0,(x,y,z),ds;
matrix M[3][2]=z,0,y,x,x^3,y;
qhmatrix(M);
↪ [1]:
↪ 1,2,1
↪ [2]:
↪ 1,0,
↪ 2,1,
↪ 3,2
pmat(M);
↪ z, 0,
↪ y, x,
↪ x3, y

```

D.6.16.7 relweight

Procedure from library `spcurve.lib` (see [Section D.6.16 \[spcurve.lib\]](#), page 1347).

Usage: `relweight(N,W,a)`; N matrix, W intmat, a intvec

Assume: N is a non-zero matrix
 W is an integer matrix of the same size as N
 a is an integer vector giving the weights of the variables

Return: integer, $\max(a\text{-weighted order}(N_{ij}) - W_{ij} \mid \text{all entries } ij)$
string "ERROR" if sizes do not match

Example:

```

LIB "spcurve.lib";
ring r=32003,(x,y,z),ds;
matrix N[2][3]=z,0,y,x,x^3,y;
intmat W[2][3]=1,1,1,1,1,1;
intvec a=1,1,1;

```

```
relweight(N,W,a);
↳ 2
```

D.6.16.8 posweight

Procedure from library `spcurve.lib` (see [Section D.6.16 \[spcurve.lib\]](#), page 1347).

Usage: `posweight(M,t1,n[,s])`; M matrix, t1 module, n int, s string
 n=0 : all deformations of non-negative weight
 n=1 : only non-constant deformations of non-negative weight
 n=2 : all deformations of positive weight

Assume: M is a presentation matrix of a Cohen-Macaulay codimension 2 ideal and t1 is its T1 space in matrix notation

Return: new ring containing a list posw, consisting of a presentation matrix describing the deformation given by the generators of T1 of non-negative/positive weight and the weight vector for the new variables

Note: The current basering should not contain any variables named T(i) where i is some integer!

Example:

```
LIB "spcurve.lib";
ring r=32003,(x(1),x(2),x(3)),ds;
ideal curve=(x(3)-x(1)^2)*x(3),(x(3)-x(1)^2)*x(2),x(2)^2-x(1)^7*x(3);
matrix M=isCMcod2(curve);
list l=matrixT1(M,3);
def rneu=posweight(l[1],std(l[2]),0);
setring rneu;
pmat(posw[1]);
↳ T(2)+x(1)*T(1), -x(3)+x(1)^2,
↳ -x(3), x(2),
↳ x(2), -x(1)^7
posw[2];
↳ 3,1
```

D.6.16.9 KSpencerKernel

Procedure from library `spcurve.lib` (see [Section D.6.16 \[spcurve.lib\]](#), page 1347).

Usage: `KSpencerKernel(M[,s][,v])`; M matrix, s string, v intvec
 optional parameters (please specify in this order, if both are present):
 * s = first of the names of the new rings
 e.g. "R" leads to ring names R and R1
 * v of size $n(n+1)$ leads to the following module ordering
 $\text{gen}(v[1]) > \text{gen}(v[2]) > \dots > \text{gen}(v[n(n+1)])$ where the matrix entry ij corresponds to $\text{gen}((i-1)*n+j)$

Assume: M is a quasihomogeneous $n \times (n+1)$ matrix where the n minors define an isolated space curve singularity

Return: new ring containing the coefficient matrix KS representing the kernel of the Kodaira-Spencer map of the family of non-negative deformations having the given singularity as special fibre

Note: * the initial basering should not contain variables with name $e(i)$ or $T(i)$, since those variable names will internally be used by the script
 * setting an intvec with 5 entries and name `watchProgress` shows the progress of the computations:
`watchProgress[1]>0` => option(`prot`) in groebner commands
`watchProgress[2]>0` => trace output for highcorner
`watchProgress[3]>0` => output of deformed matrix
`watchProgress[4]>0` => result of elimination step
`watchProgress[4]>1` => trace output of multiplications with `xyz` and subsequent reductions
`watchProgress[5]>0` => matrix representing the kernel using `print`

Example:

```
LIB "spcurve.lib";
ring r=0,(x,y,z),ds;
matrix M[3][2]=z-x^7,0,y^2,z,x^9,y;
def rneu=KSpencerKernel(M,"ar");
setring rneu;
basing;
↳ // coefficients: QQ
↳ // number of vars : 17
↳ //      block  1 : ordering Ws
↳ //                : names  e(1) e(2) e(3) e(4) e(5) e(6) x y z
↳ //                : weights -21 -10 -32 -21 -27 -16 3 16 21
↳ //      block  2 : ordering wp
↳ //                : names  T(1) T(2) T(3) T(4) T(5) T(6) T(7) T(8)
↳ //                : weights  8   5   2  10   7   4   1   2
↳ //      block  3 : ordering C
print(KS);
↳ T(7),  0,      0,      0,      0,      0,      0,      0,
↳ KS[2,1],6*T(3), 3*T(7), 0,      0,      0,      0,      0,
↳ KS[3,1],KS[3,2],KS[3,3],6*T(3),3*T(7),0,      0,      0,
↳ 10*T(4),8*T(1), 7*T(5), 5*T(2),4*T(6),2*T(8),2*T(3),T(7)
```

D.6.17 spectrum_lib**Library:** spectrum.lib**Purpose:** Singularity Spectrum for Nondegenerate Singularities**Author:** S. Endrass**Procedures:****D.6.17.1 spectrumnd**Procedure from library `spectrum.lib` (see [Section D.6.17 \[spectrum.lib\]](#), page 1352).**Usage:** spectrumnd($f[1]$); poly f **Assume:** basering has characteristic 0 and local ordering,
 f has isolated singularity at 0 and nondegenerate principal part**Return:**

```
list S:
  ideal S[1]: spectral numbers in increasing order
  intvec S[2]:
    int S[2][i]: multiplicity of spectral number S[1][i]
```

Note: if a second argument 1 is given,
no test for a degenerate principal part will be done
SEE_ALSO: gmssing_lib

Example:

```
LIB "spectrum.lib";
ring R=0,(x,y),ds;
poly f=x^31+x^6*y^7+x^2*y^12+x^13*y^2+y^29;
list s=spectrumnd(f);
size(s[1]);
  ↪ 174
s[1][22];
  ↪ -27/58
s[2][22];
  ↪ 2
```

D.6.18 surfacesignature_lib

Library: surfacesignature.lib

Purpose: signature of surface singularity

Authors: Gerhard Pfister pfister@mathematik.uni-kl.de
Muhammad Ahsan Banyamin ahsanbanyamin@gmail.com
Stefan Steidel steidel@mathematik.uni-kl.de

Overview: A library for computing the signature of irreducible surface singularity. The signature of a surface singularity is defined in [3]. The algorithm we use has been proposed in [9].

Let g in $C[x,y]$ define an isolated curve singularity at 0 in C^2 and $f:=z^N+g(x,y)$. The zero-set $V:=V(f)$ in C^3 of f has an isolated singularity at 0. For a small $e>0$ let $V_e:=V(f-e)$ in C^3 be the Milnor fibre of $(V,0)$ and $s: H_2(V_e, R) \times H_2(V_e, R) \rightarrow R$ be the intersection form (cf. [1],[7]). $H_2(V_e, R)$ is an m -dimensional R -vector space, m the Milnor number of $(V,0)$ (cf. [1],[4],[5],[6]), and s is a symmetric bilinear form. Let $\text{sigma}(f)$ be the signature of s , called the signature of the surface singularity $(V,0)$. Formulae to compute the signature are given by Nemethi (cf. [8],[9]) and van Doorn, Steenbrink (cf. [2]).

We have implemented three approaches using Puiseux expansions, the resolution of singularities resp. the spectral pairs of the singularity.

Procedures:**D.6.18.1 signatureBrieskorn**

Procedure from library `surfacesignature.lib` (see [Section D.6.18 \[surfacesignature.lib\]](#), [page 1353](#)).

Usage: `signatureBrieskorn(a1,a2,a3)`; $a1,a2,a3 = \text{integers}$

Return: signature of Brieskorn singularity $x^{a1}+y^{a2}+z^{a3}$

Example:

```
LIB "surfacesignature.lib";
ring R = 0,x,dp;
signatureBrieskorn(11,3,5);
↪ -48
```

D.6.18.2 signaturePuisseux

Procedure from library `surfacesignature.lib` (see [Section D.6.18 \[surfacesignature.lib\]](#), [page 1353](#)).

Usage: `signaturePuisseux(N,f)`; $N = \text{int}$, $f = \text{irreducible poly in 2 variables}$

Return: signature of surface singularity defined by $z^N + f(x,y) = 0$

Example:

```
LIB "surfacesignature.lib";
ring r = 0,(x,y),dp;
int N = 3;
poly f = x15-21x14+8x13y-6x13-16x12y+20x11y2-x12+8x11y-36x10y2
+24x9y3+4x9y2-16x8y3+26x7y4-6x6y4+8x5y5+4x3y6-y8;
signaturePuisseux(N,f);
↪ -92
```

D.6.18.3 signatureNemethi

Procedure from library `surfacesignature.lib` (see [Section D.6.18 \[surfacesignature.lib\]](#), [page 1353](#)).

Usage: `signatureNemethi(N,f)`; $N = \text{integer}$, $f = \text{reduced poly in 2 variables}$, $\#$ empty or 1,2,3
- if $\#[1] = 1$ then resolution of singularity is used
- if $\#[1] = 2$ then spectral pairs are used
- if $\#$ is empty then both upper variants are used in parallel and the fastest returns the result

Return: signature of surface singularity defined by $z^N + f(x,y) = 0$

Remark: computes the signature of some special surface singularities

Example:

```
LIB "surfacesignature.lib";
ring r = 0, (x,y), dp;
int N = 3;
poly f = x15-21x14+8x13y-6x13-16x12y+20x11y2-x12+8x11y-36x10y2
+24x9y3+4x9y2-16x8y3+26x7y4-6x6y4+8x5y5+4x3y6-y8;
signatureNemethi(N,f,1);
↳ -92
printlevel = 1;
signatureNemethi(N,f);
↳ Resolution of singularity has been used.
↳ -92
```

D.7 Invariant theory

D.7.1 finvar.lib

Library: finvar.lib**Purpose:** Invariant Rings of Finite Groups**Author:** Agnes E. Heydtmann, contact via Wolfram Decker: decker@mathematik.uni-kl.de Simon A. King, email: simon.king@nuigalway.ie**Overview:** A library for computing polynomial invariants of finite matrix groups and generators of related varieties. The algorithms are based on B. Sturmfels, G. Kemper, S. King and W. Decker et al..**Procedures:**

D.7.1.1 invariant_ring

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\]](#), page 1355).

Usage: `invariant_ring(G1,G2,...[,flags]);`
`G1,G2,...`: <matrices> generating a finite matrix group, `flags`: an optional <intvec> with three entries: if the first one equals 0, the program attempts to compute the Molien series and Reynolds operator, if it equals 1, the program is told that the Molien series should not be computed, if it equals -1 characteristic 0 is simulated, i.e. the Molien series is computed as if the base field were characteristic 0 (the user must choose a field of large prime characteristic, e.g. 32003) and if the first one is anything else, it means that the characteristic of the base field divides the group order (i.e. it will not even be attempted to compute the Reynolds operator or Molien series), the second component should give the size of intervals between canceling common factors in the expansion of Molien series, 0 (the default) means only once after generating all terms, in prime characteristic also a negative number can be given to indicate that common factors should always be canceled when the expansion is simple (the root of the extension field occurs not among the coefficients)

Return: primary and secondary invariants for any matrix representation of a finite group**Display:** information about the various stages of the program if the third flag does not equal 0

Theory: Bases of homogeneous invariants are generated successively and those are chosen as primary invariants that lower the dimension of the ideal generated by the previously found invariants (see "Generating a Noetherian Normalization of the Invariant Ring of a Finite Group" by Decker, Heydtmann, Schreyer (1998)). In the non-modular case secondary invariants are calculated by finding a basis (in terms of monomials) of the basering modulo the primary invariants, mapping to invariants with the Reynolds operator and using those or their power products such that they are linearly independent modulo the primary invariants (see "Some Algorithms in Invariant Theory of Finite Groups" by Kemper and Steel (1997)). In the modular case they are generated according to "Generating Invariant Rings of Finite Groups over Arbitrary Fields" by Kemper (1996).

Example:

```
LIB "finvar.lib";
ring R=0,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
matrix P,S,IS=invariant_ring(A);
print(P);
↳ z2,x2+y2,x2y2
print(S);
↳ 1,xyz,x2z-y2z,x3y-xy3
print(IS);
↳ xyz,x2z-y2z,x3y-xy3
```

D.7.1.2 invariant_ring_random

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\], page 1355](#)).

Usage: `invariant_ring_random(G1,G2,...,r[,flags]);`
`G1,G2,...`: <matrices> generating a finite matrix group, `r`: an <int> where $-|r|$ to $|r|$ is the range of coefficients of random combinations of bases elements that serve as primary invariants, `flags`: an optional <intvec> with three entries: if the first equals 0, the program attempts to compute the Molien series and Reynolds operator, if it equals 1, the program is told that the Molien series should not be computed, if it equals -1 characteristic 0 is simulated, i.e. the Molien series is computed as if the base field were characteristic 0 (the user must choose a field of large prime characteristic, e.g. 32003) and if the first one is anything else, then the characteristic of the base field divides the group order (i.e. we will not even attempt to compute the Reynolds operator or Molien series), the second component should give the size of intervals between canceling common factors in the expansion of the Molien series, 0 (the default) means only once after generating all terms, in prime characteristic also a negative number can be given to indicate that common factors should always be canceled when the expansion is simple (the root of the extension field does not occur among the coefficients)

Return: primary and secondary invariants for any matrix representation of a finite group

Display: information about the various stages of the program if the third flag does not equal 0

Theory: is the same as for `invariant_ring` except that random combinations of basis elements are chosen as candidates for primary invariants and hopefully they lower the dimension of the previously found primary invariants by the right amount.

Example:

```

LIB "finvar.lib";
ring R=0,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
matrix P,S,IS=invariant_ring_random(A,1);
print(P);
↳ z2,x2+y2,x4+y4-z4
print(S);
↳ 1,xyz,x2z-y2z,x3y-xy3
print(IS);
↳ xyz,x2z-y2z,x3y-xy3

```

D.7.1.3 primary_invariants

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\], page 1355](#)).

- Usage:** `primary_invariants(G1,G2,...[,flags]);`
`G1,G2,...`: <matrices> generating a finite matrix group, `flags`: an optional <intvec> with three entries, if the first one equals 0 (also the default), the programme attempts to compute the Molien series and Reynolds operator, if it equals 1, the programme is told that the Molien series should not be computed, if it equals -1 characteristic 0 is simulated, i.e. the Molien series is computed as if the base field were characteristic 0 (the user must choose a field of large prime characteristic, e.g. 32003) and if the first one is anything else, it means that the characteristic of the base field divides the group order, the second component should give the size of intervals between canceling common factors in the expansion of the Molien series, 0 (the default) means only once after generating all terms, in prime characteristic also a negative number can be given to indicate that common factors should always be canceled when the expansion is simple (the root of the extension field occurs not among the coefficients)
- Display:** information about the various stages of the programme if the third flag does not equal 0
- Return:** primary invariants (type <matrix>) of the invariant ring and if computable Reynolds operator (type <matrix>) and Molien series (type <matrix>) or ring name (type string) where the Molien series can be found in the char p case; if the first flag is 1 and we are in the non-modular case then an <intvec> is returned giving some of the degrees where no non-trivial homogeneous invariants can be found
- Theory:** Bases of homogeneous invariants are generated successively and those are chosen as primary invariants that lower the dimension of the ideal generated by the previously found invariants (see paper "Generating a Noetherian Normalization of the Invariant Ring of a Finite Group" by Decker, Heydtmann, Schreyer (1998)).

Example:

```

LIB "finvar.lib";
ring R=0,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
list L=primary_invariants(A);
print(L[1]);
↳ z2,x2+y2,x2y2

```

D.7.1.4 primary_invariants_random

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\], page 1355](#)).

- Usage:** `primary_invariants_random(G1,G2,...,r[,flags]);`
`G1,G2,...:` <matrixes> generating a finite matrix group, `r:` an <int> where $-|r|$ to $|r|$ is the range of coefficients of the random combinations of bases elements, `flags:` an optional <intvec> with three entries, if the first one equals 0 (also the default), the programme attempts to compute the Molien series and Reynolds operator, if it equals 1, the programme is told that the Molien series should not be computed, if it equals -1 characteristic 0 is simulated, i.e. the Molien series is computed as if the base field were characteristic 0 (the user must choose a field of large prime characteristic, e.g. 32003) and if the first one is anything else, it means that the characteristic of the base field divides the group order, the second component should give the size of intervals between canceling common factors in the expansion of the Molien series, 0 (the default) means only once after generating all terms, in prime characteristic also a negative number can be given to indicate that common factors should always be canceled when the expansion is simple (the root of the extension field does not occur among the coefficients)
- Display:** information about the various stages of the programme if the third flag does not equal 0
- Return:** primary invariants (type <matrix>) of the invariant ring and if computable Reynolds operator (type <matrix>) and Molien series (type <matrix>), if the first flag is 1 and we are in the non-modular case then an <intvec> is returned giving some of the degrees where no non-trivial homogeneous invariants can be found
- Theory:** Bases of homogeneous invariants are generated successively and random linear combinations are chosen as primary invariants that lower the dimension of the ideal generated by the previously found invariants (see "Generating a Noetherian Normalization of the Invariant Ring of a Finite Group" by Decker, Heydtmann, Schreyer (1998)).

Example:

```
LIB "finvar.lib";
ring R=0,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
list L=primary_invariants_random(A,1);
print(L[1]);
↪ z2,x2+y2,x4+y4-z4
```

D.7.1.5 invariant_algebra_reynolds

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar_lib\]](#), page 1355).

- Usage:** `invariant_algebra_reynolds(REY[,v]);`
`REY:` a $g \times n$ <matrix> representing the Reynolds operator of a finite matrix group, where g is the group order and n is the number of variables of the basering;
`v:` an optional <int>
- Return:** A minimal homogeneous generating set of the invariant ring, type <matrix>
- Assume:** We are in the non-modular case, i.e., the characteristic of the basering does not divide the group order;
`REY` is the 1st return value of `group_reynolds()`, `reynolds_molien()` or the second one of `primary_invariants()`
- Display:** Information on the progress of computations if `v` does not equal 0
- Theory:** We do an incremental search in increasing degree d . Generators of the invariant ring are found among the Reynolds images of monomials of degree d . The generators are chosen

by Groebner basis techniques (see S. King: Minimal generating sets of non-modular invariant rings of finite groups).

Note: `invariant_algebra_reynolds` should not be used in rings with weighted orders.

Example:

```
LIB "finvar.lib";
ring R=0,(a,b,c,d),dp;
matrix A[4][4]=
0,0,1,0,
0,0,0,1,
1,0,0,0,
0,1,0,0;
list L = group_reynolds(A);
matrix G = invariant_algebra_reynolds(L[1],1);
↳ We have 4 relevant monomials in degree 1
↳ We found generator number 1 in degree 1
↳ We found generator number 2 in degree 1
↳ Computing Groebner basis up to the new degree 2
↳ We have 3 relevant monomials in degree 2
↳ We found generator number 3 in degree 2
↳ We found generator number 4 in degree 2
↳ We found generator number 5 in degree 2
↳ Computing Groebner basis up to the new degree 3
↳ We found the degree bound 2
↳ We went beyond the degree bound, so, we are done!
G;
↳ G[1,1]=b+d
↳ G[1,2]=a+c
↳ G[1,3]=b2+d2
↳ G[1,4]=ab+cd
↳ G[1,5]=a2+c2
```

See also: [Section D.7.1.6 \[invariant_algebra_perm\]](#), page 1359.

D.7.1.6 `invariant_algebra_perm`

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar_lib\]](#), page 1355).

Usage: `invariant_algebra_perm(GEN[v]);`
 GEN: a list of generators of a permutation group. It is given in disjoint cycle form, where trivial cycles can be omitted; e.g., the generator $(1,2)(3,4)(5)$ is given by `<list(list(1,2),list(3,4))>`.
 v: an optional `<int>`

Return: A minimal homogeneous generating set of the invariant ring of the group presented by GEN, type `<matrix>`

Assume: We are in the non-modular case, i.e., the characteristic of the basering does not divide the group order. Note that the function does not verify whether this assumption holds or not

Display: Information on the progress of computations if v does not equal 0

Theory: We do an incremental search in increasing degree d. Generators of the invariant ring are found among the orbit sums of degree d. The generators are chosen by Groebner

basis techniques (see S. King: Minimal generating sets of non-modular invariant rings of finite groups).

Note: `invariant_algebra_perm` should not be used in rings with weighted orders.

Example:

```
LIB "finvar.lib";
ring R=0,(a,b,c,d),dp;
def GEN=list(list(list(1,3),list(2,4)));
matrix G = invariant_algebra_perm(GEN,1);
↳ Searching generators in degree 1
↳ We have 2 orbit sums of degree 1
↳ We found generator number 1 in degree 1
↳ We found generator number 2 in degree 1
↳ Computing Groebner basis up to the new degree 2
↳ Searching generators in degree 2
↳ We have 3 orbit sums of degree 2
↳ We found generator number 3 in degree 2
↳ We found generator number 4 in degree 2
↳ We found generator number 5 in degree 2
↳ Computing Groebner basis up to the new degree 3
↳ We found the degree bound 2
↳ We went beyond the degree bound, so, we are done!
G;
↳ G[1,1]=b+d
↳ G[1,2]=a+c
↳ G[1,3]=b2+d2
↳ G[1,4]=ab+cd
↳ G[1,5]=a2+c2
```

See also: [Section D.7.1.5 \[invariant_algebra_reynolds\]](#), page 1358.

D.7.1.7 cyclotomic

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar_lib\]](#), page 1355).

Usage: `cyclotomic(i)`; i integer > 0

Returns: the i -th cyclotomic polynomial (type `<poly>`) as one in the first ring variable

Theory: $x^i - 1$ is divided by the j -th cyclotomic polynomial where j takes on the value of proper divisors of i

Example:

```
LIB "finvar.lib";
ring R=0,(x,y,z),dp;
print(cyclotomic(25));
↳ x20+x15+x10+x5+1
```

D.7.1.8 group_reynolds

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar_lib\]](#), page 1355).

Usage: `group_reynolds(G1,G2,...[,v])`;
 $G1, G2, \dots$: $n \times n$ `<matrices>` generating a finite matrix group, v : an optional `<int>`

Assume: n is the number of variables of the basering, g the number of group elements

Return: a <list>, the first list element will be a $g \times n$ <matrix> representing the Reynolds operator if we are in the non-modular case; if the characteristic is >0 , `minpoly==0` and the finite group non-cyclic the second list element is an <int> giving the lowest common multiple of the matrix group elements' order (used in `molien`); in general all other list elements are $n \times n$ <matrices> listing all elements of the finite group

Display: information if v does not equal 0

Theory: The entire matrix group is generated by getting all left products of generators with the new elements from the last run through the loop (or the generators themselves during the first run). All the ones that have been generated before are thrown out and the program terminates when no new elements found in one run. Additionally each time a new group element is found the corresponding ring mapping of which the Reynolds operator is made up is generated. They are stored in the rows of the first return value.

Example:

```
LIB "finvar.lib";
ring R=0,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
list L=group_reynolds(A);
print(L[1]);
  ↪ y, -x,-z,
  ↪ -x,-y,z,
  ↪ -y,x, -z,
  ↪ x, y, z
print(L[2..size(L)]);
  ↪ 0, 1,0,
  ↪ -1,0,0,
  ↪ 0, 0,-1
  ↪ -1,0, 0,
  ↪ 0, -1,0,
  ↪ 0, 0, 1
  ↪ 0,-1,0,
  ↪ 1,0, 0,
  ↪ 0,0, -1
  ↪ 1,0,0,
  ↪ 0,1,0,
  ↪ 0,0,1
```

D.7.1.9 molien

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\], page 1355](#)).

Usage: `molien(G1,G2,...[,ringname,lcm,flags]);`
 $G1,G2,\dots$: $n \times n$ <matrices>, all elements of a finite matrix group, `ringname`: a <string> giving a name for a new ring of characteristic 0 for the Molien series in case of prime characteristic, `lcm`: an <int> giving the lowest common multiple of the elements' orders in case of prime characteristic, `minpoly==0` and a non-cyclic group, `flags`: an optional <intvec> with three components: if the first element is not equal to 0 characteristic 0 is simulated, i.e. the Molien series is computed as if the base field were characteristic 0 (the user must choose a field of large prime characteristic, e.g. 32003), the second component should give the size of intervals between canceling common factors in the expansion of the Molien series, 0 (the default) means only once after generating all terms, in prime characteristic also a negative number can be given to indicate that

common factors should always be canceled when the expansion is simple (the root of the extension field does not occur among the coefficients)

Assume: n is the number of variables of the basering, G_1, G_2, \dots are the group elements generated by `group_reynolds()`, `lcm` is the second return value of `group_reynolds()`

Return: in case of characteristic 0 a 1×2 <matrix> giving enumerator and denominator of Molien series; in case of prime characteristic a ring with the name 'ringname' of characteristic 0 is created where the same Molien series (named M) is stored

Display: information if the third component of flags does not equal 0

Theory: In characteristic 0 the terms $1/\det(1-xE)$ for all group elements of the Molien series are computed in a straight forward way. In prime characteristic a Brauer lift is involved. The returned matrix gives enumerator and denominator of the expanded version where common factors have been canceled.

Example:

```
LIB "finvar.lib";
"          note the case of prime characteristic";
 $\mapsto$           note the case of prime characteristic
ring R=0,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
list L=group_reynolds(A);
matrix M=molien(L[2..size(L)]);
print(M);
 $\mapsto$  x3+x2-x+1,-x7+x6+x5-x4+x3-x2-x+1
ring S=3,(x,y,z),dp;
string newring="alksdfjlaskdjf";
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
list L=group_reynolds(A);
molien(L[2..size(L)],newring);
setring Finvar::alksdfjlaskdjf;
print(M);
 $\mapsto$  x3+x2-x+1,-x7+x6+x5-x4+x3-x2-x+1
setring S;
kill Finvar::alksdfjlaskdjf;
```

D.7.1.10 reynolds_molien

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar_lib\], page 1355](#)).

Usage: `reynolds_molien(G1,G2,...[,ringname,flags]);`
 G_1, G_2, \dots : $n \times n$ <matrices> generating a finite matrix group, `ringname`: a <string> giving a name for a new ring of characteristic 0 for the Molien series in case of prime characteristic, `flags`: an optional <intvec> with three components: if the first element is not equal to 0 characteristic 0 is simulated, i.e. the Molien series is computed as if the base field were characteristic 0 (the user must choose a field of large prime characteristic, e.g. 32003) the second component should give the size of intervals between canceling common factors in the expansion of the Molien series, 0 (the default) means only once after generating all terms, in prime characteristic also a negative number can be given to indicate that common factors should always be canceled when the expansion is simple (the root of the extension field does not occur among the coefficients)

Assume: n is the number of variables of the basering, G_1, G_2, \dots are the group elements generated by `group_reynolds()`, g is the size of the group

Return: a `gxn <matrix>` representing the Reynolds operator is the first return value and in case of characteristic 0 a `1x2 <matrix>` giving numerator and denominator of Molien series is the second one; in case of prime characteristic a ring with the name 'ringname' of characteristic 0 is created where the same Molien series (named M) is stored

Display: information if the third component of flags does not equal 0

Theory: The entire matrix group is generated by getting all left products of the generators with new elements from the last run through the loop (or the generators themselves during the first run). All the ones that have been generated before are thrown out and the program terminates when are no new elements found in one run. Additionally each time a new group element is found the corresponding ring mapping of which the Reynolds operator is made up is generated. They are stored in the rows of the first return value. In characteristic 0 the terms $1/\det(1-xE)$ is computed whenever a new element E is found. In prime characteristic a Brauer lift is involved and the terms are only computed after the entire matrix group is generated (to avoid the modular case). The returned matrix gives numerator and denominator of the expanded version where common factors have been canceled.

Example:

```
LIB "finvar.lib";
"          note the case of prime characteristic";
↳          note the case of prime characteristic
ring R=0,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
matrix REY,M=reynolds_molien(A);
print(REY);
↳ y, -x,-z,
↳ -x,-y,z,
↳ -y,x, -z,
↳ x, y, z
print(M);
↳ x3+x2-x+1,-x7+x6+x5-x4+x3-x2-x+1
ring S=3,(x,y,z),dp;
string newring="Qadjoint";
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
matrix REY=reynolds_molien(A,newring);
print(REY);
↳ y, -x,-z,
↳ -x,-y,z,
↳ -y,x, -z,
↳ x, y, z
setring Finvar::Qadjoint;
print(M);
↳ x3+x2-x+1,-x7+x6+x5-x4+x3-x2-x+1
setring S;
kill Finvar::Qadjoint;
```

D.7.1.11 partial_molien

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\], page 1355](#)).

Usage: `partial_molien(M,n[,p]);`
M: a `1x2 <matrix>`, n: an `<int>` indicating number of terms in the expansion, p: an optional `<poly>`

Assume: M is the return value of molien or the second return value of reynolds_molien, p ought to be the second return value of a previous run of partial_molien and avoids recalculating known terms

Return: n terms (type <poly>) of the partial expansion of the Molien series (first n if there is no third parameter given, otherwise the next n terms depending on a previous calculation) and an intermediate result (type <poly>) of the calculation to be used as third parameter in a next run of partial_molien

Theory: The following calculation is implemented:

$$\frac{(1+a_1x+a_2x^2+\dots+a_nx^n)/(1+b_1x+b_2x^2+\dots+b_mx^m)=(1+(a_1-b_1)x+\dots+(a_1-b_1)x+(a_2-b_2)x^2+\dots+(a_1-b_1)x+b_1(a_1-b_1)x^2+\dots)}{(1+b_1x+b_2x^2+\dots+b_mx^m)}$$

Example:

```
LIB "finvar.lib";
ring R=0,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
matrix REY,M=reynolds_molien(A);
poly p(1..2);
p(1..2)=partial_molien(M,5);
p(1);
↪ 4x5+5x4+2x3+2x2+1
p(1..2)=partial_molien(M,5,p(2));
p(1);
↪ 18x10+12x9+13x8+8x7+8x6
```

D.7.1.12 evaluate_reynolds

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\], page 1355](#)).

Usage: evaluate_reynolds(REY,I);
REY: a <matrix> representing the Reynolds operator, I: an arbitrary <ideal>

Assume: REY is the first return value of group_reynolds() or reynolds_molien()

Returns: image of the polynomials defining I under the Reynolds operator (type <ideal>)

Note: the characteristic of the coefficient field of the polynomial ring should not divide the order of the finite matrix group

Theory: REY has been constructed in such a way that each row serves as a ring mapping of which the Reynolds operator is made up.

Example:

```
LIB "finvar.lib";
ring R=0,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
list L=group_reynolds(A);
ideal I=x2,y2,z2;
print(evaluate_reynolds(L[1],I));
↪ 1/2x2+1/2y2,
↪ 1/2x2+1/2y2,
↪ z2
```

D.7.1.13 invariant_basis

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\], page 1355](#)).

Usage: `invariant_basis(g,G1,G2,...);`
`g`: an `<int>` indicating of which degree (>0) the homogeneous basis should be, `G1,G2,...`:
`<matrices>` generating a finite matrix group

Returns: the basis (type `<ideal>`) of the space of invariants of degree `g`

Theory: A general polynomial of degree `g` is generated and the generators of the matrix group applied. The difference ought to be 0 and this way a system of linear equations is created. It is solved by computing syzygies.

Example:

```
LIB "finvar.lib";
ring R=0,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
print(invariant_basis(2,A));
↪ x2+y2,
↪ z2
```

D.7.1.14 invariant_basis_reynolds

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\], page 1355](#)).

Usage: `invariant_basis_reynolds(REY,d[,flags]);`
`REY`: a `<matrix>` representing the Reynolds operator, `d`: an `<int>` indicating of which degree (>0) the homogeneous basis should be, `flags`: an optional `<intvec>` with two entries: its first component gives the dimension of the space (default `<0>` meaning unknown) and its second component is used as the number of polynomials that should be mapped to invariants during one call of `evaluate_reynolds` if the dimension of the space is unknown or the number such that number \times dimension polynomials are mapped to invariants during one call of `evaluate_reynolds`

Assume: `REY` is the first return value of `group_reynolds()` or `reynolds_molien()` and `flags[1]` given by `partial_molien`

Return: the basis (type `<ideal>`) of the space of invariants of degree `d`

Theory: Monomials of degree `d` are mapped to invariants with the Reynolds operator. A linearly independent set is generated with the help of `minbase`.

Example:

```
LIB "finvar.lib";
ring R=0,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
intvec flags=0,1,0;
matrix REY,M=reynolds_molien(A,flags);
flags=8,6;
print(invariant_basis_reynolds(REY,6,flags));
↪ z6,
↪ x2z4+y2z4,
↪ x2y2z2,
↪ x3yz2-xy3z2,
↪ x4z2+y4z2,
```

```

↳ x4y2+x2y4,
↳ x5y-xy5,
↳ x6+y6

```

D.7.1.15 primary_char0

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\], page 1355](#)).

Usage: `primary_char0(REY,M[,v]);`
 REY: a <matrix> representing the Reynolds operator, M: a 1x2 <matrix> representing the Molien series, v: an optional <int>

Assume: REY is the first return value of `group_reynolds` or `reynolds_molien` and M the one of `molien` or the second one of `reynolds_molien`

Display: information about the various stages of the programme if v does not equal 0

Return: primary invariants (type <matrix>) of the invariant ring

Theory: Bases of homogeneous invariants are generated successively and those are chosen as primary invariants that lower the dimension of the ideal generated by the previously found invariants (see paper "Generating a Noetherian Normalization of the Invariant Ring of a Finite Group" by Decker, Heydtmann, Schreyer (1998)).

Example:

```

LIB "finvar.lib";
ring R=0,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
matrix REY,M=reynolds_molien(A);
matrix P=primary_char0(REY,M);
print(P);
↳ z2,x2+y2,x2y2

```

D.7.1.16 primary_charp

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\], page 1355](#)).

Usage: `primary_charp(REY,ringname[,v]);`
 REY: a <matrix> representing the Reynolds operator, ringname: a <string> giving the name of a ring where the Molien series is stored, v: an optional <int>

Assume: REY is the first return value of `group_reynolds` or `reynolds_molien` and ringname gives the name of a ring of characteristic 0 that has been created by `molien` or `reynolds_molien`

Display: information about the various stages of the programme if v does not equal 0

Return: primary invariants (type <matrix>) of the invariant ring

Theory: Bases of homogeneous invariants are generated successively and those are chosen as primary invariants that lower the dimension of the ideal generated by the previously found invariants (see paper "Generating a Noetherian Normalization of the Invariant Ring of a Finite Group" by Decker, Heydtmann, Schreyer (1998)).

Example:

```

LIB "finvar.lib";
ring R=3,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
list L=group_reynolds(A);

```

```

string newring="alskdfj";
molien(L[2..size(L)],newring);
matrix P=primary_charp(L[1],newring);
kill Finvar::'newring';
print(P);
↪ z2,x2+y2,x2y2

```

D.7.1.17 primary_char0_no_molien

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\], page 1355](#)).

- Usage:** `primary_char0_no_molien(REY[,v]);`
 REY: a <matrix> representing the Reynolds operator, v: an optional <int>
- Assume:** REY is the first return value of `group_reynolds` or `reynolds_molien`
- Display:** information about the various stages of the programme if v does not equal 0
- Return:** primary invariants (type <matrix>) of the invariant ring and an <intvec> listing some of the degrees where no non-trivial homogeneous invariants are to be found
- Theory:** Bases of homogeneous invariants are generated successively and those are chosen as primary invariants that lower the dimension of the ideal generated by the previously found invariants (see paper "Generating a Noetherian Normalization of the Invariant Ring of a Finite Group" by Decker, Heydtmann, Schreyer (1998)).

Example:

```

LIB "finvar.lib";
ring R=0,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
list L=group_reynolds(A);
list l=primary_char0_no_molien(L[1]);
print(l[1]);
↪ z2,x2+y2,x2y2

```

D.7.1.18 primary_charp_no_molien

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\], page 1355](#)).

- Usage:** `primary_charp_no_molien(REY[,v]);`
 REY: a <matrix> representing the Reynolds operator, v: an optional <int>
- Assume:** REY is the first return value of `group_reynolds` or `reynolds_molien`
- Display:** information about the various stages of the programme if v does not equal 0
- Return:** primary invariants (type <matrix>) of the invariant ring and an <intvec> listing some of the degrees where no non-trivial homogeneous invariants are to be found
- Theory:** Bases of homogeneous invariants are generated successively and those are chosen as primary invariants that lower the dimension of the ideal generated by the previously found invariants (see paper "Generating a Noetherian Normalization of the Invariant Ring of a Finite Group" by Decker, Heydtmann, Schreyer (1998)).

Example:

```

LIB "finvar.lib";
ring R=3,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;

```

```
list L=group_reynolds(A);
list l=primary_charp_no_molien(L[1]);
print(l[1]);
↳ z2,x2+y2,x2y2
```

D.7.1.19 primary_charp_without

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\], page 1355](#)).

Usage: `primary_charp_without(G1,G2,...[,v]);`
`G1,G2,...:` <matrixes> generating a finite matrix group, `v:` an optional <int>

Display: information about the various stages of the programme if `v` does not equal 0

Return: primary invariants (type <matrix>) of the invariant ring

Theory: Bases of homogeneous invariants are generated successively and those are chosen as primary invariants that lower the dimension of the ideal generated by the previously found invariants (see paper "Generating a Noetherian Normalization of the Invariant Ring of a Finite Group" by Decker, Heydtmann, Schreyer (1998)). No Reynolds operator or Molien series is used.

Example:

```
LIB "finvar.lib";
ring R=2,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
matrix P=primary_charp_without(A);
print(P);
↳ x+y,z,xy
```

D.7.1.20 primary_char0_random

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\], page 1355](#)).

Usage: `primary_char0_random(REY,M,r[,v]);`
`REY:` a <matrix> representing the Reynolds operator, `M:` a 1x2 <matrix> representing the Molien series, `r:` an <int> where $-|r|$ to $|r|$ is the range of coefficients of the random combinations of bases elements, `v:` an optional <int>

Assume: `REY` is the first return value of `group_reynolds` or `reynolds_molien` and `M` the one of `molien` or the second one of `reynolds_molien`

Display: information about the various stages of the programme if `v` does not equal 0

Return: primary invariants (type <matrix>) of the invariant ring

Theory: Bases of homogeneous invariants are generated successively and random linear combinations are chosen as primary invariants that lower the dimension of the ideal generated by the previously found invariants (see "Generating a Noetherian Normalization of the Invariant Ring of a Finite Group" by Decker, Heydtmann, Schreyer (1998)).

Example:

```
LIB "finvar.lib";
ring R=0,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
matrix REY,M=reynolds_molien(A);
matrix P=primary_char0_random(REY,M,1);
print(P);
↳ z2,x2+y2,x4+y4-z4
```

D.7.1.21 primary_charp_random

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\], page 1355](#)).

- Usage:** `primary_charp_random(REY,ringname,r[,v]);`
 REY: a <matrix> representing the Reynolds operator, ringname: a <string> giving the name of a ring where the Molien series is stored, r: an <int> where $-|r|$ to $|r|$ is the range of coefficients of the random combinations of bases elements, v: an optional <int>
- Assume:** REY is the first return value of `group_reynolds` or `reynolds_molien` and ringname gives the name of a ring of characteristic 0 that has been created by `molien` or `reynolds_molien`
- Display:** information about the various stages of the programme if v does not equal 0
- Return:** primary invariants (type <matrix>) of the invariant ring
- Theory:** Bases of homogeneous invariants are generated successively and random linear combinations are chosen as primary invariants that lower the dimension of the ideal generated by the previously found invariants (see "Generating a Noetherian Normalization of the Invariant Ring of a Finite Group" by Decker, Heydtmann, Schreyer (1998)).

Example:

```
LIB "finvar.lib";
ring R=3,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
list L=group_reynolds(A);
string newring="alskdfj";
molien(L[2..size(L)],newring);
matrix P=primary_charp_random(L[1],newring,1);
kill Finvar::'newring';
print(P);
↪ z2,x2+y2,x4+y4-z4
```

D.7.1.22 primary_char0_no_molien_random

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\], page 1355](#)).

- Usage:** `primary_char0_no_molien_random(REY,r[,v]);`
 REY: a <matrix> representing the Reynolds operator, r: an <int> where $-|r|$ to $|r|$ is the range of coefficients of the random combinations of bases elements, v: an optional <int>
- Assume:** REY is the first return value of `group_reynolds` or `reynolds_molien`
- Display:** information about the various stages of the programme if v does not equal 0
- Return:** primary invariants (type <matrix>) of the invariant ring and an <intvec> listing some of the degrees where no non-trivial homogeneous invariants are to be found
- Theory:** Bases of homogeneous invariants are generated successively and random linear combinations are chosen as primary invariants that lower the dimension of the ideal generated by the previously found invariants (see "Generating a Noetherian Normalization of the Invariant Ring of a Finite Group" by Decker, Heydtmann, Schreyer (1998)).

Example:

```
LIB "finvar.lib";
ring R=0,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
```

```
list L=group_reynolds(A);
list l=primary_char0_no_molien_random(L[1],1);
print(l[1]);
↪ z2,x2+y2,x4+y4-z4
```

D.7.1.23 primary_charp_no_molien_random

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\], page 1355](#)).

- Usage:** `primary_charp_no_molien_random(REY,r[,v]);`
 REY: a <matrix> representing the Reynolds operator, r: an <int> where $-|r|$ to $|r|$ is the range of coefficients of the random combinations of bases elements, v: an optional <int>
- Assume:** REY is the first return value of `group_reynolds` or `reynolds_molien`
- Display:** information about the various stages of the programme if v does not equal 0
- Return:** primary invariants (type <matrix>) of the invariant ring and an <intvec> listing some of the degrees where no non-trivial homogeneous invariants are to be found
- Theory:** Bases of homogeneous invariants are generated successively and random linear combinations are chosen as primary invariants that lower the dimension of the ideal generated by the previously found invariants (see "Generating a Noetherian Normalization of the Invariant Ring of a Finite Group" by Decker, Heydtmann, Schreyer (1998)).

Example:

```
LIB "finvar.lib";
ring R=3,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
list L=group_reynolds(A);
list l=primary_charp_no_molien_random(L[1],1);
print(l[1]);
↪ z2,x2+y2,x4+y4-z4
```

D.7.1.24 primary_charp_without_random

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\], page 1355](#)).

- Usage:** `primary_charp_without_random(G1,G2,...,r[,v]);`
 G1,G2,...: <matrices> generating a finite matrix group, r: an <int> where $-|r|$ to $|r|$ is the range of coefficients of the random combinations of bases elements, v: an optional <int>
- Display:** information about the various stages of the programme if v does not equal 0
- Return:** primary invariants (type <matrix>) of the invariant ring
- Theory:** Bases of homogeneous invariants are generated successively and random linear combinations are chosen as primary invariants that lower the dimension of the ideal generated by the previously found invariants (see "Generating a Noetherian Normalization of the Invariant Ring of a Finite Group" by Decker, Heydtmann, Schreyer (1998)). No Reynolds operator or Molien series is used.

Example:

```

LIB "finvar.lib";
ring R=2,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
matrix P=primary_charp_without_random(A,1);
print(P);
↳ x+y,z,xy

```

D.7.1.25 power_products

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\], page 1355](#)).

Usage: `power_products(dv,d);`
 dv: an `<intvec>` giving the degrees of homogeneous polynomials, d: the degree of the desired power products

Return: a `size(dv)*m <intmat>` where each column ought to be interpreted as containing the exponents of the corresponding polynomials. The product of the powers is then homogeneous of degree d.

Example:

```

LIB "finvar.lib";
intvec dv=5,5,5,10,10;
print(power_products(dv,10));
↳      2      1      1      0      0      0      0      0
↳      0      1      0      2      1      0      0      0
↳      0      0      1      0      1      2      0      0
↳      0      0      0      0      0      0      1      0
↳      0      0      0      0      0      0      0      1
print(power_products(dv,7));
↳      0
↳      0
↳      0
↳      0
↳      0

```

D.7.1.26 secondary_char0

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\], page 1355](#)).

Usage: `secondary_char0(P,REY,M[v][, "old"]);`
 P: a `1xn <matrix>` with homogeneous primary invariants, where n is the number of variables of the basering;
 REY: a `gxn <matrix>` representing the Reynolds operator, where g the size of the corresponding group;
 M: a `1x2 <matrix>` giving numerator and denominator of the Molien series;
 v: an optional `<int>`;
 "old": if this string occurs as (optional) parameter, then an old version of `secondary_char0` is used (for downward compatibility)

Assume: The characteristic of basering is zero;
 REY is the 1st return value of `group_reynolds()`, `reynolds_molien()` or the second one of `primary_invariants()`;
 M is the return value of `molien()` or the second one of `reynolds_molien()` or the third one of `primary_invariants()`

Return: Homogeneous secondary invariants and irreducible secondary invariants of the invariant ring (both type <matrix>)

Display: Information on the progress of the computations if v is an integer different from 0.

Theory: The secondary invariants are calculated by finding a basis (in terms of monomials) of the basering modulo the primary invariants, mapping those to invariants with the Reynolds operator. Among these images or their power products we pick secondary invariants using Groebner basis techniques (see S. King: Fast Computation of Secondary Invariants).

The size of this set can be read off from the Molien series.

Note: Secondary invariants are not uniquely determined by the given data. Specifically, the output of `secondary_char0(P,REY,M,"old")` will differ from the output of `secondary_char0(P,REY,M)`. However, the ideal generated by the irreducible homogeneous secondary invariants will be the same in both cases.

There are three internal parameters "pieces", "MonStep" and "IrrSwitch". The default values of the parameters should be fine in most cases. However, in some cases, different values may provide a better balance of memory consumption (smaller values) and speed (bigger values).

Example:

```
LIB "finvar.lib";
ring R=0,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
list L=primary_invariants(A);
matrix S,IS=secondary_char0(L[1..3],1);
↳
↳ We need to find
↳ 1 secondary invariant in degree 0
↳ 0 secondary invariants in degree 1
↳ 0 secondary invariants in degree 2
↳ 2 secondary invariants in degree 3
↳ 1 secondary invariant in degree 4
↳ In degree 0 we have: 1
↳
↳ Searching in degree 3 , we need to find 2 invariant(s)...
↳ Looking for Power Products...
↳ There are 2 irreducible secondary invariants in degree 3
↳ We found all 2 irreducibles in degree 3
↳
↳ Searching in degree 4 , we need to find 1 invariant(s)...
↳ Looking for Power Products...
↳ There are 1 irreducible secondary invariants in degree 4
↳ We found all 1 irreducibles in degree 4
↳
↳ We're done!
↳
print(S);
↳ 1,xyz,x2z-y2z,x3y-xy3
print(IS);
↳ xyz,x2z-y2z,x3y-xy3
```

See also: [Section D.7.1.27 \[irred_secondary_char0\]](#), page 1373.

D.7.1.27 `irred_secondary_char0`

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\], page 1355](#)).

- Usage:** `irred_secondary_char0(P,REY,M[,v][,"PP"])`;
 P: a $1 \times n$ <matrix> with homogeneous primary invariants, where n is the number of variables of the basering;
 REY: a $g \times n$ <matrix> representing the Reynolds operator, where g the size of the corresponding group;
 M: a 1×2 <matrix> giving numerator and denominator of the Molien series;
 v: an optional <int>;
 "PP": if this string occurs as (optional) parameter, then in all degrees power products of irr. sec. inv. will be computed.
- Return:** Irreducible homogeneous secondary invariants of the invariant ring (type <matrix>)
- Assume:** We are in the non-modular case, i.e., the characteristic of the basering does not divide the group order;
 REY is the 1st return value of `group_reynolds()`, `reynolds_molien()` or the second one of `primary_invariants()`;
 M is the return value of `molien()` or the second one of `reynolds_molien()` or the third one of `primary_invariants()`
- Display:** Information on the progress of computations if v does not equal 0
- Theory:** The secondary invariants are calculated by finding a basis (in terms of monomials) of the basering modulo the primary invariants, mapping those to invariants with the Reynolds operator. Among these images or their power products we pick secondary invariants using Groebner basis techniques (see S. King: Fast Computation of Secondary Invariants). The size of this set can be read off from the Molien series. Here, only irreducible secondary invariants are explicitly computed, which saves time and memory. Moreover, if no irr. sec. inv. in degree $d-1$ have been found and unless the last optional parameter "PP" is used, a Groebner basis of primary invariants and irreducible secondary invariants up to degree $d-2$ is computed, which allows to detect irr. sec. inv. in degree d without computing power products. There are three internal parameters "pieces", "MonStep" and "IrrSwitch". The default values of the parameters should be fine in most cases. However, in some cases, different values may provide a better balance of memory consumption (smaller values) and speed (bigger values).

Example:

```
LIB "finvar.lib";
ring r= 0, (a,b,c,d,e,f),dp;
matrix A1[6][6] = 0,0,0,1,0,0,0,0,1,0,0,0,0,1,0,0,0,0,1,0,0,0,0,1,0,0,0,0,0,0,0,0,0,0,0,1,0,0,0,0,
matrix A2[6][6] = 0,1,0,0,0,0,0,1,0,0,0,0,0,0,0,0,0,0,0,0,0,1,0,0,0,0,0,1,0,0,0,0,0,1,0,0,0,0,1,
list L = primary_invariants(A1,A2);
matrix IS = irred_secondary_char0(L[1],L[2],L[3],0);
IS;
→ IS[1,1]=ab+cd+ef
→ IS[1,2]=a2d+ad2+b2e+be2+c2f+cf2
→ IS[1,3]=ac2+b2d+a2e+ce2+d2f+bf2
→ IS[1,4]=b2c+bc2+d2e+de2+a2f+af2
→ IS[1,5]=a2c+bd2+c2e+ae2+b2f+df2
→ IS[1,6]=a2cd+abd2+abe2+b2ef+c2ef+cdf2
→ IS[1,7]=ab2d+ac2d+a2be+cd2f+ce2f+bef2
```

```

↳ IS[1,8]=a2bd+acd2+ab2e+c2df+be2f+cef2
↳ IS[1,9]=a3d+ad3+b3e+be3+c3f+cf3

```

See also: [Section D.7.1.26 \[secondary_char0\]](#), page 1371.

D.7.1.28 secondary_charp

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar_lib\]](#), page 1355).

- Usage:** `secondary_charp(P,REY,ringname[,v][,"old"]);`
P: a $1 \times n$ <matrix> with homogeneous primary invariants, where n is the number of variables of the basering;
REY: a $g \times n$ <matrix> representing the Reynolds operator, where g the size of the corresponding group;
ringname: a <string> giving the name of a ring of characteristic 0 containing a 1×2 <matrix> M giving numerator and denominator of the Molien series;
v: an optional <int>;
"old": if this string occurs as (optional) parameter, then an old version of `secondary_char0` is used (for downward compatibility)
- Assume:** The characteristic of basering is not zero;
REY is the 1st return value of `group_reynolds()`, `reynolds_molien()` or the second one of `primary_invariants()`;
'ringname' is the name of a ring of characteristic 0 that has been created by `molien()` or `reynolds_molien()` or `primary_invariants()`
- Return:** secondary invariants of the invariant ring (type <matrix>) and irreducible secondary invariants (type <matrix>)
- Display:** information if v does not equal 0
- Theory:** The secondary invariants are calculated by finding a basis (in terms of monomials) of the basering modulo the primary invariants, mapping those to invariants with the Reynolds operator. Among these images or their power products we pick secondary invariants using Groebner basis techniques (see S. King: Fast Computation of Secondary Invariants). The size of this set can be read off from the Molien series.

Example:

```

LIB "finvar.lib";
ring R=3,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
list L=primary_invariants(A);
matrix S,IS=secondary_charp(L[1..size(L)],1);
↳
↳ We need to find
↳ 1 secondary invariant in degree 0
↳ 0 secondary invariants in degree 1
↳ 0 secondary invariants in degree 2
↳ 2 secondary invariants in degree 3
↳ 1 secondary invariant in degree 4
↳ In degree 0 we have: 1
↳
↳ Searching in degree 3 , we need to find 2 invariant(s)...
↳ Looking for Power Products...

```

```

↳ There are 2 irreducible secondary invariants in degree 3
↳ We found all 2 irreducibles in degree 3
↳
↳ Searching in degree 4 , we need to find 1 invariant(s)...
↳ Looking for Power Products...
↳ There are 1 irreducible secondary invariants in degree 4
↳ We found all 1 irreducibles in degree 4
↳
↳ We're done!
↳
print(S);
↳ 1,xyz,x2z-y2z,x3y-xy3
print(IS);
↳ xyz,x2z-y2z,x3y-xy3

```

D.7.1.29 secondary_no_molien

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\], page 1355](#)).

Usage: `secondary_no_molien(P,REY[,deg_vec,v]);`
P: a 1xn <matrix> with primary invariants, REY: a gxn <matrix> representing the Reynolds operator, deg_vec: an optional <intvec> listing some degrees where no non-trivial homogeneous invariants can be found, v: an optional <int>

Assume: n is the number of variables of the basering, g the size of the group, REY is the 1st return value of `group_reynolds()`, `reynolds_molien()` or the second one of `primary_invariants()`, deg_vec is the second return value of `primary_char0_no_molien()`, `primary_charp_no_molien()`, `primary_char0_no_molien_random()` or `primary_charp_no_molien_random()`

Return: secondary invariants of the invariant ring (type <matrix>)

Display: information if v does not equal 0

Theory: Secondary invariants are calculated by finding a basis (in terms of monomials) of the basering modulo primary invariants, mapping those to invariants with the Reynolds operator and using these images as candidates for secondary invariants. We have the Reynolds operator, hence, we are in the non-modular case. Therefore, the invariant ring is Cohen-Macaulay, hence the number of secondary invariants is the product of the degrees of primary invariants divided by the group order.

Note: <secondary_and_irreducibles_no_molien> should usually be faster and of more useful functionality.

Example:

```

LIB "finvar.lib";
ring R=3,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
list L=primary_invariants(A,intvec(1,1,0));
// In that example, there are no secondary invariants
// in degree 1 or 2.
matrix S=secondary_no_molien(L[1..2],intvec(1,2),1);
↳
↳ We need to find 4 secondary invariants.
↳
↳ In degree 0 we have: 1

```

```

↳
↳ Searching in degree 3 ...
↳   We found sec. inv. number 2 in degree 3
↳   We found sec. inv. number 3 in degree 3
↳ Searching in degree 4 ...
↳   We found sec. inv. number 4 in degree 4
↳
↳ We're done!
↳
print(S);
↳ 1,xyz,x2z-y2z,x3y-xy3

```

See also: [Section D.7.1.31 \[secondary_and_irreducibles_no_molien\]](#), page 1377.

D.7.1.30 irred_secondary_no_molien

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\]](#), page 1355).

- Usage:** `irred_secondary_no_molien(P,REY[,deg_vec,v]);`
P: a $1 \times n$ <matrix> with primary invariants, REY: a $g \times n$ <matrix> representing the Reynolds operator, deg_vec: an optional <intvec> listing some degrees where no irreducible secondary invariants can be found, v: an optional <int>
- Assume:** n is the number of variables of the basering, g the size of the group, REY is the 1st return value of `group_reynolds()`, `reynolds_molien()` or the second one of `primary_invariants()`
- Return:** Irreducible secondary invariants of the invariant ring (type <matrix>)
- Display:** information if v does not equal 0
- Theory:** Irred. secondary invariants are calculated by finding a basis (in terms of monomials) of the basering modulo primary and previously found secondary invariants, mapping those to invariants with the Reynolds operator. Among these images we pick secondary invariants, using Groebner basis techniques.

Example:

```

LIB "finvar.lib";
ring R=3,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
list L=primary_invariants(A,intvec(1,1,0));
// In that example, there are no secondary invariants
// in degree 1 or 2.
matrix IS=irred_secondary_no_molien(L[1..2],intvec(1,2),1);
↳
↳ Searching irred. sec. inv. in degree 3
↳   We have 4 candidates for irred. secondaries
↳   We found irr. sec. inv. number 1 in degree 3
↳   We found irr. sec. inv. number 2 in degree 3
↳ Searching irred. sec. inv. in degree 4
↳   We have 1 candidates for irred. secondaries
↳   We found irr. sec. inv. number 3 in degree 4
↳ Searching irred. sec. inv. in degree 5
↳ Searching irred. sec. inv. in degree 6
↳ Searching irred. sec. inv. in degree 7
↳ Searching irred. sec. inv. in degree 8
↳ Searching irred. sec. inv. in degree 9

```

```

↳ Searching irred. sec. inv. in degree 10
↳ Searching irred. sec. inv. in degree 11
↳ Searching irred. sec. inv. in degree 12
↳ Searching irred. sec. inv. in degree 13
print(IS);
↳ x2z-y2z,xyz,x3y-xy3

```

See also: [Section D.7.1.27 \[irred_secondary_char0\]](#), page 1373.

D.7.1.31 secondary_and_irreducibles_no_molien

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar_lib\]](#), page 1355).

Usage: `secondary_and_irreducibles_no_molien(P,REY[,deg_vec,v]);` P: a $1 \times n$ <matrix> with primary invariants, REY: a $g \times n$ <matrix> representing the Reynolds operator, deg_vec: an optional <intvec> listing some degrees where no non-trivial homogeneous invariants can be found, v: an optional <int>

Assume: n is the number of variables of the basering, g the size of the group, REY is the 1st return value of `group_reynolds()`, `reynolds_molien()` or the second one of `primary_invariants()`

Return: secondary invariants of the invariant ring (type <matrix>) and irreducible secondary invariants (type <matrix>)

Display: information if v does not equal 0

Theory: Secondary invariants are calculated by finding a basis (in terms of monomials) of the basering modulo primary invariants, mapping those to invariants with the Reynolds operator. Among these images or their power products we pick secondary invariants using Groebner basis techniques (see S. King: Fast Computation of Secondary Invariants). We have the Reynolds operator, hence, we are in the non-modular case. Therefore, the invariant ring is Cohen-Macaulay, hence the number of secondary invariants is the product of the degrees of primary invariants divided by the group order.

Example:

```

LIB "finvar.lib";
ring R=3,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
list L=primary_invariants(A,intvec(1,1,0));
// In that example, there are no secondary invariants
// in degree 1 or 2.
matrix S,IS=secondary_and_irreducibles_no_molien(L[1..2],intvec(1,2),1);
↳
↳ We need to find 4 secondary invariants.
↳
↳ In degree 0 we have: 1
↳
↳ Searching in degree 3
↳ Looking for Power Products...
↳ Looking for irreducible secondary invariants in degree 3
↳ We found irreducible sec. inv. number 1 in degree 3
↳ We found irreducible sec. inv. number 2 in degree 3
↳
↳ Searching in degree 4
↳ Looking for Power Products...
↳ Looking for irreducible secondary invariants in degree 4

```

```

↳      We found irreducible sec. inv. number 1 in degree 4
↳
↳
↳      We're done!
↳
print(S);
↳ 1,xyz,x2z-y2z,x3y-xy3
print(IS);
↳ xyz,x2z-y2z,x3y-xy3

```

See also: [Section D.7.1.29 \[secondary_no_molien\]](#), page 1375.

D.7.1.32 secondary_not_cohen_macaulay

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar_lib\]](#), page 1355).

Usage: `secondary_not_cohen_macaulay(P,G1,G2,...[,v]);`
P: a $1 \times n$ <matrix> with primary invariants, G1,G2,...: $n \times n$ <matrices> generating a finite matrix group, v: optional <int>

Assume: n is the number of variables of the basering

Return: secondary invariants of the invariant ring (type <matrix>)

Display: information on the progress of computation if v does not equal 0

Theory: Secondary invariants are generated following "Generating Invariant Rings of Finite Groups over Arbitrary Fields" by Kemper (1996).

Example:

```

LIB "finvar.lib";
ring R=2,(x,y,z),dp;
matrix A[3][3]=0,1,0,-1,0,0,0,0,-1;
list L=primary_invariants(A);
matrix S=secondary_not_cohen_macaulay(L[1],A);
print(S);
↳ 1

```

D.7.1.33 orbit_variety

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar_lib\]](#), page 1355).

Usage: `orbit_variety(F,s);`
F: a $1 \times m$ <matrix> defining an invariant ring, s: a <string> giving the name for a new ring

Return: a Groebner basis (type <ideal>, named G) for the ideal defining the orbit variety (i.e. the syzygy ideal) in the new ring (named 's')

Theory: The ideal of algebraic relations of the invariant ring generators is calculated, then the variables of the original ring are eliminated and the polynomials that are left over define the orbit variety

Example:

```

LIB "finvar.lib";
ring R=0,(x,y,z),dp;
matrix F[1][7]=x2+y2,z2,x4+y4,1,x2z-1y2z,xyz,x3y-1xy3;
string newring="E";

```

```

orbit_variety(F,newring);
print(G);
↳ y(4)-1,
↳ y(5)*y(6)-y(2)*y(7),
↳ y(2)*y(3)-y(5)^2-2*y(6)^2,
↳ y(1)^2*y(6)-2*y(3)*y(6)+y(5)*y(7),
↳ y(1)^2*y(5)-y(3)*y(5)-2*y(6)*y(7),
↳ y(1)^2*y(2)-y(2)*y(3)-2*y(6)^2,
↳ y(1)^4-3*y(1)^2*y(3)+2*y(3)^2+2*y(7)^2
basing;
↳ // coefficients: QQ
↳ // number of vars : 7
↳ //          block  1 : ordering dp
↳ //          : names  y(1) y(2) y(3) y(4) y(5) y(6) y(7)
↳ //          block  2 : ordering C

```

D.7.1.34 rel_orbit_variety

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar.lib\], page 1355](#)).

Usage: `rel_orbit_variety(I,F[,s]);`
 I: an <ideal> invariant under the action of a group,
 F: a 1xm <matrix> defining the invariant ring of this group.
 s: optional <string>; if s is present then (for downward compatibility) the old procedure <relative_orbit_variety> is called, and in this case s gives the name of a new <ring>.

Return: Without optional string s, a list L of two rings is returned.
 The ring L[1] carries a weighted degree order with variables y(1..m), the weight of y(k) equal to the degree of the k-th generators F[1,k] of the invariant ring.
 L[1] contains a Groebner basis (type <ideal>, named G) of the ideal defining the relative orbit variety with respect to I.
 The ring L[2] has the variables of the basering together with y(1..m) and carries a block order: The first block is the order of the basering, the second is the weighted degree order occurring in L[1]. L[2] contains G and a Groebner basis (type <ideal>, named Conv) such that if p is any invariant polynomial expressed in the variables of the basering then `reduce(p,Conv)` is a polynomial in the new variables y(1..m) such that evaluation at the generators of the invariant ring yields p. This can be used to avoid the application of <algebra_containment> (see [Section D.4.2.1 \[algebra_containment\], page 880](#)).
 For the case of optional string s, the function is equivalent to [Section D.7.1.35 \[relative_orbit_variety\], page 1380](#).

Theory: A Groebner basis of the ideal of algebraic relations of the invariant ring generators is calculated, then one of the basis elements plus the ideal generators. The variables of the original ring are eliminated and the polynomials that are left define the relative orbit variety with respect to I. The elimination is done by a weighted blockorder that has the advantage of dealing with quasi-homogeneous ideals.

Note: We provide the ring L[1] for the sake of downward compatibility, since it is closer to the ring returned by `relative_orbit_variety` than L[2]. However, L[1] carries a weighted degree order, whereas the ring returned by `relative_orbit_variety` is lexicographically ordered.

Example:

```
LIB "finvar.lib";
```

```

ring R=0,(x,y,z),dp;
matrix F[1][3]=x+y+z,xy+xz+yz,xyz;
ideal I=x2+y2+z2-1,x2y+y2z+z2x-2x-2y-2z,xy2+yz2+zx2-2x-2y-2z;
list L = rel_orbit_variety(I,F);
↳
↳ // 'rel_orbit_variety' created a list of two rings.
↳ // If L is the name of that list, you can access
↳ // the first ring by
↳ //   def R = L[1]; setring R;
↳ // (similarly for the second ring)
def AllR = L[2];
setring(AllR);
print(G);
↳ y(1)^2-2*y(2)-1,
↳ y(1)*y(2)-3*y(3)-4*y(1),
↳ 2*y(2)^2-3*y(1)*y(3)-7*y(2)-4,
↳ 6*y(3)^2-15*y(1)*y(3)+25*y(2)+12
print(Conv);
↳ x+y+z-y(1),
↳ y^2+y*z+z^2-y*y(1)-z*y(1)+y(2),
↳ z^3-z^2*y(1)+z*y(2)-y(3)
basing;
↳ // coefficients: QQ
↳ // number of vars : 6
↳ //      block  1 : ordering dp
↳ //                : names    x y z
↳ //      block  2 : ordering wp
↳ //                : names    y(1) y(2) y(3)
↳ //                : weights    1   2   3
↳ //      block  3 : ordering C

```

See also: [Section D.7.1.35 \[relative_orbit_variety\]](#), page 1380.

D.7.1.35 relative_orbit_variety

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar_lib\]](#), page 1355).

Usage: `relative_orbit_variety(I,F,s);`
 I: an <ideal> invariant under the action of a group,
 F: a 1xm <matrix> defining the invariant ring of this group,
 s: a <string> giving a name for a new ring

Return: The procedure ends with a new ring named `s`.
 It contains a Groebner basis
 (type <ideal>, named `G`) for the ideal defining the
 relative orbit variety with respect to `I` in the new ring.

Theory: A Groebner basis of the ideal of algebraic relations of the invariant ring generators is calculated, then one of the basis elements plus the ideal generators. The variables of the original ring are eliminated and the polynomials that are left define the relative orbit variety with respect to `I`.

Note: This procedure is now replaced by `rel_orbit_variety` (see [Section D.7.1.34 \[rel_orbit_variety\]](#), page 1379), which uses a different elimination order that should usually allow faster computations.

Example:

```

LIB "finvar.lib";
ring R=0,(x,y,z),dp;
matrix F[1][3]=x+y+z,xy+xz+yz,xyz;
ideal I=x2+y2+z2-1,x2y+y2z+z2x-2x-2y-2z,xy2+yz2+zx2-2x-2y-2z;
string newring="E";
relative_orbit_variety(I,F,newring);
print(G);
↳ 27*y(3)6-513*y(3)4+33849*y(3)2-784,
↳ 1475*y(2)+9*y(3)4-264*y(3)2+736,
↳ 8260*y(1)+9*y(3)5-87*y(3)3+5515*y(3)
basing;
↳ // coefficients: QQ
↳ // number of vars : 3
↳ //      block  1 : ordering lp
↳ //              : names    y(1) y(2) y(3)
↳ //      block  2 : ordering C

```

See also: [Section D.7.1.34 \[rel_orbit_variety\]](#), page 1379.

D.7.1.36 image_of_variety

Procedure from library `finvar.lib` (see [Section D.7.1 \[finvar_lib\]](#), page 1355).

Usage: `image_of_variety(I,F);`
 I: an arbitray <ideal>,
 F: a 1xm <matrix> defining an invariant ring of some matrix group

Return: The <ideal> defining the image under that group of the variety defined by I

Theory: `rel_orbit_variety(I,F)` is called and the newly introduced variables in the output are replaced by the generators of the invariant ring. This ideal in the original variables defines the image of the variety defined by I

Example:

```

LIB "finvar.lib";
ring R=0,(x,y,z),dp;
matrix F[1][3]=x+y+z,xy+xz+yz,xyz;
ideal I=xy;
print(image_of_variety(I,F));
↳ xyz

```

D.7.2 ainvar_lib

Library: `ainvar.lib`

Purpose: Invariant Rings of the Additive Group

Authors: Gerhard Pfister (email: pfister@mathematik.uni-kl.de), Gert-Martin Greuel (email: greuel@mathematik.uni-kl.de)

Procedures:

D.7.2.1 invariantRing

Procedure from library `ainvar.lib` (see [Section D.7.2 \[ainvar.lib\], page 1381](#)).

Usage: `invariantRing(m,p,q,b[r,pa]);` m matrix, p,q poly, b,r int, pa string

Assume: p,q variables with $m(p)=q$ and q invariant under m
i.e. if $p=x(i)$ and $q=x(j)$ then $m[j,1]=0$ and $m[i,1]=x(j)$

Return: ideal, containing generators of the ring of invariants of the additive group $(K,+)$ given by the vector field

$$m = m[1,1]*d/dx(1) + \dots + m[n,1]*d/dx(n).$$

If $b>0$ the computation stops after all invariants of degree $\leq b$ (and at least one of higher degree) are found or when all invariants are computed.

If $b\leq 0$, the computation continues until all generators of the ring of invariants are computed (should be used only if the ring of invariants is known to be finitely generated, otherwise the algorithm might not stop).

If $r=1$ a different reduction is used which is sometimes faster (default $r=0$).

Display: if pa is given (any string as 5th or 6th argument), the computation pauses whenever new invariants are found and displays them

Theory: The algorithm for computing the ring of invariants works in char 0 or sufficiently large characteristic.

$(K,+)$ acts as the exponential of the vector field defined by the matrix m.

For background see G.-M. Greuel, G. Pfister,

Geometric quotients of unipotent group actions, Proc. London Math. Soc. (3) 67, 75-105 (1993).

Example:

```
LIB "ainvar.lib";
//Winkelmann: free action but Spec(k[x(1),...,x(5)]) --> Spec(invariant ring)
//is not surjective
ring rw=0,(x(1..5)),dp;
matrix m[5][1];
m[3,1]=x(1);
m[4,1]=x(2);
m[5,1]=1+x(1)*x(4)+x(2)*x(3);
ideal in=invariantRing(m,x(3),x(1),0);          //compute full invariant ring
in;
  ↪ in[1]=x(1)
  ↪ in[2]=x(2)
  ↪ in[3]=x(2)*x(3)*x(4)-x(2)*x(5)+x(4)
  ↪ in[4]=x(1)*x(3)*x(4)-x(1)*x(5)+x(3)
//Deveney/Finston: The ring of invariants is not finitely generated
ring rf=0,(x(1..7)),dp;
matrix m[7][1];
m[4,1]=x(1)^3;
m[5,1]=x(2)^3;
m[6,1]=x(3)^3;
m[7,1]=(x(1)*x(2)*x(3))^2;
ideal in=invariantRing(m,x(4),x(1),6);          //all invariants up to degree 6
in;
  ↪ in[1]=x(1)
  ↪ in[2]=x(3)
```

```

↳ in[3]=x(2)
↳ in[4]=x(3)^3*x(4)-x(1)^3*x(6)
↳ in[5]=x(2)^3*x(4)-x(1)^3*x(5)
↳ in[6]=x(2)^2*x(3)^2*x(4)-x(1)*x(7)
↳ in[7]=x(1)^2*x(2)^2*x(6)-x(3)*x(7)
↳ in[8]=x(1)^2*x(3)^2*x(5)-x(2)*x(7)
↳ in[9]=x(1)^2*x(2)*x(3)^4*x(4)*x(5)+x(1)^2*x(2)^4*x(3)*x(4)*x(6)-x(1)^5*x(\
2)*x(3)*x(5)*x(6)-2*x(2)^2*x(3)^2*x(4)*x(7)+x(1)*x(7)^2

```

D.7.2.2 derivat

Procedure from library `ainvar.lib` (see [Section D.7.2 \[ainvar.lib\], page 1381](#)).

Usage: `derivat(m,id)`; m matrix, id poly/vector/ideal

Assume: m is an $n \times 1$ matrix, where n = number of variables of the basering

Return: poly/vector/ideal (same type as input), result of applying the vector field by the matrix m componentwise to id ;

Note: the vector field is $m[1,1]*d/dx(1) + \dots + m[1,n]*d/dx(n)$

Example:

```

LIB "ainvar.lib";
ring q=0,(x,y,z,u,v,w),dp;
poly f=2xz-y2;
matrix m[6][1] =x,y,0,u,v;
derivat(m,f);
↳ -2y2+2xz
vector v = [2xz-y2,u6-3];
derivat(m,v);
↳ 6u6*gen(2)-2y2*gen(1)+2xz*gen(1)
derivat(m,ideal(2xz-y2,u6-3));
↳ _[1]=-2y2+2xz
↳ _[2]=6u6

```

D.7.2.3 actionIsProper

Procedure from library `ainvar.lib` (see [Section D.7.2 \[ainvar.lib\], page 1381](#)).

Usage: `actionIsProper(m)`; m matrix

Assume: m is a $n \times 1$ matrix, where n = number of variables of the basering

Return: `int` = 1, if the action defined by m is proper, 0 if not

Note: m defines a group action which is the exponential of the vector field $m[1,1]*d/dx(1) + \dots + m[1,n]*d/dx(n)$

Example:

```

LIB "ainvar.lib";
ring rf=0,x(1..7),dp;
matrix m[7][1];
m[4,1]=x(1)^3;
m[5,1]=x(2)^3;
m[6,1]=x(3)^3;
m[7,1]=(x(1)*x(2)*x(3))^2;

```

```

actionIsProper(m);
↳ 0
ring rd=0,x(1..5),dp;
matrix m[5][1];
m[3,1]=x(1);
m[4,1]=x(2);
m[5,1]=1+x(1)*x(4)^2;
actionIsProper(m);
↳ 1

```

D.7.2.4 reduction

Procedure from library `ainvar.lib` (see [Section D.7.2 \[ainvar.lib\], page 1381](#)).

Usage: `reduction(p,I[,q,n]);` p poly, I ideal, [q monomial, n int (optional)]

Return: a polynomial equal to $p-H(f_1,\dots,f_r)$, in case the leading term $LT(p)$ of p is of the form $H(LT(f_1),\dots,LT(f_r))$ for some polynomial H in r variables over the base field, $I=f_1,\dots,f_r$; if q is given, a maximal power a is computed such that q^a divides $p-H(f_1,\dots,f_r)$, and then $(p-H(f_1,\dots,f_r))/q^a$ is returned; return p if no H is found
if $n=1$, a different algorithm is chosen which is sometimes faster (default: $n=0$; q and n can be given (or not) in any order)

Note: this is a kind of SAGBI reduction in the subalgebra $K[f_1,\dots,f_r]$ of the basering

Example:

```

LIB "ainvar.lib";
ring q=0,(x,y,z,u,v,w),dp;
poly p=x2yz-x2v;
ideal dom =x-w,u2w+1,yz-v;
reduction(p,dom);
↳ 2xyzw-yzw2-2xvw+vw2
reduction(p,dom,w);
↳ 2xyz-yzw-2xv+vw

```

D.7.2.5 completeReduction

Procedure from library `ainvar.lib` (see [Section D.7.2 \[ainvar.lib\], page 1381](#)).

Usage: `completeReduction(p,I[,q,n]);` p poly, I ideal, [q monomial, n int]

Return: a polynomial, the SAGBI reduction of the polynomial p with respect to I via the procedure 'reduction' as long as possible
if $n=1$, a different algorithm is chosen which is sometimes faster (default: $n=0$; q and n can be given (or not) in any order)

Note: help reduction; shows an explanation of SAGBI reduction

Example:

```

LIB "ainvar.lib";
ring q=0,(x,y,z,u,v,w),dp;
poly p=x2yz-x2v;
ideal dom =x-w,u2w+1,yz-v;
completeReduction(p,dom);
↳ 2xyzw-yzw2-2xvw+vw2
completeReduction(p,dom,w);
↳ 0

```

D.7.2.6 localInvar

Procedure from library `ainvar.lib` (see [Section D.7.2 \[ainvar.lib\], page 1381](#)).

Usage: `localInvar(m,p,q,h)`; m matrix, p,q,h polynomials

Assume: $m(q)$ and h are invariant under the vector field m , i.e. $m(m(q))=m(h)=0$ h must be a ring variable

Return: a polynomial, the invariant polynomial of the vector field

$$m = m[1,1]*d/dx(1) + \dots + m[n,1]*d/dx(n)$$

with respect to p,q,h . It is defined as follows: set $inv = p$ if p is invariant, and else set $inv = m(q)^N * \sum_{i=1..N-1} \{ (-1)^i * (1/i!) * m^i(p) * (q/m(q))^i \}$ where $m^N(p) = 0$, $m^{(N-1)}(p) \neq 0$; the result is inv divided by h as often as possible

Example:

```
LIB "ainvar.lib";
ring q=0,(x,y,z),dp;
matrix m[3][1];
m[2,1]=x;
m[3,1]=y;
poly in=localInvar(m,z,y,x);
in;
↳ -1/2y2+xz
```

D.7.2.7 furtherInvar

Procedure from library `ainvar.lib` (see [Section D.7.2 \[ainvar.lib\], page 1381](#)).

Usage: `furtherInvar(m,id,karl,q)`; m matrix, $id,karl$ ideals, q poly, n int

Assume: $karl,id,q$ are invariant under the vector field m ,
moreover, q must be a variable

Return: list of two ideals, the first ideal contains further invariants of the vector field

$$m = \sum m[i,1]*d/dx(i) \text{ with respect to } id,p,q,$$

i.e. we compute elements in the (invariant) subring generated by id which are divisible by q and divide them by q as often as possible. The second ideal contains all invariants given before. If $n=1$, a different algorithm is chosen which is sometimes faster (default: $n=0$)

Example:

```
LIB "ainvar.lib";
ring r=0,(x,y,z,u),dp;
matrix m[4][1];
m[2,1]=x;
m[3,1]=y;
m[4,1]=z;
ideal id=localInvar(m,z,y,x),localInvar(m,u,y,x);
ideal karl=id,x;
list in=furtherInvar(m,id,karl,x);
in;
↳ [1]:
↳ _[1]=y2z2-8/3xz3-2y3u+6xyzu-3x2u2
↳ [2]:
```

```

↳  _[1]=-1/2y2+xz
↳  _[2]=1/3y3-xyz+x2u
↳  _[3]=x

```

D.7.2.8 sortier

Procedure from library `ainvar.lib` (see [Section D.7.2 \[ainvar.lib\]](#), page 1381).

Usage: `sortier(id)`; `id` ideal/module

Return: the same ideal/module but with generators ordered by their leading terms, starting with the smallest

Example:

```

LIB "ainvar.lib";
ring q=0, (x,y,z,u,v,w), dp;
ideal i=w,x,z,y,v;
sortier(i);
↳  _[1]=w
↳  _[2]=v
↳  _[3]=z
↳  _[4]=y
↳  _[5]=x

```

D.7.3 rinvar.lib

Library: `rinvar.lib`

Purpose: Invariant Rings of Reductive Groups

Author: Thomas Bayer, `tbayer@in.tum.de`
<http://wwwmayr.informatik.tu-muenchen.de/personen/bayert/> Current Address: Institut fuer Informatik, TU Muenchen

Overview: Implementation based on Derksen's algorithm. Written in the scope of the diploma thesis (advisor: Prof. Gert-Martin Greuel) 'Computations of moduli spaces of semi-quasihomogenous singularities and an implementation in Singular'

Procedures: See also: [Section D.6.14 \[qhmoduli.lib\]](#), page 1332; [Section D.8.6 \[zeroset.lib\]](#), page 1433.

D.7.3.1 HilbertSeries

Procedure from library `rinvar.lib` (see [Section D.7.3 \[rinvar.lib\]](#), page 1386).

Usage: `HilbertSeries(I, w)`; ideal `I`, intvec `w`

Purpose: compute the polynomial `p` of the Hilbert Series, represented by `p/q`, of the ring $K[t_1, \dots, t_m, y_1, \dots, y_r]/I$ where '`w`' are the weights of the variables, computed, e.g., by 'HilbertWeights', '`I`' is of the form $I[1] - y_1, \dots, I[r] - y_r$ and is quasihomogenous w.r.t. '`w`'

Return: intvec

Note: the leading 0 of the result does not belong to `p`, but is needed in the Hilbert driven 'std'.

D.7.3.2 HilbertWeights

Procedure from library `rinvar.lib` (see [Section D.7.3 \[rinvar.lib\], page 1386](#)).

Purpose: compute the weights of the "slack" variables needed for the computation of the algebraic relations of the generators of 'I' s.t. the Hilbert driven 'std' can be used.

Return: intvec

Assume: basering = $K[t_1, \dots, t_m, \dots]$, 'I' is quasihomogenous w.r.t. 'w' and contains only polynomials in t_1, \dots, t_m

D.7.3.3 ImageVariety

Procedure from library `rinvar.lib` (see [Section D.7.3 \[rinvar.lib\], page 1386](#)).

Usage: ImageVariety(ideal I, F [, w]); ideal I; F is a list/ideal, intvec w.

Purpose: compute the Zariski closure of the image of the variety of I under the morphism F.

Note: if 'I' and 'F' are quasihomogenous w.r.t. 'w' then the Hilbert-driven 'std' is used.

Return: polynomial ring over the same ground field, containing the ideal 'imageid'. The variables are $Y(1), \dots, Y(k)$ where $k = \text{size}(F) - \text{'imageid'}$ is the ideal of the Zariski closure of $F(X)$ where X is the variety of I.

Example:

```
LIB "rinvar.lib";
ring B = 0, (x,y), dp;
ideal I = x4 - y4;
ideal F = x2, y2, x*y;
def R = ImageVariety(I, F);
↳
↳ // 'ImageVariety' created a new ring.
↳ // To see the ring, type (if the name 'R' was assigned to the return value):
↳ show(R);
↳ // To access the ideal of the image variety, type
↳ setring R; imageid;
↳
↳ setring R;
↳ imageid;
↳ imageid[1]=Y(1)*Y(2)-Y(3)^2
↳ imageid[2]=Y(1)^2-Y(2)^2
↳ imageid[3]=Y(2)^3-Y(1)*Y(3)^2
```

D.7.3.4 ImageGroup

Procedure from library `rinvar.lib` (see [Section D.7.3 \[rinvar.lib\], page 1386](#)).

Usage: ImageGroup(G, action); ideal G, action;

Purpose: compute the ideal of the image of G in $GL(m, K)$ induced by the linear action 'action', where G is an algebraic group and 'action' defines an action of G on K^m ($\text{size}(\text{action}) = m$).

Return: ring, a polynomial ring over the same ground field as the basering, containing the ideals 'groupid' and 'actionid'.
 - 'groupid' is the ideal of the image of G (order \leq order of G) - 'actionid' defines the linear action of 'groupid' on K^m .

Note: 'action' and 'actionid' have the same orbits
 all variables which give only rise to 0's in the $m \times m$ matrices of G have been omitted.

Assume: basering $K[s(1..r), t(1..m)]$ has $r + m$ variables, G is the ideal of an algebraic group and F is an action of G on K^m . G contains only the variables $s(1)..s(r)$. The action 'action' is given by polynomials f_1, \dots, f_m in basering, s.t. on the ring level we have
 $K[t_1, \dots, t_m] \rightarrow K[s_1, \dots, s_r, t_1, \dots, t_m]/G$
 $t_i \rightarrow f_i(s_1, \dots, s_r, t_1, \dots, t_m)$

Example:

```
LIB "rinvar.lib";
ring B = 0, (s(1..2), t(1..2)), dp;
ideal G = s(1)^3-1, s(2)^10-1;
ideal action = s(1)*s(2)^8*t(1), s(1)*s(2)^7*t(2);
def R = ImageGroup(G, action);
↳
↳ // 'ImageGroup' created a new ring.
↳ // To see the ring, type (if the name 'R' was assigned to the return value):
↳ show(R);
↳ // To access the ideal of the image of the input group and to access the new
↳ // action of the group, type
↳ setring R; groupid; actionid;
↳
↳ setring R;
↳ groupid;
↳ groupid[1]=-s(1)+s(2)^4
↳ groupid[2]=s(1)^8-s(2)^2
↳ groupid[3]=s(1)^7*s(2)^2-1
↳ actionid;
↳ actionid[1]=s(1)*t(1)
↳ actionid[2]=s(2)*t(2)
```

D.7.3.5 InvariantRing

Procedure from library `rinvar.lib` (see [Section D.7.3 \[rinvar.lib\]](#), page 1386).

Usage: `InvariantRing(G, Gact [, opt]);` ideal G, Gact; int opt

Purpose: compute generators of the invariant ring of G w.r.t. the action 'Gact'

Assume: G is a finite group and 'Gact' is a linear action.

Return: ring R; this ring comes with the ideals 'invars' and 'groupid' and with the poly 'newA':
 - 'invars' contains the algebra generators of the invariant ring - 'groupid' is the ideal of G in the new ring
 - 'newA' is the new representation of the primitive root of the minimal polynomial of the ring which was active when calling the procedure (if the minpoly did not change, 'newA' is set to 'a').

Note: the minimal polynomial of the output ring depends on some random choices

Example:

```
LIB "rinvar.lib";
ring B = 0, (s(1..2), t(1..2)), dp;
ideal G = -s(1)+s(2)^3, s(1)^4-1;
ideal action = s(1)*t(1), s(2)*t(2);
def R = InvariantRing(std(G), action);
↳
↳ // 'InvariantRing' created a new ring.
↳ // To see the ring, type (if the name 'R' was assigned to the return value):
↳
↳     show(R);
↳ // To access the generators of the invariant ring type
↳     setring R; invars;
↳ // Note that the input group G is stored in R as the ideal 'groupid'; to
↳ // see it, type
↳     groupid;
↳ // Note that 'InvariantRing' might change the minimal polynomial
↳ // The representation of the algebraic number is given by 'newA'
↳
setring R;
invars;
↳ invars[1]=t(1)^4
↳ invars[2]=t(1)^3*t(2)^3
↳ invars[3]=t(1)^2*t(2)^6
↳ invars[4]=t(1)*t(2)^9
↳ invars[5]=t(2)^12
```

D.7.3.6 InvariantQ

Procedure from library `rinvar.lib` (see [Section D.7.3 \[rinvar.lib\], page 1386](#)).

Usage: `InvariantQ(f, G, action)`; poly `f`; ideal `G`, action

Purpose: check whether the polynomial `f` is invariant w.r.t. `G`, where `G` acts via 'action' on K^m .

Assume: `basing = K[s_1,...,s_m,t_1,...,t_m]` where $K = \mathbb{Q}$ or $K = \mathbb{Q}(a)$ and `minpoly != 0`, `f` contains only `t_1,...,t_m`, `G` is the ideal of an algebraic group and a standardbasis.

Return: `int`;
0 if `f` is not invariant,
1 if `f` is invariant

Note: `G` need not be finite

D.7.3.7 LinearizeAction

Procedure from library `rinvar.lib` (see [Section D.7.3 \[rinvar.lib\], page 1386](#)).

Usage: `LinearizeAction(G,action,r)`; ideal `G`, action; `int r`

Purpose: linearize the group action 'action' and find an equivariant embedding of K^m where `m = size(action)`.

Assume: `G` contains only variables `var(1..r)` (`r = nrs`)
`basing = K[s(1..r),t(1..m)]`, $K = \mathbb{Q}$ or $K = \mathbb{Q}(a)$ and `minpoly != 0`.

Return: polynomial ring containing the ideals 'actionid', 'embedid', 'groupid' - 'actionid' is the ideal defining the linearized action of G - 'embedid' is a parameterization of an equivariant embedding (closed) - 'groupid' is the ideal of G in the new ring

Note: set printlevel > 0 to see a trace

Example:

```
LIB "rinvar.lib";
ring B = 0,(s(1..5), t(1..3)),dp;
ideal G = s(3)-s(4), s(2)-s(5), s(4)*s(5), s(1)^2*s(4)+s(1)^2*s(5)-1, s(1)^2*s(5)^2-
ideal action = -s(4)*t(1)+s(5)*t(1), -s(4)^2*t(2)+2*s(4)^2*t(3)^2+s(5)^2*t(2), s(4)*
LinearActionQ(action, 5);
↳ 0
def R = LinearizeAction(G, action, 5);
↳
↳ // 'LinearizeAction' created a new ring.
↳ // To see the ring, type (if the name 'R' was assigned to the return valu\
e):
↳ show(R);
↳ // To access the new action and the equivariant embedding, type
↳ setring R; actionid; embedid; groupid
↳
setring R;
R;
↳ // coefficients: QQ
↳ // number of vars : 9
↳ // block 1 : ordering dp
↳ // : names s(1) s(2) s(3) s(4) s(5) t(1) t(2) t(3) t(\
4)
↳ // block 2 : ordering C
actionid;
↳ actionid[1]=-s(4)*t(1)+s(5)*t(1)
↳ actionid[2]=-s(4)^2*t(2)+s(5)^2*t(2)+2*s(4)^2*t(4)
↳ actionid[3]=s(4)*t(3)+s(5)*t(3)
↳ actionid[4]=s(4)^2*t(4)+s(5)^2*t(4)
embedid;
↳ embedid[1]=t(1)
↳ embedid[2]=t(2)
↳ embedid[3]=t(3)
↳ embedid[4]=t(3)^2
groupid;
↳ groupid[1]=s(3)-s(4)
↳ groupid[2]=s(2)-s(5)
↳ groupid[3]=s(4)*s(5)
↳ groupid[4]=s(1)^2*s(4)+s(1)^2*s(5)-1
↳ groupid[5]=s(1)^2*s(5)^2-s(5)
↳ groupid[6]=s(4)^4-s(5)^4+s(1)^2
↳ groupid[7]=s(1)^4+s(4)^3-s(5)^3
↳ groupid[8]=s(5)^5-s(1)^2*s(5)
LinearActionQ(actionid, 5);
↳ 1
```

D.7.3.8 LinearActionQ

Procedure from library `rinvar.lib` (see [Section D.7.3 \[rinvar.lib\], page 1386](#)).

Usage: `LinearActionQ(action,nrs)`; ideal action, int nrs

Purpose: check whether the action defined by 'action' is linear w.r.t. the variables `var(nrs + 1...nvars(basering))`.

Return: 0 action not linear
1 action is linear

Example:

```
LIB "rinvar.lib";
ring R = 0, (s(1..5), t(1..3)), dp;
ideal G = s(3)-s(4), s(2)-s(5), s(4)*s(5), s(1)^2*s(4)+s(1)^2*s(5)-1,
s(1)^2*s(5)^2-s(5), s(4)^4-s(5)^4+s(1)^2, s(1)^4+s(4)^3-s(5)^3,
s(5)^5-s(1)^2*s(5);
ideal Gaction = -s(4)*t(1)+s(5)*t(1),
-s(4)^2*t(2)+2*s(4)^2*t(3)^2+s(5)^2*t(2),
s(4)*t(3)+s(5)*t(3);
LinearActionQ(Gaction, 5);
↪ 0
LinearActionQ(Gaction, 8);
↪ 1
```

D.7.3.9 LinearCombinationQ

Procedure from library `rinvar.lib` (see [Section D.7.3 \[rinvar.lib\], page 1386](#)).

Usage: `LinearCombination(I, f)`; ideal I, poly f

Purpose: test whether f can be written as a linear combination of the generators of I.

Return: 0 f is not a linear combination
1 f is a linear combination

D.7.3.10 MinimalDecomposition

Procedure from library `rinvar.lib` (see [Section D.7.3 \[rinvar.lib\], page 1386](#)).

Usage: `MinimalDecomposition(f,a,b)`; poly f; int a, b.

Purpose: decompose f as a sum $M[1,1]*M[2,1] + \dots + M[1,r]*M[2,r]$ where $M[1,i]$ contains only $s(1..a)$, $M[2,i]$ contains only $t(1..b)$ s.t. r is minimal

Assume: f polynomial in $K[s(1..a),t(1..b)]$, $K = \mathbb{Q}$ or $K = \mathbb{Q}(a)$ and `minpoly != 0`

Return: 2 x r matrix M s.t. $f = M[1,1]*M[2,1] + \dots + M[1,r]*M[2,r]$

Example:

```
LIB "rinvar.lib";
ring R = 0, (s(1..2), t(1..2)), dp;
poly h = s(1)*(t(1) + t(1)^2) + (t(2) + t(2)^2)*(s(1)^2 + s(2));
matrix M = MinimalDecomposition(h, 2, 2);
M;
↪ M[1,1]=s(1)^2+s(2)
↪ M[1,2]=s(1)
```

```

↳ M[2,1]=t(2)^2+t(2)
↳ M[2,2]=t(1)^2+t(1)
M[1,1]*M[2,1] + M[1,2]*M[2,2] - h;
↳ 0

```

D.7.3.11 NullCone

Procedure from library `rinvar.lib` (see [Section D.7.3 \[rinvar.lib\], page 1386](#)).

Usage: `NullCone(G, action)`; ideal G, action

Purpose: compute the ideal of the nullcone of the linear action of G on K^n , given by 'action', by means of Deksen's algorithm

Assume: `basing = K[s(1..r),t(1..n)]`, $K = \mathbb{Q}$ or $K = \mathbb{Q}(a)$ and `minpoly != 0`, G is an ideal of a reductive algebraic group in $K[s(1..r)]$, 'action' is a linear group action of G on K^n ($n = \text{ncols}(\text{action})$)

Return: ideal of the nullcone of G.

Note: the generators of the nullcone are homogenous, but in general not invariant

Example:

```

LIB "rinvar.lib";
ring R = 0, (s(1..2), x, y), dp;
ideal G = -s(1)+s(2)^3, s(1)^4-1;
ideal action = s(1)*x, s(2)*y;
ideal inv = NullCone(G, action);
inv;
↳ inv[1]=x^4
↳ inv[2]=x^3*y^3
↳ inv[3]=x^2*y^6
↳ inv[4]=x*y^9
↳ inv[5]=y^12

```

D.7.3.12 ReynoldsImage

Procedure from library `rinvar.lib` (see [Section D.7.3 \[rinvar.lib\], page 1386](#)).

Usage: `ReynoldsImage(RO, f)`; list RO, poly f

Purpose: compute the Reynolds image of the polynomial f, where RO represents the Reynolds operator

Return: poly

D.7.3.13 ReynoldsOperator

Procedure from library `rinvar.lib` (see [Section D.7.3 \[rinvar.lib\], page 1386](#)).

Usage: `ReynoldsOperator(G, action [, opt])`; ideal G, action; int opt

Purpose: compute the Reynolds operator of the group G which acts via 'action'

Return: polynomial ring R over a simple extension of the ground field of the basering (the extension might be trivial), containing a list 'ROelements', the ideals 'id', 'actionid' and the polynomial 'newA'. $R = K(a)[s(1..r),t(1..n)]$.
- 'ROelements' is a list of ideals, each ideal represents a substitution map $F : R \rightarrow R$

according to the zero-set of G - 'id' is the ideal of G in the new ring
 - 'newA' is the new representation of a in terms of a . If the basering does not contain
 a parameter then 'newA' = 'a'.

Assume: basering = $K[s(1..r), t(1..n)]$, $K = \mathbb{Q}$ or $K = \mathbb{Q}(a')$ and minpoly $\neq 0$, G is the ideal of
 a finite group in $K[s(1..r)]$, 'action' is a linear group action of G

D.7.3.14 SimplifyIdeal

Procedure from library `rinvar.lib` (see [Section D.7.3 \[rinvar.lib\]](#), page 1386).

Purpose: simplify ideal I to the ideal I' , do not change the names of the first m variables, new
 ideal I' might contain less variables. I' contains variables `var(1..m)`

Return: list
 _[1] ideal I'
 _[2] ideal representing a map ϕ to a ring with probably less vars. s.th. $\phi(I) = I'$
 _[3] list of variables
 _[4] list from 'elimpart'

D.7.4 stratify_lib

Library: stratify.lib

Purpose: Algorithmic Stratification for Unipotent Group-Actions

Author: Anne Fruehbis-Krueger, anne@mathematik.uni-kl.de

Procedures:

D.7.4.1 prepMat

Procedure from library `stratify.lib` (see [Section D.7.4 \[stratify.lib\]](#), page 1393).

Usage: `prepMat(M,wr,ws,step);`
 where M is a matrix, wr is an intvec of size `ncols(M)`, ws an intvec of size `nrows(M)`
 and `step` is an integer

Return: 2 lists of submatrices corresponding to the filtrations specified by wr and ws :
 the first list corresponds to the list for the filtration of AdA , i.e. the ranks of these
 matrices will be the r_i , the second one to the list for the filtration of L , i.e. the ranks
 of these matrices will be the s_i

Note: * the entries of the matrix M are $M_{ij} = \delta_i(x_j)$,
 * wr is used to determine what subset of the set of all dx_i is generating $AdF^l(A)$:
 if $(k-1)*step \leq wr[i] < k*step$, then dx_i is in the set of generators of $AdF^l(A)$ for all
 $l \geq k$ and the i -th column of M appears in each submatrix starting from the k -th
 * ws is used to determine what subset of the set of all δ_i is generating $Z_l(L)$:
 if $(k-1)*step \leq ws[i] < k*step$, then δ_i is in the set of generators of $Z_l(A)$ for $l <$
 k and the i -th row of M appears in each submatrix up to the $(k-1)$ th
 * the entries of wr and ws as well as `step` should be positive integers

Example:

```
LIB "stratify.lib";
ring r=0,(t(1..3)),dp;
matrix M[2][3]=0,t(1),3*t(2),0,0,t(1);
```

```

print(M);
↳ 0,t(1),3*t(2),
↳ 0,0, t(1)
intvec wr=1,3,5;
intvec ws=2,4;
int step=2;
prepMat(M,wr,ws,step);
↳ [1]:
↳ [1]:
↳ _[1,1]=0
↳ _[2,1]=0
↳ [2]:
↳ _[1,1]=0
↳ _[1,2]=t(1)
↳ _[2,1]=0
↳ _[2,2]=0
↳ [3]:
↳ _[1,1]=0
↳ _[1,2]=t(1)
↳ _[1,3]=3*t(2)
↳ _[2,1]=0
↳ _[2,2]=0
↳ _[2,3]=t(1)
↳ [2]:
↳ [1]:
↳ _[1,1]=0
↳ _[1,2]=t(1)
↳ _[1,3]=3*t(2)
↳ _[2,1]=0
↳ _[2,2]=0
↳ _[2,3]=t(1)
↳ [2]:
↳ _[1,1]=0
↳ _[1,2]=0
↳ _[1,3]=t(1)

```

D.7.4.2 stratify

Procedure from library `stratify.lib` (see [Section D.7.4 \[stratify.lib\]](#), page 1393).

Usage: `stratify(M,wr,ws,step);`
 where M is a matrix, wr is an intvec of size `ncols(M)`, ws an intvec of size `nrows(M)` and `step` is an integer

Return: list of lists, each entry of the big list corresponds to one locally closed set and has the following entries:
 1) intvec giving the corresponding rs-vector
 2) ideal determining the closed set
 3) list d of polynomials determining the open set $D(d[1])$ empty list if there is more than one open set
 4-n) lists of polynomials determining open sets which all lead to the same rs-vector

Note: * ring ordering should be global, i.e. the ring should be a polynomial ring
 * the entries of the matrix M are $M_{ij}=\delta_i(x_j)$,

* wr is used to determine what subset of the set of all dx_i is generating $\text{AdF}^l(A)$:
 if $(k-1)*\text{step} < wr[i] \leq k*\text{step}$, then dx_i is in the set of generators of $\text{AdF}^l(A)$ for all $l \geq k$
 * ws is used to determine what subset of the set of all δ_i is generating $Z_l(L)$:
 if $(k-1)*\text{step} \leq ws[i] < k*\text{step}$, then δ_i is in the set of generators of $Z_l(A)$ for $l < k$
 * the entries of wr and ws as well as step should be positive integers
 * the filtrations have to be known, no sanity checks concerning the filtrations are performed !!!

Example:

```
LIB "stratify.lib";
ring r=0,(t(1..3)),dp;
matrix M[2][3]=0,t(1),3*t(2),0,0,t(1);
intvec wr=1,3,5;
intvec ws=2,4;
int step=2;
stratify(M,wr,ws,step);
↳ [1]:
↳ [1]:
↳ 0,0,0,0
↳ [2]:
↳ _[1]=t(2)
↳ _[2]=t(1)
↳ [3]:
↳ [1]:
↳ 1
↳ [2]:
↳ [1]:
↳ 0,1,0,1
↳ [2]:
↳ _[1]=t(1)
↳ [3]:
↳ [1]:
↳ t(2)
↳ [2]:
↳ t(2)
↳ [3]:
↳ [1]:
↳ 1,2,1,2
↳ [2]:
↳ _[1]=0
↳ [3]:
↳ [1]:
↳ t(1)
↳ [2]:
↳ t(1)
```

D.8 Symbolic-numerical solving**D.8.1 ffsolve.lib**

Library: ffsolve.lib

Purpose: multivariate equation solving over finite fields

Author: Gergo Gyula Borus, borisz@borisz.net

Procedures:

D.8.1.1 ffsolve

Procedure from library `ffsolve.lib` (see [Section D.8.1 \[ffsolve.lib\]](#), page 1395).

Usage: `ffsolve(I[, L]);` I ideal, L list of strings

Return: list L, the common roots of I as ideal

Assume: basering is a finite field of type (p^n, a)

Example:

```
LIB "ffsolve.lib";
ring R = (2,a),x(1..3),lp;
minpoly=a2+a+1;
ideal I;
I[1]=x(1)^2*x(2)+(a)*x(1)*x(2)^2+(a+1);
I[2]=x(1)^2*x(2)*x(3)^2+(a)*x(1);
I[3]=(a+1)*x(1)*x(3)+(a+1)*x(1);
ffsolve(I);
↪ [1]:
↪   _[1]=x(3)+1
↪   _[2]=x(2)+(a+1)
↪   _[3]=x(1)+(a+1)
↪ [2]:
↪   _[1]=x(3)+1
↪   _[2]=x(2)+(a)
↪   _[3]=x(1)+1
```

D.8.1.2 PEsolve

Procedure from library `ffsolve.lib` (see [Section D.8.1 \[ffsolve.lib\]](#), page 1395).

Usage: `PEsolve(I[, i]);` I ideal, i optional integer
 solve I (system of multivariate equations) over a finite field using an equivalence property when i is not given or set to 2, otherwise if i is set to 0 then check whether common roots exists

Return: list if optional parameter is not given or set to 2, integer if optional is set to 0

Assume: basering is a finite field of type (p^n, a)

Note: When the optional parameter is set to 0, `speoff` only checks if I has common roots, then return 1, otherwise return 0.

Example:

```

LIB "ffsolve.lib";
ring R = (2,a),x(1..3),lp;
minpoly=a2+a+1;
ideal I;
I[1]=x(1)^2*x(2)+(a)*x(1)*x(2)^2+(a+1);
I[2]=x(1)^2*x(2)*x(3)^2+(a)*x(1);
I[3]=(a+1)*x(1)*x(3)+(a+1)*x(1);
PEsolve(I);
⇒ // ** redefining I ( ideal I = defaultIdeal();)
⇒ // ** redefining new ( list new = increment(start,i);)
⇒ // ** redefining l (int l=1;)
⇒ // ** redefining new ( list new = increment(start,i);)
⇒ // ** redefining l (int l=1;)
⇒ // ** redefining new ( list new = increment(start,i);)
⇒ // ** redefining l (int l=1;)
⇒ // ** redefining new ( list new = increment(start,i);)
⇒ // ** redefining l (int l=1;)
⇒ // ** redefining new ( list new = increment(start,i);)
⇒ // ** redefining l (int l=1;)
⇒ // ** redefining new ( list new = increment(start,i);)
⇒ // ** redefining l (int l=1;)
⇒ // ** redefining new ( list new = increment(start,i);)
⇒ // ** redefining l (int l=1;)
⇒ // ** redefining new ( list new = increment(start,i);)
⇒ // ** redefining l (int l=1;)
⇒ // ** redefining new ( list new = increment(start,i);)
⇒ // ** redefining l (int l=1;)
⇒ // ** redefining new ( list new = increment(start,i);)
⇒ // ** redefining l (int l=1;)
⇒ // ** redefining new ( list new = increment(start,i);)
⇒ // ** redefining l (int l=1;)
⇒ // ** redefining res ( ideal res;)
⇒ // ** redefining new ( list new = increment(start,i);)
⇒ // ** redefining l (int l=1;)
⇒ [1]:
⇒ _[1]=x(3)+1
⇒ _[2]=x(2)+(a)
⇒ _[3]=x(1)+1
⇒ [2]:
⇒ _[1]=x(3)+1
⇒ _[2]=x(2)+(a+1)
⇒ _[3]=x(1)+(a+1)

```

D.8.1.3 simplesolver

Procedure from library `ffsolve.lib` (see [Section D.8.1 \[ffsolve.lib\]](#), page 1395).

Usage: `simplesolver(I); I ideal`
 solve I (system of multivariate equations) over a
 finite field by exhausting search

Return: list L, the common roots of I as ideal

Assume: basering is a finite field of type (p^n, a)

Example:

```
LIB "ffsolve.lib";
```

```

ring R = (2,a),x(1..3),lp;
minpoly=a2+a+1;
ideal I;
I[1]=x(1)^2*x(2)+(a)*x(1)*x(2)^2+(a+1);
I[2]=x(1)^2*x(2)*x(3)^2+(a)*x(1);
I[3]=(a+1)*x(1)*x(3)+(a+1)*x(1);
simplesolver(I);
↳ [1]:
↳   _[1]=x(3)+1
↳   _[2]=x(2)+(a)
↳   _[3]=x(1)+1
↳ [2]:
↳   _[1]=x(3)+1
↳   _[2]=x(2)+(a+1)
↳   _[3]=x(1)+(a+1)

```

D.8.1.4 GBsolve

Procedure from library `ffsolve.lib` (see [Section D.8.1 \[ffsolve.lib\]](#), page 1395).

Usage: GBsolve(I); I ideal
 solve I (system of multivariate equations) over an
 extension of Z/p by Groebner basis methods

Return: list L, the common roots of I as ideal

Assume: basering is a finite field of type (p^n, a)

Example:

```

LIB "ffsolve.lib";
ring R = (2,a),x(1..3),lp;
minpoly=a2+a+1;
ideal I;
I[1]=x(1)^2*x(2)+(a)*x(1)*x(2)^2+(a+1);
I[2]=x(1)^2*x(2)*x(3)^2+(a)*x(1);
I[3]=(a+1)*x(1)*x(3)+(a+1)*x(1);
GBsolve(I);
↳ [1]:
↳   _[1]=x(3)+1
↳   _[2]=x(2)+(a)
↳   _[3]=x(1)+1
↳ [2]:
↳   _[1]=x(3)+1
↳   _[2]=x(2)+(a+1)
↳   _[3]=x(1)+(a+1)

```

D.8.1.5 XLsolve

Procedure from library `ffsolve.lib` (see [Section D.8.1 \[ffsolve.lib\]](#), page 1395).

Usage: XLsolve(I[, d]); I ideal, d optional integer
 solve I (system of multivariate polynomials) with a
 variant of the linearization technique, multiplying
 the polynomials with monomials of degree at most d
 (default is 2)

Return: list L of the common roots of I as ideals

Assume: basering is a finite field of type (p^n, a)

Example:

```
LIB "ffsolve.lib";
ring R = (2,a),x(1..3),lp;
minpoly=a2+a+1;
ideal I;
I[1]=(a)*x(1)^2+x(2)^2+(a+1);
I[2]=(a)*x(1)^2+(a)*x(1)*x(3)+(a)*x(2)^2+1;
I[3]=(a)*x(1)*x(3)+1;
I[4]=x(1)^2+x(1)*x(3)+(a);
Xlsolve(I, 3);
↳ [1]:
↳   _[1]=x(3)+(a+1)
↳   _[2]=x(2)+1
↳   _[3]=x(1)+1
```

D.8.1.6 ZZsolve

Procedure from library `ffsolve.lib` (see [Section D.8.1 \[ffsolve.lib\]](#), page 1395).

Usage: `ZZsolve(I)`; I ideal
 solve I (system of multivariate equations) over a finite field by mapping the polynomials to a single univariate polynomial over extension of the basering

Return: list, the common roots of I as ideal

Assume: basering is a finite field of type (p^n, a)

Example:

```
LIB "ffsolve.lib";
ring R = (2,a),x(1..3),lp;
minpoly=a2+a+1;
ideal I;
I[1]=x(1)^2*x(2)+(a)*x(1)*x(2)^2+(a+1);
I[2]=x(1)^2*x(2)*x(3)^2+(a)*x(1);
I[3]=(a+1)*x(1)*x(3)+(a+1)*x(1);
ZZsolve(I);
↳ [1]:
↳   _[1]=x(3)+1
↳   _[2]=x(2)+(a)
↳   _[3]=x(1)+1
↳ [2]:
↳   _[1]=x(3)+1
↳   _[2]=x(2)+(a+1)
↳   _[3]=x(1)+(a+1)
```

D.8.2 presolve.lib

Library: `presolve.lib`

Purpose: Pre-Solving of Polynomial Equations

Author: Gert-Martin Greuel, email: greuel@mathematik.uni-kl.de,

Procedures:

D.8.2.1 degreepart

Procedure from library `presolve.lib` (see [Section D.8.2 \[presolve.lib\], page 1399](#)).

Usage: `degreepart(id,d1,d2[,v]);` id=ideal/module, d1,d2=integers, v=intvec

Return: list of size 2,
 _[1]: generators of id of [v-weighted] total degree \geq d1 and \leq d2 (default: v = 1,...,1)
 _[2]: remaining generators of id

Note: if id is of type int/number/poly it is converted to ideal, if id is of type int-mat/matrix/vector to module and then the corresponding generators are computed

Example:

```
LIB "presolve.lib";
ring r=0,(x,y,z),dp;
ideal i=1+x+x2+x3+x4,3,xz+y3+z8;
degreepart(i,0,4);
↳ [1]:
↳   _[1]=x4+x3+x2+x+1
↳   _[2]=3
↳ [2]:
↳   _[1]=z8+y3+xz
module m=[x,y,z],x*[x3,y2,z],[1,x2,z3,0,1];
intvec v=2,3,6;
show(degreepart(m,8,8,v));
↳ // list, 2 element(s):
↳ [1]:
↳   // module, 1 generator(s)
↳ [x4,xy2,xz]
↳ [2]:
↳   // module, 2 generator(s)
↳ [x,y,z]
↳ [1,x2,z3,0,1]
```

D.8.2.2 elimlinearpart

Procedure from library `presolve.lib` (see [Section D.8.2 \[presolve.lib\], page 1399](#)).

Usage: `elimlinearpart(i[,n]);` i=ideal, n=integer,
 default: n=nvars(basering)

Return: list L with 5 entries:
 L[1]: ideal obtained from i by substituting from the first n variables those which appear in a linear part of i, by putting this part into triangular form
 L[2]: ideal of variables which have been substituted
 L[3]: ideal, j-th element defines substitution of j-th var in [2]
 L[4]: ideal of variables of basering, eliminated ones are set to 0
 L[5]: ideal, describing the map from the basering to itself such that L[1] is the image of i

Note: the procedure always interreduces the ideal i internally w.r.t. ordering dp .

Example:

```
LIB "presolve.lib";
ring s=0,(u,x,y,z),dp;
ideal i = u3+y3+z-x,x2y2+z3,y+z+1,y+u;
elimlinearpart(i);
↳ [1]:
↳   _[1]=z4+3z3+z2
↳ [2]:
↳   _[1]=u
↳   _[2]=x
↳   _[3]=y
↳ [3]:
↳   _[1]=u-z-1
↳   _[2]=x-z
↳   _[3]=y+z+1
↳ [4]:
↳   _[1]=0
↳   _[2]=0
↳   _[3]=0
↳   _[4]=z
↳ [5]:
↳   _[1]=z+1
↳   _[2]=z
↳   _[3]=-z-1
↳   _[4]=z
```

D.8.2.3 elimpart

Procedure from library `presolve.lib` (see [Section D.8.2 \[presolve_lib\], page 1399](#)).

Usage: `elimpart(i [,n,e]);` i =ideal, n,e =integers
 n : only the first n vars are considered for substitution,
 $e=0$: substitute from linear part of i (same as `elimlinearpart`)
 $e!=0$: eliminate also by direct substitution
(default: $n = nvars(basering)$, $e = 1$)

Return: list of 5 objects:

- [1]: ideal obtained by substituting from the first n variables those from i , which appear in the linear part of i (or, if $e!=0$, which can be expressed directly in the remaining vars)
- [2]: ideal, variables which have been substituted
- [3]: ideal, i -th element defines substitution of i -th var in [2]
- [4]: ideal of variables of basering, substituted ones are set to 0
- [5]: ideal, describing the map from the basering, say $k[x(1..m)]$, to itself onto $k[.variables from [4].]$ and [1] is the image of i

The ideal i is generated by [1] and [3] in $k[x(1..m)]$, the map [5] maps [3] to 0, hence induces an isomorphism

$$k[x(1..m)]/i \rightarrow k[.variables from [4].]/[1]$$

Note: Applying `elimpart` to `interred(i)` may result in more substitutions. However, `interred` may be more expansive than `elimpart` for big ideals

Example:

```

LIB "presolve.lib";
ring s=0,(u,x,y,z),dp;
ideal i = xy2-xu4-x+y2,x2y2+z3+zy,y+z2+1,y+u2;
elimpart(i);
↳ [1]:
↳   _[1]=u2-z2-1
↳   _[2]=u12-u2z+z3
↳ [2]:
↳   _[1]=y
↳   _[2]=x
↳ [3]:
↳   _[1]=u2+y
↳   _[2]=-u4+x
↳ [4]:
↳   _[1]=u
↳   _[2]=0
↳   _[3]=0
↳   _[4]=z
↳ [5]:
↳   _[1]=u
↳   _[2]=u4
↳   _[3]=-u2
↳   _[4]=z
i = interred(i); i;
↳ i[1]=z2+y+1
↳ i[2]=y2-x
↳ i[3]=u2+y
↳ i[4]=x3+z3+yz
elimpart(i);
↳ [1]:
↳   _[1]=u2-z2-1
↳   _[2]=u12-u2z+z3
↳ [2]:
↳   _[1]=x
↳   _[2]=y
↳ [3]:
↳   _[1]=-y2+x
↳   _[2]=u2+y
↳ [4]:
↳   _[1]=u
↳   _[2]=0
↳   _[3]=0
↳   _[4]=z
↳ [5]:
↳   _[1]=u
↳   _[2]=u4
↳   _[3]=-u2
↳   _[4]=z
elimpart(i,2);
↳ [1]:
↳   _[1]=z2+y+1
↳   _[2]=u2+y

```

```

↳   _[3]=y6+z3+yz
↳ [2] :
↳   _[1]=x
↳ [3] :
↳   _[1]=-y2+x
↳ [4] :
↳   _[1]=u
↳   _[2]=0
↳   _[3]=y
↳   _[4]=z
↳ [5] :
↳   _[1]=u
↳   _[2]=y2
↳   _[3]=y
↳   _[4]=z

```

D.8.2.4 elimpartanyr

Procedure from library `presolve.lib` (see [Section D.8.2 \[presolve.lib\]](#), page 1399).

Usage: `elimpartanyr(i [p,e]);` `i`=ideal, `p`=polynomial, `e`=integer
`p`: product of vars to be eliminated,
`e`=0: substitute from linear part of `i` (same as `elimlinearpart`)
`e`!=0: eliminate also by direct substitution
(default: `p`=product of all vars, `e`=1)

Return: list of 6 objects:
[1]: (interreduced) ideal obtained by substituting from `i` those vars appearing in `p`, which occur in the linear part of `i` (or which can be expressed directly in the remaining variables, if `e`!=0)
[2]: ideal, variables which have been substituted
[3]: ideal, `i`-th element defines substitution of `i`-th var in [2]
[4]: ideal of variables of basering, substituted ones are set to 0
[5]: ideal, describing the map from the basering, say `k[x(1..m)]`, to itself onto `k[..variables fom [4].]` and [1] is the image of `i`
[6]: int, # of vars considered for substitution (= # of factors of `p`)

The ideal `i` is generated by [1] and [3] in `k[x(1..m)]`, the map [5] maps [3] to 0, hence induces an isomorphism

$$k[x(1..m)]/i \rightarrow k[..variables fom [4].]/[1]$$

Note: the procedure uses `execute` to create a ring with ordering `dp` and vars placed correctly and then applies `elimpart`.

Example:

```

LIB "presolve.lib";
ring s=0,(x,y,z),dp;
ideal i = x3+y2+z,x2y2+z3,y+z+1;
elimpartanyr(i,z);
↳ [1] :
↳   _[1]=x3+y2-y-1
↳   _[2]=x2y2-y3-3y2-3y-1
↳ [2] :

```

```

↳   _[1]=z
↳ [3]:
↳   _[1]=y+z+1
↳ [4]:
↳   _[1]=0
↳   _[2]=x
↳   _[3]=y
↳ [5]:
↳   _[1]=-y-1
↳   _[2]=x
↳   _[3]=y
↳ [6]:
↳   1

```

D.8.2.5 fastelim

Procedure from library `presolve.lib` (see [Section D.8.2 \[presolve.lib\], page 1399](#)).

Usage: `fastelim(i,p[h,o,a,b,e,m]);` i =ideal, p =polynomial; h,o,a,b,e =integers
 p : product of variables to be eliminated;

Optional parameters:

- $h \neq 0$: use Hilbert-series driven std-basis computation
- $o \neq 0$: use `proc valvars` for a - hopefully - optimal ordering of vars
- $a \neq 0$: order vars to be eliminated w.r.t. increasing complexity
- $b \neq 0$: order vars not to be eliminated w.r.t. increasing complexity
- $e \neq 0$: use `elimpart` first to eliminate easy part
- $m \neq 0$: compute a minimal system of generators

(default: $h,o,a,b,e,m = 0,1,0,0,0,0$)

Return: ideal obtained from i by eliminating those variables, which occur in p

Example:

```

LIB "presolve.lib";
ring s=31991,(e,f,x,y,z,t,u,v,w,a,b,c,d),dp;
ideal i = w2+f2-1, x2+t2+a2-1, y2+u2+b2-1, z2+v2+c2-1,
d2+e2-1, f4+2u, wa+tf, xy+tu+ab;
fastelim(i,xytua,1,1);      //with hilb,valvars
↳ _[1]=z2+v2+c2-1
↳ _[2]=f2+w2-1
↳ _[3]=e2+d2-1
fastelim(i,xytua,1,0,1);   //with hilb,minbase
↳ _[1]=z2+v2+c2-1
↳ _[2]=f2+w2-1
↳ _[3]=e2+d2-1

```

D.8.2.6 findvars

Procedure from library `presolve.lib` (see [Section D.8.2 \[presolve.lib\], page 1399](#)).

Usage: `findvars(id);` id =poly/ideal/vector/module/matrix

Return: list L with 4 entries:

L[1]: ideal of variables occurring in id
 L[2]: intvec of variables occurring in id
 L[3]: ideal of variables not occurring in id
 L[4]: intvec of variables not occurring in id

Example:

```
LIB "presolve.lib";
ring s = 0,(e,f,x,y,t,u,v,w,a,d),dp;
ideal i = w2+f2-1, x2+t2+a2-1;
findvars(i);
↳ [1]:
↳  _[1]=f
↳  _[2]=x
↳  _[3]=t
↳  _[4]=w
↳  _[5]=a
↳ [2]:
↳  2,3,5,8,9
↳ [3]:
↳  _[1]=e
↳  _[2]=y
↳  _[3]=u
↳  _[4]=v
↳  _[5]=d
↳ [4]:
↳  1,4,6,7,10
```

See also: [Section 5.1.161 \[variables\], page 279](#).

D.8.2.7 hilbvec

Procedure from library `presolve.lib` (see [Section D.8.2 \[presolve.lib\], page 1399](#)).

Usage: `hilbvec(id[,c,o]);` id=poly/ideal/vector/module/matrix, c,o=strings,
 c=char, o=ordering used by `hilb` (default: c="32003", o="dp")

Return: intvec of 1st Hilbert-series of id, computed in char c and ordering o

Note: id must be homogeneous (i.e. all vars have weight 1)

Example:

```
LIB "presolve.lib";
ring s = 0,(e,f,x,y,z,t,u,v,w,a,b,c,d,H),dp;
ideal id = w2+f2-1, x2+t2+a2-1, y2+u2+b2-1, z2+v2+c2-1,
d2+e2-1, f4+2u, wa+tf, xy+tu+ab;
id = homog(id,H);
hilbvec(id);
↳ 1,0,-7,0,20,0,-28,0,14,0,14,0,-28,0,20,0,-7,0,1,0
```

D.8.2.8 linearpart

Procedure from library `presolve.lib` (see [Section D.8.2 \[presolve.lib\], page 1399](#)).

Usage: `linearpart(id);` id=ideal/module

Return: list of size 2,
 _[1]: generators of id of total degree ≤ 1
 _[2]: remaining generators of id

Note: all variables have degree 1 (independent of ordering of basering)

Example:

```
LIB "presolve.lib";
ring r=0,(x,y,z),dp;
ideal i=1+x+x2+x3,3,x+3y+5z;
linearpart(i);
⇒ [1]:
⇒   _[1]=3
⇒   _[2]=x+3y+5z
⇒ [2]:
⇒   _[1]=x3+x2+x+1
module m=[x,y,z],x*[x3,y2,z],[1,x2,z3,0,1];
show(linearpart(m));
⇒ // list, 2 element(s):
⇒ [1]:
⇒   // module, 1 generator(s)
⇒ [x,y,z]
⇒ [2]:
⇒   // module, 2 generator(s)
⇒ [x4,xy2,xz]
⇒ [1,x2,z3,0,1]
```

D.8.2.9 tolessvars

Procedure from library `presolve.lib` (see [Section D.8.2 \[presolve.lib\], page 1399](#)).

Usage: `tolessvars(id [,s1,s2]);` id poly/ideal/vector/module/matrix, s1=string (new ordering) [default: s1="dp" or "ds" depending on whether the first block of the old ordering is a p- or an s-ordering, respectively]

Return: If id contains all vars of the basering: empty list.
 Else: ring R with the same char as the basering, but possibly less variables (only those variables which actually occur in id). In R an object IMAG (image of id under `imap`) is stored.

Display: If `printlevel >=0`, display ideal of vars, which have been omitted from the old ring.

Example:

```
LIB "presolve.lib";
ring r = 0,(x,y,z),dp;
ideal i = y2-x3,x-3,y-2x;
def R_r = tolessvars(i,"lp");
⇒
⇒ // variables which did not occur:
⇒ z
⇒
⇒ // 'tolessvars' created a ring, in which an object IMAG is stored.
⇒ // To access the object, type (if the name R was assigned to the return v\
  alue):
⇒   setring R; IMAG;
```

```

setring R_r;
show(basing);
↪ // ring: (QQ),(x,y),(lp(2),C);
↪ // minpoly = 0
↪ // objects belonging to this ring:
↪ // IMAG [0] ideal, 3 generator(s)
IMAG;
↪ IMAG[1]=-x3+y2
↪ IMAG[2]=x-3
↪ IMAG[3]=-2x+y
kill R_r;

```

D.8.2.10 solvelinearpart

Procedure from library `presolve.lib` (see [Section D.8.2 \[presolve.lib\], page 1399](#)).

Usage: `solverlinearpart(id [,n]);` id=ideal/module, n=integer (default: n=0)

Return: (interreduced) generators of id of degree ≤ 1 in reduced triangular form if n=0 [non-reduced triangular form if n!=0]

Assume: monomial ordering is a global ordering (p-ordering)

Note: may be used to solve a system of linear equations, see `gauss_row` from 'matrix.lib' for a different method

Warning: the result is very likely to be false for 'real' coefficients, use char 0 instead!

Example:

```

LIB "presolve.lib";
// Solve the system of linear equations:
//      3x +  y +  z -  u = 2
//      3x + 8y + 6z - 7u = 1
//      14x + 10y + 6z - 7u = 0
//      7x + 4y + 3z - 3u = 3
ring r = 0,(x,y,z,u),lp;
ideal i= 3x +  y +  z -  u,
13x + 8y + 6z - 7u,
14x + 10y + 6z - 7u,
7x + 4y + 3z - 3u;
ideal j= 2,1,0,3;
j = matrix(i)-matrix(j); // difference of 1x4 matrices
// compute reduced triangular form, setting
solvelinearpart(j); // the RHS equal 0 gives the solutions!
↪ _[1]=u-4
↪ _[2]=z-4
↪ _[3]=y+1
↪ _[4]=x-1
solvelinearpart(j,1); ""; // triangular form, not reduced
↪ _[1]=u-4
↪ _[2]=2z-u-4
↪ _[3]=11y+5z-8u+23
↪ _[4]=3x+y+z-u-2
↪

```

D.8.2.11 sortandmap

Procedure from library `presolve.lib` (see [Section D.8.2 \[presolve.lib\], page 1399](#)).

Usage: `sortandmap(id [,n1,p1,n2,p2...,o1,m1,o2,m2...]);`
`id=poly/ideal/vector/module,`
`p1,p2,...= polynomials (product of variables),`
`n1,n2,...= integers,`
`o1,o2,...= strings,`
`m1,m2,...= integers`
 (default: `p1=product of all vars, n1=0, o1="dp",m1=0`)
 the last `pi` (containing the remaining vars) may be omitted

Return: a ring `R`, in which a `poly/ideal/vector/module` `IMAG` is stored:
 - the ring `R` differs from the active basering only in the choice of monomial ordering and in the sorting of the variables.
 - `IMAG` is the image (under `imap`) of the input `ideal/module id`
 The new monomial ordering and sorting of vars is as follows:
 - each block of vars occurring in `pi` is sorted w.r.t. its complexity in `id`,
 - `ni` controls the sorting in `i`-th block (= vars occurring in `pi`):
 `ni=0` (resp. `ni!=0`) means that least complex (resp. most complex) vars come first
 - `oi` and `mi` define the monomial ordering of the `i`-th block:
 if `mi =0, oi=ordstr(i-th block)`
 if `mi!=0`, the ordering of the `i`-th block itself is a `blockordering`,
 each subblock having `ordstr=oi`, such that vars of same complexity are in one block

Note that only simple ordstrings `oi` are allowed: `"lp", "dp", "Dp", "ls", "ds", "Ds"`.

Note: We define a variable `x` to be more complex than `y` (with respect to `id`) if `val(x) > val(y)` lexicographically, where `val(x)` denotes the valuation vector of `x`:
 consider `id` as list of polynomials in `x` with coefficients in the remaining variables. Then:
`val(x) = (maximal occurring power of x, # of all monomials in leading coefficient, # of all monomials in coefficient of next smaller power of x,...)`.

Example:

```
LIB "presolve.lib";
ring s = 32003,(x,y,z),dp;
ideal i=x3+y2,xz+z2;
def R_r=sortandmap(i);
↳
↳ // 'sortandmap' created a ring, in which an object IMAG is stored.
↳ // To access the object, type (if the name R was assigned to the return value):
↳      setring R; IMAG;
show(R_r);
↳ // ring: (ZZ/32003),(x,y,z),(dp(3),C);
↳ // minpoly = 0
↳ // objects belonging to this ring:
↳ // IMAG [0] ideal, 2 generator(s)
setring R_r; IMAG;
↳ IMAG[1]=x3+y2
```

```

↳ IMAG[2]=xz+z2
kill R_r; setring s;
def R_r=sortandmap(i,1,xy,0,z,0,"ds",0,"lp",0);
↳
↳ // 'sortandmap' created a ring, in which an object IMAG is stored.
↳ // To access the object, type (if the name R was assigned to the return v\
  alue):
↳      setring R; IMAG;
show(R_r);
↳ // ring: (ZZ/32003),(x,y,z),(ds(2),lp(1),C);
↳ // minpoly = 0
↳ // objects belonging to this ring:
↳ // IMAG                                     [0] ideal, 2 generator(s)
setring R_r; IMAG;
↳ IMAG[1]=y2+x3
↳ IMAG[2]=z2+xz
kill R_r;

```

D.8.2.12 sortvars

Procedure from library `presolve.lib` (see [Section D.8.2 \[presolve.lib\], page 1399](#)).

Usage: `sortvars(id[,n1,p1,n2,p2,...]);`
`id=poly/ideal/vector/module,`
`p1,p2,...= polynomials (product of vars),`
`n1,n2,...= integers`
 (default: `p1=product of all vars, n1=0`)
 the last `pi` (containing the remaining vars) may be omitted

Compute: sort variables with respect to their complexity in `id`

Return: list of two elements, an ideal and a list:
 [1]: ideal, variables of basering sorted w.r.t their complexity in `id`
`ni` controls the ordering in `i`-th block (= vars occurring in `pi`):
`ni=0` (resp. `ni!=0`) means that less (resp. more) complex vars come first
 [2]: a list with 4 entries for each `pi`:
 -[1]: ideal `ai` : vars of `pi` in correct order,
 -[2]: intvec `vi`: permutation vector describing the ordering in `ai`,
 -[3]: intmat `Mi`: valuation matrix of `ai`, the columns of `Mi` being the
 valuation vectors of the vars in `ai`
 -[4]: intvec `wi`: size of 1-st, 2-nd,... block of identical columns of `Mi`
 (vars with same valuation)

Note: We define a variable `x` to be more complex than `y` (with respect to `id`) if `val(x) > val(y)` lexicographically, where `val(x)` denotes the valuation vector of `x`:
 consider `id` as list of polynomials in `x` with coefficients in the remaining variables. Then:
`val(x) = (maximal occurring power of x, # of all monomials in leading coefficient, # of all monomials in coefficient of next smaller power of x,...)`.

Example:

```

LIB "presolve.lib";
ring s=0,(x,y,z,w),dp;
ideal i = x3+y2+yw2,xz+z2,xyz-w2;
sortvars(i,0,xy,1,zw);

```

```

↳ [1] :
↳   _[1]=x
↳   _[2]=y
↳   _[3]=z
↳   _[4]=w
↳ [2] :
↳   [1] :
↳     _[1]=y
↳     _[2]=x
↳   [2] :
↳     2,1
↳   [3] :
↳     2,3,
↳     1,1,
↳     2,0,
↳     0,2
↳   [4] :
↳     1,1
↳   [5] :
↳     _[1]=w
↳     _[2]=z
↳   [6] :
↳     2,1
↳   [7] :
↳     2,2,
↳     2,1,
↳     0,2
↳   [8] :
↳     1,1

```

D.8.2.13 valvars

Procedure from library `presolve.lib` (see [Section D.8.2 \[presolve.lib\]](#), page 1399).

Usage: `valvars(id[,n1,p1,n2,p2,...]);`
`id=poly/ideal/vector/module,`
`p1,p2,...= polynomials (product of vars),`
`n1,n2,...= integers,`
`ni` controls the ordering of vars occurring in `pi`: `ni=0` (resp. `ni!=0`) means that less (resp. more) complex vars come first (default: `p1=product of all vars, n1=0`), the last `pi` (containing the remaining vars) may be omitted

Compute: valuation (complexity) of variables with respect to `id`.
`ni` controls the ordering of vars occurring in `pi`:
`ni=0` (resp. `ni!=0`) means that less (resp. more) complex vars come first.

Return: list with 3 entries:
 [1]: intvec, say `v`, describing the permutation such that the permuted ring variables are ordered with respect to their complexity in `id`
 [2]: list of intvecs, `i`-th intvec, say `v(i)` describing permutation of vars in `a(i)` such that `v=v(1),v(2),...`
 [3]: list of ideals and intmat's, say `a(i)` and `M(i)`, where
`a(i)`: factors of `pi`,
`M(i)`: valuation matrix of `a(i)`, such that the `j`-th column of `M(i)`

is the valuation vector of j -th generator of $a(i)$

Note: Use `sortvars` in order to actually sort the variables! We define a variable x to be more complex than y (with respect to id) if $\text{val}(x) > \text{val}(y)$ lexicographically, where $\text{val}(x)$ denotes the valuation vector of x :
consider id as list of polynomials in x with coefficients in the remaining variables. Then:
 $\text{val}(x) = (\text{maximal occurring power of } x, \# \text{ of all monomials in leading coefficient, } \# \text{ of all monomials in coefficient of next smaller power of } x, \dots)$.

Example:

```
LIB "presolve.lib";
ring s=0,(x,y,z,a,b),dp;
ideal i=ax2+ay3-b2x,abz+by2;
valvars (i,0,xyz);
↳ [1]:
↳ 1,2,3,4,5
↳ [2]:
↳ [1]:
↳ 3,1,2
↳ [2]:
↳ 1,2
↳ [3]:
↳ [1]:
↳ _[1]=x
↳ _[2]=y
↳ _[3]=z
↳ [2]:
↳ 2,3,1,
↳ 1,1,1,
↳ 1,1,0
↳ [3]:
↳ _[1]=a
↳ _[2]=b
↳ [4]:
↳ 1,2,
↳ 3,1,
↳ 0,2
```

D.8.2.14 idealSplit

Procedure from library `presolve.lib` (see [Section D.8.2 \[presolve.lib\], page 1399](#)).

Usage: `idealSplit(id,timeF,timeS)`; id ideal and optional
 $timeF$, $timeS$ integers to bound the time which can be used for factorization resp.
standard basis computation

Return: a list of ideals such that their intersection
has the same radical as id

Example:

```
LIB "presolve.lib";
ring r=32003,(b,s,t,u,v,w,x,y,z),dp;
ideal i=
bv+su,
```

```

bw+tu,

D.8.3 solve_lib

Library: solve.lib

Purpose: Complex Solving of Polynomial Systems

Author: Moritz Wenk, email: wenk@mathematik.uni-kl.de
 Wilfred Pohl, email: pohl@mathematik.uni-kl.de

Procedures:

D.8.3.1 laguerre_solve

Procedure from library `solve.lib` (see [Section D.8.3 \[solve.lib\]](#), page 1414).

Usage: laguerre_solve(f [, m, l, n, s]); f = polynomial,
 m, l, n, s = integers (control parameters of the method)
 m: precision of output in digits ($4 \leq m$), if basering is not ring of complex numbers;
 l: precision of internal computation in decimal digits ($l \geq 8$) only if the basering is
 not complex or complex with smaller precision;
 n: control of multiplicity of roots or of splitting of f into squarefree factors
 n < 0, no split of f (good, if all roots are simple)
 n \geq 0, try to split
 n = 0, return only different roots
 n > 0, find all roots (with multiplicity)
 s: s \neq 0, returns ERROR if $|f(\text{root})| > 0.1^m$ (when computing in the current ring)
 (default: m, l, n, s = 8, 30, 1, 0)

Assume: f is a univariate polynomial;
 basering has characteristic 0 and is either complex or without parameters.

Return: list of (complex) roots of the polynomial f, depending on n. The entries of the result
 are of type
 string: if the basering is not complex,
 number: otherwise.

Note: If printlevel > 0: displays comments (default = 0).
 If s \neq 0 and if the procedure stops with ERROR, try a higher internal precision m.

Example:

```

LIB "solve.lib";
// Find all roots of an univariate polynomial using Laguerre's method:
ring rs1= 0,(x,y),lp;
poly f = 15x5 + x3 + x2 - 10;
// 10 digits precision
laguerre_solve(f,10);

```

```

subst(f,x,l[2]);
⇒ 0

```

D.8.3.2 solve

Procedure from library `solve.lib` (see [Section D.8.3 \[solve.lib\]](#), page 1414).

Usage: `solve(G [, m, n [, l]] [,"oldring"] [,"nodisplay"]);` G = ideal, m, n, l = integers (control parameters of the method), `outR` ring,
 m : precision of output in digits ($4 \leq m$) and of the generated ring of complex numbers;
 n : control of multiplicity
 $n = 0$, return all different roots
 $n \neq 0$, find all roots (with multiplicity)

l: precision of internal computation in decimal digits ($l \geq 8$) only if the basering is not complex or complex with smaller precision,
 [default: $(m,n,l) = (8,0,30)$, or if only (m,n) are set explicitly with $n \neq 0$, then $(m,n,l) = (m,n,60)$]

Assume: the ideal is 0-dimensional;

basing has characteristic 0 and is either complex or without parameters;

Return: (1) If called without the additional parameter "oldring":

ring R with the same number of variables but with complex coefficients (and precision m). R comes with a list SOL of numbers, in which complex roots of G are stored:

* If $n = 0$, SOL is the list of all different solutions, each of them being represented by a list of numbers.

* If $n \neq 0$, SOL is a list of two list: $SOL[i][1]$ is the list of all different solutions with the multiplicity $SOL[i][2]$.

SOL is ordered w.r.t. multiplicity (the smallest first).

(2) If called with the additional parameter "oldring", the procedure looks for an appropriate ring (at top level) in which the solutions can be stored (interactive).

The user may then select an appropriate ring and choose a name for the output list in this ring. The list is exported directly to the selected ring and the return value is a string "result exported to" + name of the selected ring.

Note: If the problem is not 0-dim. the procedure stops with ERROR. If the ideal G is not a lexicographic Groebner basis, the lexicographic Groebner basis is computed internally (Hilbert driven).

The computed solutions are displayed, unless solve is called with the additional parameter "nodisplay".

Example:

```
LIB "solve.lib";
// Find all roots of a multivariate ideal using triangular sets:
int d,t,s = 4,3,2 ;
int i;
ring A=0,x(1..d),dp;
poly p=-1;
for (i=d; i>0; i--) { p=p+x(i)^s; }
ideal I = x(d)^t-x(d)^s+p;
for (i=d-1; i>0; i--) { I=x(i)^t-x(i)^s+p,I; }
I;
↪ I[1]=x(1)^3+x(2)^2+x(3)^2+x(4)^2-1
↪ I[2]=x(2)^3+x(1)^2+x(3)^2+x(4)^2-1
↪ I[3]=x(3)^3+x(1)^2+x(2)^2+x(4)^2-1
↪ I[4]=x(4)^3+x(1)^2+x(2)^2+x(3)^2-1
// the multiplicity is
vdim(std(I));
↪ 81
def AC=solve(I,6,0,"nodisplay"); // solutions should not be displayed
↪
↪ // 'solve' created a ring, in which a list SOL of numbers (the complex so\
  lutions)
↪ // is stored.
↪ // To access the list of complex solutions, type (if the name R was assign\
  ed
↪ // to the return value):
```

```

⇒          setring R; SOL;
// list of solutions is stored in AC as the list SOL (default name)
setring AC;

⇒ 37

```

```
// the number of complex solutions (counted with multiplicities) is
size(SOL[1][1])*SOL[1][2]+size(SOL[2][1])*SOL[2][2];
↳ 81
```

D.8.3.3 ures_solve

Procedure from library `solve.lib` (see [Section D.8.3 \[solve.lib\]](#), page 1414).

Usage: `ures_solve(i [, k, p]);` i = ideal, k, p = integers
 $k=0$: use sparse resultant matrix of Gelfand, Kapranov and Zelevinsky,
 $k=1$: use resultant matrix of Macaulay which works only for homogeneous ideals,
 $p>0$: defines precision of the long floats for internal computation if the basering is not complex (in decimal digits),
(default: $k=0, p=30$)

Assume: i is a zerodimensional ideal given by a quadratic system, that is,
 $nvars(basing) = ncols(i) =$ number of vars actually occurring in i ,

Return: If the ground field is the field of complex numbers: list of numbers (the complex roots of the polynomial system $i=0$).
Otherwise: ring R with the same number of variables but with complex coefficients (and precision p). R comes with a list `SOL` of numbers, in which complex roots of the polynomial system i are stored:

Example:

```
LIB "solve.lib";
// compute the intersection points of two curves
ring rsq = 0,(x,y),lp;
ideal gls= x2 + y2 - 10, x2 + xy + 2y2 - 16;
def R=ures_solve(gls,0,16);
↳
↳ // 'ures_solve' created a ring, in which a list SOL of numbers (the compl\
  ex
↳ // solutions) is stored.
↳ // To access the list of complex solutions, type (if the name R was assign\
  ned
↳ // to the return value):
↳      setring R; SOL;
setring R; SOL;

↳ -2.82842712474619
↳   [2]:
↳ -1.414213562373095
↳ [2]:
↳   [1]:
↳      -1
↳   [2]:
↳      3
↳ [3]:
↳   [1]:
↳      1
↳   [2]:
```

```

↳      -3
↳ [4] :
↳      [1] :
↳ 2.82842712474619
↳      [2] :
↳ 1.414213562373095

```

D.8.3.4 mp_res_mat

Procedure from library `solve.lib` (see [Section D.8.3 \[solve.lib\]](#), page 1414).

Usage: `mp_res_mat(i [, k]);` i ideal, k integer,
 $k=0$: sparse resultant matrix of Gelfand, Kapranov and Zelevinsky,
 $k=1$: resultant matrix of Macaulay ($k=0$ is default)

Assume: The number of elements in the input system must be the number of variables in the basering plus one;
if $k=1$ then i must be homogeneous.

Return: module representing the multipolynomial resultant matrix

Example:

```

LIB "solve.lib";
// compute resultant matrix in ring with parameters (sparse resultant matrix)
ring rsq= (0,u0,u1,u2),(x1,x2),lp;
ideal i= u0+u1*x1+u2*x2,x1^2 + x2^2 - 10,x1^2 + x1*x2 + 2*x2^2 - 16;
module m = mp_res_mat(i);
print(m);
↳ -16,0, -10,0, (u0),0, 0, 0, 0, 0,
↳ 0, -16,0, -10,(u2),(u0),0, 0, 0, 0,
↳ 2, 0, 1, 0, 0, (u2),0, 0, 0, 0,
↳ 0, 2, 0, 1, 0, 0, 0, 0, 0, 0,
↳ 0, 0, 0, 0, (u1),0, -10,(u0),0, -16,
↳ 1, 0, 0, 0, 0, (u1),0, (u2),(u0),0,
↳ 0, 1, 0, 0, 0, 0, 1, 0, (u2),2,
↳ 1, 0, 1, 0, 0, 0, 0, (u1),0, 0,

// computing sparse resultant
det(mn);
⇒ -7056

```

D.8.3.5 interpolate

Procedure from library `solve.lib` (see [Section D.8.3 \[solve.lib\]](#), page 1414).

Usage: `interpolate(p,v,d)`; p,v =ideals of numbers, d =integer

Assume: Ground field K is the field of rational numbers, p and v are lists of elements of the ground field K with $p[j] \neq -1,0,1$, $\text{size}(p) = n$ (= number of vars) and $\text{size}(v)=N=(d+1)^n$.

Return: poly f , the unique polynomial f of degree $n*d$ with prescribed values $v[i]$ at the points $p(i)=(p[1]^{(i-1)},\dots,p[n]^{(i-1)})$, $i=1,\dots,N$.

Note: mainly useful when $n=1$, i.e. f is satisfying $f(p^{(i-1)}) = v[i]$, $i=1..d+1$.

Example:

```

LIB "solve.lib";
ring r1 = 0,(x),lp;
// determine f with deg(f) = 4 and
// v = values of f at points 3^0, 3^1, 3^2, 3^3, 3^4
ideal v=16,0,11376,1046880,85949136;
interpolate( 3, v, 4 );
⇒ 2x4-22x2+36

```

See also: [Section 5.1.159 \[vandermonde\]](#), page 279.

D.8.3.6 fglm_solve

Procedure from library `solve.lib` (see [Section D.8.3 \[solve.lib\], page 1414](#)).

Usage: `fglm_solve(i [, p]);` *i* ideal, *p* integer

Assume: the ground field has char 0.

Return: ring *R* with the same number of variables but with complex coefficients (and precision *p*). *R* comes with a list `rlist` of numbers, in which the complex roots of *i* are stored. *p*>0: gives precision of complex numbers in decimal digits [default: *p*=30].

Note: The procedure uses a standard basis of *i* to determine all complex roots of *i*.

Example:

```
LIB "solve.lib";
ring r = 0,(x,y),lp;
// compute the intersection points of two curves
ideal s = x2 + y2 - 10, x2 + xy + 2y2 - 16;
def R = fglm_solve(s,10);
↳
↳ // 'fglm_solve' created a ring, in which a list rlist of numbers (the
↳ // complex solutions) is stored.
↳ // To access the list of complex solutions, type (if the name R was assign\
↳ // ed
↳ // to the return value):
↳      setring R; rlist;
setring R; rlist;

↳ [4]:
↳   [1]:
↳ -1
↳   [2]:
↳ 3
```

D.8.3.7 lex_solve

Procedure from library `solve.lib` (see [Section D.8.3 \[solve.lib\], page 1414](#)).

Usage: `lex_solve(i[,p]);` *i*=ideal, *p*=integer,
p>0: gives precision of complex numbers in decimal digits (default: *p*=30).

Assume: i is a reduced lexicographical Groebner bases of a zero-dimensional ideal, sorted by increasing leading terms.

Return: ring R with the same number of variables but with complex coefficients (and precision p). R comes with a list `rlist` of numbers, in which the complex roots of i are stored.

Example:

```
LIB "solve.lib";
ring r = 0,(x,y),lp;
// compute the intersection points of two curves
ideal s = x2 + y2 - 10, x2 + xy + 2y2 - 16;
def R = lex_solve(stdfglm(s),10);
↳
↳ // 'lex_solve' created a ring, in which a list rlist of numbers (the
↳ // complex solutions) is stored.
↳ // To access the list of complex solutions, type (if the name R was assign\
ned
↳ // to the return value):

```

D.8.3.8 simplexOut

Procedure from library `solve.lib` (see [Section D.8.3 \[solve.lib\], page 1414](#)).

Usage: `simplexOut(l); l list`

Assume: l is the output of `simplex`.

Return: Nothing. The procedure prints the computed solution of `simplex` (as strings) in a nice format.

Example:

```
LIB "solve.lib";
ring r = (real,10),(x),lp;
```

```

// consider the max. problem:
//
//   maximize  x(1) + x(2) + 3*x(3) - 0.5*x(4)
//
// with constraints:  x(1) +          2*x(3)          <= 740
//                   2*x(2)          - 7*x(4) <= 0
//                   x(2) - x(3) + 2*x(4) >= 0.5
//                   x(1) + x(2) + x(3) + x(4) = 9
//
matrix sm[5][5]= 0, 1, 1, 3,-0.5,
740,-1, 0,-2, 0,
0, 0,-2, 0, 7,
0.5, 0,-1, 1,-2,
9,-1,-1,-1,-1;
int n = 4; // number of constraints
int m = 4; // number of variables
int m1= 2; // number of <= constraints
int m2= 1; // number of >= constraints
int m3= 1; // number of == constraints
list sol=simplex(sm, n, m, m1, m2, m3);
simplexOut(sol);
↳ z = 17.025
↳ x2 = 3.325
↳ x4 = 0.95
↳ x3 = 4.725

```

See also: [Section 5.1.138 \[simplex\]](#), page 256.

D.8.3.9 triangLf_solve

Procedure from library `solve.lib` (see [Section D.8.3 \[solve.lib\]](#), page 1414).

Usage: `triangLf_solve(i [, p])`; i ideal, p integer,
 $p > 0$: gives precision of complex numbers in digits (default: $p=30$).

Assume: the ground field has char 0; i is a zero-dimensional ideal

Return: ring R with the same number of variables but with complex coefficients (and precision p). R comes with a list `rlist` of numbers, in which the complex roots of i are stored.

Note: The procedure uses a triangular system (Lazard's Algorithm with factorization) computed from a standard basis to determine recursively all complex roots of the input ideal i with Laguerre's algorithm.

Example:

```

LIB "solve.lib";
ring r = 0,(x,y),lp;
// compute the intersection points of two curves
ideal s = x2 + y2 - 10, x2 + xy + 2y2 - 16;
def R = triangLf_solve(s,10);
↳
↳ // 'triangLf_solve' created a ring, in which a list rlist of numbers (the
↳ // complex solutions) is stored.
↳ // To access the list of complex solutions, type (if the name R was assign\
↳ // ed
↳ // to the return value):

```

```

↳          setring R; rlist;
setring R; rlist;

```

D.8.3.10 triangM_solve

Procedure from library `solve.lib` (see [Section D.8.3 \[solve.lib\], page 1414](#)).

Usage: `triangM_solve(i [, p])`; `i`=ideal, `p`=integer,
`p`>0: gives precision of complex numbers in digits (default: `p`=30).

Assume: the ground field has char 0;
`i` zero-dimensional ideal

Return: ring `R` with the same number of variables but with complex coefficients (and precision `p`). `R` comes with a list `rlist` of numbers, in which the complex roots of `i` are stored.

Note: The procedure uses a triangular system (Moellers Algorithm) computed from a standard basis of input ideal `i` to determine recursively all complex roots with Laguerre's algorithm.

Example:

```

LIB "solve.lib";
ring r = 0,(x,y),lp;
// compute the intersection points of two curves
ideal s = x2 + y2 - 10, x2 + xy + 2y2 - 16;
def R = triangM_solve(s,10);
↳
↳ // 'triangM_solve' created a ring, in which a list rlist of numbers (the
↳ // complex solutions) is stored.
↳ // To access the list of complex solutions, type (if the name R was assign\
↳   ned
↳ // to the return value):
↳          setring R; rlist;
setring R; rlist;

D.8.3.11 triangL_solve

Procedure from library `solve.lib` (see [Section D.8.3 \[solve.lib\], page 1414](#)).

Usage: `triangL_solve(i [, p]);` i =ideal, p =integer,
 $p > 0$: gives precision of complex numbers in digits (default: $p=30$).

Assume: the ground field has char 0; i is a zero-dimensional ideal.

Return: ring R with the same number of variables, but with complex coefficients (and precision p). R comes with a list `rlist` of numbers, in which the complex roots of i are stored.

Note: The procedure uses a triangular system (Lazard's Algorithm) computed from a standard basis of input ideal i to determine recursively all complex roots with Laguerre's algorithm.

Example:

```

LIB "solve.lib";
ring r = 0,(x,y),lp;

D.8.3.12 triang_solve

Procedure from library `solve.lib` (see [Section D.8.3 \[solve.lib\], page 1414](#)).

Usage: `triang_solve(l,p [,d]);` l =list, p,d =integers
 l is a list of finitely many triangular systems, such that the union of their varieties equals the variety of the initial ideal.
 $p>0$: gives precision of complex numbers in digits,
 $d>0$: gives precision ($1<d<p$) for near-zero-determination,
(default: $d=1/2*p$).

Assume: the ground field has char 0;
 l was computed using the algorithm of Lazard or the algorithm of Moeller (see `triang.lib`).

Return: ring R with the same number of variables, but with complex coefficients (and precision p). R comes with a list `rlist` of numbers, in which the complex roots of l are stored.

Example:

```

LIB "solve.lib";
ring r = 0,(x,y),lp;
// compute the intersection points of two curves
ideal s= x2 + y2 - 10, x2 + xy + 2y2 - 16;
def R=triang_solve(triangLfak(stdfglm(s)),10);
⇒
⇒ // 'triang_solve' created a ring, in which a list rlist of numbers (the
⇒ // complex solutions) is stored.
⇒ // To access the list of complex solutions, type (if the name R was assign\
    ned
⇒ // to the return value):

D.8.4 triang_lib

Library: triang.lib

Purpose: Decompose Zero-dimensional Ideals into Triangular Sets

Author: D. Hillebrand

Procedures:

D.8.4.1 triangL

Procedure from library `triang.lib` (see [Section D.8.4 \[triang.lib\]](#), page 1427).

Usage: triangL(G); G=ideal

Assume: G is the reduced lexicographical Groebner basis of the zero-dimensional ideal (G), sorted by increasing leading terms.

Return: a list of finitely many triangular systems, such that the union of their varieties equals the variety of (G).

Note: Algorithm of Lazard (see: Lazard, D.: Solving zero-dimensional algebraic systems, J. Symb. Comp. 13, 117 - 132, 1992).

Example:

```

LIB "triang.lib";
ring rC5 = 0,(e,d,c,b,a),lp;
triangL(stdfglm(cyclic(5)));
↳ [1] :
↳ _[1]=a5-1
↳ _[2]=b-a
↳ _[3]=c2+3ca+a2
↳ _[4]=d+c+3a
↳ _[5]=e-a
↳ [2] :
↳ _[1]=a5-1
↳ _[2]=b-a
↳ _[3]=c-a
↳ _[4]=d2+3da+a2

```

```

↳   _[5]=e+d+3a
↳ [3]:
↳   _[1]=a5-1
↳   _[2]=b6+4b5a+5b4a2+5b3a3+5b2a4+4b+a
↳   _[3]=5c+8b5a+30b4a2+30b3a3+25b2a4+30b+22a
↳   _[4]=5d-2b5a-10b4a2-15b3a3-10b2a4-10b-8a
↳   _[5]=5e-6b5a-20b4a2-15b3a3-15b2a4-15b-9a
↳ [4]:
↳   _[1]=a10+123a5+1
↳   _[2]=55b2-2ba6-233ba-8a7-987a2
↳   _[3]=55c+a6+144a
↳   _[4]=55d+a6+144a
↳   _[5]=55e+55b-2a6-233a

```

D.8.4.2 triangLfak

Procedure from library `triang.lib` (see [Section D.8.4 \[triang.lib\], page 1427](#)).

Usage: `triangLfak(G); G=ideal`

Assume: `G` is the reduced lexicographical Groebner basis of the zero-dimensional ideal (`G`), sorted by increasing leading terms.

Return: a list of finitely many triangular systems, such that the union of their varieties equals the variety of (`G`).

Note: Algorithm of Lazard with factorization (see: Lazard, D.: Solving zero-dimensional algebraic systems, *J. Symb. Comp.* 13, 117 - 132, 1992).

Remark: each polynomial of the triangular systems is factorized.

Example:

```

LIB "triang.lib";
ring rC5 = 0, (e,d,c,b,a), lp;
triangLfak(stdfglm(cyclic(5)));
↳ [1]:
↳   _[1]=a-1
↳   _[2]=b-1
↳   _[3]=c-1
↳   _[4]=d2+3d+1
↳   _[5]=e+d+3
↳ [2]:
↳   _[1]=a-1
↳   _[2]=b-1
↳   _[3]=c2+3c+1
↳   _[4]=d+c+3
↳   _[5]=e-1
↳ [3]:
↳   _[1]=a-1
↳   _[2]=b4+b3+b2+b+1

↳   _[5]=e-1

```

D.8.4.3 triangM

Procedure from library `triang.lib` (see [Section D.8.4 \[triang.lib\], page 1427](#)).

Usage: `triangM(G[,i]);` G=ideal, i=integer,

Assume: G is the reduced lexicographical Groebner basis of the zero-dimensional ideal (G), sorted by increasing leading terms.

Return: a list of finitely many triangular systems, such that the union of their varieties equals the variety of (G). If $i = 2$, then each polynomial of the triangular systems is factorized.

Note: Algorithm of Moeller (see: Moeller, H.M.: On decomposing systems of polynomial equations with finitely many solutions, *Appl. Algebra Eng. Commun. Comput.* 4, 217 - 230, 1993).

Example:

```

LIB "triang.lib";
ring rC5 = 0,(e,d,c,b,a),lp;
triangM(stdfglm(cyclic(5))); //oder: triangM(stdfglm(cyclic(5)),2);
↳ [1]:
↳   _[1]=a5-1
↳   _[2]=b-a
↳   _[3]=c-a
↳   _[4]=d2+3da+a2
↳   _[5]=e+d+3a
↳ [2]:
↳   _[1]=a10+123a5+1
↳   _[2]=55b2-2ba6-233ba-8a7-987a2
↳   _[3]=55c+a6+144a
↳   _[4]=55d+a6+144a
↳   _[5]=55e+55b-2a6-233a
↳ [3]:
↳   _[1]=a5-1
↳   _[2]=b6+4b5a+5b4a2+5b3a3+5b2a4+4b+a
↳   _[3]=5c+8b5a+30b4a2+30b3a3+25b2a4+30b+22a
↳   _[4]=5d-2b5a-10b4a2-15b3a3-10b2a4-10b-8a
↳   _[5]=5e-6b5a-20b4a2-15b3a3-15b2a4-15b-9a
↳ [4]:
↳   _[1]=a5-1
↳   _[2]=b-a
↳   _[3]=c2+3ca+a2
↳   _[4]=d+c+3a
↳   _[5]=e-a

```

D.8.4.4 triangMH

Procedure from library `triang.lib` (see [Section D.8.4 \[triang.lib\], page 1427](#)).

Usage: `triangMH(G[,i]);` G=ideal, i=integer

Assume: G is the reduced lexicographical Groebner basis of the zero-dimensional ideal (G) , sorted by increasing leading terms.

Return: a list of finitely many triangular systems, such that the disjoint union of their varieties equals the variety of (G) . If $i = 2$, then each polynomial of the triangular systems is factorized.

Note: Algorithm of Moeller and Hillebrand (see: Moeller, H.M.: On decomposing systems of polynomial equations with finitely many solutions, Appl. Algebra Eng. Commun. Comput. 4, 217 - 230, 1993 and Hillebrand, D.: Triangulierung nulldimensionaler Ideale - Implementierung und Vergleich zweier Algorithmen, master thesis, Universitaet Dortmund, Fachbereich Mathematik, Prof. Dr. H.M. Moeller, 1999).

Example:

```
LIB "triang.lib";
ring rC5 = 0, (e,d,c,b,a), lp;
triangMH(stdfglm(cyclic(5)));
↳ [1]:
↳  _[1]=a5-1
↳  _[2]=b-a
↳  _[3]=c-a
↳  _[4]=d2+3da+a2
↳  _[5]=e+d+3a
↳ [2]:
↳  _[1]=a10+123a5+1
↳  _[2]=55b2-2ba6-233ba-8a7-987a2
↳  _[3]=55c+a6+144a
↳  _[4]=55d+a6+144a
↳  _[5]=55e+55b-2a6-233a
↳ [3]:
↳  _[1]=a5-1
↳  _[2]=b6+4b5a+5b4a2+5b3a3+5b2a4+4b+a
↳  _[3]=5c+8b5a+30b4a2+30b3a3+25b2a4+30b+22a
↳  _[4]=5d-2b5a-10b4a2-15b3a3-10b2a4-10b-8a
↳  _[5]=5e-6b5a-20b4a2-15b3a3-15b2a4-15b-9a
↳ [4]:
↳  _[1]=a5-1

↳  _[3]=c2+3ca+a2
↳  _[4]=d+c+3a
↳  _[5]=e-a
```

D.8.5 ntsolve.lib

Library: ntsolve.lib

Purpose: Real Newton Solving of Polynomial Systems

Authors: Wilfred Pohl, email: pohl@mathematik.uni-kl.de
Dietmar Hillebrand

Procedures:

D.8.5.1 nt_solve

Procedure from library `ntsolve.lib` (see [Section D.8.5 \[ntsolve.lib\]](#), page 1431).

Usage: `nt_solve(gls,ini[,ipar]);` `gls,ini=` ideals, `ipar=list/intvec`,
`gls`: contains the equations, for which a solution will be computed
`ini`: ideal of initial values (approximate solutions to start with),
`ipar`: control integers (default: `ipar = [100, 10]`)
`ipar[1]`: max. number of iterations
`ipar[2]`: accuracy (we have the l₂-norm `||.||`): accepts solution `sol`
if `||gls(sol)|| < eps0*(0.1^ipar[2])`
where `eps0 = ||gls(ini)||` is the initial error

Assume: `gls` is a zerodimensional ideal with `nvars(basing) = size(gls) (>1)`

Return: ideal, coordinates of one solution (if found), 0 else

Note: if `printlevel > 0`: displays comments (default = 0)

Example:

```
LIB "ntsolve.lib";
ring rsq = (real,40),(x,y,z,w),lp;
ideal gls = x2+y2+z2-10, y2+z3+w-8, xy+yz+xz+w5 - 1,w3+y;
ideal ini = 3.1,2.9,1.1,0.5;
intvec ipar = 200,0;
ideal sol = nt_solve(gls,ini,ipar);
sol;
↳ sol[1]=0.8698104581550055082008024750939710335537
↳ sol[2]=2.821577445750324600849626251771718236941
↳ sol[3]=1.132312008466417990006094015711266871732
↳ sol[4]=-1.413071026406678849397999475590194239628
```

D.8.5.2 triMNewton

Procedure from library `ntsolve.lib` (see [Section D.8.5 \[ntsolve.lib\]](#), page 1431).

Usage: `triMNewton(G,a[,ipar]);` `G,a=` ideals, `ipar=list/intvec`

Assume: `G`: `g1,...,gn`, a triangular system of `n` equations in `n` vars, i.e. `gi=gi(var(n-i+1),...,var(n))`,
`a`: ideal of numbers, coordinates of an approximation of a common zero of `G` to start
with (with `a[i]` to be substituted in `var(i)`),
`ipar`: control integer vector (default: `ipar = [100, 10]`)
`ipar[1]`: max. number of iterations
`ipar[2]`: accuracy (we have as norm `||.||` absolute value):
accepts solution `sol` if `|G(sol)| < |G(a)|*(0.1^ipar[2])`.

Return: an ideal, coordinates of a better approximation of a zero of `G`

Example:

```
LIB "ntsolve.lib";
ring r = (real,30),(z,y,x),(lp);
ideal i = x^2-1,y^2+x4-3,z2-y4+x-1;
ideal a = 2,3,4;
intvec e = 20,10;
ideal l = triMNewton(i,a,e);
l;
↳ l[1]=-2.00000000004226573888027914342
↳ l[2]=1.41421356237309504880168872421
↳ l[3]=1
```

D.8.6 zeroset_lib

Library: zeroset.lib

Purpose: Procedures for roots and factorization

Author: Thomas Bayer, email: tbayer@mathematik.uni-kl.de,
<http://wwwmayr.informatik.tu-muenchen.de/personen/bayert/>
 Current address: Hochschule Ravensburg-Weingarten

Overview: Algorithms for finding the zero-set of a zero-dim. ideal in $\mathbb{Q}(a)[x_1, \dots, x_n]$, roots and factorization of univariate polynomials over $\mathbb{Q}(a)[t]$ where a is an algebraic number. Written in the scope of the diploma thesis (advisor: Prof. Gert-Martin Greuel) 'Computations of moduli spaces of semiquasihomogeneous singularities and an implementation in Singular'. This library is meant as a preliminary extension of the functionality of Singular for univariate factorization of polynomials over simple algebraic extensions in characteristic 0.

Note: Subprocedures with postfix 'Main' require that the ring contains a variable 'a' and no parameters, and the ideal 'mpoly', where 'minpoly' from the basering is stored.

Procedures:

D.8.6.1 Quotient

Procedure from library `zeroset.lib` (see [Section D.8.6 \[zeroset_lib\]](#), page 1433).

Usage: `Quotient(f, g)`; where f, g are polynomials;

Purpose: compute the quotient q and remainder r s.t. $f = g \cdot q + r$, $\deg(r) < \deg(g)$

Return: list of polynomials
`_[1]` = quotient q
`_[2]` = remainder r

Assume: `basering = Q[x]` or `Q(a)[x]`

Note: This procedure is outdated, and should no longer be used. Use `div` and `mod` instead.

Example:

```
LIB "zeroset.lib";
ring R = (0,a), x, lp;
minpoly = a2+1;
poly f = x4 - 2;
poly g = x - a;
list qr = Quotient(f, g);
qr;
↳ [1]:
↳ x3+(a)*x2-x+(-a)
↳ [2]:
↳ 0
qr[1]*g + qr[2] - f;
↳ 1
```

D.8.6.2 remainder

Procedure from library `zeroset.lib` (see [Section D.8.6 \[zeroset.lib\], page 1433](#)).

Usage: `remainder(f, g)`; where f, g are polynomials

Purpose: compute the remainder of the division of f by g , i.e. a polynomial r s.t. $f = g \cdot q + r$, $\deg(r) < \deg(g)$.

Return: `poly`

Assume: `basing = Q[x]` or `Q(a)[x]`

Note: outdated, use `mod/reduce` instead

Example:

```
LIB "zeroset.lib";
ring R = (0,a), x, lp;
minpoly = a2+1;
poly f = x4 - 1;
poly g = x3 - 1;
remainder(f, g);
↳ x-1
```

D.8.6.3 roots

Procedure from library `zeroset.lib` (see [Section D.8.6 \[zeroset.lib\], page 1433](#)).

Usage: `roots(f)`; where f is a polynomial

Purpose: compute all roots of f in a finite extension of the ground field without multiplicities.

Return: `ring`, a polynomial ring over an extension field of the ground field, containing a list 'theRoots' and polynomials 'newA' and 'f':

- 'theRoots' is the list of roots of the polynomial f (no multiplicities)

- if the ground field is $Q(a')$ and the extension field is $Q(a)$, then 'newA' is the representation of a' in $Q(a)$.

If the basering contains a parameter 'a' and the minpoly remains unchanged then 'newA' = 'a'.

If the basering does not contain a parameter then 'newA' = 'a' (default).

- 'f' is the polynomial f in $Q(a)$ (a' being substituted by 'newA')

Assume: ground field to be Q or a simple extension of Q given by a minpoly

Example:

```
LIB "zeroset.lib";
ring R = (0,a), x, lp;
minpoly = a2+1;
poly f = x3 - a;
def R1 = roots(f);
↳
↳ // 'roots' created a new ring which contains the list 'theRoots' and
↳ // the polynomials 'f' and 'newA'
↳ // To access the roots, newA and the new representation of f, type
↳   def R = roots(f); setring R; theRoots; newA; f;
↳
↳   setring R1;
```

```

minpoly;
↳ (a4-a2+1)
newA;
↳ (a3)
f;
↳ x3+(-a3)
theRoots;
↳ [1]:
↳ (-a3)
↳ [2]:
↳ (a)
↳ [3]:
↳ (a3-a)
map F;
F[1] = theRoots[1];
F(f);
↳ 0

```

D.8.6.4 sqfrNorm

Procedure from library `zeroset.lib` (see [Section D.8.6 \[zeroset.lib\], page 1433](#)).

Usage: `sqfrNorm(f)`; where f is a polynomial

Purpose: compute the norm of the squarefree polynomial f in $\mathbb{Q}(a)[x]$.

Return: list with 3 entries

```

_ [1] = squarefree norm of g (poly)
_ [2] = g (= f(x - s*a)) (poly)
_ [3] = s (int)

```

Assume: f must be squarefree, `basing = $\mathbb{Q}(a)[x]$` and `minpoly != 0`.

Note: the norm is an element of $\mathbb{Q}[x]$

Example:

```

LIB "zeroset.lib";
ring R = (0,a), x, lp;
minpoly = a2+1;
poly f = x4 - 2*x + 1;
sqfrNorm(f);
↳ [1]:
↳ x8+4*x6-4*x5+8*x4+8*x3-4*x2+8*x+8
↳ [2]:
↳ x4+(-4a)*x3-6*x2+(4a-2)*x+(2a+2)
↳ [3]:
↳ 1

```

D.8.6.5 zeroSet

Procedure from library `zeroset.lib` (see [Section D.8.6 \[zeroset.lib\], page 1433](#)).

Usage: `zeroSet(I [,opt])`; I =ideal, `opt`=integer

Purpose: compute the zero-set of the zero-dim. ideal I , in a finite extension of the ground field.

Return: ring, a polynomial ring over an extension field of the ground field, containing a list 'theZeroseT', a polynomial 'newA', and an ideal 'id':

- 'theZeroseT' is the list of the zeros of the ideal I, each zero is an ideal.
- if the ground field is $\mathbb{Q}(b)$ and the extension field is $\mathbb{Q}(a)$, then 'newA' is the representation of b in $\mathbb{Q}(a)$.
If the basering contains a parameter 'a' and the minpoly remains unchanged then 'newA' = 'a'.
- 'id' is the ideal I in $\mathbb{Q}(a)[x_1, \dots]$ (a' substituted by 'newA')

Assume: $\dim(I) = 0$, and ground field to be \mathbb{Q} or a simple extension of \mathbb{Q} given by a minpoly.

Options: opt = 0: no primary decomposition (default)
opt > 0: primary decomposition

Note: If I contains an algebraic number (parameter) then I must be transformed w.r.t. 'newA' in the new ring.

Example:

```
LIB "zeroseT.lib";
ring R = (0,a), (x,y,z), lp;
minpoly = a2 + 1;
ideal I = x2 - 1/2, a*z - 1, y - 2;
def T = zeroSet(I);
setring T;
minpoly;
⇒ (4a4+4a2+9)
newA;
⇒ (1/3a3+5/6a)
id;
⇒ id[1]=(1/3a3+5/6a)*z-1
⇒ id[2]=y-2
⇒ id[3]=2*x2-1
theZeroseT;
⇒ [1]:
⇒   _[1]=(-1/3a3+1/6a)
⇒   _[2]=2
⇒   _[3]=(-1/3a3-5/6a)
⇒ [2]:
⇒   _[1]=(1/3a3-1/6a)
⇒   _[2]=2
⇒   _[3]=(-1/3a3-5/6a)
map F1 = basering, theZeroseT[1];
map F2 = basering, theZeroseT[2];
F1(id);
⇒ _[1]=0
⇒ _[2]=0
⇒ _[3]=0
F2(id);
⇒ _[1]=0
⇒ _[2]=0
⇒ _[3]=0
```

D.8.6.6 egcdMain

Procedure from library `zeroset.lib` (see [Section D.8.6 \[zeroset.lib\], page 1433](#)).

Usage: `egcdMain(f, g)`; where f, g are polynomials

Purpose: compute the polynomial gcd of f and g over $\mathbb{Q}(a)[x]$

Return: `poly`

Assume: `basing = $\mathbb{Q}[x, a]$` and ideal `mpoly` is defined (it might be 0), this represents the ring $\mathbb{Q}(a)[x]$ together with its minimal polynomial.

Note: outdated, use `gcd` instead

D.8.6.7 factorMain

Procedure from library `zeroset.lib` (see [Section D.8.6 \[zeroset.lib\], page 1433](#)).

Usage: `factorMain(f)`; where f is a polynomial

Purpose: compute the factorization of the squarefree polynomial f over $\mathbb{Q}(a)[t]$, `minpoly = $p(a)$` .

Return: list with 2 entries

`_[1]` = factors, first is a constant

`_[2]` = multiplicities (not yet implemented)

Assume: `basing = $\mathbb{Q}[x, a]$` , representing $\mathbb{Q}(a)[x]$. An ideal `mpoly` must be defined, representing the minimal polynomial (it might be 0!).

Note: outdated, use `factorize` instead

D.8.6.8 invertNumberMain

Procedure from library `zeroset.lib` (see [Section D.8.6 \[zeroset.lib\], page 1433](#)).

Usage: `invertNumberMain(f)`; where f is a polynomial

Purpose: compute $1/f$ if f is a number in $\mathbb{Q}(a)$, i.e., f is represented by a polynomial in $\mathbb{Q}[a]$.

Return: `poly` $1/f$

Assume: `basing = $\mathbb{Q}[x_1, \dots, x_n, a]$` , ideal `mpoly` must be defined and `!= 0` !

Note: outdated, use `/` instead

D.8.6.9 quotientMain

Procedure from library `zeroset.lib` (see [Section D.8.6 \[zeroset.lib\], page 1433](#)).

Usage: `quotientMain(f, g)`; where f, g are polynomials

Purpose: compute the quotient q and remainder r s.th. $f = g*q + r$, $\deg(r) < \deg(g)$

Return: list of polynomials

`_[1]` = quotient q

`_[2]` = remainder r

Assume: `basing = $\mathbb{Q}[x, a]$` and ideal `mpoly` is defined (it might be 0), this represents the ring $\mathbb{Q}(a)[x]$ together with its minimal polynomial.

Note: outdated, use `div/mod` instead

D.8.6.10 remainderMain

Procedure from library `zeroset.lib` (see [Section D.8.6 \[zeroset.lib\], page 1433](#)).

Usage: `remainderMain(f, g)`; where f, g are polynomials

Purpose: compute the remainder r s.t. $f = g \cdot q + r$, $\deg(r) < \deg(g)$

Return: `poly`

Assume: `basing = Q[x,a]` and ideal `mpoly` is defined (it might be 0), this represents the ring $\mathbb{Q}(a)[x]$ together with its minimal polynomial.

Note: outdated, use `mod/reduce` instead

D.8.6.11 rootsMain

Procedure from library `zeroset.lib` (see [Section D.8.6 \[zeroset.lib\], page 1433](#)).

Usage: `rootsMain(f)`; where f is a polynomial

Purpose: compute all roots of f in a finite extension of the ground field without multiplicities.

Return: list, all entries are polynomials

- `_[1]` = roots of f , each entry is a polynomial
- `_[2]` = 'newA' - if the ground field is $\mathbb{Q}(b)$ and the extension field is $\mathbb{Q}(a)$, then 'newA' is the representation of b in $\mathbb{Q}(a)$
- `_[3]` = minpoly of the algebraic extension of the ground field

Assume: `basing = Q[x,a]` ideal `mpoly` must be defined, it might be 0!

Note: might change the ideal `mpoly`!!

D.8.6.12 sqfrNormMain

Procedure from library `zeroset.lib` (see [Section D.8.6 \[zeroset.lib\], page 1433](#)).

Usage: `sqfrNorm(f)`; where f is a polynomial

Purpose: compute the norm of the squarefree polynomial f in $\mathbb{Q}(a)[x]$.

Return: list with 3 entries

- `_[1]` = squarefree norm of g (poly)
- `_[2]` = g ($= f(x - s \cdot a)$) (poly)
- `_[3]` = s (int)

Assume: f must be squarefree, `basing = Q[x,a]` and ideal `mpoly` is equal to 'minpoly', this represents the ring $\mathbb{Q}(a)[x]$ together with 'minpoly'.

Note: the norm is an element of $\mathbb{Q}[x]$

D.8.6.13 containedQ

Procedure from library `zeroset.lib` (see [Section D.8.6 \[zeroset.lib\], page 1433](#)).

Usage: `containedQ(data, f [, opt])`; `data=list`; `f=any type`; `opt=integer`

Purpose: test if f is an element of `data`.

Return: int
 0 if f not contained in data
 1 if f contained in data

Options: opt = 0 : use '==' for comparing f with elements from data
 opt = 1 : use `sameQ` for comparing f with elements from data

D.8.6.14 `sameQ`

Procedure from library `zeroset.lib` (see [Section D.8.6 \[zeroset.lib\], page 1433](#)).

Usage: `sameQ(a, b)`; a,b=list/intvec

Purpose: test $a == b$ elementwise, i.e., $a[i] = b[i]$.

Return: int
 0 if $a \neq b$
 1 if $a == b$

D.8.7 `signcond.lib`

Library: `signcond.lib`

Purpose: Routines for computing realizable sign conditions

Author: Enrique A. Tobis, `etobis@dc.uba.ar`

Overview: Routines to determine the number of solutions of a multivariate polynomial system which satisfy a given sign configuration.

References:
 Basu, Pollack, Roy, "Algorithms in Real Algebraic Geometry", Springer, 2003.

Procedures:

D.8.7.1 `signcnd`

Procedure from library `signcond.lib` (see [Section D.8.7 \[signcond.lib\], page 1439](#)).

Usage: `signcnd(P,I)`; ideal P,I

Return: list: the sign conditions realized by the polynomials of P on $V(I)$. The output of `signcnd` is a list of two lists. Both lists have the same length. This length is the number of sign conditions realized by the polynomials of P on the set $V(i)$.
 Each element of the first list indicates a sign condition of the polynomials of P.
 Each element of the second list indicates how many elements of $V(I)$ give rise to the sign condition expressed by the same position on the first list.
 See the example for further explanations of the output.

Assume: I is a Groebner basis.

Note: The procedure `psigncnd` performs some pretty printing of this output.

Example:

```
LIB "signcond.lib";
ring r = 0, (x,y), dp;
ideal i = (x-2)*(x+3)*x, y*(y-1);
ideal P = x,y;
list l = signcnd(P,i);
```

```

size(l[1]);      // = the number of sign conditions of P on V(i)
↳ 6
//Each element of l[1] indicates a sign condition of the polynomials of P.
//The following means  $P[1] > 0$ ,  $P[2] = 0$ :
l[1][2];
↳ [1]:
↳ 1
↳ [2]:
↳ 0
//Each element of l[2] indicates how many elements of V(I) give rise to
//the sign condition expressed by the same position on the first list.
//The following means that exactly 1 element of V(I) gives rise to the
//condition  $P[1] > 0$ ,  $P[2] = 0$ :
l[2][2];
↳ 1

```

See also: [Section D.8.7.3 \[firstoct\]](#), page 1440; [Section D.8.7.2 \[psigncnd\]](#), page 1440.

D.8.7.2 psigncnd

Procedure from library `signcond.lib` (see [Section D.8.7 \[signcond.lib\]](#), page 1439).

Usage: `psigncnd(P,l)`; ideal P, list l

Return: list: a formatted version of l

Example:

```

LIB "signcond.lib";
ring r = 0,(x,y),dp;
ideal i = (x-2)*(x+3)*x,(y-1)*(y+2)*(y+4);
ideal P = x,y;
list l = signcnd(P,i);
psigncnd(P,l);
↳ 1 elements of V(I) satisfy {P[1] = 0,P[2] > 0}
↳ 1 elements of V(I) satisfy {P[1] > 0,P[2] > 0}
↳ 1 elements of V(I) satisfy {P[1] < 0,P[2] > 0}
↳ 2 elements of V(I) satisfy {P[1] = 0,P[2] < 0}
↳ 2 elements of V(I) satisfy {P[1] > 0,P[2] < 0}
↳ 2 elements of V(I) satisfy {P[1] < 0,P[2] < 0}
↳

```

See also: [Section D.8.7.1 \[signcnd\]](#), page 1439.

D.8.7.3 firstoct

Procedure from library `signcond.lib` (see [Section D.8.7 \[signcond.lib\]](#), page 1439).

Usage: `firstoct(I)`; I ideal

Return: number: the number of points of V(I) lying in the first octant

Assume: I is given by a Groebner basis.

Example:

```

LIB "signcond.lib";
ring r = 0,(x,y),dp;
ideal i = (x-2)*(x+3)*x,y*(y-1);

```

```

firstoct(i);
↳ 1

```

See also: [Section D.8.7.1 \[signcnd\]](#), page 1439.

D.9 Visualization

D.9.1 graphics_lib

Library: graphics.lib

Purpose: Procedures to use Graphics with Mathematica

Author: Christian Gorzel, gorzelc@math.uni-muenster.de

Procedures:

D.9.1.1 staircase

Procedure from library `graphics.lib` (see [Section D.9.1 \[graphics_lib\]](#), page 1441).

Usage: staircase(s,I); s a string, I ideal in two variables

Return: string with Mathematica input for displaying staircase diagrams of an ideal I, i.e. exponent vectors of the initial ideal of I

Note: ideal I should be given by a standard basis. Let s="" and copy and paste the result into a Mathematica notebook.

Example:

```

LIB "graphics.lib";
ring r0 = 0,(x,y),ls;
ideal I = -1x2y6-1x4y2, 7x6y5+1/2x7y4+6x4y6;
staircase("",std(I));
↳
↳ Show[Graphics[{
↳ {GrayLevel[0.5],Map[Rectangle[#, {9,9}] &, {{2,6},{6,2}}]},
↳ {PointSize[0.03], Map[Point, {{2,6},{6,2}}]},
↳ Table[Circle[{i,j},0.1], {i,0,9}, {j,0,9}]],
↳ Axes->True,AspectRatio->Automatic]]
↳
ring r1 = 0,(x,y),dp;
ideal I = fetch(r0,I);
staircase("",std(I));
↳
↳ Show[Graphics[{
↳ {GrayLevel[0.5],Map[Rectangle[#, {12,9}] &, {{2,6},{7,4},{9,2}}]},
↳ {PointSize[0.03], Map[Point, {{2,6},{7,4},{9,2}}]},
↳ Table[Circle[{i,j},0.1], {i,0,12}, {j,0,9}]],
↳ Axes->True,AspectRatio->Automatic]]
↳
ring r2 = 0,(x,y),wp(2,3);
ideal I = fetch(r0,I);
staircase("",std(I));
↳
↳ Show[Graphics[{

```

```

⇒ {GrayLevel[0.5],Map[Rectangle[#, {13,9}] &, {{2,6},{8,3},{10,2},{6,5}}]},
⇒ {PointSize[0.03], Map[Point, {{2,6},{8,3},{10,2},{6,5}}]},
⇒ Table[Circle[{i,j},0.1],{i,0,13},{j,0,9}],
⇒ Axes->True,AspectRatio->Automatic]]
⇒
// Paste the output into a Mathematica notebook
// active evaluation of the cell with SHIFT RETURN

```

D.9.1.2 mathinit

Procedure from library `graphics.lib` (see [Section D.9.1 \[graphics.lib\], page 1441](#)).

Usage: `mathinit()`;

Return: initializing string for loading Mathematica's `ImplicitPlot`

Example:

```

LIB "graphics.lib";
mathinit();
⇒ << Graphics'ImplicitPlot'
// Paste the output into a Mathematica notebook
// active evaluation of the cell with SHIFT RETURN

```

D.9.1.3 mplot

Procedure from library `graphics.lib` (see [Section D.9.1 \[graphics.lib\], page 1441](#)).

Usage: `mplot(fname, I [,I1,I2,...,s]);` `fname=string`; `I,I1,I2,..=ideals`, `s=string` representing the plot region.

Use the ideals `I1,I2,..` in order to produce multiple plots (they need to have the same number of entries as `I!`).

Return: string, text with Mathematica commands to display a plot

Note: The plotregion is defaulted to `-1,1` around zero.

For implicit given curves enter first the string returned by procedure `mathinit` into Mathematica in order to load `ImplicitPlot`. The following conventions for `I` are used:

- ideal with 2 entries in one variable means a parametrised plane curve,
- ideal with 3 entries in one variable means a parametrised space curve,
- ideal with 3 entries in two variables means a parametrised surface,
- ideal with 2 entries in two variables means an implicit curve given as `I[1]==I[2]`,
- ideal with 1 entry (or one polynomial) in two variables means an implicit curve given as `f == 0`,

Example:

```

LIB "graphics.lib";
// ----- plane curves -----
ring rr0 = 0,x,dp; export rr0;
⇒ // ** 'rr0' is already global
ideal I = x3 + x, x2;
ideal J = x2, -x+x3;
mplot("",I,J,"-2,2");
⇒
⇒ ParametricPlot[{{s^3+s,s^2},{s^2,s^3-s}},{s,-2,2},

```

```

↳ AspectRatio->Automatic];
↳
// Paste the output into a Mathematica notebook
// active evaluation of the cell with SHIFT RETURN
// ----- space curves -----
I = x3,-1/10x3+x2,x2;
mplot("",I);
↳
↳ ParametricPlot3D[{{s^3,-1/10*s^3+s^2,s^2}},{s,-1,1},
↳ ViewPoint->{1.3,-2.4,2}];
↳
// Paste the output into a Mathematica notebook
// active evaluation of the cell with SHIFT RETURN
// ----- surfaces -----
ring rr1 = 0,(x,y),dp; export rr1;
↳ // ** 'rr1' is already global
ideal J = xy,y,x2;
mplot("",J,"-2,1","1,2");
↳
↳ ParametricPlot3D[{{s*t,t,s^2}},{s,-2,1},{t,1,2},
↳ Boxed->True, Axes->True, ViewPoint->{1.3,-2.4,2}];
↳
// Paste the output into a Mathematica notebook
// active evaluation of the cell with SHIFT RETURN
kill rr0,rr1;

```

D.9.2 latex_lib

Library: latex.lib

Purpose: Typesetting of Singular-Objects in LaTeX2e

Author: Christian Gorzel, gorzelc@math.uni-muenster.de

Global variables:

TeXwidth, TeXnofrac, TeXbrack, TeXproj, TeXaligned, TeXreplace, NoDollars are used to control the typesetting. Call `texdemo()`; to obtain a LaTeX2e file `texlibdemo.tex` explaining the features of `latex.lib` and its global variables.

TeXwidth (int) -1, 0, 1..9, >9: controls breaking of long polynomials

TeXnofrac (int) flag: write 1/2 instead of `\frac{1}{2}`

TeXbrack (string) "{", "(", "<", "|", empty string:

controls brackets around ideals and matrices

TeXproj (int) flag: write ":" instead of "," in vectors

TeXaligned (int) flag: write maps (and ideals) aligned

TeXreplace (list) list entries = 2 strings: replacing symbols

NoDollars (int) flag: suppresses surrounding \$ signs

Procedures:

D.9.2.1 closetex

Procedure from library `latex.lib` (see [Section D.9.2 \[latex.lib\], page 1443](#)).

Usage: `closetex(fname)`; fname string

Return: nothing; writes a LaTeX2e closing line into file `<fname>`.

Note: preceding ">>" are deleted and suffix ".tex" (if not given) is added to `fname`.

Example:

```
LIB "latex.lib";
opentex("exmpl");
texobj("exmpl", "{\\large \\bf hello}");
closetex("exmpl");
```

D.9.2.2 opentex

Procedure from library `latex.lib` (see [Section D.9.2 \[latex.lib\], page 1443](#)).

Usage: `opentex(fname)`; `fname` string

Return: nothing; writes a LaTeX2e header into a new file `<fname>`.

Note: preceding ">>" are deleted and suffix ".tex" (if not given) is added to `fname`.

Example:

```
LIB "latex.lib";
opentex("exmpl");
texobj("exmpl", "hello");
closetex("exmpl");
```

D.9.2.3 tex

Procedure from library `latex.lib` (see [Section D.9.2 \[latex.lib\], page 1443](#)).

Usage: `tex(fname)`; `fname` string

Return: nothing; calls latex (LaTeX2e) for compiling the file `fname`

Note: preceding ">>" are deleted and suffix ".tex" (if not given) is added to `fname`.

Example:

```
LIB "latex.lib";
ring r;
ideal I = maxideal(7);
opentex("exp001"); // open latex2e document
texobj("exp001", "An ideal ", I);
closetex("exp001");
tex("exp001");
↳ calling latex2e for: exp001.tex
↳
↳ This is pdfTeX, Version 3.14159265-2.6-1.40.17 (TeX Live 2016) (preloaded\
  format=latex)
↳ restricted \write18 enabled.
↳ entering extended mode
↳ (./exp001.tex
↳ LaTeX2e <2016/03/31> patch level 3
↳ Babel <3.9r> and hyphenation patterns for 3 language(s) loaded.
↳ (/usr/share/texmf-dist/tex/latex/base/article.cls
↳ Document Class: article 2014/09/29 v1.4h Standard LaTeX document class
↳ (/usr/share/texmf-dist/tex/latex/base/size10.clo)
↳ (/usr/share/texmf-dist/tex/latex/amsmath/amsmath.sty

```

D.9.2.4 texdemo

Procedure from library `latex.lib` (see [Section D.9.2 \[latex.lib\]](#), page 1443).

Usage: `texdemo()`;

Return: nothing; generates a LaTeX2e file called `texlibdemo.tex` explaining the features of `latex.lib` and its global variables.

D.9.2.5 texfactorize

Procedure from library `latex.lib` (see [Section D.9.2 \[latex.lib\]](#), page 1443).

Usage: `texfactorize(fname,f)`; `fname` string, `f` poly

Return: if `fname=""`: string, `f` as a product of its irreducible factors
otherwise: append this string to the file `<fname>`, and return nothing.

Note: preceding `>>>` are deleted and suffix `.tex` (if not given) is added to `fname`.

Example:

```

LIB "latex.lib";
ring r2 = 13,(x,y),dp;
poly f = (x+1+y)^2*x3y*(2x-2y)*y12;
texfactorize("",f);
⇒ $-2\cdot x^3\cdot y^{13}\cdot (x+y+1)^2\cdot (-x+y)$
ring R49 = (7,a),x,dp;
minpoly = a2+a+3;
poly f = (a24x5+x3)*a2x6*(x+1)^2;
f;
⇒ (a+3)*x13+(2a-1)*x12+(-2a+1)*x10+(-a-3)*x9
texfactorize("",f);
⇒ $(a+3)\cdot (x-1)\cdot (x+1)^3\cdot x^9$

```

D.9.2.6 texmap

Procedure from library `latex.lib` (see [Section D.9.2 \[latex.lib\]](#), page 1443).

Usage: `texmap(fname,m,@r1,@r2)`; `fname` string, `m` string/map, `@r1,@r2` rings

Return: if `fname=""`: string, the map `m` from `@r1` to `@r2` (preceded by its name if `m = string`)
in TeX-typesetting;
otherwise: append this string to the file `<fname>`, and return nothing.

Note: preceding ">>" are deleted in `fname`, and suffix ".tex" (if not given) is added to `fname`.
If `m` is a string then it has to be the name of an existing map from `@r1` to `@r2`.

Example:

```
LIB "latex.lib";
// ----- prepare for example -----
if (defined(TeXaligned)) {int Teali=TeXaligned; kill TeXaligned;}
if (defined(TeXreplace)) {list Terep=TeXreplace; kill TeXreplace;}
// ----- the example starts here -----
//
string fname = "tldemo";
ring @r1=0,(x,y,z),dp;
export @r1;
⇨ // ** '@r1' is already global
ring r2=0,(u,v),dp;
map @phi =(@r1,u2,uv -v,v2); export @phi;
⇨ // ** '@phi' is already global
list TeXreplace;
TeXreplace[1] = list("@phi","\phi"); // @phi --> \phi
export TeXreplace;
⇨ // ** 'TeXreplace' is already global
texmap("", "@phi", @r1, r2); // standard form
⇨ $$
⇨ \begin{array}{rcc}
⇨ \phi: \mathbb{Q}[x,y,z] & \xrightarrow{\quad} & \mathbb{Q}[u,v] \\
⇨ \left(x,y,z\right) & \longmapsto & \left(u^2, uv-v, v^2\right) \\
⇨ \left(
⇨ \begin{array}{c}
⇨ u^2 \\
⇨ uv-v \\
⇨ v^2
⇨ \end{array}
⇨ \right) \\
⇨ \end{array} \\
⇨ \right) \\
⇨ \end{array} \\
⇨ $$
//
int TeXaligned; export TeXaligned; // map in one line
⇨ // ** 'TeXaligned' is already global
texmap("", @phi, @r1, r2);
⇨ $\mathbb{Q}[x,y,z] \xrightarrow{\quad} \mathbb{Q}[u,v], \ \ \left(x,y,z\right) \longmapsto \left(u^2, uv-v, v^2\right)$
//
kill @r1, TeXreplace, TeXaligned;
//
// --- restore global variables if previously defined ---
if (defined(Teali)) {int TeXaligned=Teali; export TeXaligned; kill Teali;}
if (defined(Terep)) {list TeXreplace=Terep; export TeXreplace; kill Terep;}
```

D.9.2.7 texname

Procedure from library `latex.lib` (see [Section D.9.2 \[latex.lib\]](#), page 1443).

Usage: `texname(fname,s);` `fname,s` strings

Return: if `fname=""`: the transformed string `s`, for which the following rules apply:

```

s' + "~"          --> "\\tilde{" + s' + "}"
"_" + int         --> "_{" + int + "}"
 "[" + s' + "]"   --> "_{" + s' + "}"
 "A..Z" + int     --> "A..Z" + "^{" + int + "}"
 "a..z" + int     --> "a..z" + "_{" + int + "}"
 "(" + int + "," + s' + ")" --> "_{" + int + "}" + "^{" + s' + "}"

```

Furthermore, strings which begin with a left brace are modified by deleting the first and the last character (which is then assumed to be a right brace).

if `fname!=""`: append the transformed string `s` to the file `<fname>`, and return nothing.

Note: preceding `>>` are deleted in `fname`, and suffix `.tex` (if not given) is added to `fname`.

Example:

```

LIB "latex.lib";
ring r = 0,(x,y),lp;
poly f = 3xy4 + 2xy2 + x5y3 + x + y6;
texname("", "{f(10)}");
↳ f(10)
texname("", "f(10) =");
↳ f_{10} =
texname("", "n1");
↳ n_{1}
texname("", "T1_12");
↳ T^{1}_{12}
texname("", "g'_{11}");
↳ g'_{11}
texname("", "f23");
↳ f_{23}
texname("", "M[2,3]");
↳ M_{2,3}
texname("", "A(0,3)");
↳ A_{0}^{3};
texname("", "E~(3)");
↳ \tilde{E}_{3}

```

D.9.2.8 texobj

Procedure from library `latex.lib` (see [Section D.9.2 \[latex.lib\]](#), page 1443).

Usage: `texobj(fname,l)`; `fname` string, `l` list

Return: if `fname=""`: string, the entries of `l` in LaTeX-typesetting;
otherwise: append this string to the file `<fname>`, and return nothing.

Note: preceding `>>` are deleted in `fname`, and suffix `.tex` (if not given) is added to `fname`.

Example:

```

LIB "latex.lib";
// ----- prepare for example -----
if (defined(TeXaligned)) {int Teali=TeXaligned; kill TeXaligned;}
if (defined(TeXbrack)){string Tebra=TeXbrack; kill TeXbrack;}
//
// ----- typesetting for polynomials -----
ring r = 0,(x,y),lp;
poly f = x5y3 + 3xy4 + 2xy2 + y6;

```

```

f;
⇒ x5y3+3xy4+2xy2+y6
texobj("",f);
⇒ $$
⇒ \begin{array}{r1}
⇒ & x^5y^3+3xy^4+2xy^2+y^6\\
⇒ \end{array}
⇒ $$
// ----- typesetting for ideals -----

⇒ \left(
⇒ \begin{array}{c}
⇒ 5x^4y^3+3y^4+2y^2, \\
⇒ 3x^5y^2+12xy^3+4xy+6y^5
⇒ \end{array}
⇒ \right)$$
// ----- variation of typesetting for ideals -----
int TeXaligned = 1; export TeXaligned;
⇒ // ** 'TeXaligned' is already global
string TeXbrack = "<"; export TeXbrack;
⇒ // ** 'TeXbrack' is already global
texobj("",G);
⇒ $\left<5x^4y^3+3y^4+2y^2,3x^5y^2+12xy^3+4xy+6y^5\right>$
kill TeXaligned, TeXbrack;
// ----- typesetting for matrices -----
matrix J = jacob(G);
texobj("",J);
⇒ $$
⇒ \left(
⇒ \begin{array}{*{2}{c}}
⇒ 20x^3y^3 & 15x^4y^2+12y^3+4y \\
⇒ 15x^4y^2+12y^3+4y & 6x^5y+36xy^2+4x+30y^4
⇒ \end{array}
⇒ \right)
⇒ $$
// ----- typesetting for intmats -----
intmat m[3][4] = 9,2,4,5,2,5,-2,4,-6,10,-1,2,7;
texobj("",m);
⇒ $$
⇒ \left(
⇒ \begin{array}{*{4}{r}}
⇒ 9 & 2 & 4 & 5\\
⇒ 2 & 5 & -2 & 4\\
⇒ -6 & 10 & -1 & 2
⇒ \end{array}
⇒ \right)
⇒ $$
//

```

```
// --- restore global variables if previously defined ---
if (defined(Teali)){int TeXaligned=Teali; export TeXaligned; kill Teali;}
if (defined(Tebra)){string TeXbrack=Tebra; export TeXbrack; kill Tebra;}
```

D.9.2.9 texpoly

Procedure from library `latex.lib` (see [Section D.9.2 \[latex.lib\], page 1443](#)).

Usage: `texpoly(fname,p)`; `fname` string, `p` poly

Return: if `fname=""`: string, the polynomial `p` in LaTeX-typesetting;
otherwise: append this string to the file `<fname>`, and return nothing.

Note: preceding `>>` are deleted in `fname`, and suffix `.tex` (if not given) is added to `fname`.

Example:

```
LIB "latex.lib";
ring r0=0,(x,y,z),dp;
poly f = -1x^2 + 2;
texpoly("",f);
 $\mapsto$   $^{-}x^{2}+2$ 
ring rr= real,(x,y,z),dp;
texpoly("",2x2y23z);
 $\mapsto$   $2.000x^{2}y^{23}z$ 
ring r7= 7,(x,y,z),dp;
poly f = 2x2y23z;
texpoly("",f);
 $\mapsto$   $2x^{2}y^{23}z$ 
ring rab =(0,a,b),(x,y,z),dp;
poly f = (-2a2 +b3 -2)/a * x2y4z5 + (a2+1)*x + a+1;
f;
 $\mapsto$   $(-2a2+b3-2)/(a)*x2y4z5+(a2+1)*x+(a+1)$ 
texpoly("",f);
 $\mapsto$   $^{-}\frac{2a^{2}-b^{3}+2}{a}\cdot x^{2}y^{4}z^{5}+(a^{2}+1)\cdot x+(a+1)$ 
texpoly("",1/(a2+2)*x2+2/b*x+(a+1)/3);
 $\mapsto$   $\frac{1}{a^{2}+2}\cdot x^{2}+\frac{2}{b}\cdot x+\frac{a+1}{3}$ 
```

D.9.2.10 texproc

Procedure from library `latex.lib` (see [Section D.9.2 \[latex.lib\], page 1443](#)).

Usage: `texproc(fname,pname)`; `fname,pname` strings

Assume: ‘`pname`’ is a procedure.

Return: if `fname=""`: string, the proc ‘`pname`’ in a verbatim environment in LaTeX-typesetting;
otherwise: append this string to the file `<fname>`, and return nothing.

Note: preceding `>>` are deleted in `fname`, and suffix `.tex` (if not given) is added to `fname`.

Example:

```
LIB "latex.lib";
texproc("", "texproc");
 $\mapsto$   $\begin{verbatim}$ 
 $\mapsto$  proc texproc(string fname,string pname)
 $\mapsto$  {
```

```

↳ int i,j,k,nl;
↳ string @p,s,t;
↳
↳ j = 1;
↳
↳ if (defined('pname'))
↳ { if (typeof('pname')== "proc")
↳   { @p = string('pname');
↳     nl = find(@p,newline);
↳     s = "\\begin{verbatim}" + newline;
↳     s = s + "proc " + pname + "(";
↳     i = find(@p,"parameter"); // collecting the parameters
↳     k = find(@p,"alias"); // and the alias arguments
↳     while((i and i < nl) or (k and k < nl))
↳     {
↳       if (i and (k==0 or i<k))
↳       {
↳         j=find(@p,";",i);
↳         t = @p[i+10,j-i-10];
↳         if(i>1){s = s + ",";};
↳         s = s + t;
↳       }
↳       if (k and (i==0 or k<i))
↳       {
↳         j=find(@p,";",k);
↳         t = @p[k,j-k];
↳         if(k>1){s = s + ",";};
↳         s = s + t;
↳       }
↳       i = find(@p,"parameter",j);
↳       k = find(@p,"alias",j);
↳     }
↳     s = s + ")" + newline;
↳     j++; // skip one for the newline
↳     i = find(@p,"+"return();" + newline,j);
↳     if (!(i))
↳     { i = find(@p,"+"RETURN();" + newline,j); } // j kann hier weg
↳     s = s + "{" + @p[j,i-j-1] + "}" + newline;
↳     s = s + "\\end{verbatim}" + newline;
↳   }
↳ }
↳ else
↳ { print(" // -- Error: No such proc defined");
↳   return();
↳ }
↳ if(size(fname))
↳ { i=1;
↳   while (fname[i]==">"){i++;}
↳   fname = fname[i,size(fname)-i+1];
↳   if (size(fname)>=4) // check if filename is ending with ".tex"
↳   { if(fname[size(fname)-3,4]!=".tex") {fname = fname + ".tex"; }
↳   }
↳ }
↳ else {fname = fname + ".tex";}

```

```

↳ write(fname,s);
↳ }
↳ else{return(s);}
↳ }
↳ \end{verbatim}
↳

```

D.9.2.11 texring

Procedure from library `latex.lib` (see [Section D.9.2 \[latex.lib\]](#), page 1443).

Usage: `texring(fname, r[L]);` `fname` string, `r` ring, `L` list

Return: if `fname=""`: string, the ring in TeX-typesetting;
otherwise: append this string to the file `<fname>` and return nothing.

Note: preceding `>>>` are deleted and suffix `.tex` (if not given) is added to `fname`.
The optional list `L` is assumed to be a list of strings which control, for instance the symbol for the field of coefficients.
For more details call `texdemo()`; (generates a LaTeX2e file called `texlibdemo.tex` which explains all features of `texring`).

Example:

```

LIB "latex.lib";
ring r0 = 0,(x,y),dp;           // char = 0, polynomial ordering
texring("",r0);
↳ $\mathbb{Q}[x,y]$
//
ring r7 =7,(x(0..2)),ds;       // char = 7, local ordering
texring("",r7);
↳ $\mathbb{Z}_7[[x_0,x_1,x_2]]$
//
ring r1 = 0,(x1,x2,y1,y2),wp(1,2,3,4);
texring("",r1);
↳ $\mathbb{Q}[x_1,x_2,y_1,y_2]$
//
ring rr = real,(x),dp;        // real numbers
texring("",rr);
↳ $\mathbb{R}[x]$
//
ring rC = complex,x,dp;      // complex coefficients
texring("",rC);
↳ $\mathbb{C}[x]$
//
ring rabc =(0,t1,t2,t3),(x,y),dp; // ring with parameters
texring("",rabc);
↳ $\mathbb{Q}(t_1,t_2,t_3)[x,y]$
//
ring ralg = (7,a),(x1,x2),ds; // algebraic extension
minpoly = a2-a+3;
texring("",ralg);
↳ $\mathbb{Z}_7(a)[[x_1,x_2]]$
texring("",ralg,"mipo");
↳ $\mathbb{Z}_7(a)/(a^2-a+3)[[x_1,x_2]]$
//

```

```

ring r49=(49,a),x,dp;           // Galois field
texring("",r49);
⇒  $\mathbb{F}_{49}[x]$ 
//
setring r0;                     // quotient ring
ideal i = x2-y3;
qring q = std(i);
texring("",q);
⇒  $\mathbb{Q}[x,y]/\langle y^3-x^2 \rangle$ 
//
// ----- additional features -----
ring r9 =0,(x(0..9)),ds;
texring("",r9,1);
⇒  $\mathbb{Q}[[x_0,\dots,x_9]]$ 
texring("",r9,"C","{","^G");
⇒  $\mathbb{C}\langle x_0,x_1,x_2,x_3,x_4,x_5,x_6,x_7,x_8,x_9 \rangle^G$ 
//
ring rxy = 0,(x(1..5),y(1..6)),ds;
intvec v = 5,6;
texring("",rxy,v);
⇒  $\mathbb{Q}[[x_1,\dots,x_5],y_1,\dots,y_6]]$ 

```

D.9.2.12 rmx

Procedure from library `latex.lib` (see [Section D.9.2 \[latex.lib\]](#), page 1443).

Usage: `rmx(fname)`; fname string

Return: nothing; removes the `.log` and `.aux` files associated to the LaTeX file `<fname>`.

Note: If `fname` ends by `".dvi"` or `".tex"`, the `.dvi` or `.tex` file will be deleted, too.

Example:

```

LIB "latex.lib";
ring r;
poly f = x+y+z;
opentex("exp001");           // defaulted latex2e document
texobj("exp001","A polynom",f);
closetex("exp001");
tex("exp001");
⇒ calling latex2e for: exp001.tex
⇒
⇒ This is pdfTeX, Version 3.14159265-2.6-1.40.17 (TeX Live 2016) (preloaded\
  format=latex)
⇒ restricted \write18 enabled.
⇒ entering extended mode
⇒ (./exp001.tex
⇒ LaTeX2e <2016/03/31> patch level 3
⇒ Babel <3.9r> and hyphenation patterns for 3 language(s) loaded.

⇒ No file exp001.aux.
⇒ (/usr/share/texmf-dist/tex/latex/amsfonts/umsa.fd)
⇒ (/usr/share/texmf-dist/tex/latex/amsfonts/umsb.fd) [1] (./exp001.aux) )
⇒ Output written on exp001.dvi (1 page, 308 bytes).
⇒ Transcript written on exp001.log.
rmx("exp001"); // removes aux and log file of exp001
system("sh","rm exp001.*");
⇒ 0

```

D.9.2.13 xdvi

Procedure from library `latex.lib` (see [Section D.9.2 \[latex.lib\]](#), page 1443).

Usage: `xdvi(fname[,style]);` `fname,style = string`

Return: nothing; displays dvi-file `fname.dvi` with previewer `xdvi`

Note: suffix `.dvi` may be omitted in `fname`
`style` captures the program that will be called instead of the default (`xdvi`)

Example:

```

LIB "latex.lib";
intmat m[3][4] = 9,2,4,5,2,5,-2,4,-6,10,-1,2,7;
opentex("exp001");
texobj("exp001","An intmat: ",m);

```

D.9.3 surf_lib

Library: surf.lib

Purpose: Procedures for Graphics with Surf

Author: Hans Schoenemann, Frank Seelisch

Note: Using this library requires the program `surf` to be installed. You can download `surf` either from <http://sourceforge.net/projects/surf> or from <ftp://www.mathematik.uni-kl.de/pub/Math/Singular/utils/>. The procedure `surfer` requires the program `surfer` (version 1.4.1 or newer) to be installed. You can download `surfer` from <http://imaginary.org/program/surfer>

Procedures: See also: [Section D.9.4 \[surfex_lib\]](#), page 1455.

D.9.3.1 plot

Procedure from library `surf.lib` (see [Section D.9.3 \[surf.lib\]](#), page 1454).

Usage: `plot(I)`; `I` ideal or poly

Assume: `I` defines a plane curve or a surface given by one equation

Return: nothing

Note: requires the external program ‘surf’ to be installed, to close the graphical interface just press ‘Q’

Example:

```

LIB "surf.lib";
// ----- plane curves -----
ring rr0 = 0,(x1,x2),dp;
ideal I = x1^3 - x2^2;
plot(I);
ring rr1 = 0,(x,y,z),dp;
ideal I(1) = 2x2-1/2x3 +1-y+1;
plot(I(1));
// ---- Singular Logo -----
poly logo = ((x+3)^3 + 2*(x+3)^2 - y^2)*(x^3 - y^2)*((x-3)^3-2*(x-3)^2-y^2);
plot(logo);
// Steiner surface
ideal J(2) = x^2*y^2+x^2*z^2+y^2*z^2-17*x*y*z;
plot(J(2));
// -----
plot(x*(x2-y2)+z2);
// E7
plot(x^3-x*y^3+z^2);

```

```
// Whitney umbrella
plot(z^2-x^2*y);
```

D.9.3.2 surfer

Procedure from library `surf.lib` (see [Section D.9.3 \[surf.lib\], page 1454](#)).

Usage: `surfer(f); f poly`

Assume: `f` defines a surface given by one equation

Return: nothing

Note: requires the external program ‘surfer’ to be installed, to close the graphical interface just close the window of surfer

Example:

```
LIB "surf.lib";
ring rr1 = 0, (x,y,z), dp;
// Steiner surface
ideal J(2) = x^2*y^2+x^2*z^2+y^2*z^2-17*x*y*z;
surfer(J(2));
// -----
surfer(x*(x2-y2)+z2);
// E7
surfer(x^3-x*y^3+z^2);
// Whitney umbrella
surfer(z^2-x^2*y);
```

D.9.4 surfex.lib

Library: `surfex.lib`

Purpose: Procedures for visualizing and rotating surfaces.

Author: Oliver Labs

This library uses the program `surf`
(written by Stefan Endrass and others)
and `surfex` (written by Oliver Labs and others, mainly Stephan Holzer).

Note: It is still an alpha version (see <http://www.AlgebraicSurface.net>)
This library requires the program `surfex`, `surf` and `java` to be installed. The software is used for producing raytraced images of surfaces. You can download `surfex` from <http://www.surfex.AlgebraicSurface.net>
`surfex` is a front-end for `surf` which aims to be easier to use than the original tool.

Procedures: See also: [Section D.9.3 \[surf.lib\], page 1454](#).

D.9.4.1 plotRotated

Procedure from library `surfex.lib` (see [Section D.9.4 \[surfex.lib\], page 1455](#)).

Usage: `plotRotated(poly p, list coords, list #)`

This opens the external program `surfex` for drawing the surface given by `p`, seen as a surface in the real affine space with coordinates `coords`. The optional `int` parameter can be used to set plotting quality.

Assume: coords is a list of three variables.
The basering is of characteristic zero and without parameters.

Example:

```
LIB "surfex.lib";
"Example:";
// An easy example: a surface with four conical nodes.
ring r = 0, (x,y,z), dp;
poly cayley_cubic = x^3+y^3+z^3+1^3-1/4*(x+y+z+1)^3;
// plotRotated(cayley_cubic, list(x,y,z));
// A difficult example: a surface with a one-dimensional real component!
poly whitney_umbrella = x^2*z-y^2;
// The Whitney Umbrella without its handle:
plotRotated(whitney_umbrella, list(x,y,z));
// The Whitney Umbrella together with its handle:
plotRotated(whitney_umbrella, list(x,y,z), 2);
```

D.9.4.2 plotRot

Procedure from library `surfex.lib` (see [Section D.9.4 \[surfex.lib\], page 1455](#)).

Usage: `plotRot(poly p, list #)`
Similar to `plotRotated`, but guesses automatically which coordinates should be used.
The optional int parameter can be used to set plotting quality.
It opens the external program `surfex` for drawing the surface given by `p`, seen as a surface in the real affine space with coordinates `coords`.

Assume: The basering is of characteristic zero and without parameters.

Example:

```
LIB "surfex.lib";
"Example:";
// More variables in the basering, but only 3 variables in the polynomial:
ring r1 = 0, (w,x,y,z), dp;
poly cayley_cubic = x^3+y^3+z^3+1^3-1/4*(x+y+z+1)^3;
plotRot(cayley_cubic);
// Three variables in the basering, but fewer variables in the polynomial:
ring r2 = 0, (x,y,z), dp;
plotRot(x^2+y^2-1);
plotRot(y^2+z^2-1);
// A cubic surface with a solitary point:
// Use the additional parameter 3 to ask singular
// to compute the singular locus before calling surfex.
ring r3 = 0, (x,y,z), dp;
poly kn_10 = x^3-3*x*y^2+z^3+3*x^2+3*y^2+z^2;
plotRot(kn_10, 3);
// The swallowtail:
// a surface with a real solitary curve sticking out of the surface.
// Use the additional parameter 3 to ask singular
// to compute the singular locus before calling surfex.
poly swallowtail = -4*y^2*z^3-16*x*z^4+27*y^4+144*x*y^2*z+128*x^2*z^2-256*x^3;
```

D.9.4.3 plotRotatedList

Procedure from library `surfex.lib` (see [Section D.9.4 \[surfex.lib\], page 1455](#)).

Usage: `plotRotatedList(list varieties, list coords, list #)`
 This opens the external program surfex for drawing the surfaces given by varieties, seen as a surface in the real affine space with coordinates coords. The optional int parameter can be used to set plotting quality.

Assume: coords is a list of three variables, varieties is a list of ideals describing the varieties to be shown.
 The basering is of characteristic zero and without parameters.

Example:

```
LIB "surfex.lib";
"Example:";
// A cubic surface together with a tritangent plane
// (i.e. a plane which cuts out three lines).
ring r = 0, (x,y,z), dp;
poly cayley_cubic = x^3+y^3+z^3+1^3-1/4*(x+y+z+1)^3;
poly plane = 1-x-y-z;
plotRotatedList(list(cayley_cubic, plane), list(x,y,z));
// The same cubic and plane.
// The plane is not shown but only its intersection with the surface.
plotRotatedList(list(cayley_cubic, ideal(cayley_cubic, plane)), list(x,y,z));
```

D.9.4.4 plotRotatedDirect

Procedure from library surfex.lib (see [Section D.9.4 \[surfex.lib\], page 1455](#)).

Usage: `plotRotatedDirect(list varieties, list #)`
 This opens the external program surfex for drawing the surfaces given by varieties, seen as a surface in the real affine space with coordinates x,y,z. The format for the list varieties is not fully documented yet; please, see the examples below and try to adjust the examples to suit your needs.
 The optional int parameter can be used to set plotting quality.

Assume: Passes the equations directly to surfex, i.e., the variable names should be x,y,z.
 The advantage is that one can use parameters p1, p2, ...; these will be passed to surfex.

Example:

```
LIB "surfex.lib";
"Example:";
// A cubic surface depending on a parameter:
ring r = (0,p1), (x,y,z), dp;
poly cayley_cubic = x^3+y^3+z^3+1^3-p1*(x+y+z+1)^3;
// The entries of the list of varieties can either be polynomials
plotRotatedDirect(list(list(list(cayley_cubic)),
list(),
list(list(1,"0.0","1.0","500","0.25+0.25*sin(PI*p1)"))
));
// or strings which represent surfex-readable polynomials
plotRotatedDirect(list(list(list("x^3+y^3+z^3+1^3-p1*(x+y+z+1)^3")),
list(),
list(list("1","0.0","1.0","500","0.25+0.25*sin(PI*p1)"))
));
// More complicated varieties
plotRotatedDirect(list(list(list("x^2+y^2-z^2-3^2"),
```

```
list("x*sin(p1)+y*cos(p1)-3")),
list(list(list(1,2))),
list(list("1","0.0","1.0","500","2*PI*p1"))
));
```

D.9.4.5 plotRotatedListFromSpecifyList

Procedure from library `surfex.lib` (see [Section D.9.4 \[surfex.lib\]](#), page 1455).

Usage: `plotRotatedListFromSpecifyList(list varietiesList, list #)`; `varietiesList` has a complicated format (not documented yet); see the example.
The optional `int` parameter can be used to set plotting quality.

Assume: The basering is of characteristic zero.

Example:

```
LIB "surfex.lib";
"Example:";
// A cubic surface depending on a parameter:
ring r = (0,p1), (x,y,z), dp;
poly cayley_cubic = x^3+y^3+z^3+1^3-p1*(x+y+z+1)^3;
poly plane = 1-x-y-z;
plotRotatedListFromSpecifyList(list(list(list(list("eqno:", "1"),
list("equation:",
string(cayley_cubic))
)
),
list(),
list(list(1,"0.0","1.0","500","0.25+0.25*sin(PI*p1)")),
list()
));
```

D.10 Coding theory

D.10.1 brnoeth.lib

Library: `brnoeth.lib`

Purpose: Brill-Noether Algorithm, Weierstrass-SG and AG-codes

Authors: Jose Ignacio Farran Martin, ignfar@eis.uva.es
Christoph Lossen, lossen@mathematik.uni-kl.de

Overview: Implementation of the Brill-Noether algorithm for solving the Riemann-Roch problem and applications to Algebraic Geometry codes. The computation of Weierstrass semi-groups is also implemented.

The procedures are intended only for plane (singular) curves defined over a prime field of positive characteristic.

For more information about the library see the end of the file `brnoeth.lib`.

Procedures:

D.10.1.1 Adj_div

Procedure from library `brnoeth.lib` (see [Section D.10.1 \[brnoeth.lib\], page 1458](#)).

Usage: `Adj_div(f [,l]);` f a poly, l a list

Return: list L with the computed data:

$L[1]$ a list of rings: $L[1][1]=\text{aff}_r$ (affine), $L[1][2]=\text{Proj}_R$ (projective),
 $L[2]$ an intvec with 2 entries (degree, genus),
 $L[3]$ a list of intvec (closed places),
 $L[4]$ an intvec (conductor),
 $L[5]$ a list of lists:
 $L[5][d][1]$ a (local) ring over an extension of degree d ,
 $L[5][d][2]$ an intvec (degrees of base points of places of degree d)

Note: `Adj_div(f)`; computes and stores the fundamental data of the plane curve defined by f as needed for AG codes.

In the affine ring you can find the following data:

poly CHI: affine equation of the curve,
ideal Aff_SLocus: affine singular locus (std),
list Inf_Points: points at infinity
 $\text{Inf_Points}[1]$: singular points
 $\text{Inf_Points}[2]$: non-singular points,
list Aff_SPoints: affine singular points (if not empty).

In the projective ring you can find the projective equation CHI of the curve (poly).

In the local rings $L[5][d][1]$ you find:

list POINTS: base points of the places of degree d ,
list LOC_EQS: local equations of the curve at the base points,
list BRANCHES: Hamburger-Noether developments of the places,
list PARAMETRIZATIONS: local parametrizations of the places,

Each entry of the list $L[3]$ corresponds to one closed place (i.e., a place and all its conjugates) which is represented by an intvec of size two, the first entry is the degree of the place (in particular, it tells the local ring where to find the data describing one representative of the closed place), and the second one is the position of those data in the lists POINTS, etc., inside this local ring.

In the intvec $L[4]$ (conductor) the i -th entry corresponds to the i -th entry in the list of places $L[3]$.

With no optional arguments, the conductor is computed by local invariants of the singularities; otherwise it is computed by the Dedekind formula.

An affine point is represented by a list P where $P[1]$ is std of a prime ideal and $P[2]$ is an intvec containing the position of the places above P in the list of closed places $L[3]$.

If the point is at infinity, $P[1]$ is a homogeneous irreducible polynomial in two variables.

If `printlevel` ≥ 0 additional comments are displayed (default: `printlevel=0`).

Warning: The parameter of the needed field extensions is called 'a'. Thus, there should be no global object named 'a' when executing `Adj_div`.

Example:

```
LIB "brnoeth.lib";
int plevel=printlevel;
```

```

printlevel=-1;

printlevel=plevel;

```

See also: [Section D.10.1.2 \[NSplaces\]](#), page 1461; [Section D.10.1.10 \[closed_points\]](#), page 1471.

D.10.1.2 NSplaces

Procedure from library `brnoeth.lib` (see [Section D.10.1 \[brnoeth.lib\]](#), page 1458).

Usage: `NSplaces(h, CURVE)`, where `h` is an intvec and `CURVE` is a list

Return: list L with updated data of CURVE after computing all non-singular affine closed places whose degrees are in the intvec h:

in L[1][1]: (affine ring) lists Aff_Points(d) with affine non-singular
(closed) points of degree d (if non-empty),
in L[3]: the newly computed closed places are added,
in L[5]: local rings created/updated to store (repres. of) new places.

See [Section D.10.1.1 \[Adj_div\], page 1459](#) for a description of the entries in L.

Note: The list_expression should be the output of the procedure Adj_div.
Raising printlevel, additional comments are displayed (default: printlevel=0).

Warning: The parameter of the needed field extensions is called 'a'. Thus, there should be no global object named 'a' when executing NSplaces.

Example:

```
LIB "brnoeth.lib";
int plevel=printlevel;
printlevel=-1;
ring s=2,(x,y),lp;
list C=Adj_div(x3y+y3+x);
↳ The genus of the curve is 3
// The list of computed places:
C[3];
↳ [1]:
↳ 1,1
↳ [2]:
↳ 1,2
// create places up to degree 4
list L=NSplaces(1..4,C);
// The list of computed places is now:

printlevel=plevel;

```

See also: [Section D.10.1.1 \[Adj_div\], page 1459](#); [Section D.10.1.10 \[closed_points\], page 1471](#).

D.10.1.3 BrillNoether

Procedure from library `brnoeth.lib` (see [Section D.10.1 \[brnoeth.lib\], page 1458](#)).

Usage: BrillNoether(G,CURVE); G an intvec, CURVE a list

Return: list of ideals (each of them with two homogeneous generators, which represent the numerator, resp. denominator, of a rational function).

The corresponding rational functions form a vector space basis of the linear system $L(G)$, G a rational divisor over a non-singular curve.

Note: The procedure must be called from the ring `CURVE[1][2]`, where CURVE is the output of the procedure `NSplaces`.

The intvec G represents a rational divisor supported on the closed places of $CURVE[3]$ (e.g. $G=2,0,-1$; means 2 times the closed place 1 minus 1 times the closed place 3).

Example:

```
LIB "brnoeth.lib";
int plevel=printlevel;
printlevel=-1;
ring s=2,(x,y),lp;
list C=Adj_div(x3y+y3+x);
⇒ The genus of the curve is 3
C=NSplaces(1..4,C);
// the first 3 Places in C[3] are of degree 1.
// we define the rational divisor G = 4*C[3][1]+4*C[3][3] (of degree 8):
intvec G=4,0,4;
def R=C[1][2];
setring R;
list LG=BrillNoether(G,C);
⇒ Vector basis successfully computed
// here is the vector basis of L(G):
LG;
⇒ [1]:
⇒  _[1]=1
⇒  _[2]=1
⇒ [2]:
⇒  _[1]=y
⇒  _[2]=x
⇒ [3]:
⇒  _[1]=z
⇒  _[2]=x
⇒ [4]:
⇒  _[1]=y2
⇒  _[2]=x2
⇒ [5]:
⇒  _[1]=xz2+y3
⇒  _[2]=x3
⇒ [6]:
⇒  _[1]=xyz2+y4
⇒  _[2]=x4
printlevel=plevel;
```

See also: [Section D.10.1.1 \[Adj_div\]](#), page 1459; [Section D.10.1.2 \[NSplaces\]](#), page 1461; [Section D.10.1.4 \[Weierstrass\]](#), page 1464.

D.10.1.4 Weierstrass

Procedure from library `brnoeth.lib` (see [Section D.10.1 \[brnoeth.lib\]](#), page 1458).

Usage: Weierstrass(i , m , $CURVE$); i, m integers and $CURVE$ a list

Return: list WS of two lists:
 WS[1] list of integers (Weierstr. semigroup of the curve at place i up to m)
 WS[2] list of ideals (the associated rational functions)

Note: The procedure must be called from the ring $CURVE[1][2]$, where $CURVE$ is the output of the procedure `NSplaces`.

i represents the place `CURVE[3][i]`.

Rational functions are represented by numerator/denominator in form of ideals with two homogeneous generators.

Warning: The place must be rational, i.e., necessarily `CURVE[3][i][1]=1`.

Example:

```
LIB "brnoeth.lib";
int plevel=printlevel;
printlevel=-1;
ring s=2,(x,y),lp;
list C=Adj_div(x3y+y3+x);
↳ The genus of the curve is 3
C=NSplaces(1..4,C);
def R=C[1][2];
setring R;
// Place C[3][1] has degree 1 (i.e it is rational);
list WS=Weierstrass(1,7,C);
↳ Vector basis successfully computed
// the first part of the list is the Weierstrass semigroup up to 7 :
WS[1];
↳ [1]:
↳ 0
↳ [2]:
↳ 3
↳ [3]:
↳ 5
↳ [4]:
↳ 6
↳ [5]:
↳ 7
// and the second part are the corresponding functions :
WS[2];
↳ [1]:
↳ _[1]=1
↳ _[2]=1
↳ [2]:
↳ _[1]=y
↳ _[2]=z
↳ [3]:
↳ _[1]=xy
↳ _[2]=z2
↳ [4]:
↳ _[1]=y2
↳ _[2]=z2
↳ [5]:
↳ _[1]=y3
↳ _[2]=xz2
printlevel=plevel;
```

See also: [Section D.10.1.1 \[Adj_div\]](#), page 1459; [Section D.10.1.3 \[BrillNoether\]](#), page 1463; [Section D.10.1.2 \[NSplaces\]](#), page 1461.

D.10.1.5 extcurve

Procedure from library `brnoeth.lib` (see [Section D.10.1 \[brnoeth.lib\]](#), page 1458).

Usage: `extcurve(d, CURVE);` `d` an integer, `CURVE` a list

Return: list `L` which is the update of the list `CURVE` with additional entries

`L[1][3]`: ring $(p,a),(x,y),lp$ (affine),
`L[1][4]`: ring $(p,a),(x,y,z),lp$ (projective),
`L[1][5]`: ring $(p,a),(x,y,t),ls$ (local),
`L[2][3]`: int (the number of rational places),

the rings being defined over a field extension of degree `d`.

If `d < 2` then `extcurve(d, CURVE)`; creates a list `L` which is the update of the list `CURVE` with additional entries

`L[1][5]`: ring $p,(x,y,t),ls$,
`L[2][3]`: int (the number of computed places over the base field).

In both cases, in the ring `L[1][5]` lists with the data for all the computed rational places (after a field extension of degree `d`) are created (see [Section D.10.1.1 \[Adj_div\]](#), page 1459):

lists `POINTS`, `LOC_EQS`, `BRANCHES`, `PARAMETRIZATIONS`.

Note: The list `CURVE` should be the output of `NSplaces`, and must contain (at least) one place of degree `d`.

You actually need all the places with degree dividing `d`. Otherwise, not all the places are computed, but only part of them.

This procedure must be executed before constructing AG codes, even if no extension is needed. The ring `L[1][4]` must be active when constructing codes over the field extension.

Example:

```
LIB "brnoeth.lib";
int plevel=printlevel;
printlevel=-1;
ring s=2,(x,y),lp;
list C=Adj_div(x5+y2+y);
↳ The genus of the curve is 2
C=NSplaces(1..4,C);
// since we have all points up to degree 4, we can extend the curve
// to that extension, in order to get rational points over F16;
C=extcurve(4,C);
↳ Total number of rational places : NrRatPl = 33
// e.g., display the basepoint of place no. 32:
def R=C[1][5];
setring R;
POINTS[32];
↳ [1]:
↳ (a3+a2+1)
↳ [2]:
↳ (a+1)
```

```

↳ [3] :
↳ 1
printlevel=plevel;

```

See also: [Section D.10.1.6 \[AGcode_L\]](#), page 1467; [Section D.10.1.7 \[AGcode_Omega\]](#), page 1468; [Section D.10.1.1 \[Adj_div\]](#), page 1459; [Section D.10.1.2 \[NSplaces\]](#), page 1461; [Section D.10.1.10 \[closed_points\]](#), page 1471.

D.10.1.6 AGcode_L

Procedure from library `brnoeth.lib` (see [Section D.10.1 \[brnoeth_lib\]](#), page 1458).

Usage: `AGcode_L(G, D, EC);` G,D intvec, EC a list

Return: a generator matrix for the evaluation AG code defined by the divisors G and D.

Note: The procedure must be called within the ring `EC[1][4]`, where EC is the output of `extcurve(d)` (or within the ring `EC[1][2]` if `d=1`).

The entry `i` in the intvec `D` refers to the `i`-th rational place in `EC[1][5]` (i.e., to `POINTS[i]`, etc., see [Section D.10.1.5 \[extcurve\]](#), page 1466).

The intvec `G` represents a rational divisor (see [Section D.10.1.3 \[BrillNoether\]](#), page 1463 for more details).

The code evaluates the vector space basis of $L(G)$ at the rational places given by `D`.

Warnings: `G` should satisfy $2 * \text{genus} - 2 < \text{deg}(G) < \text{size}(D)$, which is not checked by the algorithm.

`G` and `D` should have disjoint supports (checked by the algorithm).

Example:

```

LIB "brnoeth.lib";
int plevel=printlevel;
printlevel=-1;
ring s=2,(x,y),lp;
list HC=Adj_div(x3+y2+y);
↳ The genus of the curve is 1
HC=NSplaces(1..2,HC);
HC=extcurve(2,HC);
↳ Total number of rational places : NrRatPl = 9
def ER=HC[1][4];
setring ER;
intvec G=5; // the rational divisor G = 5*HC[3][1]
intvec D=2..9; // D = sum of the rational places no. 2..9 over F_4
// let us construct the corresponding evaluation AG code :
matrix C=AGcode_L(G,D,HC);
↳ Vector basis successfully computed
// here is a linear code of type [8,5,>=3] over F_4
print(C);
↳ 0,0,(a), (a+1),1, 1, (a+1),(a),
↳ 0,1,(a), (a+1),(a),(a+1),(a), (a+1),
↳ 1,1,1, 1, 1, 1, 1, 1,
↳ 0,0,(a+1),(a), 1, 1, (a), (a+1),
↳ 0,0,(a+1),(a), (a),(a+1),1, 1
printlevel=plevel;

```

See also: [Section D.10.1.7 \[AGcode_Omega\]](#), page 1468; [Section D.10.1.1 \[Adj_div\]](#), page 1459; [Section D.10.1.3 \[BrillNoether\]](#), page 1463; [Section D.10.1.5 \[extcurve\]](#), page 1466.

D.10.1.7 AGcode_Omega

Procedure from library `brnoeth.lib` (see [Section D.10.1 \[brnoeth.lib\]](#), page 1458).

Usage: `AGcode_Omega(G, D, EC);` G,D intvec, EC a list

Return: a generator matrix for the residual AG code defined by the divisors G and D.

Note: The procedure must be called within the ring `EC[1][4]`, where EC is the output of `extcurve(d)` (or within the ring `EC[1][2]` if $d=1$).

The entry i in the intvec D refers to the i -th rational place in `EC[1][5]` (i.e., to `POINTS[i]`, etc., see [Section D.10.1.5 \[extcurve\]](#), page 1466).

The intvec G represents a rational divisor (see [Section D.10.1.3 \[BrillNoether\]](#), page 1463 for more details).

The code computes the residues of a vector space basis of

$\Omega(G - D)$ at the rational places given by D.

Warnings: G should satisfy $2 * \text{genus} - 2 < \text{deg}(G) < \text{size}(D)$, which is not checked by the algorithm.

G and D should have disjoint supports (checked by the algorithm).

Example:

```
LIB "brnoeth.lib";
int plevel=printlevel;
printlevel=-1;
ring s=2,(x,y),lp;
list HC=Adj_div(x3+y2+y);
↳ The genus of the curve is 1
HC=NSplaces(1..2,HC);
HC=extcurve(2,HC);
↳ Total number of rational places : NrRatPl = 9
def ER=HC[1][4];
setring ER;
intvec G=5; // the rational divisor G = 5*HC[3][1]
intvec D=2..9; // D = sum of the rational places no. 2..9 over F_4
// let us construct the corresponding residual AG code :
matrix C=AGcode_Omega(G,D,HC);
↳ Vector basis successfully computed
// here is a linear code of type [8,3,>=5] over F_4
print(C);
↳ 0, 1, (a+1),(a), 1,1,0,0,
↳ (a+1),(a),1, 0, 1,0,1,0,
↳ (a), (a),(a+1),(a+1),1,0,0,1
printlevel=plevel;
```

See also: [Section D.10.1.6 \[AGcode_L\]](#), page 1467; [Section D.10.1.1 \[Adj_div\]](#), page 1459; [Section D.10.1.3 \[BrillNoether\]](#), page 1463; [Section D.10.1.5 \[extcurve\]](#), page 1466.

D.10.1.8 prepSV

Procedure from library `brnoeth.lib` (see [Section D.10.1 \[brnoeth.lib\]](#), page 1458).

Usage: `prepSV(G, D, F, EC);` G,D,F intvecs and EC a list

Return: list E of size $n+3$, where $n=\text{size}(D)$. All its entries but $E[n+3]$ are matrices:

E[1]: parity check matrix for the current AG code
 E[2] ... E[n+2]: matrices used in the procedure decodeSV
 E[n+3]: intvec with
 E[n+3][1]: correction capacity

epsilon
 of the algorithm
 E[n+3][2]: designed Goppa distance

delta
 of the current AG code

Note: Computes the preprocessing for the basic (Skorobogatov-Vladut) decoding algorithm. The procedure must be called within the ring EC[1][4], where EC is the output of `extcurve(d)` (or in the ring EC[1][2] if d=1). The intvec G and F represent rational divisors (see [Section D.10.1.3 \[BrillNoether\]](#), page 1463 for more details). The intvec D refers to rational places (see [Section D.10.1.7 \[AGcode_Omega\]](#), page 1468 for more details.). The current AG code is `AGcode_Omega(G,D,EC)`. If you know the exact minimum distance d and you want to use it in `decodeSV` instead of *delta*, you can change the value of E[n+3][2] to d before applying `decodeSV`. If you have a systematic encoding for the current code and want to keep it during the decoding, you must previously permute D (using `permute_L(D,P)`), e.g., according to the permutation P=L[3], L being the output of `sys_code`.

Warnings: F must be a divisor with support disjoint from the support of D and with degree $\epsilon + \text{genus}$, where

$$\epsilon := \lfloor (\text{deg}(G) - 3 * \text{genus} + 1) / 2 \rfloor .$$
 G should satisfy $2 * \text{genus} - 2 < \text{deg}(G) < \text{size}(D)$, which is not checked by the algorithm.
 G and D should also have disjoint supports (checked by the algorithm).

Example:

```
LIB "brnoeth.lib";
int plevel=printlevel;
printlevel=-1;
ring s=2,(x,y),lp;
list HC=Adj_div(x^3+y^2+y);
↳ The genus of the curve is 1
HC=NSplaces(1..2,HC);
HC=extcurve(2,HC);
↳ Total number of rational places : NrRatPl = 9
def ER=HC[1][4];
setring ER;
intvec G=5;      // the rational divisor G = 5*HC[3][1]
intvec D=2..9;  // D = sum of the rational places no. 2..9 over F_4
// construct the corresp. residual AG code of type [8,3,>=5] over F_4:
matrix C=AGcode_Omega(G,D,HC);
↳ Vector basis successfully computed
// we can correct 1 error and the genus is 1, thus F must have degree 2
```

```

// and support disjoint from that of D;
intvec F=2;
list SV=prepSV(G,D,F,HC);
↳ Vector basis successfully computed
↳ Vector basis successfully computed
↳ Vector basis successfully computed
// now everything is prepared to decode with the basic algorithm;
// for example, here is a parity check matrix to compute the syndrome :
print(SV[1]);
↳ 0,0,1, 1, (a+1),(a), (a), (a+1),
↳ 0,1,(a),(a+1),(a), (a+1),(a), (a+1),
↳ 1,1,1, 1, 1, 1, 1, 1,
↳ 0,0,1, 1, (a), (a+1),(a+1),(a),
↳ 0,0,(a),(a+1),1, 1, (a+1),(a)
// and here you have the correction capacity of the algorithm :
int epsilon=SV[size(D)+3][1];
epsilon;
↳ 1
printlevel=plevel;

```

See also: [Section D.10.1.7 \[AGcode_Omega\]](#), page 1468; [Section D.10.1.9 \[decodeSV\]](#), page 1470; [Section D.10.1.5 \[extcurve\]](#), page 1466; [Section D.10.1.13 \[permute_L\]](#), page 1473; [Section D.10.1.12 \[sys_code\]](#), page 1472.

D.10.1.9 decodeSV

Procedure from library `brnoeth.lib` (see [Section D.10.1 \[brnoeth_lib\]](#), page 1458).

Usage: `decodeSV(y, K);` y a row-matrix and K a list

Return: a codeword (row-matrix) if possible, resp. the 0-matrix (of size 1) if decoding is impossible.

For decoding the basic (Skorobogatov-Vladut) decoding algorithm is applied.

Note: The `list_expression` should be the output K of the procedure `prepSV`.

The `matrix_expression` should be a $(1 \times n)$ -matrix, where $n = \text{ncols}(K[1])$.

The decoding may fail if the number of errors is greater than the correction capacity of the algorithm.

Example:

```

LIB "brnoeth.lib";
int plevel=printlevel;
printlevel=-1;
ring s=2,(x,y),lp;
list HC=Adj_div(x3+y2+y);
↳ The genus of the curve is 1
HC=NSplaces(1..2,HC);
HC=extcurve(2,HC);
↳ Total number of rational places : NrRatPl = 9
def ER=HC[1][4];
setring ER;
intvec G=5; // the rational divisor G = 5*HC[3][1]
intvec D=2..9; // D = sum of the rational places no. 2..9 over F_4
// construct the corresp. residual AG code of type [8,3,>=5] over F_4:
matrix C=AGcode_Omega(G,D,HC);

```

```

    ↪ Vector basis successfully computed
    // we can correct 1 error and the genus is 1, thus F must have degree 2
    // and support disjoint from that of D
    intvec F=2;
    list SV=prepSV(G,D,F,HC);
    ↪ Vector basis successfully computed
    ↪ Vector basis successfully computed
    ↪ Vector basis successfully computed
    // now we produce 1 error on the zero-codeword :
    matrix y[1][8];
    y[1,3]=a;
    // and then we decode :
    print(decodeSV(y,SV));
    ↪ 0,0,0,0,0,0,0,0
    printlevel=plevel;

```

See also: [Section D.10.1.7 \[AGcode_Omega\]](#), page 1468; [Section D.10.1.5 \[extcurve\]](#), page 1466; [Section D.10.1.8 \[prepSV\]](#), page 1468.

D.10.1.10 closed_points

Procedure from library `brnoeth.lib` (see [Section D.10.1 \[brnoeth_lib\]](#), page 1458).

Usage: `closed_points(I)`; I an ideal

Return: list of prime ideals (each a Groebner basis), corresponding to the (distinct affine closed) points of $V(I)$

Note: The ideal must have dimension 0, the basering must have 2 variables, the ordering must be `lp`, and the base field must be finite and prime.
It might be convenient to set the option `(redSB)` in advance.

Example:

```

LIB "brnoeth.lib";
ring s=2,(x,y),lp;
// this is just the affine plane over F_4 :
ideal I=x^4+x,y^4+y;
list L=closed_points(I);
// and here you have all the points :
L;
↪ [1]:
↪   _[1]=y
↪   _[2]=x
↪ [2]:
↪   _[1]=y
↪   _[2]=x+1
↪ [3]:
↪   _[1]=y
↪   _[2]=x^2+x+1
↪ [4]:
↪   _[1]=y+1
↪   _[2]=x
↪ [5]:
↪   _[1]=y+1
↪   _[2]=x+1

```

```

↳ [6] :
↳   _[1]=y+1
↳   _[2]=x2+x+1
↳ [7] :
↳   _[1]=y2+y+1
↳   _[2]=x+1
↳ [8] :
↳   _[1]=y2+y+1
↳   _[2]=x+y
↳ [9] :
↳   _[1]=y2+y+1
↳   _[2]=x+y+1
↳ [10] :
↳   _[1]=y2+y+1
↳   _[2]=x

```

See also: [Section D.8.4 \[triang_lib\], page 1427](#).

D.10.1.11 dual_code

Procedure from library `brnoeth.lib` (see [Section D.10.1 \[brnoeth_lib\], page 1458](#)).

Usage: `dual_code(G)`; G a matrix of numbers

Return: a generator matrix of the dual code generated by G

Note: The input should be a matrix G of numbers.
The output is also a parity check matrix for the code defined by G

Example:

```

LIB "brnoeth.lib";
ring s=2,T,lp;
// here is the Hamming code of length 7 and dimension 3
matrix G[3][7]=1,0,1,0,1,0,1,0,1,1,0,0,1,1,0,0,0,1,1,1,1;
print(G);
↳ 1,0,1,0,1,0,1,
↳ 0,1,1,0,0,1,1,
↳ 0,0,0,1,1,1,1
matrix H=dual_code(G);
print(H);
↳ 1,1,1,0,0,0,0,
↳ 1,0,0,1,1,0,0,
↳ 0,1,0,1,0,1,0,
↳ 1,1,0,1,0,0,1

```

D.10.1.12 sys_code

Procedure from library `brnoeth.lib` (see [Section D.10.1 \[brnoeth_lib\], page 1458](#)).

Usage: `sys_code(C)`; C is a matrix of constants

Return: list L with:

L[1] is the generator matrix in standard form of an equivalent code,
L[2] is the parity check matrix in standard form of such code,
L[3] is an intvec which represents the needed permutation.

Note: Computes a systematic code which is equivalent to the given one. The input should be a matrix of numbers. The output has to be interpreted as follows: if the input was the generator matrix of an AG code then one should apply the permutation $L[3]$ to the divisor D of rational points by means of `permute_L(D,L[3])`; before continuing to work with the code (for instance, if you want to use the systematic encoding together with a decoding algorithm).

Example:

```
LIB "brnoeth.lib";
ring s=3,T,lp;
matrix C[2][5]=0,1,0,1,1,0,1,0,0,1;
print(C);
  ↪ 0,1,0,1,1,
  ↪ 0,1,0,0,1
list L=sys_code(C);
L[3];
  ↪ 2,4,3,1,5
// here is the generator matrix in standard form
print(L[1]);
  ↪ 1,0,0,0,1,
  ↪ 0,1,0,0,0
// here is the control matrix in standard form
print(L[2]);
  ↪ 0, 0,1,0,0,
  ↪ 0, 0,0,1,0,
  ↪ -1,0,0,0,1
// we can check that both codes are dual to each other
print(L[1]*transpose(L[2]));
  ↪ 0,0,0,
  ↪ 0,0,0
```

See also: [Section D.10.1.7 \[AGcode_Omega\]](#), page 1468; [Section D.10.1.13 \[permute_L\]](#), page 1473; [Section D.10.1.8 \[prepSV\]](#), page 1468.

D.10.1.13 permute_L

Procedure from library `brnoeth.lib` (see [Section D.10.1 \[brnoeth.lib\]](#), page 1458).

Usage: `permute_L(L, P)`; L, P either intvecs or lists

Return: list obtained from L by applying the permutation given by P .

Note: If P is a list, all entries must be integers.

Example:

```
LIB "brnoeth.lib";
list L=list();
L[1]="a";
L[2]="b";
L[3]="c";
L[4]="d";
intvec P=1,3,4,2;
// the list L is permuted according to P :
permute_L(L,P);
```

```

↳ [1] :
↳   a
↳ [2] :
↳   c
↳ [3] :
↳   d
↳ [4] :
↳   b

```

See also: [Section D.10.1.7 \[AGcode_Omega\]](#), page 1468; [Section D.10.1.8 \[prepSV\]](#), page 1468; [Section D.10.1.12 \[sys_code\]](#), page 1472.

D.10.2 decodegb_lib

Library: decodegb.lib

Purpose: Decoding and min distance of linear codes with GB

Author: Stanislav Bulygin, bulygin@mathematik.uni-kl.de

Overview: In this library we generate several systems used for decoding cyclic codes and finding their minimum distance. Namely, we work with the Cooper's philosophy and generalized Newton identities. The origideal method of quadratic equations is worked out here as well. We also (for comparison) enable to work with the system of Fitzgerald-Lax. We provide some auxiliary functions for further manipulations and decoding. For an overview of the methods mentioned above [Section C.8 \[Decoding codes with Groebner bases\]](#), page 712. For the vanishing ideal computation the algorithm of Farr and Gao is implemented.

Procedures:

D.10.2.1 sysCRHT

Procedure from library `decodegb.lib` (see [Section D.10.2 \[decodegb.lib\]](#), page 1474).

Usage: `sysCRHT(n,defset,e,q,m,[k]);` `n,e,q,m,k` are int, `defset` list of int's

- `n` length of the cyclic code,
- `defset` is a list representing the defining set,
- `e` the error-correcting capacity,
- `q` field size
- `m` degree extension of the splitting field,
- if `k>0` additional equations representing the fact that every two error positions are either different or at least one of them is zero

Return: the ring to work with the CRHT-ideal (with Sala's additions), containig an ideal with name 'crht'

Theory: Based on 'defset' of the given cyclic code, the procedure constructs the corresponding Cooper-Reed-Heleseth-Truong ideal 'crht'. With its help one can solve the decoding problem. For basics of the method [Section C.8.2 \[Cooper philosophy\]](#), page 714.

Example:

```

LIB "decodegb.lib";
// binary cyclic [15,7,5] code with defining set (1,3)
intvec v = option(get);
list defset=1,3;          // defining set

```

```

int n=15;                // length
int e=2;                // error-correcting capacity
int q=2;                // basefield size
int m=4;                // degree extension of the splitting field
int sala=1;            // indicator to add additional equations
def A=sysCRHT(n,defset,e,q,m);
setring A;
A;                      // shows the ring we are working in
⇨ // coefficients: ZZ/2(a)
⇨ // number of vars : 6
⇨ //      block  1 : ordering lp
⇨ //      : names  Y(2) Y(1) Z(1) Z(2) X(2) X(1)
⇨ //      block  2 : ordering C
print(crht);           // the CRHT-ideal
⇨ Y(2)*Z(2)+Y(1)*Z(1)+X(1),
⇨ Y(2)*Z(2)^3+Y(1)*Z(1)^3+X(2),
⇨ X(1)^16+X(1),
⇨ X(2)^16+X(2),
⇨ Z(1)^16+Z(1),
⇨ Z(2)^16+Z(2),
⇨ Y(1)+1,
⇨ Y(2)+1
option(redSB);
ideal red_crht=std(crht); // reduced Groebner basis
print(red_crht);
⇨ X(1)^16+X(1),
⇨ X(2)*X(1)^15+X(2),
⇨ X(2)^8+X(2)^4*X(1)^12+X(2)^2*X(1)^3+X(2)*X(1)^6,
⇨ Z(2)^2*X(1)+Z(2)*X(1)^2+X(2)+X(1)^3,
⇨ Z(2)^2*X(2)+Z(2)*X(2)*X(1)+X(2)^2*X(1)^14+X(2)*X(1)^2,
⇨ Z(2)^16+Z(2),
⇨ Z(1)+Z(2)+X(1),
⇨ Y(1)+1,
⇨ Y(2)+1
//=====
A=sysCRHT(n,defset,e,q,m,sala);
setring A;
print(crht);           // CRHT-ideal with additional equations from Sala
⇨ Y(2)*Z(2)+Y(1)*Z(1)+X(1),
⇨ Y(2)*Z(2)^3+Y(1)*Z(1)^3+X(2),
⇨ X(1)^16+X(1),
⇨ X(2)^16+X(2),
⇨ Z(1)^16+Z(1),
⇨ Z(2)^16+Z(2),
⇨ Y(1)+1,
⇨ Y(2)+1,
⇨ Z(1)^15*Z(2)+Z(1)^14*Z(2)^2+Z(1)^13*Z(2)^3+Z(1)^12*Z(2)^4+Z(1)^11*Z(2)^5+
  Z(1)^10*Z(2)^6+Z(1)^9*Z(2)^7+Z(1)^8*Z(2)^8+Z(1)^7*Z(2)^9+Z(1)^6*Z(2)^10+Z(1)^5*Z(2)^11+
  Z(1)^4*Z(2)^12+Z(1)^3*Z(2)^13+Z(1)^2*Z(2)^14+Z(1)*Z(2)^15
option(redSB);
ideal red_crht=std(crht); // reduced Groebner basis
print(red_crht);
⇨ X(1)^16+X(1),

```

```

↳ X(2)*X(1)^15+X(2),
↳ X(2)^8+X(2)^4*X(1)^12+X(2)^2*X(1)^3+X(2)*X(1)^6,
↳ Z(2)*X(1)^15+Z(2),
↳ Z(2)^2+Z(2)*X(1)+X(2)*X(1)^14+X(1)^2,
↳ Z(1)+Z(2)+X(1),
↳ Y(1)+1,
↳ Y(2)+1
red_crht[5]; // general error-locator polynomial for this code
↳ Z(2)^2+Z(2)*X(1)+X(2)*X(1)^14+X(1)^2
option(set,v);

```

See also: [Section D.10.2.4 \[sysBin\], page 1481](#); [Section D.10.2.3 \[sysNewton\], page 1477](#).

D.10.2.2 sysCRHTMindist

Procedure from library `decodegb.lib` (see [Section D.10.2 \[decodegb.lib\], page 1474](#)).

Usage: `sysCRHTMindist(n,defset,w)`; n, w are int, `defset` is list of int's

- n length of the cyclic code,
- `defset` is a list representing the defining set,
- w is a candidate for the minimum distance

Return: the ring to work with the Sala's ideal for the minimum distance containing the ideal with name 'crht_md'

Theory: Based on 'defset' of the given cyclic code, the procedure constructs the corresponding Cooper-Reed-Heleseth-Truong ideal 'crht_md'. With its help one can find minimum distance of the code in the binary case. For basics of the method [Section C.8.2 \[Cooper philosophy\], page 714](#).

Example:

```

LIB "decodegb.lib";
intvec v = option(get);
// binary cyclic [15,7,5] code with defining set (1,3)
list defset=1,3; // defining set
int n=15; // length
int d=5; // candidate for the minimum distance
def A=sysCRHTMindist(n,defset,d);
setring A;
A; // shows the ring we are working in
↳ // coefficients: ZZ/2
↳ // number of vars : 5
↳ // block 1 : ordering lp
↳ // : names Z(1) Z(2) Z(3) Z(4) Z(5)
↳ // block 2 : ordering C
print(crht_md); // the Sala's ideal for mindist
↳ Z(1)+Z(2)+Z(3)+Z(4)+Z(5),
↳ Z(1)^3+Z(2)^3+Z(3)^3+Z(4)^3+Z(5)^3,
↳ Z(1)^15+1,
↳ Z(2)^15+1,

D.10.2.3 sysNewton

Procedure from library `decodegb.lib` (see [Section D.10.2 \[decodegb.lib\]](#), page 1474).

Usage: `sysNewton (n,defset,t,q,m,[tr]);` n,t,q,m, tr int, `defset` is list int's
- n is length,

- defset is the defining set,
- t is the number of errors,
- q is basefield size,
- m is degree extension of the splitting field,
- if tr>0 it indicates that Newton identities in triangular form should be constructed

Return: the ring to work with the generalized Newton identities (in triangular form if applicable) containing the ideal with name 'newton'

Theory: Based on 'defset' of the given cyclic code, the procedure constructs the corresponding ideal 'newton' with the generalized Newton identities. With its help one can solve the decoding problem. For basics of the method [Section C.8.3 \[Generalized Newton identities\]](#), page 715.

Example:

```
LIB "decodegb.lib";
// Newton identities for a binary 3-error-correcting cyclic code of
//length 31 with defining set (1,5,7)
int n=31;          // length
list defset=1,5,7; //defining set
int t=3;          // number of errors
int q=2;          // basefield size
int m=5;          // degree extension of the splitting field
int tr=1;         // indicator of triangular form of Newton identities
def A=sysNewton(n,defset,t,q,m);
setring A;

See also: [Section D.10.2.4 \[sysBin\], page 1481](#); [Section D.10.2.1 \[sysCRHT\], page 1474](#).

D.10.2.4 sysBin

Procedure from library `decodegb.lib` (see [Section D.10.2 \[decodegb.lib\], page 1474](#)).

Usage: `sysBin (v,Q,n,[odd]);` v, n, odd are int, Q is list of int's

- v a number if errors,
- Q is a defining set of the code,
- n the length,
- odd is an additional parameter: if set to 1, then the defining set is enlarged by odd elements, which are $2^{(\text{some power})} * (\text{some element in the def.set}) \bmod n$

Return: the ring with the resulting system called 'bin'

Theory: Based on Q of the given cyclic code, the procedure constructs the corresponding ideal 'bin' with the use of the Waring function. With its help one can solve the decoding problem. For basics of the method [Section C.8.3 \[Generalized Newton identities\], page 715](#).

Example:

```

LIB "decodegb.lib";
// [31,16,7] quadratic residue code
list l=1,5,7,9,19,25;
// we do not need even synromes here
def A=sysBin(3,l,31);
setring A;

See also: [Section D.10.2.1 \[sysCRHT\], page 1474](#); [Section D.10.2.3 \[sysNewton\], page 1477](#).

D.10.2.5 encode

Procedure from library `decodegb.lib` (see [Section D.10.2 \[decodegb.lib\], page 1474](#)).

Usage: `encode(x, g)`; `x` a row vector (message), and `g` a generator matrix

Return: corresponding codeword

Example:

```

LIB "decodegb.lib";
ring r=2,x,dp;
matrix x[1][4]=1,0,1,0;
matrix g[4][7]=1,0,0,0,0,1,1,
0,1,0,0,1,0,1,
0,0,1,0,1,1,1,
0,0,0,1,1,1,0;
//encode x with the generator matrix g
print(encode(x,g));
↦ 1,0,1,0,1,0,0

```

D.10.2.6 syndrome

Procedure from library `decodegb.lib` (see [Section D.10.2 \[decodegb.lib\], page 1474](#)).

Usage: `syndrome(h, c)`; `h` a check matrix, `c` a row vector (codeword)

Return: corresponding syndrome

Example:

```

LIB "decodegb.lib";
ring r=2,x,dp;
matrix x[1][4]=1,0,1,0;
matrix g[4][7]=1,0,0,0,0,1,1,
0,1,0,0,1,0,1,
0,0,1,0,1,1,1,
0,0,0,1,1,1,0;
//encode x with the generator matrix g
matrix c=encode(x,g);
// disturb
c[1,3]=0;
//compute syndrome
//corresponding check matrix

```

```

matrix check[3][7]=1,0,0,1,1,0,1,0,1,0,1,0,1,1,0,0,1,0,1,1,1;
print(syndrome(check,c));
↳ 0,
↳ 0,
↳ 1
c[1,3]=1;
//now c is a codeword
print(syndrome(check,c));
↳ 0,
↳ 0,
↳ 0

```

D.10.2.7 sysQE

Procedure from library `decodegb.lib` (see [Section D.10.2 \[decodegb.lib\], page 1474](#)).

Usage: `sysQE(check,y,t,[fieldeq,formal]);` `check,y` matrix; `t,fieldeq,formal` int

- `check` is a parity check matrix of the code
- `y` is a received word,
- `t` the number of errors to be corrected,
- if `fieldeq=1`, then field equations are added,
- if `formal=0`, field equations on (known) syndrome variables are not added, in order to add them (note that the exponent should be equal to the number of elements in the INITIAL alphabet) one needs to set `formal>0` for the exponent

Return: the ring to work with together with the resulting system called 'qe'

Theory: Based on 'check' of the given linear code, the procedure constructs the corresponding ideal that gives an opportunity to compute unknown syndrome of the received word `y`. After computing the unknown syndromes one is able to solve the decoding problem. For basics of the method [Section C.8.5 \[Decoding method based on quadratic equations\], page 717](#).

Example:

```

LIB "decodegb.lib";
intvec v = option(get);
//correct 2 errors in [7,3] 8-ary code RS code
int t=2; int q=8; int n=7; int redun=4;
ring r=(q,a),x,dp;
matrix h_full=genMDSMat(n,a);
matrix h=submat(h_full,1..redun,1..n);
matrix g=dual_code(h);
matrix x[1][3]=0,0,1,0;
matrix y[1][7]=encode(x,g);
//disturb with 2 errors
matrix rec[1][7]=errorInsert(y,list(2,4),list(1,a));
//generate the system
def A=sysQE(h,rec,t);
setring A;
print(qe);
↳ U(1)+a^3,
↳ U(2)+a^2,
↳ U(3)+a^6,

```

```

↳ U(4),
↳ V(1)*U(1)+V(2)*U(2)+U(3),
↳ V(1)*U(2)+V(2)*U(3)+U(4),
↳ V(1)*U(3)+V(2)*U(4)+U(5),
↳ V(1)*U(4)+V(2)*U(5)+U(6),
↳ V(1)*U(5)+V(2)*U(6)+U(7),
↳ V(1)*U(6)+V(2)*U(7)+U(1),
↳ V(2)*U(1)+V(1)*U(7)+U(2)
//let us decode
option(redSB);
ideal sys_qe=std(qe);
print(sys_qe);
↳ U(7)+a,
↳ U(6)+a^3,
↳ U(5)+a^3,
↳ U(4),
↳ U(3)+a^6,
↳ U(2)+a^2,
↳ U(1)+a^3,
↳ V(2)+1,
↳ V(1)+a^4
option(set,v);

```

See also: [Section D.10.2.17 \[sysFL\]](#), page 1496.

D.10.2.8 errorInsert

Procedure from library `decodegb.lib` (see [Section D.10.2 \[decodegb.lib\]](#), page 1474).

Usage: `errorInsert(y,pos,val)`; `y` is matrix, `pos,val` are list of int's

- `y` is a (code) word,
- `pos` = positions where errors occurred,
- `val` = their corresponding values

Return: corresponding received word

Example:

```

LIB "decodegb.lib";
//correct 2 errors in [7,3] 8-ary code RS code
int t=2; int q=8; int n=7; int redun=4;
ring r=(q,a),x,dp;
matrix h_full=genMDSMat(n,a);
matrix h=submat(h_full,1..redun,1..n);
matrix g=dual_code(h);
matrix x[1][3]=0,0,1,0;
matrix y[1][7]=encode(x,g);
print(y);
↳ a6,a6,a3,a,0,0,1
//disturb with 2 errors
matrix rec[1][7]=errorInsert(y,list(2,4),list(1,a));
print(rec);
↳ a6,a2,a3,0,0,0,1
print(rec-y);
↳ 0,1,0,a,0,0,0

```

D.10.2.9 errorRand

Procedure from library `decodegb.lib` (see [Section D.10.2 \[decodegb.lib\], page 1474](#)).

Usage: `errorRand(y, num, e)`; `y` is matrix, `num,e` are int
 - `y` is a (code) word,
 - `num` is the number of errors,
 - `e` is an extension degree (if one wants values to be from $\text{GF}(p^e)$)

Return: corresponding received word

Example:

```
LIB "decodegb.lib";
//correct 2 errors in [7,3] 8-ary code RS code
int t=2; int q=8; int n=7; int redun=4;
ring r=(q,a),x,dp;
matrix h_full=genMDSMat(n,a);
matrix h=submat(h_full,1..redun,1..n);
matrix g=dual_code(h);
matrix x[1][3]=0,0,1,0;
matrix y[1][7]=encode(x,g);
//disturb with 2 random errors
matrix rec[1][7]=errorRand(y,2,3);
print(rec);
↳ a3,a6,a2,a,0,0,1
print(rec-y);
↳ a4,0,a5,0,0,0,0
```

D.10.2.10 randomCheck

Procedure from library `decodegb.lib` (see [Section D.10.2 \[decodegb.lib\], page 1474](#)).

Usage: `randomCheck(m, n, e)`; `m,n,e` are int
 - `m x n` are dimensions of the matrix,
 - `e` is an extension degree (if one wants values to be from $\text{GF}(p^e)$)

Return: random check matrix

Example:

```
LIB "decodegb.lib";
int redun=5; int n=15;
ring r=2,x,dp;
//generate random check matrix for a [15,5] binary code
matrix h=randomCheck(redun,n,1);
print(h);
↳ 0,1,0,0,0,1,1,1,0,1,1,0,0,0,0,
↳ 1,1,0,0,0,0,0,1,0,0,0,1,0,0,0,
↳ 1,0,1,1,1,1,0,0,0,1,0,0,1,0,0,
↳ 1,1,0,1,1,0,0,0,0,1,0,0,0,1,0,
↳ 0,1,0,0,0,0,0,1,1,0,0,0,0,0,1
//corresponding generator matrix
matrix g=dual_code(h);
print(g);
↳ 0,0,0,1,1,0,0,0,0,0,0,0,0,0,0,
↳ 0,0,1,0,0,1,1,0,0,0,0,0,0,0,0,
```

```

↳ 0,1,1,1,0,0,0,1,0,0,0,0,0,0,0,
↳ 1,1,0,0,0,1,0,0,1,0,0,0,0,0,0,
↳ 0,0,1,1,0,1,0,0,0,1,0,0,0,0,0,
↳ 0,0,1,0,0,1,0,0,0,0,1,0,0,0,0,
↳ 1,0,0,1,0,0,0,0,0,0,0,1,0,0,0,
↳ 0,0,1,0,0,0,0,0,0,0,0,0,1,0,0,
↳ 0,0,1,1,0,0,0,0,0,0,0,0,0,1,0,
↳ 1,1,0,0,0,1,0,0,0,0,0,0,0,0,1

```

D.10.2.11 genMDSMat

Procedure from library `decodegb.lib` (see [Section D.10.2 \[decodegb.lib\], page 1474](#)).

Usage: `genMDSMat(n, a);` n is int, a is number
- n x n are dimensions of the MDS matrix,
- a is a primitive element of the field.

Note: An MDS matrix is constructed in the following way. We take 'a' to be a generator of the multiplicative group of the field. Then we construct the Vandermonde matrix with this 'a'.

Assume: extension field should already be defined

Return: a matrix with the MDS property.

Example:

```

LIB "decodegb.lib";
int q=16; int n=15;
ring r=(q,a),x,dp;
//generate an MDS (Vandermonde) matrix
matrix h_full=genMDSMat(n,a);
print(h_full);
↳ 1,1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1,
↳ 1,a, a2, a3, a4, a5, a6, a7, a8, a9, a10,a11,a12,a13,a14,
↳ 1,a2, a4, a6, a8, a10,a12,a14,a, a3, a5, a7, a9, a11,a13,
↳ 1,a3, a6, a9, a12,1, a3, a6, a9, a12,1, a3, a6, a9, a12,
↳ 1,a4, a8, a12,a, a5, a9, a13,a2, a6, a10,a14,a3, a7, a11,
↳ 1,a5, a10,1, a5, a10,1, a5, a10,1, a5, a10,1, a5, a10,
↳ 1,a6, a12,a3, a9, 1, a6, a12,a3, a9, 1, a6, a12,a3, a9,
↳ 1,a7, a14,a6, a13,a5, a12,a4, a11,a3, a10,a2, a9, a, a8,
↳ 1,a8, a, a9, a2, a10,a3, a11,a4, a12,a5, a13,a6, a14,a7,
↳ 1,a9, a3, a12,a6, 1, a9, a3, a12,a6, 1, a9, a3, a12,a6,
↳ 1,a10,a5, 1, a10,a5, 1, a10,a5, 1, a10,a5, 1, a10,a5,
↳ 1,a11,a7, a3, a14,a10,a6, a2, a13,a9, a5, a, a12,a8, a4,
↳ 1,a12,a9, a6, a3, 1, a12,a9, a6, a3, 1, a12,a9, a6, a3,
↳ 1,a13,a11,a9, a7, a5, a3, a, a14,a12,a10,a8, a6, a4, a2,
↳ 1,a14,a13,a12,a11,a10,a9, a8, a7, a6, a5, a4, a3, a2, a

```

See also: [Section C.8.5 \[Decoding method based on quadratic equations\], page 717](#).

D.10.2.12 mindist

Procedure from library `decodegb.lib` (see [Section D.10.2 \[decodegb.lib\], page 1474](#)).

Usage: `mindist (check, q);` check matrix, q int

- check is a check matrix,
- q is the field size

Return: minimum distance of the code

Example:

```
LIB "decodegb.lib";
//determine a minimum distance for a [7,3] binary code
int q=8; int n=7; int redun=4; int t=redun+1;
ring r=(q,a),x,dp;
//generate random check matrix
matrix h=randomCheck(redun,n,1);
print(h);
↳ 0,1,0,1,0,0,0,
↳ 0,0,1,0,1,0,0,
↳ 1,1,0,0,0,1,0,
↳ 1,1,1,0,0,0,1
int l=mindist(h);
1;
↳ 3
```

D.10.2.13 decode

Procedure from library `decodegb.lib` (see [Section D.10.2 \[decodegb.lib\]](#), page 1474).

Usage: `decode(check, rec, t)`; check, rec matrix, t int

- check is the check matrix of the code,
- rec is a received word,
- t is an upper bound for the number of errors one wants to correct

Note: The method described in [Section C.8.5 \[Decoding method based on quadratic equations\]](#), page 717 is used for decoding.

Assume: Errors in rec should be correctable, otherwise the output is unpredictable

Return: a codeword that is closest to rec

Example:

```
LIB "decodegb.lib";
//correct 1 error in [15,7] binary code
int t=1; int q=16; int n=15; int redun=10;
ring r=(q,a),x,dp;
//generate random check matrix
matrix h=randomCheck(redun,n,1);
matrix g=dual_code(h);
matrix x[1][n-redun]=0,0,1,0,1,0,1;
matrix y[1][n]=encode(x,g);
print(y);
↳ 1,0,1,0,1,0,1,1,1,1,0,0,1,0,1
// find out the minimum distance of the code
list l=mindist(h);
//disturb with errors
"Correct ",(l[1]-1) div 2," errors";
↳ Correct 1 errors
matrix rec[1][n]=errorRand(y,(l[1]-1) div 2,1);
print(rec);
```

```

↳ 1,0,1,0,1,0,1,1,1,0,0,0,1,0,1
//let us decode
matrix dec_word=decode(h,rec);
print(dec_word);
↳ 1,0,1,0,1,0,1,1,1,1,0,0,1,0,1

```

D.10.2.14 decodeRandom

Procedure from library `decodegb.lib` (see [Section D.10.2 \[decodegb.lib\], page 1474](#)).

Usage: `decodeRandom(redun,q,ncodes,ntrials,[e]);` all parameters int

- `redun` is a redundancy of a (random) code,
- `q` is the field size,
- `ncodes` is the number of random codes to be processed,
- `ntrials` is the number of received vectors per code to be corrected
- If `e` is given it sets the correction capacity explicitly. It should be used in case one expects some lower bound, otherwise the procedure tries to compute the real minimum distance to find out the error-correction capacity

Return: nothing;

Example:

```

LIB "decodegb.lib";
int q=32; int n=25; int redun=n-11; int t=redun+1;
ring r=(q,a),x,dp;
// correct 2 errors in 2 random binary codes, 3 trials each
decodeRandom(n,redun,2,3,2);
↳ check matrix:
↳ 0,1,0,0,0,1,1,1,0,1,1,1,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,
↳ 1,0,0,0,0,0,1,0,0,1,0,0,1,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,
↳ 1,1,1,1,0,0,0,1,1,1,0,0,0,1,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,
↳ 1,1,0,0,0,0,1,0,1,0,0,0,0,0,1,0,0,0,0,0,0,0,0,0,0,0,0,0,0,
↳ 0,0,0,1,1,0,1,0,0,1,1,0,0,0,0,1,0,0,0,0,0,0,0,0,0,0,0,0,
↳ 0,0,1,0,1,1,1,0,1,1,1,0,0,0,0,0,1,0,0,0,0,0,0,0,0,0,0,0,
↳ 0,1,0,0,0,1,0,1,0,0,1,0,0,0,0,0,0,1,0,0,0,0,0,0,0,0,0,0,
↳ 0,1,1,1,0,1,1,1,0,0,0,0,0,0,0,0,0,0,0,0,1,0,0,0,0,0,0,0,

D.10.2.15 decodeCode

Procedure from library `decodegb.lib` (see [Section D.10.2 \[decodegb.lib\]](#), page 1474).

Usage: `decodeCode(check, ntrials, [e]);` check matrix, ntrials,e int
 - check is a parity check matrix for the code,
 - ntrials is the number of received vectors per code to be corrected.
 - If e is given it sets the correction capacity explicitly. It should be used in case one expects some lower bound, otherwise the procedure tries to compute the real minimum distance to find out the error-correction capacity

Return: nothing;

D.10.2.16 vanishId

Procedure from library `decodegb.lib` (see [Section D.10.2 \[decodegb.lib\], page 1474](#)).

Usage: `vanishId (points);` point is a list of matrices
 'points' is a list of points for which the vanishing ideal is to be constructed

Return: Vanishing ideal corresponding to the given set of points

Example:

```

LIB "decodegb.lib";
ring r=3,(x(1..3)),dp;
//generate all 3-vectors over GF(3)
list points=pointsGen(3,1);
list points2=convPoints(points);
//grasps the first 11 points
list p=graspList(points2,1,11);
print(p);
↳ [1]:

↳   _[2,1]=1
↳   _[3,1]=0
↳ [5]:
↳   _[1,1]=0
↳   _[2,1]=1
↳   _[3,1]=1
↳ [6]:
↳   _[1,1]=0

```

```

↳   _[2,1]=1
↳   _[3,1]=-1
↳ [7]:
↳   _[1,1]=0
↳   _[2,1]=-1
↳   _[3,1]=0
↳ [8]:
↳   _[1,1]=0
↳   _[2,1]=-1
↳   _[3,1]=1
↳ [9]:
↳   _[1,1]=0
↳   _[2,1]=-1
↳   _[3,1]=-1
↳ [10]:
↳   _[1,1]=1
↳   _[2,1]=0
↳   _[3,1]=0
↳ [11]:
↳   _[1,1]=1
↳   _[2,1]=0
↳   _[3,1]=1
//construct the vanishing ideal
ideal id=vanishId(p);
print(id);
↳ x(1)*x(2),
↳ x(1)^2-x(1),
↳ x(3)^3-x(3),
↳ x(1)*x(3)^2-x(1)*x(3),
↳ x(2)^3-x(2)

```

D.10.2.17 sysFL

Procedure from library `decodegb.lib` (see [Section D.10.2 \[decodegb.lib\]](#), page 1474).

Usage: `sysFL (check,y,t,e,s)`; `check,y` matrix, `t,e,s` int

- `check` is a parity check matrix of the code,
- `y` is a received word,
- `t` the number of errors to correct,
- `e` is the extension degree,
- `s` is the dimension of the point for the vanishing ideal

Return: the system of Fitzgerald-Lax for the given decoding problem

Theory: Based on 'check' of the given linear code, the procedure constructs the corresponding ideal constructed with a generalization of Cooper's philosophy. For basics of the method [Section C.8.4 \[Fitzgerald-Lax method\]](#), page 716.

Example:

```

LIB "decodegb.lib";
intvec vopt = option(get);
list l=FLpreprocess(3,1,11,2,"");
def r=l[1];
setring r;
int s_work=l[2];

```

```

//the check matrix of [11,6,5] ternary code

See also: [Section D.10.2.7 \[sysQE\]](#), page 1483.

D.10.2.18 decodeRandomFL

Procedure from library `decodegb.lib` (see [Section D.10.2 \[decodegb.lib\]](#), page 1474).

Usage: `decodeRandomFL(redun,p,e,n,t,ncodes,ntrials,minpol);`

- n is length of codes generated,
- redun = redundancy of codes generated,
- p is the characteristic,
- e is the extension degree,
- t is the number of errors to correct,
- ncodes is the number of random codes to be processed,
- ntrials is the number of received vectors per code to be corrected,
- minpol: due to some peculiarities of SINGULAR one needs to provide minimal polynomial for the extension explicitly

Return: nothing

Example:

```

LIB "decodegb.lib";
// correcting one error for one random binary code of length 25,
// redundancy 14; 10 words are processed
decodeRandomFL(25,14,2,1,1,1,10,"");

```

D.11 System and Control theory

D.11.1 Control theory background

Control systems are usually described by differential (or difference) equations, but their properties of interest are most naturally expressed in terms of the system trajectories (the set of all solutions to the equations). This is formalized by the notion of the system *behavior*. On the other hand, the manipulation of linear system equations can be formalized using algebra, more precisely module theory. The relationship between modules and behaviors is very rich and leads to deep results on system structure.

The key to the module-behavior correspondence is a property of some signal spaces that are modules over the ring of differential (or difference) operators, namely, *the injective cogenerator property*. This property makes it possible to translate any statement on the solution spaces that can be expressed in terms of images and kernels, to an equivalent statement on the modules. Thus analytic properties can be identified with algebraic properties, and conversely, the results of manipulating the modules

using computer algebra can be re-translated and interpreted using the language of systems theory. This duality (*algebraic analysis*) is widely used in behavioral systems and control theory today.

For instance, a system is **controllable** (a fundamental property for any control system) if and only if the associated module is torsion-free. This concept can be refined by the so-called controllability degrees. The strongest form of controllability (*flatness*) corresponds to a projective (or even free) module.

Controllability means that one can switch from one system trajectory to another without violating the system law (concatenation of trajectories). For one-dimensional systems (ODE) that evolve in time, this is usually interpreted as switching from a given past trajectory to a desired future trajectory. Thus the system can be forced to behave in an arbitrarily prescribed way.

The extreme case opposed to controllability is **autonomy**: autonomous systems evolve independently according to their law, without being influenceable from the outside. Again, the property can be refined in terms of autonomy degrees.

D.11.2 control_lib

Library: control.lib

Purpose: Algebraic analysis tools for System and Control Theory

Authors: Oleksandr Iena, yena@mathematik.uni-kl.de
Markus Becker, mbecker@mathematik.uni-kl.de
Viktor Levandovskyy, levandov@mathematik.uni-kl.de

Support: Forschungsschwerpunkt 'Mathematik und Praxis' (Project of Dr. E. Zerz and V. Levandovskyy), University of Kaiserslautern

Procedures:

D.11.2.1 control

Procedure from library `control.lib` (see [Section D.11.2 \[control_lib\], page 1503](#)).

Usage: `control(R)`; R a module (R is the matrix of the system of equations to be investigated)

Return: list

Purpose: compute the list of all the properties concerning controllability of the system (behavior), represented by the matrix R

Note: the properties and corresponding data like controllability, flatness, dimension of the system, degree of controllability, kernel and image representations, genericity of parameters, obstructions to controllability, annihilator of torsion submodule and left inverse are investigated

Example:

```
LIB "control.lib";
// a WindTunnel example
ring A = (0,a, omega, zeta, k),(D1, delta),dp;
module R;
R = [D1+a, -k*a*delta, 0, 0],
    [0, D1, -1, 0],
    [0, omega^2, D1+2*zeta*omega, -omega^2];
R=transpose(R);
view(R);
```

```

↳ D1+(a),(-a*k)*delta,0,0,0,
↳ 0,D1,-1,0,0,
↳ 0,(omega^2),D1+(2*omega*zeta),(-omega^2)
view(control(R));
↳ number of first nonzero Ext:
↳
↳ 2
↳
↳ controllable, not reflexive, image representation:
↳
↳ (a*omega^2*k)*delta,
↳ (omega^2)*D1+(a*omega^2),
↳ (omega^2)*D1^2+(a*omega^2)*D1,
↳ D1^3+(a+2*omega*zeta)*D1^2+(2*a*omega*zeta+omega^2)*D1+(a*omega^2)
↳
↳ dimension of the system:
↳
↳ 2
↳
↳ Parameter constellations which might lead to a non-controllable system:
↳
↳ a,k,omega
↳
↳

```

D.11.2.2 controlDim

Procedure from library `control.lib` (see [Section D.11.2 \[control.lib\], page 1503](#)).

Usage: `controlDim(R)`; R a module (R is the matrix of the system of equations to be investigated)

Return: list

Purpose: computes list of all the properties concerning controllability of the system (behavior), represented by the matrix R

Note: the properties and corresponding data like controllability, flatness, dimension of the system, degree of controllability, kernel and image representations, genericity of parameters, obstructions to controllability, annihilator of torsion submodule and left inverse are investigated.

This procedure is analogous to 'control' but uses dimension calculations.

The implemented approach works for full row rank matrices only (the check is done automatically).

Example:

```

LIB "control.lib";
//a WindTunnel example
ring A = (0,a,omega,zeta,k),(D1,delta),dp;
module R;
R = [D1+a, -k*a*delta, 0, 0],
[0, D1, -1, 0],
[0, omega^2, D1+2*zeta*omega, -omega^2];
R=transpose(R);
view(R);

```

```

↳ D1+(a),(-a*k)*delta,0,0,0,
↳ 0,D1,-1,0,0,
↳ 0,(omega^2),D1+(2*omega*zeta),(-omega^2)
view(controlDim(R));
↳ number of first nonzero Ext:
↳
↳ 2
↳
↳ controllable, not reflexive, image representation:
↳
↳ (a*omega^2*k)*delta,
↳ (omega^2)*D1+(a*omega^2),
↳ (omega^2)*D1^2+(a*omega^2)*D1,
↳ D1^3+(a+2*omega*zeta)*D1^2+(2*a*omega*zeta+omega^2)*D1+(a*omega^2)
↳
↳ dimension of the system:
↳
↳ 2
↳
↳ Parameter constellations which might lead to a non-controllable system:
↳
↳ a,k,omega
↳
↳

```

D.11.2.3 autonom

Procedure from library `control.lib` (see [Section D.11.2 \[control.lib\], page 1503](#)).

Usage: `autonom(R)`; R a module (R is a matrix of the system of equations which is to be investigated)

Return: list

Purpose: find all the properties concerning autonomy of the system (behavior) represented by the matrix R

Note: the properties and corresponding data like autonomy resp. strong autonomy, dimension of the system, autonomy degree, kernel representation and (over)determinacy are investigated

Example:

```

LIB "control.lib";
// Cauchy
ring r=0,(s1,s2,s3,s4),dp;
module R= [s1,-s2],
[s2, s1],
[s3,-s4],
[s4, s3];
R=transpose(R);
view( R );
↳ s1,-s2,
↳ s2,s1,
↳ s3,-s4,
↳ s4,s3

```

```

view( autonom(R) );
↳ number of first nonzero Ext:
↳
↳ 2
↳
↳ overdetermined, not strongly autonomous
↳
↳ dimension of the system:
↳
↳ 2
↳

```

D.11.2.4 autonomDim

Procedure from library `control.lib` (see [Section D.11.2 \[control.lib\], page 1503](#)).

Usage: `autonomDim(R)`; R a module (R is a matrix of the system of equations which is to be investigated)

Return: list

Purpose: computes the list of all the properties concerning autonomy of the system (behavior), represented by the matrix R

Note: the properties and corresponding data like autonomy resp. strong autonomy, dimension of the system, autonomy degree, kernel representation and (over)determinacy are investigated.

This procedure is analogous to 'autonom' but uses dimension calculations

Example:

```

LIB "control.lib";
// Cauchy1 example
ring r=0,(s1,s2,s3,s4),dp;
module R= [s1,-s2],
[s2, s1],
[s3,-s4],
[s4, s3];
R=transpose(R);
view( R );
↳ s1,-s2,
↳ s2,s1 ,
↳ s3,-s4,
↳ s4,s3
view( autonomDim(R) );
↳ number of first nonzero Ext:
↳
↳ 2
↳
↳ overdetermined, not strongly autonomous
↳
↳ dimension of the system:
↳
↳ 2
↳

```

D.11.2.5 leftKernel

Procedure from library `control.lib` (see [Section D.11.2 \[control.lib\], page 1503](#)).

Usage: `leftKernel(M)`; M a matrix

Return: module

Purpose: computes left kernel of matrix M (a module of all elements v such that $vM=0$)

Example:

```
LIB "control.lib";
ring r= 0,(x,y,z),dp;
matrix M[3][1] = x,y,z;
print(M);
  ↪ x,
  ↪ y,
  ↪ z
matrix L = leftKernel(M);
print(L);
  ↪ 0, -z,y,
  ↪ -y,x, 0,
  ↪ -z,0, x
// check:
print(L*M);
  ↪ 0,
  ↪ 0,
  ↪ 0
```

D.11.2.6 rightKernel

Procedure from library `control.lib` (see [Section D.11.2 \[control.lib\], page 1503](#)).

Usage: `rightKernel(M)`; M a matrix

Return: module

Purpose: computes the right kernel of matrix M (a module of all elements v such that $Mv=0$)

Example:

```
LIB "control.lib";
ring r = 0,(x,y,z),dp;
matrix M[1][3] = x,y,z;
print(M);
  ↪ x,y,z
matrix R = rightKernel(M);
print(R);
  ↪ 0, -y,-z,
  ↪ -z,x, 0,
  ↪ y, 0, x
// check:
print(M*R);
  ↪ 0,0,0
```

D.11.2.7 leftInverse

Procedure from library `control.lib` (see [Section D.11.2 \[control.lib\], page 1503](#)).

Usage: `leftInverse(M)`; M a module

Return: module

Purpose: computes such a matrix L, that $LM = \text{Id}$;

Note: exists only in the case when M is free submodule

Example:

```
LIB "control.lib";
// a trivial example:
ring r = 0, (x,z), dp;
matrix M[2][1] = 1,x2z;
print(M);
↳ 1,
↳ x2z
print( leftInverse(M) );
↳ 1,0
kill r;
// derived from the example TwoPendula:
ring r=(0,m1,m2,M,g,L1,L2),Dt,dp;
matrix U[3][1];
U[1,1]=(-L2)*Dt^4+(g)*Dt^2;
U[2,1]=(-L1)*Dt^4+(g)*Dt^2;
U[3,1]=(L1*L2)*Dt^4+(-g*L1-g*L2)*Dt^2+(g^2);
module M = module(U);
module L = leftInverse(M);
print(L);
↳ (L1^2)/(g^2*L1-g^2*L2), (-L2^2)/(g^2*L1-g^2*L2), 1/(g^2)
// check
print(L*M);
↳ 1
```

D.11.2.8 rightInverse

Procedure from library `control.lib` (see [Section D.11.2 \[control.lib\], page 1503](#)).

Usage: `rightInverse(M)`; M a module

Return: module

Purpose: computes such a matrix L, that $ML = \text{Id}$

Note: exists only in the case when M is free submodule

Example:

```
LIB "control.lib";
// a trivial example:
ring r = 0, (x,z), dp;
matrix M[1][2] = 1,x2+z;
print(M);
↳ 1,x2+z
print( rightInverse(M) );
↳ 1,
```

```

↳ 0
kill r;
// derived from the TwoPendula example:
ring r=(0,m1,m2,M,g,L1,L2),Dt,dp;
matrix U[1][3];
U[1,1]=(-L2)*Dt^4+(g)*Dt^2;
U[1,2]=(-L1)*Dt^4+(g)*Dt^2;
U[1,3]=(L1*L2)*Dt^4+(-g*L1-g*L2)*Dt^2+(g^2);
module M = module(U);
module L = rightInverse(M);
print(L);
↳ (L1^2)/(g^2*L1-g^2*L2),
↳ (-L2^2)/(g^2*L1-g^2*L2),
↳ 1/(g^2)
// check
print(M*L);
↳ 1

```

D.11.2.9 colrank

Procedure from library `control.lib` (see [Section D.11.2 \[control.lib\], page 1503](#)).

Usage: `colrank(M)`; M a matrix/module

Return: `int`

Purpose: compute the column rank of M as of matrix

Note: this procedure uses Bareiss algorithm

Example:

```

LIB "control.lib";
// de Rham complex
ring r=0,(D(1..3)),dp;
module R;
R=[0,-D(3),D(2)],
[D(3),0,-D(1)],
[-D(2),D(1),0];
R=transpose(R);
colrank(R);
↳ 2

```

D.11.2.10 genericity

Procedure from library `control.lib` (see [Section D.11.2 \[control.lib\], page 1503](#)).

Usage: `genericity(M)`; M is a matrix/module

Return: `list` (of strings)

Purpose: determine parametric expressions which have been assumed to be non-zero in the process of computing the Groebner basis

Note: the output list consists of strings. The first string contains the variables only, whereas each further string contains a single polynomial in parameters.

We strongly recommend to switch on the `redSB` and `redTail` options.

The procedure is effective with the lift procedure for modules with parameters

Example:

```

LIB "control.lib";
// TwoPendula
ring r=(0,m1,m2,M,g,L1,L2),Dt,dp;
module RR =
[m1*L1*Dt^2, m2*L2*Dt^2, -1, (M+m1+m2)*Dt^2],
[m1*L1^2*Dt^2-m1*L1*g, 0, 0, m1*L1*Dt^2],
[0, m2*L2^2*Dt^2-m2*L2*g, 0, m2*L2*Dt^2];
module R = transpose(RR);
module SR = std(R);
matrix T = lift(R,SR);
genericity(T);
↳ [1]:
↳ m1,g,L1,L2
↳ [2]:
↳ L1-L2
/-- The result might be different when computing reduced bases:
matrix T2;
option(redSB);
option(redTail);
module SR2 = std(R);
T2 = lift(R,SR2);
genericity(T2);
↳ [1]:
↳ m1,g,L1,m2,L2
↳ [2]:
↳ L1-L2

```

D.11.2.11 canonize

Procedure from library `control.lib` (see [Section D.11.2 \[control.lib\], page 1503](#)).

Usage: `canonize(L)`; L a list

Return: list

Purpose: modules in the list are canonized by computing their reduced minimal (= unique up to constant factor w.r.t. the given ordering) Groebner bases

Assume: L is the output of `control/autonomy` procedures

Example:

```

LIB "control.lib";
// TwoPendula with L1=L2=L
ring r=(0,m1,m2,M,g,L),Dt,dp;
module RR =
[m1*L*Dt^2, m2*L*Dt^2, -1, (M+m1+m2)*Dt^2],
[m1*L^2*Dt^2-m1*L*g, 0, 0, m1*L*Dt^2],
[0, m2*L^2*Dt^2-m2*L*g, 0, m2*L*Dt^2];
module R = transpose(RR);
list C = control(R);
list CC = canonize(C);
view(CC);
↳ number of first nonzero Ext:
↳

```

```

↳ 1
↳
↳ not controllable , image representation for controllable part:
↳
↳ -Dt^2
↳ -Dt^2
↳ (M*L)*Dt^4+(-m1*g-m2*g-M*g)*Dt^2,
↳ (L)*Dt^2+(-g)
↳
↳ kernel representation for controllable part:
↳
↳ 1,0,0,
↳ 0,1,0,
↳ 0,0,1
↳
↳ obstruction to controllability
↳
↳ 1,0,0
↳ 0,1,0
↳ 0,0,(L)*Dt^2+(-g)
↳
↳ annihilator of torsion module (of obstruction to controllability)
↳
↳ (L)*Dt^2+(-g)
↳
↳ dimension of the system:
↳
↳ 1
↳

```

D.11.2.12 iostruct

Procedure from library `control.lib` (see [Section D.11.2 \[control.lib\], page 1503](#)).

Usage: `iostruct(R);` R a module

Return: list L with entries: string s, intvec v, module P and module Q

Purpose: if R is the kernel-representation-matrix of some system, then we output a input-ouput representation $Py=Qu$ of the system, the components that have been chosen as outputs(intvec v) and a comment s

Note: the procedure uses Bareiss algorithm

Example:

```

LIB "control.lib";
//Example Antenna
ring r = (0, K1, K2, Te, Kp, Kc),(Dt, delta), (c,dp);
module RR;
RR =
[Dt, -K1, 0, 0, 0, 0, 0, 0, 0],
[0, Dt+K2/Te, 0, 0, 0, 0, -Kp/Te*delta, -Kc/Te*delta, -Kc/Te*delta],
[0, 0, Dt, -K1, 0, 0, 0, 0, 0],
[0, 0, 0, Dt+K2/Te, 0, 0, -Kc/Te*delta, -Kp/Te*delta, -Kc/Te*delta],
[0, 0, 0, 0, Dt, -K1, 0, 0, 0],

```

```

[0, 0, 0, 0, 0, Dt+K2/Te, -Kc/Te*delta, -Kc/Te*delta, -Kp/Te*delta];
module R = transpose(RR);
view(iostruct(R));
↳ The following components have been chosen as outputs:
↳
↳ 1,
↳ 2,
↳ 3,
↳ 4,
↳ 5,
↳ 6
↳
↳ Dt, (-K1)      ,0 ,0      ,0 ,0      ,
↳ 0 ,Dt+(K2)/(Te),0 ,0      ,0 ,0      ,
↳ 0 ,0      ,Dt, (-K1)    ,0 ,0      ,
↳ 0 ,0      ,0 ,Dt+(K2)/(Te),0 ,0      ,
↳ 0 ,0      ,0 ,0      ,Dt, (-K1)    ,
↳ 0 ,0      ,0 ,0      ,0 ,Dt+(K2)/(Te)
↳
↳ 0      ,0      ,0      ,
↳ (-Kp)/(Te)*delta, (-Kc)/(Te)*delta, (-Kc)/(Te)*delta,
↳ 0      ,0      ,0      ,
↳ (-Kc)/(Te)*delta, (-Kp)/(Te)*delta, (-Kc)/(Te)*delta,
↳ 0      ,0      ,0      ,
↳ (-Kc)/(Te)*delta, (-Kc)/(Te)*delta, (-Kp)/(Te)*delta
↳

```

D.11.2.13 findTorsion

Procedure from library `control.lib` (see [Section D.11.2 \[control.lib\], page 1503](#)).

Usage: `findTorsion(R, I)`; R an ideal/matrix/module, I an ideal

Return: module

Purpose: computes the Groebner basis of the submodule of R, annihilated by I

Note: especially helpful, when I is the annihilator of the $t(R)$ - the torsion submodule of R. In this case, the result is the explicit presentation of $t(R)$ as the submodule of R

Example:

```

LIB "control.lib";
// Flexible Rod
ring A = 0, (D1, D2), (c, dp);
module R= [D1, -D1*D2, -1], [2*D1*D2, -D1-D1*D2^2, 0];
module RR = transpose(R);
list L = control(RR);
// here, we have the annihilator:
ideal LAnn = D1; // = L[10]
module Tr = findTorsion(RR, LAnn);
print(RR); // the module itself
↳ D1,      -D1*D2,      -1,
↳ 2*D1*D2, -D1*D2^2-D1, 0
print(Tr); // generators of the torsion submodule
↳ 0,
↳ 1

```

D.11.2.14 controlExample

Procedure from library `control.lib` (see [Section D.11.2 \[control.lib\], page 1503](#)).

Usage: `controlExample(s)`; `s` a string

Return: ring

Purpose: set up an example from the mini database by initializing a ring and a module in a ring

Note: in order to see the list of available examples, execute `controlExample("show")`;
To use an example, one has to do the following. Suppose one calls the ring, where the example will be activated, `A`. Then, by executing
`def A = controlExample("Antenna");` and `setring A;`,
`A` will become a basering from the example "Antenna" with the predefined system module `R` (transposed). After that one can just execute `control(R)`; respectively `autonom(R)`; to perform the control resp. autonomy analysis of `R`.

Example:

```
LIB "control.lib";
controlExample("show"); // let us see all available examples:
⇒ The list of examples:
⇒ name: Cauchy1, desc: 1-dimensional Cauchy equation
⇒ name: Cauchy2, desc: 2-dimensional Cauchy equation
⇒ name: Control1, desc: example of a simple noncontrollable system
⇒ name: Control2, desc: example of a simple controllable system
⇒ name: Antenna, desc: antenna
⇒ name: Einstein, desc: Einstein equations in vacuum
⇒ name: FlexibleRod, desc: flexible rod
⇒ name: TwoPendula, desc: two pendula mounted on a cart
⇒ name: WindTunnel, desc: wind tunnel
⇒ name: Zerz1, desc: example from the lecture of Eva Zerz
def B = controlExample("TwoPendula"); // let us set up a particular example
setring B;
print(R);
⇒ (m1*L1)*Dt^2, (m2*L2)*Dt^2, -1, (m1+m2+M)*Dt^2,
⇒ (m1*L1^2)*Dt^2+(-m1*g*L1), 0, 0, (m1*L1)*Dt^2,
⇒ 0, (m2*L2^2)*Dt^2+(-m2*g*L2), 0, (m2*L2)*Dt^2
```

D.11.2.15 view

Procedure from library `control.lib` (see [Section D.11.2 \[control.lib\], page 1503](#)).

Usage: `view(M)`; `M` is of any type

Return: no return value

Purpose: procedure for (well-) formatted output of modules, matrices, lists of modules, matrices; shows everything even if entries are long

Note: in case of other types(not 'module', 'matrix', 'list') works just as standard 'print' procedure

Example:

```
LIB "control.lib";
ring r;
list L;
```

```

matrix M[1][3] = x2+x,y3-y,z5-4z+7;
L[1] = "a matrix:";
L[2] = M;
L[3] = "an ideal:";
L[4] = ideal(M);
view(L);
↳ a matrix:
↳
↳ x2+x,y3-y,z5-4z+7
↳
↳ an ideal:
↳
↳ x2+x,
↳ y3-y,
↳ z5-4z+7
↳

```

D.11.3 jacobson_lib

Library: jacobson.lib

Purpose: Algorithms for Smith and Jacobson Normal Form

Author: Kristina Schindelar, Kristina.Schindelar@math.rwth-aachen.de,
Viktor Levandovskyy, levandov@math.rwth-aachen.de

Overview: We work over a ring R , that is an Euclidean principal ideal domain. If R is commutative, we suppose R to be a polynomial ring in one variable. If R is non-commutative, we suppose R to have two variables, say x and d . We treat then the basering as the Ore localization of R with respect to the mult. closed set $S = K[x]$ without 0 . Thus, we treat basering as principal ideal ring with d a polynomial variable and x an invertible one.

Note, that in computations no division by x will actually happen.

Given a rectangular matrix M over R , one can compute unimodular (that is invertible) square matrices U and V , such that $U*M*V=D$ is a diagonal matrix. Depending on the ring, the diagonal entries of D have certain properties.

We call a square matrix D as before 'a weak Jacobson normal form of M '. It is known, that over the first rational Weyl algebra $K(x)\langle d \rangle$, D can be further transformed into a diagonal matrix $(1,1,\dots,1,f,0,\dots,0)$, where f is in $K(x)\langle d \rangle$. We call such a form of D the strong Jacobson normal form. The existence of strong form is not guaranteed if one works with algebra, which is not rational Weyl algebra.

Procedures: See also: [Section D.11.2 \[control_lib\]](#), page 1503.

D.11.3.1 smith

Procedure from library `jacobson.lib` (see [Section D.11.3 \[jacobson.lib\], page 1514](#)).

Usage: `smith(M[, eng1, eng2]);` M matrix, eng1 and eng2 are optional integers

Return: matrix or list of matrices, depending on arguments

Assume: Basing is a commutative polynomial ring in one variable

Purpose: compute the Smith Normal Form of M with (optionally) transformation matrices

Theory: Groebner bases are used for the Smith form like in [2] and [3].

Note: By default, just the Smith normal form of M is returned.
 If the optional integer `eng1` is non-zero, the list $\{U, D, V\}$ is returned where $U * M * V = D$ and the diagonal field entries of D are not normalized. The normalization of the latter can be done with the 'divideUnits' procedure. U and V above are square unimodular (invertible) matrices.
 Note, that the procedure works for a rectangular matrix M.

The optional integer `eng2` determines the Groebner basis engine: 0 (default) ensures the use of 'slimgb', otherwise 'std' is used.

Display: If `printlevel=1`, progress debug messages will be printed, if `printlevel>=2`, all the debug messages will be printed.

Example:

```
LIB "jacobson.lib";
ring r = 0,x,Dp;
matrix m[3][2]=x, x^4+x^2+21, x^4+x^2+x, x^3+x, 4*x^2+x, x;
list s=smith(m,1);
print(s[2]); // non-normalized Smith form of m
  => 21,0,
  => 0, x,
  => 0, 0
print(s[1]*m*s[3] - s[2]); // check U*M*V = D
  => 0,0,
  => 0,0,
  => 0,0
list t = divideUnits(s);
print(t[2]); // the Smith form of m
  => 1,0,
  => 0,x,
  => 0,0
```

See also: [Section D.11.3.3 \[divideUnits\], page 1516](#); [Section D.11.3.2 \[jacobson\], page 1515](#).

D.11.3.2 jacobson

Procedure from library `jacobson.lib` (see [Section D.11.3 \[jacobson.lib\], page 1514](#)).

Usage: `jacobson(M, eng);` M matrix, eng an optional int

Return: list

Assume: Basing is a (non-commutative) ring in two variables.

Purpose: compute a weak Jacobson normal form of M over the basering

Theory: Groebner bases and involutions are used, following [3]

Note: A list L of matrices $\{U,D,V\}$ is returned. That is $L[1]*M*L[3]=L[2]$, where $L[2]$ is a diagonal matrix and $L[1], L[3]$ are square invertible polynomial (unimodular) matrices. Note, that M can be rectangular. The optional integer `eng2` determines the Groebner basis engine: 0 (default) ensures the use of 'slingb', otherwise 'std' is used.

Display: If `printlevel=1`, progress debug messages will be printed, if `printlevel>=2`, all the debug messages will be printed.

Example:

```
LIB "jacobson.lib";
ring r = 0,(x,d),Dp;
def R = nc_algebra(1,1);  setring R; // the 1st Weyl algebra
matrix m[2][2] = d,x,0,d; print(m);
  ↪ d,x,
  ↪ 0,d
list J = jacobson(m); // returns a list with 3 entries
print(J[2]); // a Jacobson Form D for m
  ↪ xd2-d,0,
  ↪ 0, 1
print(J[1]*m*J[3] - J[2]); // check that U*M*V = D
  ↪ 0,0,
  ↪ 0,0
/* now, let us do the same for the shift algebra */
ring r2 = 0,(x,s),Dp;
def R2 = nc_algebra(1,s);  setring R2; // the 1st shift algebra
matrix m[2][2] = s,x,0,s; print(m); // matrix of the same for as above
  ↪ s,x,
  ↪ 0,s
list J = jacobson(m);
print(J[2]); // a Jacobson Form D, quite different from above
  ↪ xs2+s2,0,
  ↪ 0, x
print(J[1]*m*J[3] - J[2]); // check that U*M*V = D
  ↪ 0,0,
  ↪ 0,0
```

See also: [Section D.11.3.3 \[divideUnits\], page 1516](#); [Section D.11.3.1 \[smith\], page 1515](#).

D.11.3.3 divideUnits

Procedure from library `jacobson.lib` (see [Section D.11.3 \[jacobson.lib\], page 1514](#)).

Usage: `divideUnits(L)`; list L

Return: matrix or list of matrices

Assume: L is an output of `smith` or a `jacobson` procedures, that is either L contains one rectangular matrix with elements only on the main diagonal or L consists of three matrices, where $L[1]$ and $L[3]$ are square invertible matrices while $L[2]$ is a rectangular matrix with elements only on the main diagonal

Purpose: divide out units from the diagonal and reflect this in transformation matrices

Example:

```

LIB "jacobson.lib";
ring R=(0,m,M,L1,L2,m1,m2,g), D, lp; // two pendula example
matrix P[3][4]=m1*L1*D^2,m2*L2*D^2,(M+m1+m2)*D^2,-1,
m1*L1^2*D^2-m1*L1*g,0,m1*L1*D^2,0,0,
m2*L2^2*D^2-m2*L2*g,m2*L2*D^2,0;
list s=smith(P,1); // returns a list with 3 entries
print(s[2]); // a diagonal form, close to the Smith form
↳ (L1*L2*m2*g^2-L2^2*m2*g^2),0, 0, 0,
↳ 0, (L2),0, 0,
↳ 0, 0, (g^2),0
print(s[1]); // U, left transformation matrix
↳ 0, (-L2*m2)/(L1*m1), 1,
↳ (-L2),(M*L2+L2*m1)/(L1*m1),1,
↳ 0, 1/(L1*m1), 0
list t = divideUnits(s);
print(t[2]); // the Smith form of the matrix P
↳ 1,0,0,0,
↳ 0,1,0,0,
↳ 0,0,1,0
print(t[1]); // U', modified left transformation matrix
↳ 0, -1/(L1^2*m1*g^2-L1*L2*m1*g^2),1/(L1*L2*m2*g^2-L2^2*m2*g^2),
↳ -1,(M+m1)/(L1*m1), 1/(L2),
↳ 0, 1/(L1*m1*g^2), 0

```

D.11.4 findifs_lib**Library:** findifs.lib**Purpose:** Tools for the finite difference schemes**Authors:** Viktor Levandovskyy, levandov@math.rwth-aachen.de**Overview:** We provide the presentation of difference operators in a polynomial, semi-factorized and a nodal form. Running `findifs_example()`; will demonstrate, how we generate finite difference schemes of linear PDEs from given approximations.

Theory: The method we use have been developed by V. Levandovskyy and Bernd Martin. The computation of a finite difference scheme of a given single linear partial differential equation with constant coefficients with a given approximation rules boils down to the computation of a Groebner basis of a submodule of a free module with respect to the ordering, eliminating module components.

Support: SpezialForschungsbereich F1301 of the Austrian FWF

Procedures: See also: [Section D.15.13 \[finitediff_lib\]](#), page 1897; [Section D.9.2 \[latex_lib\]](#), page 1443.**D.11.4.1 findifs_example**Procedure from library `findifs.lib` (see [Section D.11.4 \[findifs_lib\]](#), page 1517).**Usage:** `findifs_example()`;**Return:** nothing (demo)**Purpose:** demonstration of our approach and this library**Example:**

```

LIB "findifs.lib";
findifs_example();
⇒ * Equation: u_tt - A^2 u_xx - B^2 u_yy = 0; A,B are constants
⇒ * we employ three central differences
⇒ * the vector we act on is (u_xx, u_yy, u_tt, u)^T
⇒ * Set up the ring:
⇒ ring r = (0,A,B,dt,dx,dy),(Tx,Ty,Tt),(c,dp);
⇒ * Set up the matrix with equation and approximations:
⇒ matrix M[4][4] =
⇒ // direct equation:
⇒ -A^2, -B^2, 1, 0,
⇒ // central difference u_tt
⇒ 0, 0, -dt^2*Tt, (Tt-1)^2,
⇒ // central difference u_xx
⇒ -dx^2*Tx, 0, 0, (Tx-1)^2,
⇒ // central difference u_yy
⇒ 0, -dy^2*Ty, 0, (Ty-1)^2;
⇒ * Print the differential form of equations:
⇒ (-A^2)*Uxx+(-B^2)*Uyy+Utt,
⇒ (-dt^2*Tt)*Utt+(Tt^2-2*Tt+1)*U,
⇒ (-dx^2*Tx)*Uxx+(Tx^2-2*Tx+1)*U,
⇒ (-dy^2*Ty)*Uyy+(Ty^2-2*Ty+1)*U
⇒ * Perform the elimination of module components:
⇒ module R = transpose(M);
⇒ module S = std(R);
⇒ * See the result of Groebner bases: generators are columns
⇒ print(S);
⇒ 0, 0, 0, 0, 0, (A^2),
⇒ 0, 0, 0, (dy^2)*Ty, S[2,5], (B^2),
⇒ 0, (dt^2)*Tt, S[3,3], 0, (-dx^2)*Tx, -1,
⇒ S[4,1], -Tt^2+2*Tt-1, S[4,3], -Ty^2+2*Ty-1, S[4,5], 0
⇒ * So, only the first column has its nonzero element in the last componen\
t
⇒ * Hence, this polynomial is the scheme
⇒ poly p = S[4,1];
⇒ print(p);
⇒ (A^2*dt^2*dy^2)*Tx^2*Ty*Tt+(B^2*dt^2*dx^2)*Tx*Ty^2*Tt+(-dx^2*dy^2)*Tx*Ty*\
Tt^2+(-2*A^2*dt^2*dy^2-2*B^2*dt^2*dx^2+2*dx^2*dy^2)*Tx*Ty*Tt+(-dx^2*dy^2)\
*Tx*Ty+(B^2*dt^2*dx^2)*Tx*Tt+(A^2*dt^2*dy^2)*Ty*Tt
⇒ * Create the nodal of the scheme in TeX format:
⇒ ideal I = decoef(p,dt);
⇒ difpoly2tex(I,L);
⇒ \frac{1}{\text{tri } t^2} \cdot (u^{n+2}_{j+1,k+1} + (-2) u^{n+1}_{j+1,k+1} + u^n_{\
}_{j+1,k+1}) + \frac{-\lambda^2}{\text{tri } x^2} \cdot (u^{n+1}_{j+2,k+1} + \frac{\
c\{B^2\}}{\text{tri } y^2} u^{n+1}_{j+1,k+2}) + \frac{-(2\lam\
bda^2)}{\text{tri } y^2} + 2B^2 \frac{\text{tri } x^2}{\lambda^2} \frac{\text{tri } y^2}{\
} u^{n+1}_{j+1,k\
+1} + \frac{B^2}{\text{tri } x^2} \frac{\lambda^2}{\text{tri } y^2} u^{n+1}_{j+1} + u^{n+1}_{\
j,k+1})
⇒ * Preparations for the semi-factorized form:
⇒ poly pi1 = subst(I[2],B,0);
⇒ poly pi2 = I[2] - pi1;
⇒ * Show the semi-factorized form of the scheme: 1st summand
⇒ factorize(I[1]);

```

```

⇒ [1]:
⇒   _[1]=(-dx^2*dy^2)
⇒   _[2]=Tx
⇒   _[3]=Ty
⇒   _[4]=Tt-1
⇒ [2]:
⇒   1,1,1,2
⇒ * Show the semi-factorized form of the scheme: 2nd summand
⇒ factorize(pi1);
⇒ [1]:
⇒   _[1]=(A^2*dt^2*dy^2)
⇒   _[2]=Tx-1
⇒   _[3]=Ty
⇒   _[4]=Tt
⇒ [2]:
⇒   1,2,1,1
⇒ * Show the semi-factorized form of the scheme: 3rd summand
⇒ factorize(pi1);
⇒ [1]:
⇒   _[1]=(B^2*dt^2*dx^2)
⇒   _[2]=Tx
⇒   _[3]=Ty-1
⇒   _[4]=Tt
⇒ [2]:
⇒   1,1,2,1

```

D.11.4.2 decoef

Procedure from library `findifs.lib` (see [Section D.11.4 \[findifs.lib\]](#), page 1517).

Usage: `decoef(P,n)`; P a poly, n a number

Return: ideal

Purpose: decompose polynomial P into summands with respect to the presence of the number n in the coefficients

Note: n is usually a parameter with no power

Example:

```

LIB "findifs.lib";
" EXAMPLE:";
⇒ EXAMPLE:
ring r = (0,dh,dt),(Tx,Tt),dp;
poly P = (4*dh^2-dt)*Tx^3*Tt + dt*dh*Tt^2 + dh*Tt;
decoef(P,dt);
⇒ _[1]=(4*dh^2)*Tx^3*Tt+(dh)*Tt
⇒ _[2]=(-dt)*Tx^3*Tt+(dh*dt)*Tt^2
decoef(P,dh);
⇒ _[1]=(-dt)*Tx^3*Tt
⇒ _[2]=(4*dh^2)*Tx^3*Tt+(dh*dt)*Tt^2+(dh)*Tt

```

D.11.4.3 difpoly2tex

Procedure from library `findifs.lib` (see [Section D.11.4 \[findifs.lib\]](#), page 1517).

- Usage:** `difpoly2tex(S,P[,Q]);` S an ideal, P and optional Q are lists
- Return:** string
- Purpose:** present the difference scheme in the nodal form
- Assume:** ideal S is the result of `decoef` procedure
- Note:** a list P may be empty or may contain parameters, which will not appear in denominators
an optional list Q represents the part of the scheme, depending on other function, than the major part

Example:

```
LIB "findifs.lib";
ring r = (0,dh,dt,V),(Tx,Tt),dp;
poly M = (4*dh*Tx+dt)^2*(Tt-1) + V*Tt*Tx;
ideal I = decoef(M,dt);
list L; L[1] = V;
difpoly2tex(I,L);
⇒ \frac{1}{8\text{tri } t}\cdot (u^{\{n+1\}_{j+2}}-u^{\{n\}_{j+2}}+\frac{\nu}{16\text{tri } h^{\{2\}}\}
u^{\{n+1\}_{j+1}})+ \frac{1}{16\text{tri } h}\cdot (u^{\{n+1\}_{j+1}}-u^{\{n\}_{j+1}}+\frac{\nu}{8\text{tri } t}\{8\text{tri } h\}
u^{\{n+1\}_{j}}+\frac{-\text{tri } t}{8\text{tri } h} u^{\{n\}_{j}})
poly G = V*dh^2*(Tt-Tx)^2;
difpoly2tex(I,L,G);
⇒ \frac{1}{8\text{tri } t}\cdot (u^{\{n+1\}_{j+2}}-u^{\{n\}_{j+2}}+\frac{\nu}{16\text{tri } h^{\{2\}}\}
u^{\{n+1\}_{j+1}})+ \frac{1}{16\text{tri } h}\cdot (u^{\{n+1\}_{j+1}}-u^{\{n\}_{j+1}}+\frac{\nu}{8\text{tri } t}\{8\text{tri } h\}
u^{\{n+1\}_{j}}+\frac{-\text{tri } t}{8\text{tri } h} u^{\{n\}_{j}})+ \frac{\nu}{128\text{tri } t}\cdot (p^{\{n\}_{j+2}}+(-2) p^{\{n+1\}_{j+1}}+p^{\{n+2\}_{j}})
```

D.11.4.4 exp2pt

Procedure from library `findifs.lib` (see [Section D.11.4 \[findifs.lib\]](#), page 1517).

- Usage:** `exp2pt(P[,L]);` P poly, L an optional list of strings
- Return:** string
- Purpose:** convert a polynomial M into the TeX format, in nodal form
- Assume:** coefficients must not be fractional
- Note:** an optional list L contains a string, which will replace the default value 'u' for the discretized function

Example:

```
LIB "findifs.lib";
" EXAMPLE:";
⇒ EXAMPLE:
ring r = (0,dh,dt),(Tx,Tt),dp;
poly M = (4*dh*Tx^2+1)*(Tt-1)^2;
print(exp2pt(M));
⇒ 4\text{tri } h u^{\{n+2\}_{j+2}}+(-8\text{tri } h) u^{\{n+1\}_{j+2}}+4\text{tri } h u^{\{n\}_{j+2}}+u^{\{n+2\}_{j}}+(-2) u^{\{n+1\}_{j}}+u^{\{n\}_{j}}
print(exp2pt(M,"F"));
⇒ 4\text{tri } h F^{\{n+2\}_{j+2}}+(-8\text{tri } h) F^{\{n+1\}_{j+2}}+4\text{tri } h F^{\{n\}_{j+2}}+F^{\{n+2\}_{j}}+(-2) F^{\{n+1\}_{j}}+F^{\{n\}_{j}}
```

D.11.4.5 texcoef

Procedure from library `findifs.lib` (see [Section D.11.4 \[findifs.lib\], page 1517](#)).

Usage: `texcoef(n)`; `n` a number

Return: string

Purpose: converts the number `n` into TeX format

Note: if `n` is a polynomial, `texcoef` adds extra brackets and performs some space substitutions

Example:

```
LIB "findifs.lib";
" EXAMPLE:";
⇒ EXAMPLE:
ring r = (0,dh,dt),(Tx,Tt),dp;
number n1,n2,n3 = dt/(4*dh^2-dt),(dt+dh)^2, 1/dh;
n1; texcoef(n1);
⇒ (dt)/(4*dh^2-dt)
⇒ \frac{\tri t}{4\tri h^2-\tri t}
n2; texcoef(n2);
⇒ (dh^2+2*dh*dt+dt^2)
⇒ (\tri h^2+2\tri h\tri t+\tri t^2)
n3; texcoef(n3);
⇒ 1/(dh)
⇒ \frac{1}{\tri h}
```

D.11.4.6 npar

Procedure from library `findifs.lib` (see [Section D.11.4 \[findifs.lib\], page 1517](#)).

Usage: `npar(n)`; `n` a number

Return: int

Purpose: searches for 'n' among the parameters and returns its number

Example:

```
LIB "findifs.lib";
ring r = (0,dh,dt,theta,A),t,dp;
npar(dh);
⇒ 1
number T = theta;
npar(T);
⇒ 3
npar(dh^2);
⇒ Incorrect parameter
⇒ 0
```

D.11.4.7 magnitude

Procedure from library `findifs.lib` (see [Section D.11.4 \[findifs.lib\], page 1517](#)).

Usage: `magnitude(P)`; `P` a poly

Return: poly

Purpose: compute the square of the magnitude of a complex expression

Assume: i is the variable of a basering

Example:

```
LIB "findifs.lib";
ring r = (0,d),(g,i,sin,cos),dp;
poly P = d*i*sin - g*cos +d^2*i;
NF( magnitude(P), std(i^2+1) );
 $\mapsto$   $g^2 \cos^2 + (d^2) \sin^2 + (2d^3) \sin + (d^4)$ 
```

D.11.4.8 replace

Procedure from library `findifs.lib` (see [Section D.11.4 \[findifs.lib\], page 1517](#)).

Usage: `replace(s,what,with)`; `s,what,with` strings

Return: string

Purpose: replaces in 's' all the substrings 'what' with substring 'with'

Note:

Example:

```
LIB "findifs.lib";
" EXAMPLE:";
 $\mapsto$  EXAMPLE:
ring r = (0,dt,theta),Tt,dp;
poly p = (Tt*dt+theta+1)^2+2;
string s = texfactorize("",p);
s;
 $\mapsto$   $(dt^2 \cdot Tt^2 + (2dt\theta + 2dt) \cdot Tt + (\theta^2 + 2\theta + 3))$ 
s = replace(s,"Tt","T_t"); s;
 $\mapsto$   $(dt^2 \cdot T\_t^2 + (2dt\theta + 2dt) \cdot T\_t + (\theta^2 + 2\theta + 3))$ 
s = replace(s,"dt","\\tri t"); s;
 $\mapsto$   $(\tri t^2 \cdot T\_t^2 + (2\tri t\theta + 2\tri t) \cdot T\_t + (\theta^2 + 2\theta + 3))$ 
s = replace(s,"theta","\\theta"); s;
 $\mapsto$   $(\tri t^2 \cdot T\_t^2 + (2\tri t\theta + 2\tri t) \cdot T\_t + (\theta^2 + 2\theta + 3))$ 
```

D.11.4.9 xchange

Procedure from library `findifs.lib` (see [Section D.11.4 \[findifs.lib\], page 1517](#)).

Usage: `xchange(w,a,b)`; `w,a,b` strings

Return: string

Purpose: exchanges substring 'a' with a substring 'b' in the string w

Note:

Example:

```
LIB "findifs.lib";
" EXAMPLE:";
 $\mapsto$  EXAMPLE:
ring r = (0,dt,dh,A),Tt,dp;
poly p = (Tt*dt+dh+1)^2+2*A;
string s = texpoly("",p);
```

```

s;
↪ $dt^{2}\cdot Tt^{2}+(2dtdh+2dt)\cdot Tt+(dh^{2}+2dh+2A+1)$
string t = xchange(s,"dh","dt");
t;
↪ $dh^{2}\cdot Tt^{2}+(2dhdt+2dh)\cdot Tt+(dt^{2}+2dt+2A+1)$

```

D.12 Teaching

The libraries in this section are intended to be used for teaching purposes but not for serious computations.

D.12.1 aksaka_lib

Library: aksaka.lib

Purpose: Procedures for primality testing after Agrawal, Saxena, Kayal

Authors: Christoph Mang

Overview: Algorithms for primality testing in polynomial time based on the ideas of Agrawal, Saxena and Kayal.

Procedures:

D.12.1.1 fastExpt

Procedure from library `aksaka.lib` (see [Section D.12.1 \[aksaka.lib\], page 1523](#)).

Usage: `fastExpt(a,m,n)`; $a, m, n = \text{number}$;

Return: the m -th power of a ; if $a^m > n$ the procedure returns $n+1$

Note: uses fast exponentiation

Example:

```

LIB "aksaka.lib";
fastExpt(2,10,1022);
↪ 1023

```

D.12.1.2 log2

Procedure from library `aksaka.lib` (see [Section D.12.1 \[aksaka.lib\], page 1523](#)).

Usage: `log2(x)`;

Return: logarithm to basis 2 of x

Note: calculates the natural logarithm of x with a power-series of the \ln , then the basis is changed to 2

Example:

```

LIB "aksaka.lib";
log2(1024);
↪ 10

```

D.12.1.3 PerfectPowerTest

Procedure from library `aksaka.lib` (see [Section D.12.1 \[aksaka.lib\], page 1523](#)).

Usage: `PerfectPowerTest(n);`

Return: 0 if there are numbers $a, b > 1$ with $a^b = n$;
 1 if there are no numbers $a, b > 1$ with $a^b = n$;
 if `printlevel` ≥ 1 and there are $a, b > 1$ with $a^b = n$,
 then a, b are printed

Example:

```
LIB "aksaka.lib";
PerfectPowerTest(887503681);
↪ 0
```

D.12.1.4 wurzel

Procedure from library `aksaka.lib` (see [Section D.12.1 \[aksaka.lib\], page 1523](#)).

Usage: `wurzel(r);`

Assume: characteristic of basering is 0, $r \geq 0$

Return: number, square root of r

Example:

```
LIB "aksaka.lib";
ring R = 0,x,dp;
wurzel(7629412809180100);
↪ 3441627728253432342460392959727860033763217944264409977345966987271065114\

5116713597626097705736
```

D.12.1.5 euler

Procedure from library `aksaka.lib` (see [Section D.12.1 \[aksaka.lib\], page 1523](#)).

Usage: `euler(r);`

Return: bigint $\phi(r)$, where ϕ is Eulers phi-function

Note: first r is factorized with `proc PollardRho`, then $\phi(r)$ is calculated with the help of $\phi(p)$ of every factor p ;

Example:

```
LIB "aksaka.lib";
euler(99991);
↪ 99990
```

D.12.1.6 coeffmod

Procedure from library `aksaka.lib` (see [Section D.12.1 \[aksaka.lib\], page 1523](#)).

Usage: `coeffmod(f,n);`

Assume: poly f depends on at most `var(1)` of the basering

Return: poly f modulo number n

Note: at first the coefficients of the monomials of the polynomial f are determined, then their remainder modulo n is calculated, after that the polynomial 'is put together' again

Example:

```
LIB "aksaka.lib";
ring R = 0,x,dp;
poly f=2457*x4+52345*x3-98*x2+5;
bigint n=3;
coeffmod(f,n);
↪ x3+x2+2
```

D.12.1.7 powerpolyX

Procedure from library `aksaka.lib` (see [Section D.12.1 \[aksaka.lib\], page 1523](#)).

Usage: `powerpolyX(q,n,a,r);`

Return: the q-th power of poly a modulo poly r and number n

Example:

```
LIB "aksaka.lib";
ring R=0,x,dp;
poly a=3*x3-x2+5;
poly r=x7-1;
bigint q=123;
bigint n=5;
powerpolyX(q,n,a,r);
↪ 3x5+2x4+x3+x2+1
```

D.12.1.8 ask

Procedure from library `aksaka.lib` (see [Section D.12.1 \[aksaka.lib\], page 1523](#)).

Usage: `ask(n);`

Assume: `n>1`

Return: 0 if n is composite;
1 if n is prime;
if `printlevel>=1`, you are informed what the procedure will do or has calculated

Note: ASK-algorithm; uses proc `powerpolyX` for step 5

Example:

```
LIB "aksaka.lib";
//ask(100003);
ask(32003);
↪ 1
```

D.12.2 atkins.lib

Library: `atkins.lib`

Purpose: Procedures for teaching cryptography

Author: Stefan Steidel, steidel@mathematik.uni-kl.de

Note: The library contains auxiliary procedures to compute the elliptic curve primality test of Atkin and the Atkin's Test itself. The library is intended to be used for teaching purposes but not for serious computations. Sufficiently high printlevel allows to control each step, thus illustrating the algorithms at work.

Procedures:

D.12.2.1 newTest

Procedure from library `atkins.lib` (see [Section D.12.2 \[atkins.lib\], page 1525](#)).

Usage: `newTest(L,D);`

Return: 1, if D does not already exist in L,
-1, if D does already exist in L

Example:

```
LIB "atkins.lib";
ring r = 0,x,dp;
list L=8976,-223456,556,-778,3,-55603,45,766677;
number D=-55603;
newTest(L,D);
↪ -1
```

D.12.2.2 bubblesort

Procedure from library `atkins.lib` (see [Section D.12.2 \[atkins.lib\], page 1525](#)).

Usage: `bubblesort(L);`

Return: list L, sort in decreasing order

Example:

```
LIB "atkins.lib";
ring r = 0,x,dp;
list L=-567,-233,446,12,-34,8907;
bubblesort(L);
↪ [1]:

↪ [3]:
↪ 12
↪ [4]:
↪ -34
↪ [5]:
↪ -233
↪ [6]:
↪ -567
```

D.12.2.3 disc

Procedure from library `atkins.lib` (see [Section D.12.2 \[atkins.lib\], page 1525](#)).

Usage: `disc(N,k);`

Return: list L of negative discriminants D, sorted in decreasing order

Assume: $D < 0$, D kongruent 0 or 1 modulo 4 and $|D| < 4N$

Note: $D = b^2 - 4a$, where $0 \leq b \leq k$ and $\text{intPart}((b^2)/4) + 1 \leq a \leq k$ for each b

Example:

```
LIB "atkins.lib";
disc(2003,50);

D.12.2.4 Cornacchia

Procedure from library `atkins.lib` (see [Section D.12.2 \[atkins.lib\]](#), page 1525).

Usage: `Cornacchia(d,p);`

Return: x, y such that $x^2 + d \cdot y^2 = p$ with p prime,
 -1, if the Diophantine equation has no solution,
 0, if the parameters are wrong selected

Assume: $0 < d < p$

Example:

```
LIB "atkins.lib";
Cornacchia(55,9551);
↪ [1]:
↪ 16
↪ [2]:
↪ 13
```

D.12.2.5 CornacchiaModified

Procedure from library `atkins.lib` (see [Section D.12.2 \[atkins.lib\], page 1525](#)).

Usage: `CornacchiaModified(D,p);`

Return: x, y such that $x^2 + |D| \cdot y^2 = p$ with p prime,
 -1, if the Diophantine equation has no solution,
 0, if the parameters are wrong selected

Assume: $D < 0$, D kongruent 0 or 1 modulo 4 and $|D| < 4p$

Example:

```
LIB "atkins.lib";
CornacchiaModified(-107,1319);
↪ [1]:
↪ 51
↪ [2]:
↪ 5
```

D.12.2.6 maximum

Procedure from library `atkins.lib` (see [Section D.12.2 \[atkins.lib\], page 1525](#)).

Usage: `maximum(list L);`

Return: the maximal number contained in list L

Example:

```
LIB "atkins.lib";
ring r = 0,x,dp;
list L=465,867,1233,4567,776544,233445,2334,556;
maximum(L);
↪ 776544
```

D.12.2.7 sqr

Procedure from library `atkins.lib` (see [Section D.12.2 \[atkins.lib\], page 1525](#)).

Return: the square root of w

Assume: $w \geq 0$

Note: k describes the number of decimals being calculated in the real numbers, k , $\text{intPart}(k/5)$ are inputs for the procedure "nt_solve"

Example:

```
LIB "atkins.lib";
ring R = (real,60),x,dp;
number ww=288469650108669535726081;
sqr(ww,60);
↪ 537093744140.289670042554456783715698474723764341699853789621
```

D.12.2.8 expo

Procedure from library `atkins.lib` (see [Section D.12.2 \[atkins.lib\], page 1525](#)).

Usage: `expo(z,k);`

Return: e^z to the order k

Note: k describes the number of summands being calculated in the exponential power series

Example:

```
LIB "atkins.lib";
ring r = (real,30),x,dp;
number z=40.35;
expo(z,1000);
↪ 334027593585379682.006907602277
```

D.12.2.9 jOft

Procedure from library `atkins.lib` (see [Section D.12.2 \[atkins.lib\], page 1525](#)).

Usage: `jOft(t,k);`

Return: the j -invariant of t

Assume: t is a complex number with positive imaginary part

Note: k describes the number of summands being calculated in the power series, $10*k$ is input for the procedure `expo`

Example:

```
LIB "atkins.lib";
ring r = (complex,30,i),x,dp;
number t=(-7+i*sqr(7,250))/2;
jOft(t,50);
↪ -3375
```

D.12.2.10 round

Procedure from library `atkins.lib` (see [Section D.12.2 \[atkins.lib\], page 1525](#)).

Usage: `round(r);`

Return: the nearest number to r out of Z

Assume: r should be a rational or a real number

Example:

```
LIB "atkins.lib";
ring R = (real,50),x,dp;
number r=7357683445788723456321.6788643224;
round(r);
↳ 7357683445788723456322
```

D.12.2.11 HilbertClassPoly

Procedure from library `atkins.lib` (see [Section D.12.2 \[atkins.lib\], page 1525](#)).

Return: the monic polynomial of degree $h(D)$ in $\mathbb{Z}[X]$ of which $j\text{Of}((D+\text{sqr}(D))/2)$ is a root

Assume: D is a negative discriminant

Note: k is input for the procedure "jOf",
 $5*k$ is input for the procedure "sqr",
 $10*k$ describes the number of decimals being calculated in the complex numbers

Example:

```
LIB "atkins.lib";
ring r = 0,x,dp;
bigint D=-23;
HilbertClassPoly(D,50);
↳ x3+3491750x2-5151296875x+12771880859375
```

D.12.2.12 rootsModp

Procedure from library `atkins.lib` (see [Section D.12.2 \[atkins.lib\], page 1525](#)).

Usage: `rootsModp(p,P);`

Return: list of roots of the polynomial P modulo p with p prime

Assume: $p \geq 3$

Note: this algorithm will be called recursively, and it is understood that all the operations are done in $\mathbb{Z}/p\mathbb{Z}$ (excepting `squareRoot(d,p)`)

Example:

```
LIB "atkins.lib";
ring r = 0,x,dp;
poly f=x4+2x3-5x2+x;
rootsModp(7,f);
↳ [1]:
↳ 0
↳ [2]:
↳ -1
↳ [3]:
↳ 2
↳ [4]:
↳ -3
poly g=x5+112x4+655x3+551x2+1129x+831;
rootsModp(1223,g);
↳ [1]:
↳ -33
↳ [2]:
↳ -225
```

```

↳ [3] :
↳ 206
↳ [4] :
↳ 295
↳ [5] :
↳ -355

```

D.12.2.13 wUnit

Procedure from library `atkins.lib` (see [Section D.12.2 \[atkins.lib\]](#), page 1525).

Usage: `wUnit(D);`

Return: the number of roots of unity in the quadratic order of discriminant D

Assume: $D < 0$ a discriminant kongruent to 0 or 1 modulo 4

Example:

```

LIB "atkins.lib";
bigint D=-3;
wUnit(D);
↳ 6

```

D.12.2.14 Atkin

Procedure from library `atkins.lib` (see [Section D.12.2 \[atkins.lib\]](#), page 1525).

Return: 1, if N is prime,
-1, if N is not prime,
0, if the algorithm is not applicable, since there are too few discriminants

Assume: N is coprime to 6 and different from 1

Note: $K/2$ is input for the procedure "disc",
 K is input for the procedure "HilbertClassPoly",
 B describes the number of recursions being calculated.
The basis of the algorithm is the following theorem:
Let N be an integer coprime to 6 and different from 1 and E be an elliptic curve modulo N .

Assume that we know an integer m and a point P of $E(\mathbb{Z}/N\mathbb{Z})$ satisfying the following conditions.

- (1) There exists a prime divisor q of m such that $q > (4\text{-th root}(N)+1)^2$.
- (2) $m \cdot P = O(E) = (0:1:0)$.
- (3) $(m/q) \cdot P = (x:y:t)$ with t element of $(\mathbb{Z}/N\mathbb{Z})^*$.

Then N is prime.

Example:

```

LIB "atkins.lib";
ring R = 0,x,dp;
Atkin(7691,100,5);
↳ -1
Atkin(3473,10,2);
↳ -1
printlevel=1;
Atkin(10000079,100,2);
↳ Set i = 0, n = 0 and N(i) = N(0)= 10000079.

```

```

↳ pause>
↳ List H of possibly suitable discriminants will be calculated.
↳ H = -3,-4,-7,-8,-11,-12,-15,-16,-19,-20,-23,-24,-27,-28,-31,-32,-35,-36,-\
39,-40,-43,-44,-47,-48,-51,-52,-55,-56,-59,-60,-63,-64,-67,-68,-71,-72,-7\

↳ pause>
↳ N(0) = 10000079 is divisible by 5.
↳ pause>
↳ N(0) = N = 10000079 and therefore N is not prime.
↳ pause>
↳ -1

```

D.12.3 crypto_lib

Library: crypto.lib

Purpose: Procedures for teaching cryptography

Authors: Gerhard Pfister, pfister@mathematik.uni-kl.de
David Brittinger, dativ@gmx.net

Overview: The library contains procedures to compute the discrete logarithm, primality-tests, factorization included elliptic curves. The library is intended to be used for teaching purposes but not for serious computations. Sufficiently high printlevel allows to control each step, thus illustrating the algorithms at work.

Procedures:

D.12.3.1 decimal

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: decimal(s); s = string

Return: the (decimal) number corresponding to the hexadecimal number s

Example:

```

LIB "crypto.lib";
string s ="8edfe37dae96cfd2466d77d3884d4196";
decimal(s);
↳ 189912871665444375716340628395668619670

```

D.12.3.2 eexgcdN

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: eexgcdN(L);

Return: list T such that $\sum_i L[i]*T[i]=T[n+1]=\gcd(L[1],\dots,L[n])$

Example:

```

LIB "crypto.lib";
eexgcdN(list(24,15,21));
↪ [1] :
↪    2
↪ [2] :
↪   -3
↪ [3] :
↪    0
↪ [4] :
↪    3

```

D.12.3.3 lcmN

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `lcmN(a,b);`

Return: `lcm(a,b);`

Example:

```

LIB "crypto.lib";
lcmN(24,15);
↪ 120

```

D.12.3.4 powerN

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `powerN(m,d,n);`

Return: `m^d mod n`

Example:

```

LIB "crypto.lib";
powerN(24,15,7);
↪ 6

```

D.12.3.5 chineseRem

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `chineseRem(T,L);`

Return: `x` such that `x = T[i] mod L[i]`

Note: chinese remainder theorem

Example:

```

LIB "crypto.lib";
chineseRem(list(24,15,7),list(2,3,5));
↪ 12

```

D.12.3.6 Jacobi

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `Jacobi(a,n);`

Return: the generalized Legendre symbol

Note: if n is an odd prime then $\text{Jacobi}(a,n)=0,1,-1$ if $n \mid a$, $a=x^2 \pmod n$, else

Example:

```
LIB "crypto.lib";
Jacobi(13580555397810650806,5792543);
↪ 1
```

D.12.3.7 primList

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `primList(n);`

Return: the list of all primes $\leq n$

Example:

```
LIB "crypto.lib";
list L=primList(100);
size(L);
↪ 25
L[size(L)];
↪ 97
```

D.12.3.8 primL

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `primL(q);`

Return: list of the first primes p_1, \dots, p_r such that $q > p_1 \dots p_{r-1}$ and $q < p_1 \dots p_r$

Example:

```
LIB "crypto.lib";
primL(20);
↪ [1]:
↪ 2
↪ [2]:
↪ 3
↪ [3]:
↪ 5
```

D.12.3.9 intPart

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `intPart(x);`

Return: the integral part of a rational number

Example:

```
LIB "crypto.lib";
ring r=0,x,dp;
intPart(7/3);
↪ 2
```

D.12.3.10 intRoot

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `intRoot(m);`

Return: the integral part of the square root of m

Example:

```
LIB "crypto.lib";
intRoot(20);
↪ 4
```

D.12.3.11 squareRoot

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `squareRoot(a,p);`

Return: the square root of a in \mathbb{Z}/p , p prime

Note: assumes the Jacobi symbol is 1 or $p=2$.

Example:

```
LIB "crypto.lib";
squareRoot(8315890421938608,32003);
↪ 18784
```

D.12.3.12 solutionsMod2

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `solutionsMod2(M);`

Return: an `intmat` containing a basis of the vector space of solutions of the linear system of equations defined by M over the prime field of characteristic 2

Example:

```
LIB "crypto.lib";
bigintmat M[3][3]=1,2,3,4,5,6,7,6,5;
solutionsMod2(M);
↪ 1,0,1
```

D.12.3.13 powerX

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `powerX(q,i,I);`

Return: the q -th power of the i -th variable modulo I

Assume: I is a standard basis

Example:

```
LIB "crypto.lib";
ring R = 0, (x,y), dp;
powerX(100,2,std(ideal(x3-1,y2-x)));
↳ x2
```

D.12.3.14 babyGiant

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `babyGiant(b,y,p);`

Return: the discrete logarithm x : $b^x = y \pmod p$

Note: This procedure works based on Shank's baby step - giant step method.

Example:

```
LIB "crypto.lib";
bigint b=2;
bigint y=10;
bigint p=101;
babyGiant(b,y,p);
↳ 25
```

D.12.3.15 rho

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `rho(b,y,p);`

Return: the discrete logarithm $x = \log_b(y)$: $b^x = y \pmod p$

Note: Pollard's rho:
choose random f_0 in $0, \dots, p-2$, $e_0 = 0$, define $x_0 = b^{f_0}$, define $x_i = y^{e_i} b^{f_i}$ as below.
For i large enough there is i with $x_{(i/2)} = x_i$. Let $s := e_{(i/2)} - e_i \pmod{p-1}$ and $t := f_{(i/2)} - f_i \pmod{p-1}$, $d = \gcd(s, p-1) = u*s + v*(p-1)$ then $x = tu/d + j*(p-1)/d$ for some j (to be found by trying)

Example:

```
LIB "crypto.lib";
bigint b=2;
bigint y=10;
bigint p=101;
rho(b,y,p);
↳ 25
```

D.12.3.16 MillerRabin

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `MillerRabin(n,k);`

Return: 1 if n is prime, 0 else

Note: probabilistic test of Miller-Rabin with k loops to test if n is prime. Using the theorem:
If n is prime, $n-1 = 2^s * r$, r odd, then $\text{powerN}(a,r,n) = 1$ or $\text{powerN}(a,r*2^i,n) = -1$ for some i

Example:

```
LIB "crypto.lib";
bigint x=2;
x=x^787-1;
MillerRabin(x,3);
↪ 0
```

D.12.3.17 SolowayStrassen

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: SolowayStrassen(n,k);

Return: 1 if n is prime, 0 else

Note: probabilistic test of Soloway-Strassen with k loops to test if n is prime using the theorem: If n is prime then $\text{powerN}(a, (n-1)/2, n) = \text{Jacobi}(a, n) \pmod n$

Example:

```
LIB "crypto.lib";
bigint h=10;
bigint p=h^100+267;
//p=h^100+43723;
//p=h^200+632347;
SolowayStrassen(h,3);
↪ 0
```

D.12.3.18 PocklingtonLehmer

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: PocklingtonLehmer(N); optional: PocklingtonLehmer(N,L); L a list of the first k primes

Return: message N is not prime or $\{A, \{p\}, \{a_p\}\}$ as certificate for N being prime

Note: assumes that it is possible to factorize $N-1=A*B$ such that $\text{gcd}(A,B)=1$, the factorization of A is completely known and $A^2 > N$.
N is prime if and only if for each prime factor p of A we can find a_p such that $a_p^{(N-1)/p} \equiv 1 \pmod N$ and $\text{gcd}(a_p^{(N-1)/p} - 1, N) = 1$

Example:

```
LIB "crypto.lib";
bigint N=105554676553297;
PocklingtonLehmer(N);
↪ [1]:

↳ [2]:
↳ 2

```

D.12.3.19 PollardRho

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: PollardRho(n,k,allFactors); optional: PollardRho(n,k,allFactors,L); L a list of the first k primes

Return: a list of factors of n (which could be just n),if allFactors=0
a list of all factors of n ,if allFactors=1

Note: probabilistic rho-algorithm of Pollard to find a factor of n in k loops. Creates a sequence x_i such that $(x_i)^2 = (x_{2i})^2 \pmod n$ for some i, computes $\gcd(x_i - x_{2i}, n)$ to find a divisor. To define the sequence choose x,a and define $x_{n+1} = x_n^2 + a \pmod n$, $x_1 = x$. If allFactors is 1, it tries to find recursively all prime factors using the Soloway-Strassen test.

Example:

```

LIB "crypto.lib";
bigint h=10;
bigint p=h^30+4;
PollardRho(p,5000,0);
↳ [1]:
↳ 2

↪ 84982068258408294013

See also: [Section 5.1.116 \[primefactors\]](#), page 238.

D.12.3.20 pFactor

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\]](#), page 1535).

Usage: `pFactor(n,B,P)`; n to be factorized, B a bound, P a list of primes

Return: a list of factors of n or n if no factor found

Note: Pollard's p -factorization creates the product k of powers of primes (bounded by B) from the list P with the idea that for a prime divisor p of n we have $p-1 \mid k$, and then p divides $\gcd(a^k-1, n)$ for some random a

Example:

```
LIB "crypto.lib";
list L=primList(1000);
pFactor(1241143,13,L);
↪ 547
bigint h=10;
h=h^30+25;
pFactor(h,20,L);
↪ 325
```

D.12.3.21 quadraticSieve

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\]](#), page 1535).

Usage: `quadraticSieve(n,c,B,k)`; n to be factorized, $[-c,c]$ the sieve-intervall, B a list of primes, k for using the first k elements in B

Return: a list of factors of n or the message: no divisor found

Note: The idea being used is to find x,y such that $x^2=y^2 \pmod n$ then $\gcd(x-y, n)$ can be a proper divisor of n

Example:

```
LIB "crypto.lib";
list L=primList(5000);
quadraticSieve(7429,3,L,4);
↪ 17
quadraticSieve(1241143,100,L,50);
↪ 547
```

D.12.3.22 isOnCurve

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\]](#), page 1535).

Usage: `isOnCurve(N,a,b,P)`;

Return: 1 or 0 (depending on whether P is on the curve or not)

Note: checks whether $P=(P[1]:P[2]:P[3])$ is a point on the elliptic curve defined by $y^2z=x^3+a*xz^2+b*z^3$ over \mathbb{Z}/N

Example:

```
LIB "crypto.lib";
isOnCurve(32003,5,7,list(10,16,1));
↳ 0
```

D.12.3.23 ellipticAdd

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\]](#), page 1535).

Usage: `ellipticAdd(N,a,b,P,Q);`

Return: list L, representing the point P+Q

Note: $P=(P[1]:P[2]:P[3])$, $Q=(Q[1]:Q[2]:Q[3])$ points on the elliptic curve defined by $y^2z=x^3+a*xz^2+b*z^3$ over Z/N

Example:

```
LIB "crypto.lib";
bigint N=11;
bigint a=1;
bigint b=6;
list P,Q;
P[1]=2;
P[2]=4;
P[3]=1;
Q[1]=3;
Q[2]=5;
Q[3]=1;
ellipticAdd(N,a,b,P,Q);
↳ [1]:
↳ 7
↳ [2]:
↳ 2
↳ [3]:
↳ 1
```

D.12.3.24 ellipticMult

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\]](#), page 1535).

Usage: `ellipticMult(N,a,b,P,k);`

Return: a list L representing the point $k*P$

Note: $P=(P[1]:P[2]:P[3])$ a point on the elliptic curve defined by $y^2z=x^3+a*xz^2+b*z^3$ over Z/N

Example:

```
LIB "crypto.lib";
bigint N=11;
bigint a=1;
bigint b=6;
list P;
P[1]=2;
P[2]=4;
P[3]=1;
ellipticMult(N,a,b,P,3);
```

```

↳ [1]:
↳ 8
↳ [2]:
↳ 8
↳ [3]:
↳ 1

```

D.12.3.25 ellipticRandomCurve

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `ellipticRandomCurve(N);`

Return: a list of two random numbers a, b and $4a^3+27b^2 \bmod N$

Note: $y^2z=x^3+a*xz^2+b*z^3$ defines an elliptic curve over Z/N

Example:

```

LIB "crypto.lib";
ellipticRandomCurve(32003);
↳ [1]:
↳ 22857
↳ [2]:
↳ 24963
↳ [3]:
↳ 1

```

D.12.3.26 ellipticRandomPoint

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `ellipticRandomPoint(N,a,b);`

Return: a list representing a random point $(x:y:z)$ of the elliptic curve defined by $y^2z=x^3+a*xz^2+b*z^3$ over Z/N

Example:

```

LIB "crypto.lib";
ellipticRandomPoint(32003,3,181);
↳ [1]:
↳ 22857
↳ [2]:
↳ 17476
↳ [3]:
↳ 1

```

D.12.3.27 countPoints

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `countPoints(N,a,b);`

Return: the number of points of the elliptic curve defined by $y^2=x^3+a*x+b$ over Z/N

Note: trivial approach

Example:

```

LIB "crypto.lib";
countPoints(181,71,150);
↳ 198

```

D.12.3.28 ellipticAllPoints

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `ellipticAllPoints(N,a,b);`

Return: list of points $(x:y:z)$ of the elliptic curve defined by $y^2z = x^3 + a*xz^2 + b*z^3$ over Z/N

Example:

```
LIB "crypto.lib";
list L=ellipticAllPoints(181,71,150);
size(L);
↳ 198
L[size(L)];
↳ [1]:
↳ 179
↳ [2]:
↳ 0
↳ [3]:
↳ 1
```

D.12.3.29 ShanksMestre

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `ShanksMestre(q,a,b);` optional: `ShanksMestre(q,a,b,s);` s the number of loops in the algorithm (default $s=1$)

Return: the number of points of the elliptic curve defined by $y^2 = x^3 + a*x + b$ over Z/N

Note: algorithm of Shanks and Mestre (baby-step-giant-step)

Example:

```
LIB "crypto.lib";
ShanksMestre(32003,71,602);
↳ 32021
```

D.12.3.30 Schoof

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `Schoof(N,a,b);`

Return: the number of points of the elliptic curve defined by $y^2 = x^3 + a*x + b$ over Z/N

Note: algorithm of Schoof

Example:

```
LIB "crypto.lib";
Schoof(32003,71,602);
↳ 32021
```

D.12.3.31 generateG

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `generateG(a,b,m);`

Return: m -th division polynomial

Note: generate the so-called division polynomials, i.e., the recursively defined polynomials $p_m = \text{generateG}(a,b,m)$ in $Z[x, y]$ such that, for a point $(x:y:1)$ on the elliptic curve defined by $y^2 = x^3 + a*x + b$ over Z/N the point $m*P = (x - (p_{-(m-1)}*p_{-(m+1)})/p_m^2, (p_{-(m+2)}*p_{-(m-1)}^2 - p_{-(m-2)}*p_{-(m+1)}^2)/4y*p_m^3 : 1)$ and $m*P = 0$ if and only if $p_m(P) = 0$

Example:

```
LIB "crypto.lib";
ring R = 0, (x,y), dp;
generateG(7,15,4);
↪ 4xy6+140xy4+1200xy3-980xy2-1680xy-8572x
```

D.12.3.32 factorLenstraECM

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `factorLenstraECM(N,S,B)`; optional: `factorLenstraECM(N,S,B,d)`; $d+1$ the number of loops in the algorithm (default $d=0$)

Return: a factor of N or the message no factor found

Note:

- computes a factor of N using Lenstra's ECM factorization
- the idea is that the fact that N is not prime is deduced using the operations on the elliptic curve
- is similarly to Pollard's $p-1$ -factorization

Example:

```
LIB "crypto.lib";
list L=primList(1000);
factorLenstraECM(181*32003,L,10,5);
↪ 181
bigint h=10;
h=h^30+25;
factorLenstraECM(h,L,4,3);
↪ 13
```

D.12.3.33 ECPP

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `ECPP(N)`;

Return: message: N is not prime or $\{L,P,m,q\}$ as certificate for N being prime
 L a list ($y^2 = x^3 + L[1]*x + L[2]$ defines an elliptic curve C)
 P a list ($(P[1]:P[2]:P[3])$ is a point of C)
 m, q integers

Assume: $\gcd(N,6)=1$

Note: The basis of the algorithm is the following theorem:
 Given C , an elliptic curve over Z/N , P a point of $C(Z/N)$, m an integer, q a prime with the following properties:

- $q|m$
- $q > (4\text{-th root}(N) + 1)^2$
- $m*P = 0 = (0:1:0)$
- $(m/q)*P = (x:y:z)$ and z a unit in Z/N

Then N is prime.

Example:

```

LIB "crypto.lib";
bigint N=1267985441;
ECP(N);
↳ P= [1]:
↳ 780306204
↳ [2]:
↳ 1106324420

↳ [4]:
↳ 105666103

```

D.12.3.34 calculate_ordering

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `calculate_ordering(num1, primitive, mod1)`

Return: x so that $\text{primitive}^x \equiv \text{num1} \pmod{\text{mod1}}$

Example:

```

LIB "crypto.lib";
bigint mod1 = 33;
bigint primitive = 14;
bigint num1 = 5;
calculate_ordering(num1,primitive,mod1);
↳ 3

```

D.12.3.35 is_primitive_root

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `is_primitive_root(primitive, mod1)`

Return: 1 if primitive is a primitive root modulo mod1, 0 otherwise

Example:

```

LIB "crypto.lib";
is_primitive_root(3,7);
↳ 1
is_primitive_root(2,7);
↳ 0

```

D.12.3.36 find_first_primitive_root

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `find_first_primitive_root(mod1)`

Return: First primitive root modulo `mod1`, 0 if no root can be found.

Example:

```
LIB "crypto.lib";
ring r = 0,x,lp;
find_first_primitive_root(7);
↪ 3
find_first_primitive_root(557);
↪ 2
```

D.12.3.37 binary_add

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `binary_add(binary_list)`

Return: binary encoded list, increased by 1

Example:

```
LIB "crypto.lib";
ring r = 0,x,lp;
list binary_list = 1,0,1,1,1;
binary_add(binary_list);
↪ [1]:
↪ 1
↪ [2]:
↪ 1
↪ [3]:
↪ 0
↪ [4]:
↪ 0
↪ [5]:
↪ 0
```

D.12.3.38 inverse_modulus

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `inverse_modulus(num, mod1)`

Return: inverse element of `num` modulo `mod1`

Example:

```
LIB "crypto.lib";
ring r = 0,x,lp;
int mod1 = 13;
int num = 5;
inverse_modulus(num,mod1);
↪ 8
```

D.12.3.39 is_prime

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `is_prime(n)`

Return: 1 if `n` is prime, 0 otherwise

Example:

```
LIB "crypto.lib";
ring r = 0,x,lp;
is_prime(10);
↪ 0
is_prime(7);
↪ 1
```

D.12.3.40 find_index

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `find_index(a, e)`

Return: Returns the list index of element `e` in list `a`. Returns 0 if `e` is not in `a`

Example:

```
LIB "crypto.lib";
list a = 1,5,20,6,37;
find_index(a,20);
↪ 3
find_index(a,6);
↪ 4
find_index(a,100);
↪ 0
```

D.12.3.41 subset_sum01

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `subset_sum01(knapsack,solution)`

Return: binary list of the positions of the elements included in the subset sum or 0 if no solution exists

Note: This will return the first solution of the ssk-problem, given be the smallest binary encoding. It wont return several solutions if they exist

Example:

```
LIB "crypto.lib";
list h=1,4,7,32;
subset_sum01(h,20);
↪ 0
subset_sum01(h,11);
↪ [1]:
↪ 0
↪ [2]:
↪ 1
↪ [3]:
```

```

↳ 1
↳ [4]:
↳ 0
subset_sum01(h,33);
↳ [1]:
↳ 1
↳ [2]:
↳ 0
↳ [3]:
↳ 0
↳ [4]:
↳ 1

```

D.12.3.42 subset_sum02

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `subset_sum02(knapsack,sol)`

Return: binary list of the positions of the elements included in the subset sum or 0 if no solution exists

Example:

```

LIB "crypto.lib";
list h=1,4,7,32;
subset_sum02(h,20);
↳ 0
subset_sum02(h,11);
↳ [1]:
↳ 0
↳ [2]:
↳ 1
↳ [3]:
↳ 1
↳ [4]:
↳ 0
subset_sum02(h,33);
↳ [1]:

↳ [2]:
↳ 0
↳ [3]:
↳ 0
↳ [4]:
↳ 1

```

D.12.3.43 unbounded_knapsack

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `unbounded_knapsack(knapsack,profit,capacity)`

Return: list of maximum profit of each iteration. For example, `output_list[2]` contains the maximum profit that can be achieved if the knapsack has capacity 2.

Example:

```

LIB "crypto.lib";
list h=1,4,7,32;
list knapsack = 5,2;
list profit = 10,3;
int capacity = 5;
unbounded_knapsack(knapsack,profit,capacity);
↪ [1]:
↪ 0
↪ [2]:
↪ 0
↪ [3]:
↪ 3
↪ [4]:
↪ 3
↪ [5]:
↪ 6
↪ [6]:
↪ 10

```

D.12.3.44 multidimensional_knapsack

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `multidimensional_knapsack(m,capacities,profits)`

Return: binary list of the positions of the elements included in the optimal selection

Example:

```

LIB "crypto.lib";
ring r = 0,x,lp;
matrix m[3][3] = 1,4,10,7,8,3,1,9,7;
list c = 12,17,10;
list p = 3,2,5;
multidimensional_knapsack(m,c,p);
↪ [1]:
↪ 1
↪ [2]:
↪ 0
↪ [3]:
↪ 1

```

D.12.3.45 naccache_stern_generation

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `naccache_stern_generation(key, primenum)`

Return: a hard knapsack list

Example:

```

LIB "crypto.lib";
naccache_stern_generation(5,292);
↪ 0
naccache_stern_generation(5,293);
↪ [1]:
↪ 85

```

```

↳ [2] :
↳   164
↳ [3] :
↳   117
↳ [4] :
↳   44

```

D.12.3.46 naccache_stern_encryption

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `naccache_stern_encryption(knapsack, message, primenum)`

Return: an encrypted message as integer

Example:

```

LIB "crypto.lib";
//Please note that the values for primenum and hardknapsack have been obtained from t
list hardknapsack = 85,164,117,44;
int primenum = 293;
list message = 1,0,1,0;
naccache_stern_encryption(hardknapsack,message,primenum);
↳ 9945

```

D.12.3.47 naccache_stern_decryption

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `naccache_stern_decryption(knapsack, key, primenum, message)`

Return: decrypted binary list

Example:

```

LIB "crypto.lib";
//Please note that the values have been obtained from the example of naccache_stern_g
int primenum = 293;
int message = 9945;
int key = 5;
list hardknapsack = 85,164,117,44;
naccache_stern_decryption(hardknapsack,key,primenum,message);
↳ [1] :
↳   1
↳ [2] :
↳   0
↳ [3] :
↳   1
↳ [4] :
↳   0

```

D.12.3.48 m_merkle_hellman_transformation

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `m_merkle_hellman_transformation(knapsack, primitive, mod1)`

Return: list containing a hard knapsack

Example:

```
LIB "crypto.lib";
//Please note that the values for primenum and hardknapsack have been obtained from t
list knapsack = 2,3,5,7;
int mod1 = 211;
int primitive = 2;
m_merkle_hellman_transformation(knapsack,primitive,mod1);
↳ [1]:
↳ 1
↳ [2]:
↳ 43
↳ [3]:
↳ 132
↳ [4]:
↳ 139
```

D.12.3.49 m_merkle_hellman_encryption

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `m_merkle_hellman_encryption(knapsack, message)`

Return: an encrypted message as integer

Note: This works in the same way as `merkle_hellman_encryption`. The additional function is created to keep consistency with the needed functions for every kryptosystem.

Example:

```
LIB "crypto.lib";
//Please note that the values for primenum and hardknapsack have been obtained from t
list knapsack = 1,43,132,139;
list message = 1,0,0,1;
m_merkle_hellman_encryption(knapsack,message);
↳ 140
```

D.12.3.50 m_merkle_hellman_decryption

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `m_merkle_hellman_decryption(knapsack, primitive, mod1, message)`

Return: decrypted binary list

Example:

```
LIB "crypto.lib";
//Please note that the values have been obtained from the example of m_merkle_hellma
list knapsack = 2,3,5,7;
int message = 140;
bigint primitive = 2;
bigint mod1 = 211;
m_merkle_hellman_decryption(knapsack,primitive,mod1,message);
↳ [1]:
↳ 1
↳ [2]:
↳ 0
↳ [3]:
```

```

↳ 0
↳ [4]:
↳ 1

```

D.12.3.51 merkle_hellman_encryption

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `merkle_hellman_encryption(knapsack, message)`

Return: encrypted integer

Example:

```

LIB "crypto.lib";
//Please note that the values have been obtained from the example of merkle_hellman.
list hardknapsack =3,9,15,13;
list message = 0,1,0,1;
merkle_hellman_encryption(hardknapsack,message);
↳ 22

```

D.12.3.52 merkle_hellman_decryption

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `merkle_hellman_decryption(knapsack, key, mod1, message)`

Return: decrypted binary list

Example:

```

LIB "crypto.lib";
//Please note that the values have been obtained from the example of merkle_hellman.
list hardknapsack =3,9,15,13;
int key = 3;
int message = 22;
int mod1 = 23;
merkle_hellman_decryption(hardknapsack, key, mod1, message);
↳ 15
↳ [1]:
↳ 0
↳ [2]:
↳ 1
↳ [3]:
↳ 0
↳ [4]:
↳ 1

```

D.12.3.53 super_increasing_knapsack

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `super_increasing_knapsack(ksize)`

Return: super-increasing knapsack list

Example:

```

LIB "crypto.lib";
super_increasing_knapsack(10);
↳ [1]:
↳ 512
↳ [2]:
↳ 256
↳ [3]:
↳ 128
↳ [4]:
↳ 64
↳ [5]:
↳ 32
↳ [6]:
↳ 16
↳ [7]:
↳ 8
↳ [8]:
↳ 4
↳ [9]:
↳ 2
↳ [10]:
↳ 1

```

D.12.3.54 h_increasing_knapsack

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `h_increasing_knapsack(ksize, h)`

Return: h-increasing knapsack list

Example:

```

LIB "crypto.lib";
h_increasing_knapsack(10,5);
↳ [1]:
↳ 1
↳ [2]:
↳ 2
↳ [3]:
↳ 4
↳ [4]:
↳ 8
↳ [5]:
↳ 16
↳ [6]:
↳ 32
↳ [7]:
↳ 63
↳ [8]:
↳ 124
↳ [9]:
↳ 244
↳ [10]:
↳ 480

```

D.12.3.55 injective_knapsack

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `injective_knapsack(ksize, kmaxelement)`

Return: list of injective knapsacks with maximal element `kmaxelement` and size `ksize`

Example:

```
LIB "crypto.lib";
injective_knapsack(3,9);
↳ [1]:
↳ [1]:
↳ 9
↳ [2]:
↳ 1
↳ [3]:
↳ 3
↳ [2]:

```

D.12.3.56 calculate_max_sum

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `calculate_max_sum(a)`

Return: sum of all elements in `a`

Example:

```

LIB "crypto.lib";
list a = 1,5,3,2,12;
calculate_max_sum(a);
↳ 23

```

D.12.3.57 set_is_injective

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `set_is_injective(a)`

Return: 1 if `a` is injective, 0 otherwise

Example:

```

LIB "crypto.lib";
list inj = 1,5,7,41;
list non_inj = 1,2,3,4;
set_is_injective(inj);
↳ 1
set_is_injective(non_inj);
↳ 0

```

D.12.3.58 is_h_injective

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `is_h_injective(a, h)`

Return: 1 if `a` is h-injective, 0 otherwise

Example:

```
LIB "crypto.lib";
list h_inj = 1,2,4,10,17;
is_h_injective(h_inj,3);
↪ 1
//1+2+4+10=17
is_h_injective(h_inj,4);
↪ 0
```

D.12.3.59 is_fix_injective

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `is_fix_injective(a)`

Return: 1 if `a` is fix-injective, 0 otherwise

Example:

```
LIB "crypto.lib";
//this is fix-injective because 17=10+2+4+1 with different numbers of addens.
list fix_inj = 1,2,4,10,17;
//this is not fix-injective because 4+1=2+3.
list not_fix_inj = 1,2,3,4;
is_fix_injective(fix_inj);
↪ 1
is_fix_injective(not_fix_inj);
↪ 0
```

D.12.3.60 three_elements

Procedure from library `crypto.lib` (see [Section D.12.3 \[crypto.lib\], page 1535](#)).

Usage: `three_elements(out, iterations)`

Return: `Injective_knapsack` created with the three elements method

Example:

```
LIB "crypto.lib";
//this is fix-injective because 17=10+2+4+1 with different numbers of addens.
list super_increasing = 1,2,4,10,20;
list a = three_elements(super_increasing,2);
a;

```

D.12.4 hyperel_lib

Library: hyperel.lib

Author: Markus Hochstetter, markushochstetter@gmx.de

Note: The library provides procedures for computing with divisors in the jacobian of hyperelliptic curves. In addition procedures are available for computing the rational representation of divisors and vice versa. The library is intended to be used for teaching and demonstrating purposes but not for efficient computations.

Procedures:

D.12.4.1 ishyper

Procedure from library `hyperel.lib` (see [Section D.12.4 \[hyperel_lib\], page 1561](#)).

Usage: `ishyper(h,f); h,f=poly`

Return: 1 if $y^2+h(x)y=f(x)$ is hyperelliptic, 0 otherwise

Note: Tests, if $y^2+h(x)y=f(x)$ is a hyperelliptic curve.
Curve is defined over basering. Additionally shows error-messages.

Example:

```

LIB "hyperel.lib";
ring R=7,x,dp;
// hyperelliptic curve y^2 + h*y = f
poly h=x;
poly f=x5+5x4+6x2+x+3;
ishyper(h,f);
↳ 1

```

D.12.4.2 isoncurve

Procedure from library `hyperel.lib` (see [Section D.12.4 \[hyperel_lib\], page 1561](#)).

Usage: `isoncurve(P,h,f); h,f=poly; P=list`

Return: 1 or 0 (if P is on curve or not)

Note: Tests, if $P=(P[1],P[2])$ is on the hyperelliptic curve $y^2+h(x)y=f(x)$. Curve is defined over basering.

Example:

```

LIB "hyperel.lib";
ring R=7,x,dp;
// hyperelliptic curve  $y^2 + h*y = f$ 
poly h=x;
poly f=x5+5x4+6x2+x+3;
list P=2,3;
isoncurve(P,h,f);
↪ 1

```

D.12.4.3 chinrestp

Procedure from library `hyperel.lib` (see [Section D.12.4 \[hyperel.lib\], page 1561](#)).

Usage: `chinrestp(b,moduli);` moduli, b, moduli=list of polynomials

Return: poly x, s.t. $x = b[i] \bmod \text{moduli}[i]$

Note: chinese remainder theorem for polynomials

Example:

```

LIB "hyperel.lib";
ring R=7,x,dp;
list b=3x-4, -3x2+1, 1, 4;
list moduli=(x-2)^2, (x-5)^3, x-1, x-6;
chinrestp(b,moduli);
↪ -x6-3x5-x4+2x3-2x2+3x+3

```

D.12.4.4 norm

Procedure from library `hyperel.lib` (see [Section D.12.4 \[hyperel.lib\], page 1561](#)).

Usage: `norm(a,b,h,f);`

Return: norm of $a(x)-b(x)y$ in $\text{IF}[C]$

Note: The norm is a polynomial in just one variable.
Curve C: $y^2+h(x)y=f(x)$ is defined over basering.

Example:

```

LIB "hyperel.lib";
ring R=7,x,dp;
// hyperelliptic curve  $y^2 + h*y = f$ 
poly h=x;
poly f=x5+5x4+6x2+x+3;
poly a=x2+1;
poly b=x;
norm(a,b,h,f);
↪ -x7+2x6+3x4-x3+1

```

D.12.4.5 multi

Procedure from library `hyperel.lib` (see [Section D.12.4 \[hyperel.lib\], page 1561](#)).

Usage: `multi(a,b,c,d,h,f);`

Return: list L with $L[1]-L[2]y=(a(x)-b(x)y)*(c(x)-d(x)y)$ in $\text{IF}[C]$

Note: Curve C: $y^2+h(x)y=f(x)$ is defined over basering.

Example:

```

LIB "hyperel.lib";
ring R=7,x,dp;
poly h=x;
poly f=x5+5x4+6x2+x+3;
// hyperelliptic curve y^2 + h*y = f
poly a=x2+1;
poly b=x;
poly c=5;
poly d=-x;
multi(a,b,c,d,h,f);
↳ [1]:
↳ -x7+2x6+x4-x3+2x2-2
↳ [2]:
↳ -2x3-3x

```

D.12.4.6 divisor

Procedure from library `hyperel.lib` (see [Section D.12.4 \[hyperel.lib\]](#), page 1561).

Usage: `divisor(a,b,h,f)`; optional: `divisor(a,b,h,f,s)`; `s=0,1`

Return: list P

Note: $P[1][3]*(P[1][1], P[1][2]) + \dots + P[\text{size}(P)][3]*$
 $(P[\text{size}(P)][1], P[\text{size}(P)][2]) - (*)$ `infty=div(a(x)-b(x)y)` if there is an optional parameter `s!=0`, then `divisor` additionally returns a parameter, which says, whether irreducible polynomials occurred during computations or not. Otherwise only warnings are displayed on the monitor. For `s=0` nothing happens.
 Curve $C: y^2+h(x)y=f(x)$ is defined over basering.

Example:

```

LIB "hyperel.lib";
ring R=7,x,dp;
// hyperelliptic curve y^2 + h*y = f
poly h=x;
poly f=x5+5x4+6x2+x+3;
poly a=(x-1)^2*(x-6);
poly b=0;
divisor(a,b,h,f,1);
↳ [1]:
↳ [1]:
↳ -1
↳ [2]:
↳ -3
↳ [3]:
↳ 2
↳ [2]:
↳ [1]:
↳ 1
↳ [2]:
↳ 1
↳ [3]:
↳ 2

```

```

↳ [3]:
↳ [1]:
↳ 1
↳ [2]:
↳ -2
↳ [3]:
↳ 2
↳ 0

```

D.12.4.7 gcddivisor

Procedure from library `hyperel.lib` (see [Section D.12.4 \[hyperel.lib\]](#), page 1561).

Usage: `gcddivisor(p,q);`

Return: list P

Note: gcd of two divisors

Example:

```

LIB "hyperel.lib";
ring R=7,x,dp;
// hyperelliptic curve y^2 + h*y = f
poly h=x;
poly f=x5+5x4+6x2+x+3;
// two divisors
list p=list(-1,-3,1),list(1,1,2);
list q=list(1,1,1),list(2,2,1);
gcddivisor(p,q);
↳ [1]:
↳ [1]:
↳ 1
↳ [2]:
↳ 1
↳ [3]:
↳ 1

```

D.12.4.8 semidiv

Procedure from library `hyperel.lib` (see [Section D.12.4 \[hyperel.lib\]](#), page 1561).

Usage: `semidiv(D,h,f);`

Return: list P

Note: important: Divisor D has to be semireduced!
 Computes semireduced divisor $P[1][3]*(P[1][1], P[1][2]) + \dots + P[\text{size}(P)][3]*$
 $*(P[\text{size}(P)][1], P[\text{size}(P)][2]) - (*)_{\infty} = \text{div}(D[1], D[2])$
 Curve $C: y^2 + h(x)y = f(x)$ is defined over basering.

Example:

```

LIB "hyperel.lib";
ring R=7,x,dp;
// hyperelliptic curve y^2 + h*y = f
poly h=x;
poly f=x5+5x4+6x2+x+3;

```

```

// Divisor
list D=x2-1,2x-1;
semidiv(D,h,f);
↳ [1]:
↳   [1]:
↳   -1
↳   [2]:
↳   -3
↳   [3]:
↳   1
↳ [2]:
↳   [1]:
↳   1
↳   [2]:
↳   1
↳   [3]:
↳   1

```

D.12.4.9 cantoradd

Procedure from library `hyperel.lib` (see [Section D.12.4 \[hyperel.lib\], page 1561](#)).

Usage: `cantoradd(D,Q,h,f);`

Return: list P

Note: Cantor's Algorithm - composition
 important: D and Q have to be semireduced!
 Computes semireduced divisor $\text{div}(P[1],P[2]) = \text{div}(D[1],D[2]) + \text{div}(Q[1],Q[2])$ The divisors are defined over the basering.
 Curve C: $y^2+h(x)y=f(x)$ is defined over the basering.

Example:

```

LIB "hyperel.lib";
ring R=7,x,dp;
// hyperelliptic curve y^2 + h*y = f
poly h=x;
poly f=x5+5x4+6x2+x+3;
// two divisors in rational representation
list D=x2-1,2x-1;
list Q=x2-3x+2,-3x+1;
cantoradd(D,Q,h,f);
↳ [1]:
↳   x2-x-2
↳ [2]:
↳   -3x+1

```

D.12.4.10 cantorred

Procedure from library `hyperel.lib` (see [Section D.12.4 \[hyperel.lib\], page 1561](#)).

Usage: `cantorred(D,h,f);`

Return: list N

Note: Cantor's algorithm - reduction.
 important: Divisor D has to be semireduced!
 Computes reduced divisor $\text{div}(N[1],N[2]) = \text{div}(D[1],D[2])$.
 The divisors are defined over the basering.
 Curve C: $y^2+h(x)y=f(x)$ is defined over the basering.

Example:

```
LIB "hyperel.lib";
ring R=7,x,dp;
// hyperelliptic curve  $y^2 + h*y = f$ 
poly h=x;
poly f=x5+5x4+6x2+x+3;
// semireduced divisor
list D=2x4+3x3-3x-2, -x3-2x2+3x+1;
cantorred(D,h,f);
↪ [1]:
↪   x2-2x+2
↪ [2]:
↪   2x-2
```

D.12.4.11 double

Procedure from library `hyperel.lib` (see [Section D.12.4 \[hyperel.lib\]](#), page 1561).

Usage: `double(D,h,f);`

Return: list $Q=2*D$

Note: important: Divisor D has to be semireduced!
 Special case of Cantor's algorithm.
 Computes reduced divisor $\text{div}(Q[1],Q[2]) = 2*\text{div}(D[1],D[2])$.
 The divisors are defined over the basering.
 Curve C: $y^2+h(x)y=f(x)$ is defined over the basering.

Example:

```
LIB "hyperel.lib";
ring R=7,x,dp;
// hyperelliptic curve  $y^2 + h*y = f$ 
poly h=x;
poly f=x5+5x4+6x2+x+3;
// reduced divisor
list D=x2-1,2x-1;
double(D,h,f);
↪ [1]:
↪   x2-2x+1
↪ [2]:
↪   3x-2
```

D.12.4.12 cantormult

Procedure from library `hyperel.lib` (see [Section D.12.4 \[hyperel.lib\]](#), page 1561).

Usage: `cantormult(m,D,h,f);`

Return: list $\text{res}=m*D$

Note: important: Divisor D has to be semireduced!
 Uses repeated doublings for a faster computation of the reduced divisor m^*D .
 Attention: Factor $m=\text{int}$, this means bounded.
 For $m<0$ the inverse of m^*D is returned.
 The divisors are defined over the basering.
 Curve $C: y^2+h(x)y=f(x)$ is defined over the basering.

Example:

```
LIB "hyperel.lib";
ring R=7,x,dp;
// hyperelliptic curve y^2 + h*y = f
poly h=x;
poly f=x5+5x4+6x2+x+3;
// reduced divisor
list D=x2-1,2x-1;
cantormult(34,D,h,f);
↳ [1]:
↳   x2-3x-3
↳ [2]:
↳   x+1
```

D.12.5 teachstd_lib

Library: teachstd.lib

Purpose: Procedures for teaching standard bases

Author: G.-M. Greuel, greuel@mathematik.uni-kl.de

Note: The library is intended to be used for teaching purposes, but not for serious computations. Sufficiently high printlevel allows to control each step, thus illustrating the algorithms at work. The procedures are implemented exactly as described in the book 'A SINGULAR Introduction to Commutative Algebra' by G.-M. Greuel and G. Pfister (Springer 2002).

Procedures:

D.12.5.1 ecart

Procedure from library `teachstd.lib` (see [Section D.12.5 \[teachstd_lib\]](#), page 1567).

Usage: `ecart(f)`; f poly or vector

Return: the ecart e of f of type `int`

Example:

```
LIB "teachstd.lib";
ring r=0,(x,y,z),ls;
ecart((y+z+x+xyz)**2);
↳ 4
ring s=0,(x,y,z),dp;
ecart((y+z+x+xyz)**2);
↳ 0
```

D.12.5.2 tail

Procedure from library `teachstd.lib` (see [Section D.12.5 \[teachstd.lib\], page 1567](#)).

Usage: `tail(f)`; f poly or vector

Return: f -lead(f), the tail of f of type poly

Example:

```
LIB "teachstd.lib";
ring r=0,(x,y,z),ls;
tail((y+z+x+xyz)**2);
↪ 2yz+y2+2xz+2xy+2xyz2+2xy2z+x2+2x2yz+x2y2z2
ring s=0,(x,y,z),dp;
tail((y+z+x+xyz)**2);
↪ 2x2yz+2xy2z+2xyz2+x2+2xy+y2+2xz+2yz+z2
```

D.12.5.3 sameComponent

Procedure from library `teachstd.lib` (see [Section D.12.5 \[teachstd.lib\], page 1567](#)).

Usage: `sameComponent(f,g)`; f,g poly or vector

Return: 1 if f and g are of type poly or if f and g are of type vector and their leading monomials involve the same module component, 0 if not

Example:

```
LIB "teachstd.lib";
ring r=0,(x,y,z),dp;
sameComponent([y+z+x,xyz],[z2,xyz]);
↪ 1
sameComponent([y+z+x,xyz],[z4,xyz]);
↪ 0
sameComponent(y+z+x+xyz,xy+z5);
↪ 1
```

D.12.5.4 leadmonomial

Procedure from library `teachstd.lib` (see [Section D.12.5 \[teachstd.lib\], page 1567](#)).

Usage: `leadmonomial(f)`; f poly or vector

Return: the leading monomial of f of type poly

Note: if f is of type poly, `leadmonomial(f)=leadmonom(f)`, if f is of type vector and if `leadmonom(f)=m*gen(i)` then `leadmonomial(f)=m`

Example:

```
LIB "teachstd.lib";
ring s=0,(x,y,z),(c,dp);
leadmonomial((y+z+x+xyz)^2);
↪ x2y2z2
leadmonomial([(y+z+x+xyz)^2,xyz5]);
↪ x2y2z2
```

D.12.5.5 monomialLcm

Procedure from library `teachstd.lib` (see [Section D.12.5 \[teachstd.lib\], page 1567](#)).

Usage: `monomialLcm(m,n)`; m,n of type `poly` or `vector`

Return: least common multiple of leading monomials of m and n , of type `poly`

Note: if $m = (x_1 \dots x_r)^{(a_1, \dots, a_r)} \cdot \text{gen}(i)$ ($\text{gen}(i)=1$ if m is of type `poly`) and $n = (x_1 \dots x_r)^{(b_1, \dots, b_r)} \cdot \text{gen}(j)$, then the proc returns $(x_1, \dots, x_r)^{(\max(a_1, b_1), \dots, \max(a_r, b_r))}$ if $i=j$ and 0 if $i \neq j$.

Example:

```
LIB "teachstd.lib";
ring r=0,(x,y,z),ds;
monomialLcm(xy2,yz3);
↳ xy2z3
monomialLcm([xy2,xz],[yz3]);
↳ 0
monomialLcm([xy2,xz3],[yz3]);
↳ xy2z3
```

D.12.5.6 spoly

Procedure from library `teachstd.lib` (see [Section D.12.5 \[teachstd.lib\], page 1567](#)).

Usage: `spoly(f,g,[s])`; f,g `poly` or `vector`, s `int`

Return: the s -polynomial of f and g , of type `poly` or `vector`
if $s \neq 0$ the symmetric s -polynomial (without division) is returned

Example:

```
LIB "teachstd.lib";
ring r=0,(x,y,z),ls;
spoly(2x2+x2y,3y3+xyz);
↳ x2y4-2/3x3yz
ring s=0,(x,y,z),(c,dp);
spoly(2x2+x2y,3y3+xyz);
↳ -1/3x3yz+2x2y2
spoly(2x2+x2y,3y3+xyz,1); //symmetric s-poly without division
↳ -x3yz+6x2y2
spoly([5x2+x2y,z5],[x2,y3,y4]); //s-poly for vectors
↳ [5x2,z5-y4,-y5]
```

D.12.5.7 minEcart

Procedure from library `teachstd.lib` (see [Section D.12.5 \[teachstd.lib\], page 1567](#)).

Usage: `minEcart(T,h)`; T ideal or module, h `poly` or `vector`

Return: element g from T such that $\text{leadmonom}(g)$ divides $\text{leadmonom}(h)$
 $\text{ecart}(g)$ is minimal with this property (if $T \neq 0$);
return 0 if T is 0 or $h = 0$

Example:

```

LIB "teachstd.lib";
ring R=0,(x,y,z),dp;
ideal T = x2y+x2,y3+xyz,xyz2+z4;
poly h = x2y2z2+x5+yx3+z6;
minEcart(T,h);"";
↳ x2y+x2
↳
ring S=0,(x,y,z),(c,ds);
module T = [x2+x2y,y2],[y3+xyz,x3-z3],[x3y+z4,0,x2];
vector h = [x3y+x5+x2y2z2+z6,x3];
minEcart(T,h);
↳ [x3y+z4,0,x2]

```

D.12.5.8 NFMora

Procedure from library `teachstd.lib` (see [Section D.12.5 \[teachstd.lib\]](#), page 1567).

- Usage:** NFMora(f,G[,s]); f poly or vector,G ideal or module, s int
- Return:** the Mora normal form of f w.r.t. G, same type as f
if s!=0 the symmetric s-polynomial (without division) is used
- Note:** Show comments if `printlevel > 0`, pauses computation if `printlevel > 1`

Example:

```

LIB "teachstd.lib";
ring r=0,(x,y,z),dp;
poly f = x2y2z2+x5+yx3+z6-3y3;
ideal G = x2y+x2,y3+xyz,xyz2+z6;
NFMora(f,G);"";
↳ x5-x2yz2+x3y-xyz2-3y3
↳
ring s=0,(x,y,z),ds;
poly f = x3y+x5+x2y2z2+z6;
ideal G = x2+x2y,y3+xyz,x3y2+z4;
NFMora(f,G);"";
↳ 0
↳
vector v = [f,x2+x2y];
module M = [x2+x2y,f],[y3+xyz,y3],[x3y2+z4,z2];
NFMora(v,M);
↳ x2*gen(2)+x2y*gen(2)+x3y*gen(1)+x5*gen(1)+x2y2z2*gen(1)+z6*gen(1)

```

D.12.5.9 prodcrit

Procedure from library `teachstd.lib` (see [Section D.12.5 \[teachstd.lib\]](#), page 1567).

- Usage:** prodcrit(f,g[,o]); f,g poly or vector, and optional int argument o
- Return:** 1 if product criterion applies in the same module component, 2 if `lead(f)` and `lead(g)` involve different components, 0 else
- Note:** if product criterion applies we can delete (f,g) from pairset. This procedure returns 0 if o is given and is a positive integer, or you may set the attribute "default_arg" for prodcrit to 1.

Example:

```

LIB "teachstd.lib";
ring r=0,(x,y,z),dp;
poly f = y3z3+x5+yx3+z6;
poly g = x5+yx3;
prodcrit(f,g);
↪ 1
vector v = x3z2*gen(1)+x3y*gen(1)+x2y*gen(2);
vector w = y4*gen(1)+y3*gen(2)+xyz*gen(1);
prodcrit(v,w);
↪ 0

```

D.12.5.10 chaincrit

Procedure from library `teachstd.lib` (see [Section D.12.5 \[teachstd.lib\], page 1567](#)).

Usage: `chaincrit(f,g,h)`; f,g,h poly or module

Return: 1 if chain criterion applies, 0 else

Note: if chain criterion applies to f,g,h we can delete (g,h) from pairset

Example:

```

LIB "teachstd.lib";
ring r=0,(x,y,z),dp;
poly f = x2y2z2+x5+yx3+z6;
poly g = x5+yx3;
poly h = y2z5+x5+yx3;
chaincrit(f,g,h);
↪ 1
vector u = [x2y3-z2,x2y];
vector v = [x2y2+z2,x2-y2];
vector w = [x2y4+z3,x2+y2];
chaincrit(u,v,w);
↪ 1

```

D.12.5.11 pairset

Procedure from library `teachstd.lib` (see [Section D.12.5 \[teachstd.lib\], page 1567](#)).

Usage: `pairset(G)`; G ideal or module

Return: list L ,
 $L[1]$ = the pairset of G as list (not containing pairs for which the product or the chain criterion applies),
 $L[2]$ = intvec v , $v[1]$ = # product criterion, $v[2]$ = # chain criterion

Example:

```

LIB "teachstd.lib";
ring r=0,(x,y,z),dp;
ideal G = x2y+x2,y3+xyz,xyz2+z4;
pairset(G);"";
↪ [1]:
↪   [1]:
↪     _[1]=x2y+x2
↪     _[2]=y3+xyz
↪   [2]:

```

```

↳      _[1]=x2y+x2
↳      _[2]=xyz2+z4
↳      [3]:
↳      _[1]=y3+xyz
↳      _[2]=xyz2+z4
↳ [2]:
↳      0,0
↳
module T = [x2y3-z2,x2y], [x2y2+z2,x2-y2], [x2y4+z3,x2+y2];
pairset(T);
↳ [1]:
↳      [1]:
↳      _[1]=x2y3*gen(1)+x2y*gen(2)-z2*gen(1)
↳      _[2]=x2y2*gen(1)+x2*gen(2)-y2*gen(2)+z2*gen(1)
↳      [2]:
↳      _[1]=x2y3*gen(1)+x2y*gen(2)-z2*gen(1)
↳      _[2]=x2y4*gen(1)+z3*gen(1)+x2*gen(2)+y2*gen(2)
↳ [2]:
↳      0,1

```

D.12.5.12 updatePairs

Procedure from library `teachstd.lib` (see [Section D.12.5 \[teachstd.lib\], page 1567](#)).

Usage: `updatePairs(P,S,h)`; P list, S ideal or module, h poly or vector
P a list of pairs of polys or vectors (obtained from `pairset`)

Return: list Q,
Q[1] = the pairset P enlarged by all pairs (f,h), f from S, without pairs for which the product or the chain criterion applies
Q[2] = intvec v, v[1]= # product criterion, v[2]= # chain criterion

Example:

```

LIB "teachstd.lib";
ring R1=0, (x,y,z), (c,dp);
ideal S = x2y+x2,y3+xyz;
poly h = x2y+xyz;
list P = pairset(S)[1];
P;"";
↳ [1]:
↳      _[1]=x2y+x2
↳      _[2]=y3+xyz
↳
updatePairs(P,S,h);"";
↳ [1]:
↳      [1]:
↳      _[1]=x2y+x2
↳      _[2]=y3+xyz
↳      [2]:
↳      _[1]=x2y+x2
↳      _[2]=x2y+xyz
↳ [2]:
↳      0,1
↳

```

```

module T = [x2y3-z2,x2y],[x2y4+z3,x2+y2];
P = pairset(T)[1];
P;"";
↳ [1]:
↳   _[1]=[x2y3-z2,x2y]
↳   _[2]=[x2y4+z3,x2+y2]
↳
updatePairs(P,T,[x2+x2y,y3+xyz]);
↳ [1]:
↳   [1]:
↳     _[1]=[x2y3-z2,x2y]
↳     _[2]=[x2y4+z3,x2+y2]
↳   [2]:
↳     _[1]=[x2y3-z2,x2y]
↳     _[2]=[x2y+x2,y3+xyz]
↳ [2]:
↳   0,1

```

D.12.5.13 standard

Procedure from library `teachstd.lib` (see [Section D.12.5 \[teachstd.lib\]](#), page 1567).

Usage: `standard(i[,s]);` id ideal or module, s int

Return: a standard basis of id, using generalized Mora's algorithm which is Buchberger's algorithm for global monomial orderings. If $s \neq 0$ the symmetric s-polynomial (without division) is used

Note: Show comments if `printlevel > 0`, pauses computation if `printlevel > 1`

Example:

```

LIB "teachstd.lib";
ring r=0,(x,y,z),dp;
ideal G = x2y+x2,y3+xyz,xyz2+z4;
standard(G);"";
↳ _[1]=x2y+x2
↳ _[2]=y3+xyz
↳ _[3]=xyz2+z4
↳ _[4]=x3z-x2y
↳ _[5]=-xz4+x2z2
↳ _[6]=-y2z4-x2z3
↳ _[7]=z6+x2yz2
↳ _[8]=x2z3-x3z
↳ _[9]=-x2z2+x3
↳ _[10]=x4-x2yz
↳
ring s=0,(x,y,z),(c,ds);
ideal G = 2x2+x2y,y3+xyz,3x3y+z4;
standard(G);"";
↳ _[1]=2x2+x2y
↳ _[2]=y3+xyz
↳ _[3]=3x3y+z4
↳ _[4]=-2/3z4+x3y2
↳
standard(G,1);""; //use symmetric s-poly without division

```

```

↳ _[1]=2x2+x2y
↳ _[2]=y3+xyz
↳ _[3]=3x3y+z4
↳ _[4]=-2z4+3x3y2
↳
module M = [2x2,x3y+z4],[3y3+xyz,y3],[5z4,z2];
standard(M);
↳ _[1]=[2x2,x3y+z4]
↳ _[2]=[3y3+xyz,y3]
↳ _[3]=[5z4,z2]
↳ _[4]=[0,-2/3x2y3+x3y4+1/3x4y2z+y3z4+1/3xyz5]
↳ _[5]=[0,-2/5x2z2+x3yz4+z8]
↳ _[6]=[0,-3/5y3z2-1/5xyz3+y3z4]

```

D.12.5.14 localstd

Procedure from library `teachstd.lib` (see [Section D.12.5 \[teachstd.lib\]](#), page 1567).

Usage: `localstd(id)`; `id` = ideal

Return: A standard basis for a local degree ordering, using Lazard's method.

Note: The procedure homogenizes `id` w.r.t. a new 1st variable `local@t`, computes a SB w.r.t. $(dp(1), dp)$ and substitutes `local@t` by 1. Hence the result is a SB with respect to an ordering which sorts first w.r.t. the subdegree of the original variables and then refines it with `dp`. This is the local degree ordering `ds`.
`localstd` may be used in order to avoid cancellation of units and thus to be able to use `option(contentSB)` also for local orderings.

Example:

```

LIB "teachstd.lib";
ring R = 0,(x,y,z),ds;
ideal i = xyz+z5,2x2+y3+z7,3z5+y5;
localstd(i);
↳ _[1]=y5+3z5
↳ _[2]=3x4y3z8-4x3y3z9+6x2y4z9+3y5z10
↳ _[3]=3x4z13-4x3z14+6x2yz14+3y2z15
↳ _[4]=3x4yz12-4x3yz13+6x2y2z13+3y3z14
↳ _[5]=2x2z9+x2y2z8+y3z9
↳ _[6]=2x2y4z5+y7z5-3x2yz9
↳ _[7]=6y2z10-3x2y3z8+4xy3z9-3y4z9
↳ _[8]=3x2y2z8+3y3z9+2xy4z8
↳ _[9]=18z14-4xy6z8+3y7z8-9x2yz12
↳ _[10]=xyz+z5
↳ _[11]=3xz6-y4z5
↳ _[12]=3y3z6+2xy4z5-3xyz9
↳ _[13]=y4z5-2xz9-xy2z8
↳ _[14]=3z10+2xyz9+xy3z8
↳ _[15]=2x2z5+y3z5-xyz8
↳ _[16]=y4z-2xz5+yz8
↳ _[17]=3z6+2xyz5-y2z8
↳ _[18]=2x2+y3+z7

```

D.12.6 weierstr_lib

Library: weierstr.lib

Purpose: Procedures for the Weierstrass Theorems

Author: G.-M. Greuel, greuel@mathematik.uni-kl.de

Procedures:

D.12.6.1 weierstrDiv

Procedure from library `weierstr.lib` (see [Section D.12.6 \[weierstr.lib\], page 1574](#)).

Usage: `weierstrDiv(g,f,d); g,f=poly, d=integer`

Assume: `f` must be general of finite order, say `b`, in the last ring variable, say `T`; if not use the procedure `lastvarGeneral` first

Purpose: perform the Weierstrass division of `g` by `f` up to order `d`

Return: - a list, say `l`, of two polynomials and an integer, such that
 $g = l[1]*f + l[2]$, $\deg.T(l[2]) < b$, up to (including) total degree `d`
 - `l[3]` is the number of iterations used
 - if `f` is not `T`-general, return `(0,g)`

Note: the procedure works for any monomial ordering

Theory: the proof of Grauert-Remmert (Analytische Stellenalgebren) is used for the algorithm

Example:

```
LIB "weierstr.lib";
ring R = 0,(x,y),ds;
poly f = y - xy2 + x2;
poly g = y;
list l = weierstrDiv(g,f,10); l;"";
⇒ [1]:
⇒ 1+xy-x3+x2y2-2x4y+2x6+x3y3-3x5y2+5x7y+x4y4-5x9-4x6y3+9x8y2+x5y5
⇒ [2]:
⇒ -x2+x5-2x8
⇒ [3]:
⇒ 5
⇒
l[1]*f + l[2]; //g = l[1]*f+l[2] up to degree 10
⇒ y-5x11+14x10y2+5x7y5-9x9y4-x6y7
```

D.12.6.2 weierstrPrep

Procedure from library `weierstr.lib` (see [Section D.12.6 \[weierstr.lib\], page 1574](#)).

Usage: `weierstrPrep(f,d); f=poly, d=integer`

Assume: `f` must be general of finite order, say `b`, in the last ring variable, say `T`; if not apply the procedure `lastvarGeneral` first

Purpose: perform the Weierstrass preparation of `f` up to order `d`

Return: - a list, say `l`, of two polynomials and one integer,
`l[1]` a unit, `l[2]` a Weierstrass polynomial, `l[3]` an integer such that $l[1]*f = l[2]$, where
`l[2]` is a Weierstrass polynomial, (i.e. $l[2] = T^b +$ lower terms in `T`) up to (including)
 total degree `d` `l[3]` is the number of iterations used
 - if `f` is not `T`-general, return `(0,0)`

Note: the procedure works for any monomial ordering

Theory: the proof of Grauert-Remmert (Analytische Stellenalgebren) is used for the algorithm

Example:

```
LIB "weierstr.lib";
ring R = 0, (x,y), ds;
poly f = xy+y2+y4;
list l = weierstrPrep(f,5); l; "";
↳ [1]:
↳ 1-x2+xy-y2+3x4-3x3y+3x2y2-2xy3+y4
↳ [2]:
↳ xy+y2-x3y
↳ [3]:
↳ 6
↳
f*l[1]-l[2]; // = 0 up to degree 5
↳ 3x5y+3x4y4-3x3y5+3x2y6-2xy7+y8
```

D.12.6.3 lastvarGeneral

Procedure from library `weierstr.lib` (see [Section D.12.6 \[weierstr.lib\], page 1574](#)).

Usage: `lastvarGeneral(f,d); f=poly`

Return: `poly`, say `g`, obtained from `f` by a generic change of variables, s.t. `g` is general of finite order `b` w.r.t. the last ring variable, say `T` (i.e. $g(0,\dots,0,T) = c \cdot T^b + \text{higher terms}$, $c \neq 0$)

Note: the procedure works for any monomial ordering

Example:

```
LIB "weierstr.lib";
ring R = 2, (x,y,z), ls;
poly f = xyz;
lastvarGeneral(f);
↳ z24+yz19+xz6+xyz
```

D.12.6.4 generalOrder

Procedure from library `weierstr.lib` (see [Section D.12.6 \[weierstr.lib\], page 1574](#)).

Usage: `generalOrder(f); f=poly`

Return: integer `b` if `f` is general of order `b` w.r.t. the last variable, say `T`, resp. `-1` if not (i.e. $f(0,\dots,0,T)$ is of order `b`, resp. $f(0,\dots,0,T) = 0$)

Note: the procedure works for any monomial ordering

Example:

```
LIB "weierstr.lib";
ring R = 0, (x,y), ds;
poly f = x2-4xy+4y2-2xy2+4y3+y4;
generalOrder(f);
↳ 2
```

D.12.7 rootsmr_lib

Library: rootsmr.lib

Purpose: Counting the number of real roots of polynomial systems

Author: Enrique A. Tobis, etobis@dc.uba.ar

Overview: Routines for counting the number of real roots of a multivariate polynomial system. Two methods are implemented: deterministic computation of the number of roots, via the signature of a certain bilinear form (nrRootsDeterm); and a rational univariate projection, using a pseudorandom polynomial (nrRootsProbab). It also includes a command to verify the correctness of the pseudorandom answer.

References:

Basu, Pollack, Roy, "Algorithms in Real Algebraic Geometry", Springer, 2003.

Procedures:

D.12.7.1 nrRootsProbab

Procedure from library rootsmr.lib (see [Section D.12.7 \[rootsmr_lib\]](#), page 1577).

Return: int: the number of real roots of the ideal I by a probabilistic algorithm

Assume: If I is not a Groebner basis, then a Groebner basis will be computed by using std. If I is already a Groebner basis (i.e. if attrib(I,"isSB"); returns 1) then this Groebner basis will be used, hence it must be one w.r.t. (any) global ordering. This may be useful if the ideal is known to be a Groebner basis or if it can be computed faster by a different method.

Note: If n<10 is given, n is the number of digits being used for constructing a random characteristic polynomial, a bigger n is more safe but slower (default: n=5).
If printlevel>0 the number of complex solutions is displayed (default: printlevel=0).

Example:

```
LIB "rootsmr.lib";
ring r = 0,(x,y,z),lp;
ideal i = (x-1)*(x-2),(y-1)^3*(x-y),(z-1)*(z-2)*(z-3)^2;
nrRootsProbab(i);          //no of real roots (using internally std)
↳ 9

See also: [Section D.12.7.2 \[nrRootsDeterm\]](#), page 1578; [Section D.12.8.15 \[nrroots\]](#), page 1592; [Section D.12.7.9 \[randcharpoly\]](#), page 1581; [Section D.8.3.2 \[solve\]](#), page 1415.

D.12.7.2 nrRootsDeterm

Procedure from library `rootsmr.lib` (see [Section D.12.7 \[rootsmr.lib\]](#), page 1577).

Return: int: the number of real roots of the ideal I by a deterministic algorithm

Assume: If I is not a Groebner basis, then a Groebner basis will be computed by using `std`. If I is already a Groebner basis (i.e. if `attrib(I,"isSB")`; returns 1) then this Groebner basis will be used, hence it must be one w.r.t. (any) global ordering. This may be useful if the ideal is known to be a Groebner basis or if it can be computed faster by a different method.

Note: If `printlevel>0` the number of complex solutions is displayed (default: `printlevel=0`). The procedure `nrRootsProbab` is usually faster.

Example:

```
LIB "rootsmr.lib";
ring r = 0,(x,y,z),lp;
ideal I = (x-1)*(x-2),(y-1),(z-1)*(z-2)*(z-3)^2;
nrRootsDeterm(I);          //no of real roots (using internally std)
↪ 6
I = groebner(I);          //using the hilbert driven GB computation
int pr = printlevel;
printlevel = 2;
nrRootsDeterm(I);
↪ //ideal has 8 complex solutions, counted with multiplicity
↪ 6
printlevel = pr;
```

See also: [Section D.12.7.1 \[nrRootsProbab\]](#), page 1577; [Section D.12.8.15 \[nrroots\]](#), page 1592; [Section D.8.3.2 \[solve\]](#), page 1415; [Section D.12.7.4 \[sturmquery\]](#), page 1579.

D.12.7.3 symsignature

Procedure from library `rootsmr.lib` (see [Section D.12.7 \[rootsmr.lib\]](#), page 1577).

Usage: `symsignature(m)`; m matrix. m must be symmetric.

Return: int: the signature of m

Example:

```
LIB "rootsmr.lib";
ring r = 0,(x,y),dp;
ideal i = x4-y2x,y2-13;
i = std(i);
ideal b = qbase(i);
matrix m = matbil(1,b,i);
symsignature(m);
↪ 4
```

See also: [Section D.12.7.5 \[matbil\]](#), page 1579; [Section D.12.7.4 \[sturmquery\]](#), page 1579.

D.12.7.4 sturmquery

Procedure from library `rootsmr.lib` (see [Section D.12.7 \[rootsmr.lib\]](#), page 1577).

Usage: `sturmquery(h,b,i)`; h poly, b,i ideal

Return: `int`: the Sturm query of h in $V(i)$

Assume: i is a Groebner basis, b is an ordered monomial basis of r/i , $r = \text{basing}$.

Example:

```
LIB "rootsmr.lib";
ring r = 0,(x,y),dp;
ideal i = x4-y2x,y2-13;
i = std(i);
ideal b = qbase(i);
sturmquery(1,b,i);
↪ 4
```

See also: [Section D.12.7.5 \[matbil\]](#), page 1579; [Section D.12.7.3 \[symsignature\]](#), page 1578.

D.12.7.5 matbil

Procedure from library `rootsmr.lib` (see [Section D.12.7 \[rootsmr.lib\]](#), page 1577).

Usage: `matbil(h,b,i)`; h poly, b,i ideal

Return: `matrix`: the matrix of the bilinear form $(f,g) \mapsto \text{trace}(m \cdot fhg)$, $m \cdot fhg =$ multiplication with fhg on r/i

Assume: i is a Groebner basis and b is an ordered monomial basis of r/i , $r = \text{basing}$

Example:

```
LIB "rootsmr.lib";
ring r = 0,(x,y),dp;
ideal i = x4-y2x,y2-13;
i = std(i);
ideal b = qbase(i);
poly f = x3-xy+y-13+x4-y2x;
matrix m = matbil(f,b,i);
print(m);
↪ 0, 13182, 0, -13182, 0, 0, 0, 1014,

```

See also: [Section D.12.7.6 \[matmult\]](#), page 1579; [Section D.12.7.7 \[tracemult\]](#), page 1580.

D.12.7.6 matmult

Procedure from library `rootsmr.lib` (see [Section D.12.7 \[rootsmr.lib\]](#), page 1577).

Usage: `matmult(f,b,i)`; f poly, b,i ideal

Return: `matrix`: the matrix of the multiplication map by f ($m \cdot f$) on r/i w.r.t. to the monomial basis b of r/i ($r = \text{basing}$)

Assume: i is a Groebner basis and b is an ordered monomial basis of r/i , as given by `qbase(i)`

Example:

```
LIB "rootsmr.lib";
ring r = 0,(x,y),dp;
ideal i = x4-y2x,y2-13;
i = std(i);
ideal b = qbase(i);
poly f = x3-xy+y-13+x4-y2x;
matrix m = matmult(f,b,i);
print(m);
↪ 0, 1, 0, -1,0, 0, 1, 0,
↪ 13, 0, -13,0, 0, 0, 0, 1,
↪ 0, 0, 0, 1, 0, -1,0, 0,
↪ 0, 0, 13, 0, -13,0, 0, 0,
↪ 0, -13,0, 0, 0, 1, 0, -1,
↪ -169,0, 0, 0, 13, 0, -13,0,
↪ 0, 0, 0, 0, 0, 0, -13,1,
↪ 0, 0, 0, 0, 0, 0, 13, -13
```

See also: [Section D.12.7.8 \[coords\]](#), page 1581; [Section D.12.7.5 \[matbil\]](#), page 1579.

D.12.7.7 tracemult

Procedure from library `rootsmr.lib` (see [Section D.12.7 \[rootsmr.lib\]](#), page 1577).

Usage: `tracemult(f,B,I);f poly, B,I ideal`

Return: number: the trace of the multiplication by f ($m \cdot f$) on r/I , written in the monomial basis B of r/I , $r = \text{basering}$ (faster than `matmult + trace`)

Assume: I is given by a Groebner basis and B is an ordered monomial basis of r/I

Example:

```
LIB "rootsmr.lib";
ring r = 0,(x,y),dp;
ideal i = x4-y2x,y2-13;
i = std(i);
ideal b = qbase(i);
poly f = x3-xy+y-13+x4-y2x;
matrix m = matmult(f,b,i);
print(m);
↪ 0, 1, 0, -1,0, 0, 1, 0,
↪ 13, 0, -13,0, 0, 0, 0, 1,
↪ 0, 0, 0, 1, 0, -1,0, 0,
↪ 0, 0, 13, 0, -13,0, 0, 0,
↪ 0, -13,0, 0, 0, 1, 0, -1,
↪ -169,0, 0, 0, 13, 0, -13,0,
↪ 0, 0, 0, 0, 0, 0, -13,1,
↪ 0, 0, 0, 0, 0, 0, 13, -13
tracemult(f,b,i); //the trace of m
↪ -26
```

See also: [Section D.12.7.6 \[matmult\]](#), page 1579; [Section 5.1.153 \[trace\]](#), page 276.

D.12.7.8 coords

Procedure from library `rootsmr.lib` (see [Section D.12.7 \[rootsmr.lib\], page 1577](#)).

Usage: `coords(f,b,i)`, f poly, b,i ideal

Return: list of numbers: the coordinates of the class of $f \pmod{i}$ in the monomial basis b

Assume: i is a Groebner basis and b is an ordered monomial basis of r/i , $r = \text{basering}$

Example:

```
LIB "rootsmr.lib";
ring r = 0, (x,y), dp;
ideal i = x4-y2x,y2-13;
poly f = x3-xy+y-13+x4-y2x;
i = std(i);
ideal b = qbase(i);
b;
↳ b[1]=x3y
↳ b[2]=x3
↳ b[3]=x2y
↳ b[4]=x2
↳ b[5]=xy
↳ b[6]=x
↳ b[7]=y
↳ b[8]=1
coords(f,b,i);

↳ [7]:
↳ 1
↳ [8]:
↳ -13
```

See also: [Section D.12.7.5 \[matbil\], page 1579](#); [Section D.12.7.6 \[matmult\], page 1579](#).

D.12.7.9 randcharpoly

Procedure from library `rootsmr.lib` (see [Section D.12.7 \[rootsmr.lib\], page 1577](#)).

Usage: `randcharpoly(b,i)`; `randcharpoly(b,i,n)`; b,i ideal; n int

Return: `poly`: the characteristic polynomial of a pseudorandom rational univariate projection having one zero per zero of i . If $n < 10$ is given, it is the number of digits being used for the pseudorandom coefficients (default: $n=5$)

Assume: i is a Groebner basis and b is an ordered monomial basis of r/i , $r = \text{basering}$

Note: shows a warning if `printlevel>0` (default: `printlevel=0`)

Example:

```
LIB "rootsmr.lib";
ring r = 0,(x,y,z),dp;
ideal i = (x-1)*(x-2),(y-1),(z-1)*(z-2)*(z-3)^2;
i = std(i);
ideal b = qbase(i);
poly p = randcharpoly(b,i);

```

D.12.7.10 verify

Procedure from library `rootsmr.lib` (see [Section D.12.7 \[rootsmr.lib\]](#), page 1577).

Usage: `verify(p,B,I);` p poly, B,I,ideal

Return: integer: 1 if and only if the polynomial p splits the points of $V(I)$. It's used to check the result of `randcharpoly`

Assume: I is given by a Groebner basis and B is an ordered monomial basis of r/I , $r = \text{basering}$

Note: comments the result if `printlevel>0` (default: `printlevel=0`)

Example:

```
LIB "rootsmr.lib";
ring r = 0,(x,y),dp;
poly f = x3-xy+y-13+x4-y2x;
ideal i = x4-y2x,y2-13;
i = std(i);
```

```

ideal b = qbase(i);
poly p = randcharpoly(b,i);
verify(p,b,i);
↪ 1

```

See also: [Section D.12.7.9 \[randcharpoly\]](#), page 1581.

D.12.7.11 randlinpoly

Procedure from library `rootsmr.lib` (see [Section D.12.7 \[rootsmr.lib\]](#), page 1577).

Usage: `randlinpoly()`; `randlinpoly(n)`; `n` int

Return: `poly`: linear combination of the variables of the ring, with pseudorandom coefficients. If `n < 10` is given, it is the number of digits being used for the range of the coefficients (default: `n=5`)

Example:

```

LIB "rootsmr.lib";
ring r = 0, (x,y,z,w), dp;
poly p = randlinpoly();
p;
↪ 80035x+36642y+40875z+54263w
randlinpoly(5);
↪ 68857x+95664y+28174z+34170w

```

See also: [Section D.12.7.9 \[randcharpoly\]](#), page 1581.

D.12.7.12 powersums

Procedure from library `rootsmr.lib` (see [Section D.12.7 \[rootsmr.lib\]](#), page 1577).

Usage: `powersums(f,b,i)`; `f` poly; `b,i` ideal

Return: `list`: the powersums of the results of evaluating `f` at the zeros of `I`

Assume: `i` is a Groebner basis and `b` is an ordered monomial basis of `r/i`, `r = basering`

Example:

```

LIB "rootsmr.lib";
ring r = 0, (x,y,z), dp;
ideal i = (x-1)*(x-2), (y-1), (z+5); // V(I) = {(1,1,-5), (2,1,-5)}
i = std(i);
ideal b = qbase(i);
poly f = x+y+z;
list psums = list(-2-3,4+9); // f evaluated at V(I) gives {-3,-2}
list l = powersums(f,b,i);
psums;

↪ -5
↪ [2]:
↪ 13
l;
↪ [1]:
↪ -5
↪ [2]:
↪ 13

```

See also: [Section D.12.7.13 \[symmfunc\]](#), page 1584.

D.12.7.13 symmfunc

Procedure from library `rootsmr.lib` (see [Section D.12.7 \[rootsmr.lib\]](#), page 1577).

Usage: `symmfunc(s); s list`

Return: `list`: the symmetric functions of the roots of a polynomial, given the power sums of those roots.

Example:

```
LIB "rootsmr.lib";
ring r = 0,x,dp;
poly p = (x-1)*(x-2)*(x-3);
list psums = list(1+2+3,1+4+9,1+8+27);
list l = symmfunc(psums);
l;
↳ [1]:
↳ 1
↳ [2]:
↳ -6
↳ [3]:
↳ 11
↳ [4]:
↳ -6
p; // Compare p with the elements of l
↳ x3-6x2+11x-6
```

See also: [Section D.12.7.12 \[powersums\]](#), page 1583.

D.12.7.14 univarpoly

Procedure from library `rootsmr.lib` (see [Section D.12.7 \[rootsmr.lib\]](#), page 1577).

Usage: `univarpoly(l); l list`

Return: `poly`: a polynomial `p` on the first variable of basering, say `x`, with $p = l[1] + l[2]*x + l[3]*x^2 + \dots$

Example:

```
LIB "rootsmr.lib";
ring r = 0,x,dp;
list l = list(1,2,3,4,5);
poly p = univarpoly(l);
p;
↳ x4+2x3+3x2+4x+5
```

D.12.7.15 qbase

Procedure from library `rootsmr.lib` (see [Section D.12.7 \[rootsmr.lib\]](#), page 1577).

Usage: `qbase(I); I zero-dimensional ideal`

Return: `ideal`: A monomial basis of the quotient between the basering and the ideal `I`, sorted according to the basering order.

Example:

```

LIB "rootsmr.lib";
ring r = 0, (x,y,z), dp;
ideal i = 2x2, -y2, z3;
i = std(i);
ideal b = qbase(i);
b;
↳ b[1]=xyz2
↳ b[2]=xyz
↳ b[3]=xz2
↳ b[4]=yz2
↳ b[5]=xy
↳ b[6]=xz
↳ b[7]=yz
↳ b[8]=z2
↳ b[9]=x
↳ b[10]=y
↳ b[11]=z
↳ b[12]=1
b = kbase(i);
b; // Compare this with the result of qbase
↳ b[1]=xyz2
↳ b[2]=yz2
↳ b[3]=xz2
↳ b[4]=z2
↳ b[5]=xyz
↳ b[6]=yz
↳ b[7]=xz
↳ b[8]=z
↳ b[9]=xy
↳ b[10]=y
↳ b[11]=x
↳ b[12]=1

```

See also: [Section 5.1.67 \[kbase\]](#), page 203.

D.12.8 rootsur_lib

Library: rootsur.lib

Purpose: Counting number of real roots of univariate polynomial

Author: Enrique A. Tobis, etobis@dc.uba.ar

Overview: Routines for bounding and counting the number of real roots of a univariate polynomial, by means of several different methods, namely Descartes' rule of signs, the Budan-Fourier theorem, Sturm sequences and Sturm-Habicht sequences. The first two give bounds on the number of roots. The other two compute the actual number of roots of the polynomial. There are several wrapper functions, to simplify the application of the aforesaid theorems and some functions to determine whether a given polynomial is univariate.

References:

Basu, Pollack, Roy, "Algorithms in Real Algebraic Geometry", Springer, 2003.

Procedures:

D.12.8.1 isuni

Procedure from library `rootsur.lib` (see [Section D.12.8 \[rootsur.lib\], page 1585](#)).

Usage: `isuni(p)`; poly `p`;

Return: poly: if `p` is a univariate polynomial, it returns the variable. If not, zero.

Example:

```
LIB "rootsur.lib";
ring r = 0,(x,y),dp;
poly p = 6x7-3x2+2x-15/7;
isuni(p);
  ↪ x
isuni(p*y);
  ↪ 0
```

See also: [Section D.12.8.2 \[whichvariable\], page 1586](#).

D.12.8.2 whichvariable

Procedure from library `rootsur.lib` (see [Section D.12.8 \[rootsur.lib\], page 1585](#)).

Usage: `whichvariable(p)`; poly `p`

Return: poly: if `p` is a univariate monomial, the variable. Otherwise 0.

Assume: `p` is a monomial

Example:

```
LIB "rootsur.lib";
ring r = 0,(x,y),dp;
whichvariable(x5);
  ↪ x
whichvariable(x3y);
  ↪ 0
```

See also: [Section D.12.8.1 \[isuni\], page 1586](#).

D.12.8.3 varsigns

Procedure from library `rootsur.lib` (see [Section D.12.8 \[rootsur.lib\], page 1585](#)).

Usage: `varsigns(l)`; list `l`.

Return: int: the number of sign changes in the list `l`

Example:

```
LIB "rootsur.lib";
ring r = 0,x,dp;
list l = 1,2,3;
varsigns(l);
  ↪ 0
l = 1,-1,2,-2,3,-3;
varsigns(l);
  ↪ 5
```

See also: [Section D.12.8.5 \[boundposDes\], page 1587](#).

D.12.8.4 boundBuFou

Procedure from library `rootsur.lib` (see [Section D.12.8 \[rootsur.lib\]](#), page 1585).

Usage: `boundBuFou(p,a,b)`; `p` poly, `a,b` number

Return: `int`: an upper bound for the number of real roots of `p` in $(a,b]$, with the same parity as the actual number of roots (using the Budan-Fourier Theorem)

Assume: - `p` is a univariate polynomial with rational coefficients
- `a, b` are rational numbers with $a < b$

Example:

```
LIB "rootsur.lib";
ring r = 0,x,dp;
poly p = (x+2)*(x-1)*(x-5);
boundBuFou(p,-3,5);
↪ 3
boundBuFou(p,-2,5);
↪ 2
```

See also: [Section D.12.8.5 \[boundposDes\]](#), page 1587; [Section D.12.8.3 \[varsigns\]](#), page 1586.

D.12.8.5 boundposDes

Procedure from library `rootsur.lib` (see [Section D.12.8 \[rootsur.lib\]](#), page 1585).

Usage: `boundposDes(p)`; poly `p`

Return: `int`: an upper bound for the number of positive roots of `p`, with the same parity as the actual number of positive roots of `p`.

Assume: `p` is a univariate polynomial with rational coefficients

Example:

```
LIB "rootsur.lib";
ring r = 0,x,dp;
poly p = (x+2)*(x-1)*(x-5);
boundposDes(p);
↪ 2
p = p*(x2+1);
boundposDes(p);
↪ 4
```

See also: [Section D.12.8.4 \[boundBuFou\]](#), page 1587.

D.12.8.6 boundDes

Procedure from library `rootsur.lib` (see [Section D.12.8 \[rootsur.lib\]](#), page 1585).

Usage: `boundDes(p)`; poly `p`

Return: `int`: an upper bound for the number of real roots of `p`, with the same parity as the actual number of real roots of `p`.

Assume: `p` is a univariate polynomial with rational coefficients

Example:

```

LIB "rootsur.lib";
ring r = 0,x,dp;
poly p = (x+2)*(x-1)*(x-5);
boundDes(p);
↳ 3
p = p*(x2+1);
boundDes(p);
↳ 5

```

See also: [Section D.12.8.4 \[boundBuFou\]](#), page 1587.

D.12.8.7 allrealst

Procedure from library `rootsur.lib` (see [Section D.12.8 \[rootsur_lib\]](#), page 1585).

Usage: `allrealst(p); poly p`

Return: `int`: 1 if and only if all the roots of `p` are real, 0 otherwise. Checks by using Sturm's Theorem whether all the roots of `p` are real

Assume: `p` is a univariate polynomial with rational coefficients

Example:

```

LIB "rootsur.lib";
ring r = 0,x,dp;
poly p = (x+2)*(x-1)*(x-5);
allrealst(p);
↳ 1
p = p*(x2+1);
allrealst(p);
↳ 0

```

See also: [Section D.12.8.9 \[allreal\]](#), page 1589; [Section D.12.8.10 \[sturm\]](#), page 1589; [Section D.12.8.12 \[sturmha\]](#), page 1590.

D.12.8.8 maxabs

Procedure from library `rootsur.lib` (see [Section D.12.8 \[rootsur_lib\]](#), page 1585).

Usage: `maxabs(p); poly p`

Return: `number`: an upper bound for the largest absolute value of a root of `p`

Assume: `p` is a univariate polynomial with rational coefficients

Example:

```

LIB "rootsur.lib";
ring r = 0,x,dp;
poly p = (x+2)*(x-1)*(x-5);
maxabs(p);
↳ 11

```

See also: [Section D.12.8.10 \[sturm\]](#), page 1589.

D.12.8.9 allreal

Procedure from library `rootsur.lib` (see [Section D.12.8 \[rootsur.lib\]](#), page 1585).

Usage: `allreal(p);`

Return: `int`: 1 if and only if all the roots of `p` are real, 0 otherwise

Example:

```
LIB "rootsur.lib";
ring r = 0,x,dp;
poly p = (x+2)*(x-1)*(x-5);
allreal(p);
↪ 1
p = p*(x2+1);
allreal(p);
↪ 0
```

See also: [Section D.12.8.7 \[allrealst\]](#), page 1588.

D.12.8.10 sturm

Procedure from library `rootsur.lib` (see [Section D.12.8 \[rootsur.lib\]](#), page 1585).

Usage: `sturm(p,a,b);` poly `p`, number `a,b`

Return: `int`: the number of real roots of `p` in $(a,b]$

Assume: `p` is a univariate polynomial with rational coefficients,
`a, b` are rational numbers with $a < b$

Example:

```
LIB "rootsur.lib";
ring r = 0,x,dp;
poly p = (x+2)*(x-1)*(x-5);
sturm(p,-3,6);
↪ 3
p = p*(x2+1);
sturm(p,-3,6);
↪ 3
p = p*(x+2);
sturm(p,-3,6);
↪ 3
```

See also: [Section D.12.8.9 \[allreal\]](#), page 1589; [Section D.12.8.7 \[allrealst\]](#), page 1588; [Section D.12.8.12 \[sturmha\]](#), page 1590.

D.12.8.11 sturmseq

Procedure from library `rootsur.lib` (see [Section D.12.8 \[rootsur.lib\]](#), page 1585).

Usage: `sturmseq(p);` `p` poly

Return: `list`: a Sturm sequence of `p`

Assume: `p` is a univariate polynomial with rational coefficients

Theory: The Sturm sequence of `p` (also called remainder sequence) is the sequence beginning with `p, p'` and goes on with the negative part of the remainder of the two previous polynomials, until the remainder is zero.

See: Basu, Pollack, Roy, Algorithms in Real Algebraic Geometry, Springer, 2003.

Example:

```

LIB "rootsur.lib";
ring r = 0,(z,x),dp;
poly p = x5-3x4+12x3+7x-153;
sturmseq(p);
↳ [1]:
↳ x5-3x4+12x3+7x-153
↳ [2]:
↳ x4-12/5x3+36/5x2+7/5
↳ [3]:
↳ -x3-9/7x2-5/3x+317/7
↳ [4]:
↳ -x2-756/151x+2433/151
↳ [5]:
↳ x-514191/177889
↳ [6]:
↳ 1

```

See also: [Section D.12.8.10 \[sturm\]](#), page 1589; [Section D.12.8.13 \[sturmhaseq\]](#), page 1590.

D.12.8.12 sturmha

Procedure from library `rootsur.lib` (see [Section D.12.8 \[rootsur.lib\]](#), page 1585).

Usage: `sturmha(p,a,b)`; poly p , number a,b

Return: int: the number of real roots of p in (a,b) (using a Sturm-Habicht sequence)

Example:

```

LIB "rootsur.lib";
ring r = 0,x,dp;
poly p = (x+2)*(x-1)*(x-5);
sturmha(p,-3,6);
↳ 3
p = p*(x2+1);
sturmha(p,-3,6);
↳ 3

```

See also: [Section D.12.8.9 \[allreal\]](#), page 1589; [Section D.12.8.10 \[sturm\]](#), page 1589.

D.12.8.13 sturmhaseq

Procedure from library `rootsur.lib` (see [Section D.12.8 \[rootsur.lib\]](#), page 1585).

Usage: `sturmhaseq(P)`; P poly.

Return: list: the non-zero polynomials of the Sturm-Habicht sequence of P

Assume: P is a univariate polynomial.

Theory: The Sturm-Habicht sequence (also subresultant sequence) is closely related to the Sturm sequence, but behaves better with respect to the size of the coefficients. It is defined via subresultants. See: Basu, Pollack, Roy, *Algorithms in Real Algebraic Geometry*, Springer, 2003.

Example:

```

LIB "rootsur.lib";
ring r = 0,x,dp;
poly p = x5-x4+x-3/2;
list l = sturmhaseq(p);
l;
↳ [1]:
↳ 132949/16
↳ [2]:
↳ -25x-332
↳ [3]:
↳ -16x2+42x-24
↳ [4]:
↳ 4x3-20x+73/2
↳ [5]:
↳ 5x4-4x3+1
↳ [6]:
↳ x5-x4+x-3/2

```

See also: [Section D.12.8.10 \[sturm\]](#), page 1589; [Section D.12.8.12 \[sturmha\]](#), page 1590; [Section D.12.8.11 \[sturmseq\]](#), page 1589.

D.12.8.14 reverse

Procedure from library `rootsur.lib` (see [Section D.12.8 \[rootsur.lib\]](#), page 1585).

Usage: `reverse(l); l list`

Return: `list: l reversed.`

Example:

```

LIB "rootsur.lib";
ring r = 0,x,dp;
list l = 1,2,3,4,5;
list rev = reverse(l);
l;
↳ [1]:
↳ 1
↳ [2]:
↳ 2
↳ [3]:
↳ 3
↳ [4]:
↳ 4
↳ [5]:
↳ 5
rev;
↳ [1]:
↳ 5
↳ [2]:
↳ 4
↳ [3]:
↳ 3
↳ [4]:
↳ 2
↳ [5]:
↳ 1

```

D.12.8.15 nrroots

Procedure from library `rootsur.lib` (see [Section D.12.8 \[rootsur.lib\]](#), page 1585).

Usage: `nrroots(p); poly p`

Return: `int`: the number of real roots of `p`

Example:

```
LIB "rootsur.lib";
ring r = 0,x,dp;
poly p = (x+2)*(x-1)*(x-5);
nrroots(p);
↪ 3
p = p*(x2+1);
nrroots(p);
↪ 3
```

See also: [Section D.12.8.5 \[boundposDes\]](#), page 1587; [Section D.12.8.10 \[sturm\]](#), page 1589; [Section D.12.8.12 \[sturmha\]](#), page 1590.

D.12.8.16 isparam

Procedure from library `rootsur.lib` (see [Section D.12.8 \[rootsur.lib\]](#), page 1585).

Usage: `isparam(ideal/module/poly/list);`

Return: `int`: 0 if the argument has non-parametric coefficients and 1 if it has parametric coefficients

Example:

```
LIB "rootsur.lib";
ring r = 0,x,dp;
isparam(2x3-56x+2);
↪ 0
ring s = (0,a,b,c),x,dp;
isparam(2x3-56x+2);
↪ 0
isparam(2x3-56x+abc);
↪ 1
```

D.13 Tropical Geometry

D.13.1 gfan.lib

Library: `gfan.lib`

Purpose: Interface to `gfan` and `gfanlib` for computations in convex geometry

Authors: Anders N. Jensen, email: jensen@imf.au.dk
Yue Ren, email: ren@mathematik.uni-kl.de
Frank Seelisch

Procedures:

D.13.1.1 fullSpace

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `fullSpace(n); n int`

Return: cone, the ambient space of dimension `n`

Example:

```
LIB "gfan.lib";
cone c = fullSpace(2);
generatorsOfLinealitySpace(c);
↪ -1, 0,
↪ 0, -1
```

D.13.1.2 origin

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `origin(n); n int`

Return: cone, the origin in an ambient space of dimension `n`

Example:

```
LIB "gfan.lib";
cone c = origin(2);
equations(c);
↪ 1,0,
↪ 0,1
```

D.13.1.3 positiveOrthant

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `positiveOrthant(n); n int`

Return: cone, the positive orthant of dimension `n`

Example:

```
LIB "gfan.lib";
cone c = positiveOrthant(2);
rays(c);
↪ 1,0,
↪ 0,1
```

D.13.1.4 ambientDimension

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `ambientDimension(c); c cone`
`ambientDimension(f); f fan`
`ambientDimension(p); p polytope`

Return: int, the dimension of the ambient space the input lives in

Example:

```

LIB "gfan.lib";
intmat M1[2][2]=
1,0,
0,1;
cone c1=coneViaPoints(M1);
ambientDimension(c1);
↳ 2
intmat M2[2][3]=
1,0,0,
0,1,0;
cone c2=coneViaPoints(M2);
ambientDimension(c2);
↳ 3
fan f = emptyFan(3);
ambientDimension(f);
↳ 3

```

D.13.1.5 canonicalizeCone

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `canonicalizeCone(c); c cone`

Return: `cone`, a unique representation of the cone `c`

Example:

```

LIB "gfan.lib";
intmat M[5][3]=
8,1,9,
9,2,4,
0,6,2,
8,8,8,
0,9,5;
cone c=coneViaInequalities(M);
c;
↳ AMBIENT_DIM
↳ 3
↳ INEQUALITIES
↳ 0,3,1,
↳ 0,9,5,
↳ 1,1,1,
↳ 8,1,9,
↳ 9,2,4
↳ LINEAR_SPAN
↳
↳
cone cc=canonicalizeCone(c);
cc;
↳ AMBIENT_DIM
↳ 3
↳ FACETS
↳ 0,3,1,
↳ 0,9,5,
↳ 8,1,9,

```

```

↳ 9,2,4
↳ LINEAR_SPAN
↳
↳
// computes a unique representation of c
c == cc;
↳ 1
// some procedures work with the known inequalities and equations
// in order to obtain a unique output,
// bring the cone in canonical form beforehand
relativeInteriorPoint(c);
↳ 7,4,-6
relativeInteriorPoint(cc);
↳ 7,4,-6

```

D.13.1.6 codimension

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `codimension(c)`; `c` cone
 `codimension(f)`; `f` fan
 `codimension(p)`; `p` polytope

Return: `int`, the codimension of the input

Example:

```

LIB "gfan.lib";
intmat M1[1][2]=
1,0;
cone c1=coneViaPoints(M1);
codimension(c1);
↳ 1
intmat M2[2][2]=
1,0,
0,1;
cone c2=coneViaPoints(M2);
codimension(c2);
↳ 0
fan f = emptyFan(2);
codimension(f);
↳ -1
insertCone(f,c1);
codimension(f);
↳ 1
insertCone(f,c2);
codimension(f);
↳ 0

```

D.13.1.7 coneViaPoints

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `coneViaPoints(HL)`; `intmat HL`
 `coneViaPoints(HL,L)`; `intmat HL`, `intmat L`
 `coneViaPoints(HL,L,flags)`; `intmat HL`, `intmat L`, `int flags`

Return: cone

Purpose: cone generated by half lines generated by the row vectors of HL and (if stated) by lines generated by the row vectors of L; flags may range between 0,...,3 defining an upper and lower bit ($0=0*2+0$, $1=0*2+1$, $2=1*2+0$, $3=1*2+1$),
 if upper bit is 1, then program assumes that each row vector in HL generates a ray of the cone,
 if lower bit is 1, then program assumes that the span of the row vectors of L is the lineality space of the cone,
 if either bit is 0, then program computes the information itself.

Example:

```
LIB "gfan.lib";
// Let's define a cone in R^3 generated by the following half lines:
intmat HL[5][3]=
1,0, 0,
-1,0, 0,
0,1, 1,
0,1,-1,
0,0, 1;
cone c=coneViaPoints(HL);
c;
↳ AMBIENT_DIM
↳ 3
↳ FACETS
↳ 0,1,0,
↳ 0,1,1
↳ LINEAR_SPAN
↳
↳
kill HL,c;
// Note that (1,0,0) and (-1,0,0) form a line, hence also possible:
intmat HL[3][3]=
0,1, 1,
0,1,-1,
0,0, 1;
intmat L[1][3]=
1,0,0;
cone c=coneViaPoints(HL,L);
c;
↳ AMBIENT_DIM
↳ 3
↳ FACETS
↳ 0,1,0,
↳ 0,1,1
↳ LINEAR_SPAN
↳
↳
kill HL,L,c;
// lineality space is exactly Lin(1,0,0)
intmat HL[3][3]=
0,1, 1,
0,1,-1,
0,0, 1;
```

```

intmat L[1][3]=
1,0,0;
cone c=coneViaPoints(HL,L,1);
c;
↳ AMBIENT_DIM
↳ 3
↳ FACETS
↳ 0,1,0,
↳ 0,1,1
↳ LINEAR_SPAN
↳
↳
kill HL,L,c;
// and that (0,1,-1), (0,1,1) generate rays
intmat HL[3][3]=
0,1, 1,
0,1,-1;
intmat L[1][3]=
1,0,0;
cone c=coneViaPoints(HL,L,1);
c;
↳ AMBIENT_DIM
↳ 3
↳ FACETS
↳ 0,1,-1,
↳ 0,1, 1
↳ LINEAR_SPAN
↳
↳
kill HL,L,c;
// and that (0,1,-1), (0,1,1) generate rays
intmat HL[3][3]=
0,1, 1,
0,1,-1;
intmat L[1][3]=
1,0,0;
cone c=coneViaPoints(HL,L,3);
c;
↳ AMBIENT_DIM
↳ 3
↳ FACETS
↳ 0,1,-1,
↳ 0,1, 1
↳ LINEAR_SPAN
↳
↳

```

D.13.1.8 coneViaInequalities

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\]](#), page 1592).

Usage: `coneViaInequalities(IE);` intmat IE
 `coneViaInequalities(IE,E);` intmat IE, intmat E
 `coneViaInequalities(IE,E,flags);` intmat IE, intmat E, int flags

Return: cone

Purpose: cone consisting of all points x , such that $IE*x \geq 0$ in each component and (if stated) $E*x = 0$;
 inequalities and (if stated) equations will be transformed, getting rid of redundancies;
 flags may range between 0,...,3 defining an upper and lower bit ($0=0*2+0$, $1=0*2+1$,
 $2=1*2+0$, $3=1*2+1$),
 if higher bit is 1, then program assumes each inequality yields a facet, if lower bit is 1,
 then program assumes the kernel of E is the span of the cone, if either bit is 0, then
 program computes the information itself.

Example:

```
LIB "gfan.lib";
// Let's define a cone in R^3 given by the following inequalities:
intmat IE[6][3]=
1,3,5,
1,5,3,
0,1,-1,
0,1,1,
1,0,0,
-1,0,0;
cone c=coneViaInequalities(IE);
c;
↳ AMBIENT_DIM
↳ 3
↳ INEQUALITIES
↳ 0,1,-1,
↳ 0,1, 1,
↳ 1,3, 5,
↳ 1,5, 3
↳ LINEAR_SPAN
↳ -1,0,0
↳
// Note that the last two inequalities yield  $x_1 = 0$ , hence also possible:
intmat IE[4][3]=
↳ // ** redefining IE (intmat IE[4][3]=)
0,1,-1,
0,1,1;
intmat E[1][3]=
1,0,0;
cone c=coneViaInequalities(IE,E);
↳ // ** redefining c (cone c=coneViaInequalities(IE,E);)
c;
↳ AMBIENT_DIM
↳ 3
↳ INEQUALITIES
↳ 0,1,-1,
↳ 0,1, 1
↳ LINEAR_SPAN
↳ 1,0,0
↳
// each inequalities gives rise to a facet
intmat IE[2][3]=
↳ // ** redefining IE (intmat IE[2][3]=)
```

```

0,1,-1,
0,1,1;
intmat E[1][3]=
↳ // ** redefining E (intmat E[1][3]=)
1,0,0;
cone c=coneViaInequalities(IE,E,1);
↳ // ** redefining c (cone c=coneViaInequalities(IE,E,1);)
c;
↳ AMBIENT_DIM
↳ 3
↳ INEQUALITIES
↳ 0,1,-1,
↳ 0,1, 1
↳ LINEAR_SPAN
↳ 1,0,0
↳
// and the kernel of E is the span of the cone
intmat IE[2][3]=
↳ // ** redefining IE (intmat IE[2][3]=)
0,1,-1,
0,1,1;
intmat E[1][3]=
↳ // ** redefining E (intmat E[1][3]=)
1,0,0;
cone c=coneViaInequalities(IE,E,3);
↳ // ** redefining c (cone c=coneViaInequalities(IE,E,3);)
c;
↳ AMBIENT_DIM
↳ 3
↳ FACETS
↳ 0,1,-1,
↳ 0,1, 1
↳ LINEAR_SPAN
↳ 1,0,0
↳

```

D.13.1.9 coneLink

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\]](#), page 1592).

Usage: `coneLink(c,w)`; `c` cone, `w` intvec/bigintmat

Return: cone, the link of `c` around `w`

Example:

```

LIB "gfan.lib";
intmat M[3][3]=
1,0,0,
0,1,0,
0,0,1;
cone c=coneViaPoints(M);
intvec v=1,0,0;
cone cv=coneLink(c,v);
rays(cv);

```

```

↳ 0,1,0,
↳ 0,0,1
generatorsOfLinealitySpace(cw);
↳ -1,0,0
intvec w=1,1,1;
cone cw=coneLink(c,w);
rays(cw);
↳
generatorsOfLinealitySpace(cw);
↳ -1, 0, 0,
↳ 0,-1, 0,
↳ 0, 0,-1

```

D.13.1.10 containsAsFace

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `containsAsFace(c,d)`; `c` cone, `d` cone

Return: 1, if `d` is a face of `c`; 0 otherwise

Example:

```

LIB "gfan.lib";
intmat M[2][2]=
1,0,
0,1;
cone c=coneViaPoints(M);
intmat N1[1][2]=
1,1;
cone d1=coneViaPoints(N1);
containsInSupport(c,d1);
↳ 1
containsAsFace(c,d1);
↳ 0
intmat N2[1][2]=
0,1;
cone d2=coneViaPoints(N2);
containsInSupport(c,d2);
↳ 1
containsAsFace(c,d2);
↳ 1

```

D.13.1.11 containsInSupport

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `containsInSupport(c,d)`; `c` cone, `d` cone
`containsInSupport(c,p)`; `c` cone, `p` intvec/bigintmat

Return: 1, if `d` resp. `p` is contained in `c`; 0 otherwise

Example:

```

LIB "gfan.lib";
intmat M[2][2]=
1,0,
0,1;

```

```

cone c=coneViaPoints(M);
containsInSupport(c,c);
↳ 1
intmat N1[2][2]=
1,1,
0,1;
cone d1=coneViaPoints(N1);
containsInSupport(c,d1);
↳ 1
intmat N2[2][2]=
1,1,
1,-1;
cone d2=coneViaPoints(N2);
containsInSupport(c,d2);
↳ 0
intvec p1=0,1;
containsInSupport(c,p1);
↳ 1
intvec p2=1,-1;
containsInSupport(c,p2);
↳ 0

```

D.13.1.12 containsPositiveVector

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\]](#), page 1592).

Usage: `containsPositiveVector(c);` c cone

Return: 1, if c contains a vector with only positive entries in its relative interior

Example:

```

LIB "gfan.lib";
intmat M1[2][2]=
1,1,
1,-1;
cone c1=coneViaPoints(M1);
containsPositiveVector(c1);
↳ 1
intmat M2[2][2]=
0,1,
-1,0;
cone c2=coneViaPoints(M2);
containsPositiveVector(c2);
↳ 0

```

D.13.1.13 containsRelatively

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\]](#), page 1592).

Usage: `containsRelatively(c,p);` c cone, p intvec

Return: 1 iff the given cone contains the given point in its relative interior; 0 otherwise

Example:

```

LIB "gfan.lib";
intmat M[2][2]=
1,0,
0,1;
cone c=coneViaPoints(M);
intvec p1=1,1;
containsRelatively(c,p1);
↳ 1
intvec p2=0,1;
containsRelatively(c,p2);
↳ 0

```

D.13.1.14 convexHull

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `convexHull(c1,c2)`; c1 cone, c2 cone
 `convexHull(c1,p1)`; c1 cone, p1 polytope
 `convexHull(p1,c1)`; p1 cone, c1 polytope
 `convexHull(p1,p2)`; p1 polytope, p2 polytope

Return: cone resp polytope, the convex hull of its two input objects

Example:

```

LIB "gfan.lib";
intmat M1[2][2]=
1,0,
0,1;
cone c1=coneViaPoints(M1);
intmat M2[2][2]=
1,1,
1,-1;
cone c2=coneViaPoints(M2);
intmat M3[2][2]=
1,0,
0,-1;
cone c3=coneViaPoints(M3);
cone c12=convexHull(c1,c2);
c12;
↳ AMBIENT_DIM
↳ 2
↳ FACETS
↳ 1,0,
↳ 1,1
↳ LINEAR_SPAN
↳
↳
print(rays(c12));
↳ 1,-1,
↳ 0, 1
cone c23=convexHull(c2,c3);
c23;
↳ AMBIENT_DIM
↳ 2

```

```

↳ FACETS
↳ 1, -1,
↳ 1, 0
↳ LINEAR_SPAN
↳
↳

↳ FACETS
↳ 1,0
↳ LINEAR_SPAN
↳
↳
print(rays(c13));
↳ 1,0

```

D.13.1.15 convexIntersection

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `convexIntersection(c1,c2)`; c1 cone, c2 cone
 `convexIntersection(c1,p1)`; c1 cone, p1 polytope
 `convexIntersection(p1,c1)`; p1 cone, c1 polytope
 `convexIntersection(p1,p2)`; p1 polytope, p2 polytope

Return: cone resp polytope, the convex hull of its two input objects

Example:

```

LIB "gfan.lib";
intmat M1[2][2]=
1,0,
0,1;
cone c1=coneViaPoints(M1);
intmat M2[2][2]=
1,1,
1,-1;
cone c2=coneViaPoints(M2);
intmat M3[2][2]=
1,0,
0,-1;
cone c3=coneViaPoints(M3);
cone c12=convexIntersection(c1,c2);
c12;
↳ AMBIENT_DIM
↳ 2
↳ FACETS
↳ 0, 1,
↳ 1, -1
↳ LINEAR_SPAN

```

```

↳
↳
print(rays(c12));
↳ 1,0,
↳ 1,1
cone c23=convexIntersection(c2,c3);
c23;
↳ AMBIENT_DIM
↳ 2
↳ FACETS
↳ 0,-1,
↳ 1, 1
↳ LINEAR_SPAN
↳
↳
print(rays(c23));
↳ 1, 0,
↳ 1,-1
cone c13=convexIntersection(c1,c3);
c13;
↳ AMBIENT_DIM
↳ 2
↳ FACETS
↳ 1,0
↳ LINEAR_SPAN
↳ 0,1
↳
print(rays(c13));
↳ 1,0

```

D.13.1.16 dimension

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\]](#), page 1592).

Usage: `dimension(c)`; `c` cone
 `dimension(f)`; `f` fan
 `dimension(p)`; `p` polytope

Return: `int`, the dimension of the input

Example:

```

LIB "gfan.lib";
intmat M1[1][2]=
1,0;
cone c1=coneViaPoints(M1);
dimension(c1);
↳ 1
intmat M2[2][2]=
1,0,
0,1;
cone c2=coneViaPoints(M2);
dimension(c2);
↳ 2
fan f = emptyFan(2);

```

```

dimension(f);
↳ -1
insertCone(f,c1);
dimension(f);
↳ 1
insertCone(f,c2);
dimension(f);
↳ 2

```

D.13.1.17 dualCone

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `dualCone(c); c cone`

Return: `cone`, the dual of `c`

Example:

```

LIB "gfan.lib";
intmat M1[2][2]=
1,0,
0,1;
cone c1=coneViaPoints(M1);
cone d1=dualCone(c1);
d1;
↳ AMBIENT_DIM
↳ 2
↳ INEQUALITIES
↳ 0,1,
↳ 1,0
↳ LINEAR_SPAN
↳
↳
print(rays(d1));
↳ 1,0,
↳ 0,1
intmat M2[2][2]=
1,1,
0,1;
cone c2=coneViaPoints(M2);
cone d2=dualCone(c2);
d2;
↳ AMBIENT_DIM
↳ 2
↳ INEQUALITIES
↳ 0,1,
↳ 1,1
↳ LINEAR_SPAN
↳
↳
print(rays(d2));
↳ 1,0,
↳ -1,1

```

D.13.1.18 equations

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `equations(c)`; `c` cone
 `equations(p)`; `p` polytope

Return: `bigintmat`, defining equations of `c` resp `p`

Note: neither unique nor complete, unless `c` resp `p` in canonical form

Example:

```
LIB "gfan.lib";
intmat M1[2][2]=
1,0,
0,1;
cone c1=coneViaPoints(M1);
bigintmat E1=equations(c1);
print(E1);
↳
intmat M2[1][2]=
1,0;
cone c2=coneViaPoints(M2);
bigintmat E2=equations(c2);
print(E2);
↳ 0,-1
```

D.13.1.19 faceContaining

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `faceContaining(c,w)`; `c` cone, `w` `intvec`/`bigintmat`

Assume: `containsInSupport(c,w)==1`

Return: cone, the face of `c` containing `w` in its relative interior

Example:

```
LIB "gfan.lib";
intmat M[2][2]=
1,0,
0,1;
cone c=coneViaPoints(M);
faceContaining(c,intvec(1,0));
↳ AMBIENT_DIM
↳ 2
↳ INEQUALITIES
↳ 1,0
↳ LINEAR_SPAN
↳ 0,1
↳
faceContaining(c,intvec(0,1));
↳ AMBIENT_DIM
↳ 2
↳ INEQUALITIES
↳ 0,1
↳ LINEAR_SPAN
```

```

↳ 1,0
↳
faceContaining(c,intvec(1,1));
↳ AMBIENT_DIM
↳ 2
↳ INEQUALITIES
↳ 0,1,
↳ 1,0
↳ LINEAR_SPAN
↳
↳
faceContaining(c,intvec(0,0));
↳ AMBIENT_DIM
↳ 2
↳ INEQUALITIES
↳
↳ LINEAR_SPAN
↳ 1,0,
↳ 0,1
↳

```

D.13.1.20 facets

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `facets(c)`; c cone
 `facets(p)`; p polytope

Return: `bigintmat`, the facets of c resp p

Example:

```

LIB "gfan.lib";
intmat M1[2][2]=
1,0,
0,1;
cone c1=coneViaPoints(M1);
bigintmat F1=facets(c1);
print(F1);
↳ 0,1,
↳ 1,0
intmat M2[2][2]=
1,1,
0,-1;
cone c2=coneViaPoints(M2);
bigintmat F2=facets(c2);
print(F2);
↳ 1,-1,
↳ 1, 0

```

D.13.1.21 generatorsOfLinealitySpace

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `generatorsOfLinealitySpace(c)`; c cone

Return: `bigintmat`, generators of the lineality space of c

Example:

```
LIB "gfan.lib";
intmat M[5][3]=
1,0,0,
0,1,0,
0,0,1,
-1,0,0,
0,-1,0;
cone c=coneViaPoints(M);
bigintmat L=generatorsOfLinealitySpace(c);
print(L);
↳ -1, 0,0,
↳ 0,-1,0
```

D.13.1.22 generatorsOfSpan

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `generatorsOfSpan(c)`; `c` cone

Return: `bigintmat`, generators of the span of `c`

Example:

```
LIB "gfan.lib";
intmat M[3][5]=
1,0,0,0,0,
0,1,0,0,0,
0,0,1,0,0;
cone c=coneViaPoints(M);
bigintmat S=generatorsOfSpan(c);
print(S);
↳ -1, 0, 0,0,0,
↳ 0,-1, 0,0,0,
↳ 0, 0,-1,0,0
```

D.13.1.23 getLinearForms

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `getLinearForms(c)`; `c` cone
`getLinearForms(p)`; `p` polytope

Return: `bigintmat`, linear forms previously stored in `c` resp `p`

Example:

```
LIB "gfan.lib";
intmat M[2][3]=
-1,0,0,
0,-1,0;
cone c=coneViaPoints(M);
getLinearForms(c);
↳
intvec v=1,1,1;
setLinearForms(c,v);
getLinearForms(c);
↳ 1,1,1
```

D.13.1.24 getMultiplicity

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `getMultiplicity(c); c cone`
 `getMultiplicity(p); p polytope`

Return: `bigint`, 1 or a multiplicity previously stored in `c` resp `p`

Example:

```
LIB "gfan.lib";
intmat M[2][3]=
-1,0,0,
0,-1,0;
cone c=coneViaPoints(M);
getMultiplicity(c);
↳ 1
setMultiplicity(c,3);
getMultiplicity(c);
↳ 3
```

D.13.1.25 inequalities

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `inequalities(c); c cone`
 `inequalities(p); p polytope`

Return: `bigintmat`, the inequalities of `c` resp `p`

Note: neither unique nor irredundant, unless `c` resp `p` in canonical form

Example:

```
LIB "gfan.lib";
intmat M1[2][2]=
1,0,
0,1;
cone c1=coneViaPoints(M1);
bigintmat I1=inequalities(c1);
print(I1);
↳ 0,1,
↳ 1,0
intmat M2[2][2]=
1,1,
0,-1;
cone c2=coneViaPoints(M2);
bigintmat I2=inequalities(c2);
print(I2);
↳ 1,-1,
↳ 1, 0
```

D.13.1.26 isFullSpace

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `isFullSpace(c); c cone`

Return: 1, if c is the entire ambient space; 0 otherwise

Example:

```
LIB "gfan.lib";
cone c1;
isFullSpace(c1);
↪ 1
intmat M2[2][2]=
1,0,
0,1;
cone c2=coneViaPoints(M2);
isFullSpace(c2);
↪ 0
intmat M3[4][2]=
1,0,
0,1,
-1,0,
0,-1;
cone c3=coneViaPoints(M3);
isFullSpace(c3);
↪ 1
```

D.13.1.27 isOrigin

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `isOrigin(c)`; c cone

Return: 1, if c is the origin; 0 otherwise

Example:

```
LIB "gfan.lib";
cone c1;
isOrigin(c1);
↪ 1
intmat M2[2][2]=
1,0,
0,1;
cone c2=coneViaPoints(M2);
isOrigin(c2);
↪ 0
intmat M3[4][2]=
1,0,
0,1,
-1,0,
0,-1;
cone c3=coneViaPoints(M3);
isOrigin(c3);
↪ 0
```

D.13.1.28 isSimplicial

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `isSimplicial(c)`; c cone
`isSimplicial(f)`; f fan

Return: 1, if c resp f is simplicial; 0 otherwise

Example:

```
LIB "gfan.lib";
intmat M1[3][3]=
1,0,0,
0,1,0,
0,0,1;
cone c1=coneViaPoints(M1);
isSimplicial(c1);
↳ 1
intmat M2[4][3]=
1,0,0,
0,1,0,
0,0,1,
1,1,-1;
cone c2=coneViaPoints(M2);
isSimplicial(c2);
↳ 0
/*****/
fan f=emptyFan(3);
isSimplicial(f);
↳ 1
intmat N1[3][3]=
1,0,0,
0,1,0,
0,0,1;
cone d1=coneViaPoints(N1);
insertCone(f,d1);
isSimplicial(f);
↳ 1
intmat N2[4][3]=
1,0,0,
0,1,0,
1,0,-1,
0,1,-1;
cone d2=coneViaPoints(N2);
insertCone(f,d2);
isSimplicial(f);
↳ 0
```

D.13.1.29 linealityDimension

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: linealityDimension(c); c cone
linealityDimension(f); f fan

Return: int, the dimension of the lineality space of c resp f

Example:

```
LIB "gfan.lib";
intmat M1[3][3]=
1,0,0,
0,1,0,
```

```

0,0,1;
cone c1=coneViaPoints(M1);
linealityDimension(c1);
↳ 0
intmat M2[4][3]=
1,0,0,
0,1,0,
0,0,1,
-1,0,0;
cone c2=coneViaPoints(M2);
linealityDimension(c2);
↳ 1

```

D.13.1.30 linealitySpace

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\]](#), page 1592).

Usage: `linealitySpace(c); c cone`

Return: `cone`, the lineality space of `c`

Example:

```

LIB "gfan.lib";
intmat M1[3][3]=
1,0,0,
0,1,0,
0,0,1;
cone c1=coneViaPoints(M1);
cone l1=linealitySpace(c1);
l1;
↳ AMBIENT_DIM
↳ 3
↳ INEQUALITIES
↳
↳ LINEAR_SPAN
↳ 1,0,0,
↳ 0,1,0,
↳ 0,0,1
↳
intmat M2[4][3]=
1,0,0,
0,1,0,
0,0,1,
-1,0,0;
cone c2=coneViaPoints(M2);
cone l2=linealitySpace(c2);
l2;
↳ AMBIENT_DIM
↳ 3
↳ INEQUALITIES
↳
↳ LINEAR_SPAN
↳ 0,1,0,
↳ 0,0,1
↳

```

D.13.1.31 negatedCone

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `negatedCone(c); c cone`

Return: `cone`, the negative of `c`

Example:

```
LIB "gfan.lib";
intmat M[2][2]=
1,0,
0,1;
cone c=coneViaPoints(M);
cone cn=negatedCone(c);
print(rays(cn));
↪ -1, 0,
↪ 0, -1
```

D.13.1.32 polytopeViaInequalities

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `polytopeViaInequalities(EV [, E [, flags]]); intmat EV,E, int flags`

Return: polytope consisting of all points x , such that $IE^*x \geq 0$ in each component and (if stated) $E^*x = 0$;
 flags may range between 0,...,3 defining an upper and lower bit ($0=0*2+0$, $1=0*2+1$, $2=1*2+0$, $3=1*2+1$),
 if higher bit is 1, then program assumes each inequality yields a facet, if lower bit is 1, then program assumes the kernel of E is the span of the cone, if either bit is 0, then program computes the information itself.

Example:

```
LIB "gfan.lib";
intmat IE[2][3]=
1,0,0,
0,1,0;
intmat E[1][3]=
0,0,1;
polytope p=polytopeViaInequalities(IE,E);
P;
↪ AMBIENT_DIM
↪ 2
↪ INEQUALITIES
↪ 0,1,0,
↪ 1,0,0
↪ EQUATIONS
↪ 0,0,1
↪
```

D.13.1.33 polytopeViaPoints

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `polytopeViaPoints(V [, flags]); intmat V, int flags`

Return: polytope which is the intersection of the cone generated by the row vectors of V with the hyperplane, in which the first coordinate equals 1; flags may be 0 or 1, if flags is 1, then program assumes that each row vector of M generates a ray in the cone, if flags is 0, then program computes that information itself

Example:

```
LIB "gfan.lib";
// This is a polytope in R^2 generated by (0,0), (1,0), (0,1), (0,0);
intmat V[4][3]=
1,0,0,
1,1,0,
1,0,1,
1,1,1;
polytope p1=polytopeViaPoints(V);
p1;
↳ AMBIENT_DIM
↳ 2
↳ INEQUALITIES
↳ 0, 0, 1,
↳ 0, 1, 0,
↳ 1,-1, 0,
↳ 1, 0,-1
↳ EQUATIONS
↳
↳
// This is a polytope in R^2 generated by (1/2,2/3), (3/4,4/5), (5/6,6/7):
intmat V[3][3]=
↳ // ** redefining V (intmat V[3][3]=)
6,3,4,
20,15,16,
42,35,36;
polytope p2=polytopeViaPoints(V);
p2;
↳ AMBIENT_DIM
↳ 2
↳ INEQUALITIES
↳ -10,-24, 35,
↳ -6, -8, 15,
↳ 8, 12,-21
↳ EQUATIONS
↳
↳
// This polytope is the positive orthant in R^2:
// (0,1,0) and (0,0,1) imply that the polytope is unbounded in that direction
intmat V[3][3]=
↳ // ** redefining V (intmat V[3][3]=)
1,0,0,
0,1,0,
0,0,1;
polytope p3=polytopeViaPoints(V);
p3;
↳ AMBIENT_DIM
↳ 2
```

```

↳ INEQUALITIES
↳ 0,0,1,
↳ 0,1,0,
↳ 1,0,0
↳ EQUATIONS
↳
↳

```

D.13.1.34 quotientLatticeBasis

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `quotientLatticeBasis(c); c cone`

Return: `bigintmat`, a basis of Z^n intersected with the span of c modulo Z^n intersected with the lineality space of c

Example:

```

LIB "gfan.lib";
intmat M[3][2]=
1,0,
0,1,
-1,0;
cone c=coneViaPoints(M);
bigintmat Q=quotientLatticeBasis(c);
print(Q);
↳ 0,1

```

D.13.1.35 randomPoint

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `randomPoint(c); c cone`

Return: `bigintmat`, a random point in the relative interior of c

Example:

```

LIB "gfan.lib";
intmat M[3][2]=
1,0,
0,1,
-1,0;
cone c=coneViaPoints(M);
bigintmat Q=randomPoint(c);
print(Q);
↳ -380636641,1335380034

```

D.13.1.36 rays

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `rays(c); c cone`

Return: `bigintmat`, generators of the rays of c , orthogonal to its lineality space

Example:

```

LIB "gfan.lib";
intmat M1[2][2]=
1,0,
0,1;
cone c1=coneViaPoints(M1);
bigintmat R1=rays(c1);
print(R1);
↪ 1,0,
↪ 0,1
intmat M2[3][2]=
1,0,
0,1,
-1,0;
cone c2=coneViaPoints(M2);
bigintmat R2=rays(c2);
print(R2);
↪ 0,1

```

D.13.1.37 relativeInteriorPoint

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `relativeInteriorPoint(c); c cone`

Return: `bigintmat`, a point in the relative interior of `c`

Note: not unique, unless `c` is in its canonical form

Example:

```

LIB "gfan.lib";
intmat M1[2][2]=
1,0,
0,1;
cone c1=coneViaPoints(M1);
relativeInteriorPoint(c1);
↪ 1,1
intmat M2[2][2]=
1,0,
1,1;
cone c2=coneViaPoints(M2);
relativeInteriorPoint(c2);
↪ 2,1

```

D.13.1.38 semigroupGenerator

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `semigroupGenerator(c); c cone`

Return: `bigintmat`, the generator of Z^n intersected with `c` modulo Z^n intersected with the lineality space of `c`

Assume: `dimension(c) == linealityDimension(c)+1`

Example:

```
LIB "gfan.lib";
intmat M[3][2]=
1,0,
0,1,
-1,0;
cone c=coneViaPoints(M);
semigroupGenerator(c);
↳ 0,1
```

D.13.1.39 setLinearForms

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `setLinearForms(c)`; `c` cone
 `setLinearForms(p)`; `p` polytope

Return: none, stores linear forms in `c` resp `p`

Example:

```
LIB "gfan.lib";
intmat M[2][3]=
-1,0,0,
0,-1,0;
cone c=coneViaPoints(M);
getLinearForms(c);
↳
intvec v=1,1,1;
setLinearForms(c,v);
getLinearForms(c);
↳ 1,1,1
```

D.13.1.40 setMultiplicity

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `setMultiplicity(c)`; `c` cone
 `setMultiplicity(p)`; `p` polytope

Return: none, stores a multiplicity in `c` resp `p`

Example:

```
LIB "gfan.lib";
intmat M[2][3]=
-1,0,0,
0,-1,0;
cone c=coneViaPoints(M);
getMultiplicity(c);
↳ 1
setMultiplicity(c,3);
getMultiplicity(c);
↳ 3
```

D.13.1.41 span

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: span(c); c cone

Return: bigintmat, unique irredundant equations of c

Note: the name 'span' was chosen to be in line with polymake's nomenclature

Example:

```
LIB "gfan.lib";
intmat M[3][5]=
1,0,0,0,0,
0,1,0,0,0,
0,0,1,0,0;
cone c=coneViaPoints(M);
bigintmat Eq=span(c);
print(Eq);
↳ 0,0,0,-1, 0,
↳ 0,0,0, 0,-1
```

D.13.1.42 uniquePoint

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: uniquePoint(c); c cone

Return: bigintmat, a unique point in c stable under reflections at coordinate hyperplanes

Example:

```
LIB "gfan.lib";
intmat M1[2][2]=
1,0,
0,1;
cone c1=coneViaPoints(M1);

↳ -1,1
```

D.13.1.43 containsInCollection

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: containsInCollection(f,c); f fan, c cone

Return: 1, if f contains c; 0 otherwise

Example:

```
LIB "gfan.lib";
fan f=emptyFan(2);
intmat M[2][2]=
1,0,
0,1;
cone c=coneViaPoints(M);
containsInCollection(f,c);
```

```

↳ 0
insertCone(f,c);
containsInCollection(f,c);
↳ 1

```

D.13.1.44 emptyFan

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\]](#), page 1592).

Usage: `emptyFan(n); n int`

Return: `fan`, an empty fan in ambient dimension `n`

Example:

```

LIB "gfan.lib";
fan f=emptyFan(2);
f;
↳ _application PolyhedralFan
↳ _version 2.2
↳ _type PolyhedralFan

D.13.1.45 fanViaCones

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `fanViaCones(L);` L list
 `fanViaCones(c1[,...,ck]);` c1,...,ck cones

Return: fan, creates a fan generated by the cones in L resp c1,...,ck

Example:

```
LIB "gfan.lib";
intmat M[2][2]=1,0,0,1;
cone c=coneViaPoints(M);
intmat N[2][2]=1,0,0,-1;
cone d=coneViaPoints(N);

D.13.1.47 fVector

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `fVector(f)`; `f` fan

Return: `bigintmat`, the f-Vector of `f`

Example:

```

LIB "gfan.lib";
fan f=emptyFan(2);
fVector(f);
↳
intmat M[2][2]=1,0,0,1;
cone c=coneViaPoints(M);
insertCone(f,c);
fVector(f);
↳ 1,2,1

```

D.13.1.48 getCone

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `getCone(f,d,i[,o,m])`; `f` fan, `d` int, `i` int, `o` int, `m` int

Assume: `d` is between 0 and `ambientDimension(f)`
`i` is between 1 and `numberOfConesOfDimension(f,d,o,m)`

Return: `cone`, returns in the fan `f` of all cones in dimension `d` the `i`-th cone if `o=1`, it will enumerate over cone orbits (deactivated for now) if `m=1`, it will enumerate over maximal cones

Example:

```

LIB "gfan.lib";
intmat M[3][3]=
1,0,0,
0,1,0,
0,0,1;
cone c=coneViaPoints(M);
fan f=emptyFan(3);
insertCone(f,c);

↳ 0,-1,0
↳

```

D.13.1.49 insertCone

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `insertCone(f,c[b]);` f fan, c cone, b int

Assume: `isCompatible(f,c)=1`

Return: none, inserts the cone c into f
if b=0, then skips check whether f and c are compatible

Example:

```

LIB "gfan.lib";
fan f=emptyFan(3);
f;
↳ _application PolyhedralFan
↳ _version 2.2
↳ _type PolyhedralFan

D.13.1.50 isCompatible

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `isCompatible(f,c)`; `f` fan, `c` cone

Return: 1 if `f` and `c` live in the same ambient space and
if the intersection of `c` with any cone of `f` is a face of each; 0 otherwise

Example:

```

LIB "gfan.lib";
fan f=emptyFan(3);
intmat M1[3][3]=
1,0,0,
0,1,0,
0,0,1;
cone c1=coneViaPoints(M1);
isCompatible(f,c1);
↳ 1
insertCone(f,c1);
intmat M2[3][3]=
1,1,1,
1,0,0,
0,1,0;
cone c2=coneViaPoints(M2);
isCompatible(f,c2);
↳ 0
intmat M3[3][3]=
1,0,0,
0,1,0,
0,0,-1;
cone c3=coneViaPoints(M3);
isCompatible(f,c3);
↳ 1

```

D.13.1.51 isPure

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `isPure(f)`; `f` fan

Return: 1 if all maximal cones of f are of the same dimension 0 otherwise

Example:

```
LIB "gfan.lib";
fan f=fullFan(2);
isPure(f);
↳ 1
fan g=emptyFan(2);
intmat M1[2][2]=
1,0,
0,1;
cone c1=coneViaPoints(M1);
insertCone(g,c1);
isPure(g);
↳ 1
intmat M2[1][2]=
0,-1;
cone c2=coneViaPoints(M2);
insertCone(g,c2);
isPure(g,c2);
↳ 0
```

D.13.1.52 nmaxcones

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: nmaxcones(f); f fan

Return: int, the number of maximal cones in f

Example:

```
LIB "gfan.lib";
fan f=emptyFan(3);
nmaxcones(f);
↳ 0
intmat M1[3][3]=
1,0,0,
0,1,0,
0,0,1;
cone c1=coneViaPoints(M1);
insertCone(f,c1);
nmaxcones(f);
↳ 1
intmat M2[2][3]=
1,0,0,
0,-1,0;
cone c2=coneViaPoints(M2);
insertCone(f,c2);
nmaxcones(f);
↳ 2
```

D.13.1.53 ncones

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `ncones(f); f fan`

Return: `int`, the number of cones in `f`

Example:

```
LIB "gfan.lib";
fan f=emptyFan(3);
ncones(f);
↳ 0
intmat M1[3][3]=
1,0,0,
0,1,0,
0,0,1;
cone c1=coneViaPoints(M1);
insertCone(f,c1);
ncones(f);
↳ 8
intmat M2[2][3]=
1,0,0,
0,-1,0;
cone c2=coneViaPoints(M2);
insertCone(f,c2);
ncones(f);
↳ 10
```

D.13.1.54 numberOfConesOfDimension

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `numberOfConesOfDimension(f,d[,o,m]); f fan, d int, o int, m int`

Assume: `d` is between 0 and `ambientDimension(f)`

Return: `cone`, returns in the fan `f` the number of cones in dimension `d` if `o=1`, it will only count cone orbits (deactivated for now) if `m=1`, it will only count maximal cones

Example:

```
LIB "gfan.lib";
fan f=emptyFan(3);
ncones(f);
↳ 0
intmat M[3][3]=
1,0,0,
0,1,0,
0,0,1;
cone c=coneViaPoints(M);
insertCone(f,c);
numberOfConesOfDimension(f,0,0,0);
↳ 1
numberOfConesOfDimension(f,0,0,1);
↳ 0
numberOfConesOfDimension(f,1,0,0);
↳ 3
numberOfConesOfDimension(f,0,0,1);
↳ 0
numberOfConesOfDimension(f,2,0,0);
```

```

↳ 3
numberOfConesOfDimension(f,2,0,1);
↳ 0
numberOfConesOfDimension(f,3,0,0);
↳ 1
numberOfConesOfDimension(f,3,0,1);
↳ 1

```

D.13.1.55 removeCone

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `removeCone(f,c[,b]);` f fan, c cone, b int

Assume: `containsInCollection(f,c)=1`

Return: none, removes the cone c from f
if b=0, skips the check whether c is contained in f

Example:

```

LIB "gfan.lib";
intmat M[2][2]=1,0,0,1;
intmat N[2][2]=1,0,1,-1;
cone c=coneViaPoints(M);
cone d=coneViaPoints(N);
fan f=emptyFan(2);
insertCone(f,c);
insertCone(f,d);

D.13.1.56 dualPolytope

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `dualPolytope(p)`; `p` polytope

Return: polytope, the dual of `p`

Example:

```

LIB "gfan.lib";
intmat M[4][2]=
0,0,
1,0,
0,1,
1,1;
polytope p=polytopeViaPoints(M);

D.13.1.57 newtonPolytope

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `newtonPolytope(f)`; `f` poly

Return: polytope, the convex hull of all exponent vectors of `f`

Example:

```

LIB "gfan.lib";
ring r;
poly f=x+y+z;
polytope p=newtonPolytope(f);
p;

```

D.13.1.58 vertices

Procedure from library `gfan.lib` (see [Section D.13.1 \[gfan.lib\], page 1592](#)).

Usage: `vertices(p)`; `p` polytope

Return: `bigintmat`, the vertices of `p` modulo its lineality space

Example:

```

LIB "gfan.lib";
intmat M[4][3]=
1,0,0,
1,2,0,
1,0,2,
1,2,2,
1,1,1;
polytope p=polytopeViaPoints(M);
vertices(p);
↳ 1,2,0,
↳ 1,0,0,
↳ 1,0,2,
↳ 1,2,2

```

D.13.2 polymake_lib

Library: `polymake.lib`

Purpose: Computations with polytopes and fans, interface to `polymake` and `TOPCOM`

Author: Thomas Markwig, email: keilen@mathematik.uni-kl.de
Yue Ren, email: ren@mathematik.uni-kl.de

Warning: Most procedures will not work unless `polymake` or `topcom` is installed and if so, they will only work with the operating system LINUX! For more detailed information see IMPORTANT NOTE respectively consult the help string of the procedures.

The conventions used in this library for polytopes and fans, e.g. the length and labeling of their vertices resp. rays, differs from the conventions used in `polymake` and thus from the conventions used in the `polymake` extension `polymake.so` of Singular. We recommend to use the newer `polymake.so` whenever possible.

Important note:

Even though this is a Singular library for computing polytopes and fans such as the Newton polytope or the Groebner fan of a polynomial, most of the hard computations are NOT done by Singular but by the program
- `polymake` by Ewgenij Gawrilow, TU Berlin and Michael Joswig, TU Darmstadt (see

<http://www.polymake.org/>),
 respectively (only in the procedure triangulations) by the program
 - topcom by Joerg Rambau, Universitaet Bayreuth (see
<http://www.rambau.wm.uni-bayreuth.de/TOPCOM/>);
 this library should rather be seen as an interface which allows to use a (very
 limited) number of options which polymake respectively topcom offers to compute
 with polytopes and fans and to make the results available in Singular for further
 computations; moreover, the user familiar with Singular does not have to learn
 the syntax of polymake or topcom, if the options offered here are sufficient for his
 purposes.
 Note, though, that the procedures concerned with planar polygons are independent of
 both, polymake and topcom.

**Procedures using polymake: Procedures using topcom: Procedures concerned with planar polygons:
 Procedures using libpolymake:**

D.13.2.1 polymakePolytope

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake_lib\]](#), page 1632).

Usage: `polymakePolytope(points); polytope intmat`

Assume: each row of points gives the coordinates of a lattice point of a polytope with their affine coordinates as given by the output of `secondaryPolytope`

Purpose: the procedure calls `polymake` to compute the vertices of the polytope as well as its dimension and information on its facets

Return: list, L with four entries
 L[1] : an integer matrix whose rows are the coordinates of vertices of the polytope
 L[2] : the dimension of the polytope
 L[3] : a list whose *i*th entry explains to which vertices the *i*th vertex of the Newton polytope is connected
 – i.e. L[3][*i*] is an integer vector and an entry *k* in there means that the vertex L[1][*i*] is connected to the vertex L[1][*k*]
 L[4] : an matrix of type `bigintmat` whose rows multiplied by (1,var(1),...,var(nvar)) give a linear system of equations describing the affine hull of the polytope, i.e. the smallest affine space containing the polytope

Note: - for its computations the procedure calls the program `polymake` by Evgenij Gawrilow, TU Berlin and Michael Joswig, TU Darmstadt; it therefore is necessary that this program is installed in order to use this procedure;
 see <http://www.polymake.org/>
 - note that in the vertex edge graph we have changed the `polymake` convention which starts indexing its vertices by zero while we start with one !

Example:

```
LIB "polymake.lib";
⇒ Welcome to polymake version
⇒ Copyright (c) 1997-2015
⇒ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
⇒ http://www.polymake.org
// the lattice points of the unit square in the plane
list points=intvec(0,0),intvec(0,1),intvec(1,0),intvec(1,1);
// the secondary polytope of this lattice point configuration is computed
```

```

↳ _[2,1]=x(1)-x(4)
↳ _[3,1]=x(2)-x(3)

```

D.13.2.2 newtonPolytopeP

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake_lib\]](#), page 1632).

Usage: `newtonPolytopeP(f); f poly`

Return: list, L with four entries
 L[1] : an integer matrix whose rows are the coordinates of vertices of the Newton polytope of f
 L[2] : the dimension of the Newton polytope of f
 L[3] : a list whose *i*th entry explains to which vertices the *i*th vertex of the Newton polytope is connected
 – i.e. L[3][*i*] is an integer vector and an entry *k* in there means that the vertex L[1][*i*] is connected to the vertex L[1][*k*]
 L[4] : an matrix of type `bigintmat` whose rows multiplied by $(1, \text{var}(1), \dots, \text{var}(nvar))$ give a linear system of equations describing the affine hull of the Newton polytope, i.e. the smallest affine space containing the Newton polytope

Note: - if we replace the first column of L[4] by zeros, i.e. if we move the affine hull to the origin, then we get the equations for the orthogonal complement of the linearity space of the normal fan dual to the Newton polytope, i.e. we get the EQUATIONS that we need as input for `polymake` when computing the normal fan

- the procedure calls for its computation polymake by Evgenij Gawrilow, TU Berlin and Michael Joswig, so it only works if polymake is installed; see <http://www.polymake.org/>

Example:

D.13.2.3 newtonPolytopeLP

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake_lib\]](#), page 1632).

Usage: `newtonPolytopeLP(f); f poly`

Return: list, the exponent vectors of the monomials occurring in `f`, i.e. the lattice points of the Newton polytope of `f`

Example:

```
LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org

```

D.13.2.4 triangulations

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake_lib\]](#), page 1632).

Usage: `triangulations(polygon[,#]); list polygon, list #`

Assume: `polygon` is a list of integer vectors of the same size representing the affine coordinates of the lattice points

Purpose: the procedure considers the marked polytope given as the convex hull of the lattice points and with these lattice points as markings; it then computes all possible triangulations of this marked polytope

Return: list, each entry corresponds to one triangulation and the *i*th entry is itself a list of integer vectors of size three, where each integer vector defines one triangle in the triangulation by telling which points of the input are the vertices of the triangle

Note:

- the procedure calls for its computations the program `points2triangs` from the program `topcom` by Joerg Rambau, Universitaet Bayreuth; it therefore is necessary that this program is installed in order to use this procedure; see <http://www.rambau.wm.uni-bayreuth.de/TOPCOM/>;
- if you only want to have the regular triangulations the procedure should be called with the string `'regular'` as optional argument
- the procedure creates the files `/tmp/triangulationsinput` and `/tmp/triangulationsoutput`;

the former is used as input for `points2triangs` and the latter is its output containing

the triangulations of corresponding to points in the format of `points2triangs`; if you wish to use this for further computations with `topcom`, you have to call the procedure with the string `'keepfiles'` as optional argument

- note that an integer `i` in an integer vector representing a triangle refers to the `i`th lattice point, i.e. `polygon[i]`; this convention is different from `TOPCOM`'s convention, where `i` would refer to the `i`-1st lattice point

Example:

```
LIB "polymake.lib";

```

D.13.2.5 secondaryPolytope

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: `secondaryPolytope(polygon[,#]);` list polygon, list #

Assume:

- polygon is a list of integer vectors of the same size representing the affine coordinates of lattice points
- if the triangulations of the corresponding polygon have already been computed with the procedure `triangulations` then these can be given as a second (optional) argument in order to avoid doing this computation again

Purpose: the procedure considers the marked polytope given as the convex hull of the lattice points and with these lattice points as markings; it then computes the lattice points of the secondary polytope given by this marked polytope which correspond to the triangulations computed by the procedure `triangulations`

Return: list, say `L`, such that:

- `L[1]` = `intmat`, each row gives the affine coordinates of a lattice point in the secondary polytope given by the marked polytope corresponding to polygon
- `L[2]` = the list of corresponding triangulations

Note: if the triangulations are not handed over as optional argument the procedure calls for its computation of these triangulations the program `points2triangs` from the program `topcom` by Joerg Rambau, Universitaet Bayreuth; it therefore is necessary that this program is installed in order to use this procedure; see <http://www.rambau.wm.uni-bayreuth.de/TOPCOM/>);

Example:

```

↳      [2]:
↳      1,2,4
```

D.13.2.6 cycleLength

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake_lib\]](#), page 1632).

Usage: `cycleLength(boundary,interior)`; list boundary, intvec interior

Assume: boundary is a list of integer vectors describing a cycle in some convex lattice polygon around the lattice point interior ordered clock wise

Return: string, the cycle length of the corresponding cycle in the dual tropical curve

Example:

```
LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
// the integer vectors in boundary are lattice points on the boundary
```

```

// of a convex lattice polygon in the plane
list boundary=intvec(0,0),intvec(0,1),intvec(0,2),intvec(2,2),
intvec(2,1),intvec(2,0);
// interior is a lattice point in the interior of this lattice polygon
intvec interior=1,1;
// compute the general cycle length of a cycle of the corresponding cycle
// in the dual tropical curve, note that (0,1) and (2,1) do not contribute
cycleLength(boundary,interior);
↳ -4*u11+u00+u02+u22+u20

```

D.13.2.7 splitPolygon

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake_lib\]](#), page 1632).

Usage: `splitPolygon` (markings); markings list

Assume: markings is a list of integer vectors representing lattice points in the plane which we consider as the marked points of the convex lattice polytope spanned by them

Purpose: split the marked points in the vertices, the points on the facets which are not vertices, and the interior points

Return: list, L consisting of three lists
`L[1]` : represents the vertices the polygon ordered clockwise
`L[1][i][1]` = intvec, the coordinates of the *i*th vertex
`L[1][i][2]` = int, the position of `L[1][i][1]` in markings
`L[2][i]` : represents the lattice points on the facet of the polygon with endpoints `L[1][i]` and `L[1][i+1]`
(i considered modulo `size(L[1])`)
`L[2][i][j][1]` = intvec, the coordinates of the *j*th lattice point on that facet
`L[2][i][j][2]` = int, the position of `L[2][i][j][1]` in markings
`L[3]` : represents the interior lattice points of the polygon
`L[3][i][1]` = intvec, coordinates of *i*th interior point
`L[3][i][2]` = int, the position of `L[3][i][1]` in markings

Example:

```

D.13.2.8 eta

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: `eta(triang,polygon)`; `triang`, `polygon` list

Assume: `polygon` has the format of the output of `splitPolygon`, i.e. it is a list with three entries describing a convex lattice polygon in the following way:

`polygon[1]` : is a list of lists; for each `i` the entry `polygon[1][i][1]` is a lattice point which is a vertex of the lattice

`polygon`, and `polygon[1][i][2]` is an integer assigned to this lattice point as identifying index

`polygon[2]` : is a list of lists; for each vertex of the polygon, i.e. for each entry in `polygon[1]`, it contains a list `polygon[2][i]`, which contains the lattice points on the facet with endpoints `polygon[1][i]` and `polygon[1][i+1]` - `i` considered mod `size(polygon[1])`; each such lattice point contributes an entry

`polygon[2][i][j][1]` which is an integer

vector giving the coordinate of the lattice point and an entry `polygon[2][i][j][2]` which is the identifying index

`polygon[3]` : is a list of lists, where each entry corresponds to a lattice point in the interior of the polygon, with

`polygon[3][j][1]` being the coordinates of the point

and `polygon[3][j][2]` being the identifying index;

`triang` is a list of integer vectors all of size three describing a triangulation of the polygon described by `polygon`; if an entry of `triang` is the vector (i,j,k) then the triangle is built by the vertices with indices `i`, `j` and `k`

Return: `intvec`, the integer vector `eta` describing that vertex of the Newton polytope discriminant of the polygone whose dual cone in the Groebner fan contains the cone of the secondary fan of the polygon corresponding to the given triangulation

Note: for a better description of `eta` see Gelfand, Kapranov, Zelevinski: *Discriminants, Resultants and multidimensional Determinants*. Chapter 10.

D.13.2.9 findOrientedBoundary

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: `findOrientedBoundary(polygon);` polygon list

Assume: polygon is a list of integer vectors defining integer lattice points in the plane

Return: list `l` with the following interpretation
`l[1]` = list of integer vectors such that the polygonal path defined by these is the boundary of the convex hull of the lattice points in polygon
`l[2]` = list, the redundant points in `l[1]` have been removed

Example:

```

D.13.2.10 cyclePoints

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: `cyclePoints(triang,points,pt)` triang,points list, pt int

Assume:

- points is a list of integer vectors describing the lattice points of a marked polygon;
- triang is a list of integer vectors describing a triangulation of the marked polygon in the sense that an integer vector of the form (i,j,k) describes the triangle formed by polygon[i], polygon[j] and polygon[k];
- pt is an integer between 1 and size(points), singling out a lattice point among the marked points

Purpose: consider the convex lattice polygon, say P, spanned by all lattice points in points which in the triangulation triang are connected to the point points[pt]; the procedure computes all marked points in points which lie on the boundary of that polygon, ordered clockwise

Return: list, of integer vectors which are the coordinates of the lattice points on the boundary of the above mentioned polygon P, if this polygon is not the empty set (that would be the case if points[pt] is not a vertex of any triangle in the triangulation); otherwise return the empty list

Example:

```

```

D.13.2.11 latticeArea

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: `latticeArea(polygon)`; polygon list

Assume: polygon is a list of integer vectors in the plane

Return: int, the lattice area of the convex hull of the lattice points in polygon, i.e. twice the Euclidean area

Example:

```
LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
// define a polygon with lattice area 5
list polygon=intvec(1,2),intvec(1,0),intvec(2,0),intvec(1,1),
intvec(2,1),intvec(0,0);
latticeArea(polygon);
↳ 5
```

D.13.2.12 picksFormula

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: picksFormula(polygon); polygon list

Assume: polygon is a list of integer vectors in the plane and consider their convex hull C

Return: list, L of three integers
 L[1] : the lattice area of C, i.e. twice the Euclidean area
 L[2] : the number of lattice points on the boundary of C
 L[3] : the number of interior lattice points of C

Note: the integers in L are related by Pick's formula, namely: $L[1]=L[2]+2*L[3]-2$

Example:

```

// the number's are related by Pick's formula:
pick[1]-pick[2]-2*pick[3]+2;
↳ 0
```

D.13.2.13 ellipticNF

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: `ellipticNF(polygon); polygon list`

Assume: `polygon` is a list of integer vectors in the plane such that their convex hull C has precisely one interior lattice point; i.e. C is the Newton polygon of an elliptic curve

Purpose: compute the normal form of the polygon with respect to the unimodular affine transformations $T=A*x+v$; there are sixteen different normal forms (see e.g. Bjorn Poonen, Fernando Rodriguez-Villegas: Lattice Polygons and the number 12. Amer. Math. Monthly 107 (2000), no. 3, 238–250.)

Return: list, L such that
 $L[1]$: list whose entries are the vertices of the normal form of the polygon
 $L[2]$: the matrix A of the unimodular transformation
 $L[3]$: the translation vector v of the unimodular transformation
 $L[4]$: list such that the i th entry is the image of `polygon[i]` under the unimodular transformation T

Example:

D.13.2.14 ellipticNFDB

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: `ellipticNFDB(n[,#]);` n int, # list

Assume: n is an integer between 1 and 16

Purpose: this is a database storing the 16 normal forms of planar polygons with precisely one interior point up to unimodular affine transformations (see e.g. Bjorn Poonen, Fernando Rodriguez-Villegas: Lattice Polygons and the number 12. Amer. Math. Monthly 107 (2000), no. 3, 238–250.)

Return: list, L such that
 L[1]: list whose entries are the vertices of the nth normal form
 L[2]: list whose entries are all the lattice points of the nth normal form
 L[3]: only present if the optional parameter # is present, and then it is a polynomial in the variables (x,y) whose Newton polygon is the nth normal form

Note: the optional parameter is only allowed if the basering has the variables x and y

Example:

D.13.2.15 boundaryLatticePoints

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: `boundaryLatticePoints(p)`; `p` polytope

Assume: `isBounded(p)==1`

Return: `intmat`, all lattice points on the relative boundary of `p`

Example:

```

LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
intmat M[3][3]=
1,2,-1,
1,-1,2,
1,-1,-1;
polytope p = polytopeViaPoints(M);
boundaryLatticePoints(p);

⇒ 1,1,-1,
⇒ 1,1,0,
⇒ 1,2,-1
intmat N[2][3]=
1,2,0,
1,0,2;
polytope q = polytopeViaPoints(N);
boundaryLatticePoints(q);
⇒ 1,0,2,
⇒ 1,2,0

```

D.13.2.16 ehrhartPolynomialCoeff

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake_lib\]](#), page 1632).

Usage: `ehrhartPolynomialCoeff(p)`; `p` polytope

Assume: `isBounded(p)==1`

Return: `intvec`, all lattice points on the relative boundary of `p`

Example:

```

LIB "polymake.lib";
⇒ Welcome to polymake version
⇒ Copyright (c) 1997-2015
⇒ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
⇒ http://www.polymake.org

D.13.2.17 fVectorP

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\], page 1632](#)).

Usage: `fVectorP(p)`; `p` polytope

Return: `intvec`, the f-vector or `p`

Example:

```
LIB "polymake.lib";
⇒ Welcome to polymake version
⇒ Copyright (c) 1997-2015
⇒ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
⇒ http://www.polymake.org

⇒
⇒ 6,12,8
```

D.13.2.18 facetVertexLatticeDistances

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\], page 1632](#)).

Usage: `facetVertexLatticeDistances(p)`; `p` polytope

Return: `intmat`, encodes the lattice distances between vertices (columns) and facets (rows) of `p`.

Example:

```
LIB "polymake.lib";
⇒ Welcome to polymake version
⇒ Copyright (c) 1997-2015
⇒ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
⇒ http://www.polymake.org
intmat M[4][3]=
1,2,0,
1,0,1,
1,2,1,
1,0,0;
polytope p = polytopeViaPoints(M);
facetVertexLatticeDistances(p);
⇒ polymake: used package ppl
⇒ The Parma Polyhedra Library (PPL): A C++ library for convex polyhedra
⇒ and other numerical abstractions.
⇒ http://www.cs.unipr.it/ppl/
```

```

↳
↳ 0,1,1,0,
↳ 2,2,0,0,
↳ 1,0,0,1,
↳ 0,0,2,2

```

D.13.2.19 facetWidth

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: `facetWidth(p)`; `p` polytope

Assume: `isBounded(p)==1`

Return: `int`, maximal integral width going over all facet normals

Example:

```

LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
intmat M[4][3]=
1,2,0,
1,0,1,
1,2,1,
1,0,0;
polytope p = polytopeViaPoints(M);
facetWidth(p);
↳ polymake: used package ppl
↳ The Parma Polyhedra Library (PPL): A C++ library for convex polyhedra
↳ and other numerical abstractions.
↳ http://www.cs.unipr.it/ppl/
↳
↳ 2

```

D.13.2.20 facetWidths

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: `facetWidths(p)`; `p` polytope

Assume: `isBounded(p)==1`

Return: `intvec`, vector with the integral widths of all facet normals

Example:

```

LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
intmat M[4][3]=
1,2,0,
1,0,1,
1,2,1,
1,0,0;

```

```

polytope p = polytopeViaPoints(M);
facetWidths(p);
↳ polymake: used package ppl
↳ The Parma Polyhedra Library (PPL): A C++ library for convex polyhedra
↳ and other numerical abstractions.
↳ http://www.cs.unipr.it/ppl/
↳
↳ 1,2,1,2

```

D.13.2.21 gorensteinIndex

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\], page 1632](#)).

Usage: `gorensteinIndex(p)`; `p` polytope

Assume: `isGorenstein(p)==1`

Return: `int`, a factor `n` such that $n \cdot p + v$ is reflexive for some translation `v`

Note: the translation `v` can be computed via `gorensteinVector(p)`

Example:

```

LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
intmat M[4][3]=1,1,0, 1,0,1, 1,0,0, 1,1,1;
polytope p = polytopeViaPoints(M);
gorensteinIndex(p);
↳ polymake: used package ppl
↳ The Parma Polyhedra Library (PPL): A C++ library for convex polyhedra
↳ and other numerical abstractions.
↳ http://www.cs.unipr.it/ppl/
↳
↳ 2

```

D.13.2.22 gorensteinVector

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\], page 1632](#)).

Usage: `gorensteinVector(p)`; `p` polytope

Assume: `isGorenstein(p)==1`

Return: `intvec`, a vector `v` such that $n \cdot p + v$ is reflexive for some factor `n`

Note: the factor `n` can be computed via `gorensteinIndex(p)`

Example:

```

LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
intmat M[4][3]=1,1,0, 1,0,1, 1,0,0, 1,1,1;
polytope p = polytopeViaPoints(M);

```

```

gorensteinVector(p);
↳ polymake: used package ppl
↳ The Parma Polyhedra Library (PPL): A C++ library for convex polyhedra
↳ and other numerical abstractions.
↳ http://www.cs.unipr.it/ppl/
↳
↳ 1,1,1

```

D.13.2.23 hStarVector

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake_lib\]](#), page 1632).

Usage: `hStarVector(p); p polytope`

Return: `intvec`, the h^* vector of `p`

Example:

```

LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org

```

D.13.2.25 hilbertBasis

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake_lib\]](#), page 1632).

Usage: `hilbertBasis(c); c cone`

Return: `intmat`, the Hilbert basis of `c` intersected with Z^n

Example:

```

LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org

```

D.13.2.26 interiorLatticePoints

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake_lib\]](#), page 1632).

Usage: `interiorLatticePoints(p)`; `p` polytope

Assume: `isBounded(p)==1`

Return: `intmat`, all lattice points in the relative interior of `p`

Example:

```

LIB "polymake.lib";
⇒ Welcome to polymake version
⇒ Copyright (c) 1997-2015
⇒ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
⇒ http://www.polymake.org
intmat M[3][3]=
1,2,-1,
1,-1,2,
1,-1,-1;
polytope p = polytopeViaPoints(M);
interiorLatticePoints(p);
⇒ polymake: used package ppl
⇒ The Parma Polyhedra Library (PPL): A C++ library for convex polyhedra
⇒ and other numerical abstractions.
⇒ http://www.cs.unipr.it/ppl/
⇒
⇒ 1,0,0
intmat N[2][3]=
1,2,0,
1,0,2;
polytope q = polytopeViaPoints(N);
interiorLatticePoints(q);
⇒ 1,1,1

```

D.13.2.27 isBounded

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake_lib\]](#), page 1632).

Usage: `isBounded(p)`; `p` polytope

Return: 1, if `p` is bounded; 0 otherwise

Example:

```

LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
intmat M[4][4]=
1,1,0,0,
1,0,1,0,
1,0,0,1,
1,-1,-1,-1;
polytope p = polytopeViaPoints(M);
isBounded(p);
↳ 1
M=
1,1,0,0,
1,0,1,0,
0,0,0,1,
1,-1,-1,-1;
p = polytopeViaPoints(M);
isBounded(p);
↳ 0

```

D.13.2.28 isCanonical

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: `isCanonical(p)`; `p` polytope

Return: 1, if `p` has exactly one interior lattice point; 0 otherwise

Example:

```

LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org

```

D.13.2.31 isLatticeEmpty

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\], page 1632](#)).

Usage: `isLatticeEmpty(p)`; `p` polytope

Return: 1, if `p` contains no lattice points other than the vertices; 0 otherwise

Example:

```
LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org

↳ 1

```

D.13.2.34 isSmooth

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: `isSmooth(c)`; `c` cone
 `isSmooth(f)`; `f` fan
 `isSmooth(p)`; `p` polytope

Return: 1, if the input is smooth; 0 otherwise

Example:

```
LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org

```

```

polytope q = polytopeViaPoints(Mq);
isSmooth(q);
↳ 1

```

D.13.2.35 isTerminal

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: `isTerminal(p); p polytope`

Return: 1, if `p` has exactly one interior lattice point and all other lattice points are vertices; 0 otherwise

Example:

```

LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org

D.13.2.36 isVeryAmple

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: `isVeryAmple(p)`; `p` polytope

Return: 1, if `p` is very ample; 0 otherwise

Example:

```

LIB "polymake.lib";
  ↪ Welcome to polymake version
  ↪ Copyright (c) 1997-2015
  ↪ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
  ↪ http://www.polymake.org

  polytope q = polytopeViaPoints(N);
  isVeryAmple(q);
  ↪ 1

```

D.13.2.37 latticeCodegree

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: `latticeCodegree(p)`; `p` polytope

Return: `int`, the smallest number `n` such that `n*p` has a relative interior lattice point

Note: `dimension(p)+1==latticeDegree(p)+latticeCodegree(p)`

Example:

```
LIB "polymake.lib";
⇒ Welcome to polymake version
⇒ Copyright (c) 1997-2015
⇒ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
⇒ http://www.polymake.org
intmat M[4][3]=
1,1,0,
1,1,1,
1,0,1,
1,0,0;
polytope p = polytopeViaPoints(M);
latticeCodegree(p);
⇒ polymake: used package ppl
⇒ The Parma Polyhedra Library (PPL): A C++ library for convex polyhedra
⇒ and other numerical abstractions.
⇒ http://www.cs.unipr.it/ppl/
⇒
⇒ 2
intmat N[4][4]=
1,1,0,0,
1,0,1,0,
1,0,0,1,
1,0,0,0;
polytope q = polytopeViaPoints(N);
latticeCodegree(q);
⇒ 4
```

D.13.2.38 latticeDegree

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: `latticeDegree(p)`; `p` polytope

Return: `int`, the degree of the Ehrhart polynomial of `p`

Note: `dimension(p)+1==latticeDegree(p)+latticeCodegree(p)`

Example:

```
LIB "polymake.lib";
⇒ Welcome to polymake version
⇒ Copyright (c) 1997-2015
⇒ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
⇒ http://www.polymake.org
intmat M[4][3]=
1,1,0,
1,1,1,
```

```

1,0,1,
1,0,0;
polytope p = polytopeViaPoints(M);
latticeDegree(p);

1,0,1,0,
1,0,0,1,
1,0,0,0;
polytope q = polytopeViaPoints(N);
latticeDegree(q);
↳ 0

```

D.13.2.39 latticePoints

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: `latticePoints(p)`; `p` polytope

Assume: `isBounded(p)==1`

Return: `intmat`, all lattice points in `p`

Example:

```

LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
intmat M[3][3]=
1,2,-1,
1,-1,2,
1,-1,-1;
polytope p = polytopeViaPoints(M);
latticePoints(p);
↳ polymake: used package ppl
↳ The Parma Polyhedra Library (PPL): A C++ library for convex polyhedra
↳ and other numerical abstractions.
↳ http://www.cs.unipr.it/ppl/
↳
↳ 1,-1,-1,
↳ 1,-1,0,
↳ 1,-1,1,
↳ 1,-1,2,

↳ 1,0,0,
↳ 1,0,1,
↳ 1,1,-1,
↳ 1,1,0,

```

```

↳ 1,2,-1
intmat N[2][3]=
1,2,0,
1,0,2;
polytope q = polytopeViaPoints(N);
latticePoints(q);
↳ 1,0,2,
↳ 1,1,1,
↳ 1,2,0

```

D.13.2.40 latticeVolume

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: `latticeVolume(p)`; `p` polytope

Assume: `isBounded(p)==1`

Return: `int`, the lattice volume of `p`

Example:

```

LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
intmat M[4][3]=
1,1,0,
1,1,1,
1,0,1,
1,0,0;
polytope p = polytopeViaPoints(M);
latticeVolume(p);
↳ polymake: used package ppl
↳ The Parma Polyhedra Library (PPL): A C++ library for convex polyhedra
↳ and other numerical abstractions.
↳ http://www.cs.unipr.it/ppl/
↳
↳ 2
intmat N[4][3]=
1,1,0,
1,2,1,
1,0,1,
1,0,0;
polytope q = polytopeViaPoints(N);
latticeVolume(q);
↳ 3
intmat W[4][4]=
1,1,0,0,
1,0,1,0,
1,0,0,1,
1,0,0,0;
polytope r = polytopeViaPoints(W);
latticeVolume(r);
↳ 1

```

D.13.2.41 maximalFace

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake_lib\], page 1632](#)).

Usage: `maximalFace(p,v)`; `p` polytope, `v` intvec

Assume: `v` lies in the negative dual tail cone of `p`

Return: intmat, vertices of the face of `p` on which the linear form `v` is maximal

Note: the maximal face is independent of the first coordinate of `v` since `p` is considered as a polytope in the plane (first coordinate) = 1.

Example:

```
LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
intmat M[3][3]=
1,1,0,
1,0,1,
1,-1,-1;
intvec v = 0,1,1;
polytope p = polytopeViaPoints(M);
maximalFace(p,v);
↳ polymake: used package ppl
↳ The Parma Polyhedra Library (PPL): A C++ library for convex polyhedra
↳ and other numerical abstractions.
↳ http://www.cs.unipr.it/ppl/
↳
↳ 1,1,0,
↳ 1,0,1
intvec w = -5,1,1;
maximalFace(p,w);
↳ 1,1,0,
↳ 1,0,1
```

D.13.2.42 maximalValue

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake_lib\], page 1632](#)).

Usage: `maximalValue(p,v)`; `p` polytope, `v` intvec

Assume: `v` lies in the negative dual tail cone of `p`

Return: intmat, vertices of the face of `p` on which the linear form `v` is maximal

Note: first coordinate of `v` corresponds to a shift of the maximal value since `p` is considered as a polytope in the plane (first coordinate) = 1.

Example:

```
LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
intmat M[3][3]=
```

```

1,1,0,
1,0,1,
1,-1,-1;
intvec v = 0,1,1;
polytope p = polytopeViaPoints(M);
maximalValue(p,v);
⇒ polymake: used package ppl
⇒ The Parma Polyhedra Library (PPL): A C++ library for convex polyhedra
⇒ and other numerical abstractions.
⇒ http://www.cs.unipr.it/ppl/
⇒
⇒ 1
intvec w = -5,1,1;
maximalValue(p,w);
⇒ -4

```

D.13.2.43 minimalFace

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake_lib\]](#), page 1632).

Usage: `minimalFace(p,v)`; `p` polytope, `v` intvec

Assume: `v` lies in the dual tail cone of `p`

Return: intmat, vertices of the face of `p` on which the linear form `v` is minimal

Note: the minimal face is independent of the first coordinate of `v` since `p` is considered as a polytope in the plane $(\text{first coordinate}) = 1$.

Example:

```

LIB "polymake.lib";
⇒ Welcome to polymake version
⇒ Copyright (c) 1997-2015
⇒ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
⇒ http://www.polymake.org
intmat M[3][3]=
1,1,0,
1,0,1,
1,-1,-1;
intvec v = 0,-1,-1;
polytope p = polytopeViaPoints(M);
minimalFace(p,v);
⇒ polymake: used package ppl
⇒ The Parma Polyhedra Library (PPL): A C++ library for convex polyhedra
⇒ and other numerical abstractions.
⇒ http://www.cs.unipr.it/ppl/
⇒
⇒ 1,1,0,
⇒ 1,0,1
intvec w = 5,-1,-1;
minimalFace(p,w);
⇒ 1,1,0,
⇒ 1,0,1

```

D.13.2.44 minimalValue

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: `minimalValue(p,v)`; `p` polytope, `v` intvec

Assume: `v` lies in the negative dual tail cone of `p`

Return: intmat, vertices of the face of `p` on which the linear form `v` is minimal

Note: first coordinate of `v` corresponds to a shift of the minimal value since `p` is considered as a polytope in the plane (first coordinate) = 1.

Example:

```
LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
intmat M[3][3]=
1,1,0,
1,0,1,
1,-1,-1;
intvec v = 0,-1,-1;
polytope p = polytopeViaPoints(M);
minimalValue(p,v);
↳ polymake: used package ppl
↳ The Parma Polyhedra Library (PPL): A C++ library for convex polyhedra
↳ and other numerical abstractions.
↳ http://www.cs.unipr.it/ppl/
↳
↳ -1
intvec w = 5,-1,-1;
minimalValue(p,w);
↳ 4
```

D.13.2.45 minkowskiSum

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: `minkowskiSum(c,d)`; `c` cone, `d` cone
`minkowskiSum(c,q)`; `c` cone, `q` polytope
`minkowskiSum(p,d)`; `p` polytope, `d` cone
`minkowskiSum(p,q)`; `p` polytope, `q` polytope

Assume: input arguments have the same ambient dimension

Return: cone, if both inputs are cones; polytope, otherwise
the minkowski sum of the two input arguments

Example:

```
LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
intmat M[3][4]=
```

```

1,1,0,0,
1,0,1,0,
1,0,0,0;
intmat N[3][4]=
1,0,0,1,
1,-1,-1,-1,
1,0,0,0;
polytope p = polytopeViaPoints(M);
polytope q = polytopeViaPoints(N);
vertices(minkowskiSum(p,q));
⇒ polymake: used package ppl
⇒ The Parma Polyhedra Library (PPL): A C++ library for convex polyhedra
and other numerical abstractions.
⇒ http://www.cs.unipr.it/ppl/
⇒
⇒ 1, 0, 1, 0,
⇒ 1, 1, 0, 0,
⇒ 1, 1, 0, 1,
⇒ 1, 0, -1, -1,
⇒ 1, -1, -1, -1,
⇒ 1, 0, 0, 1,
⇒ 1, 0, 1, 1,
⇒ 1, -1, 0, -1

```

D.13.2.46 nBoundaryLatticePoints

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: `nBoundaryLatticePoints(p)`; `p` polytope

Assume: `isBounded(p)==1`

Return: `int`, the number of lattice points in the relative boundary of `p`

Example:

```

LIB "polymake.lib";
⇒ Welcome to polymake version
⇒ Copyright (c) 1997-2015
⇒ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
⇒ http://www.polymake.org

```

D.13.2.47 nHilbertBasis

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: `nHilbertBasis(c)`; `c` cone

Return: `int`, the number of elements in the Hilbert basis of `c` intersected with Z^n

Example:

```

LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org

D.13.2.50 normalFan

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: `normalFan(p); p polytope`

Return: `fan`, the normal fan of `p`

Example:

```

D.13.2.51 vertexAdjacencyGraph

Procedure from library `polymake.lib` (see [Section D.13.2 \[polymake.lib\]](#), page 1632).

Usage: `vertexAdjacencyGraph(p); p` polytope

Return: list, the first entry is a bigintmat containing all vertices as row vectors, and therefore assigning all vertices an integer. the second entry is a list of intvecs representing the adjacency graph of the vertices of `p`, the intvec in position `i` contains all vertices `j` which are connected to vertex `i` via an edge of `p`.

D.13.3 realizationMatroids_lib

Library: realizationMatroids.lib

Purpose: Deciding Relative Realizability for Tropical Fan Curves in 2-Dimensional Matroidal Fans

Authors: Anna Lena Winstel, winstel@mathematik.uni-kl.de

Overview: In tropical geometry, one question to ask is the following: given a one-dimensional balanced polyhedral fan C which is set theoretically contained in the tropicalization $\text{trop}(Y)$ of an algebraic variety Y , does there exist a curve X in Y such that $\text{trop}(X) = C$? This equality of C and $\text{trop}(X)$ denotes an equality of both, the fans $\text{trop}(X)$ and C and their weights on the maximal cones. The relative realization space of C with respect to Y is the space of all algebraic curves in Y which tropicalize to C .

This library provides procedures deciding relative realizability for tropical fan curves, i.e. one-dimensional weighted balanced polyhedral fans, contained in two-dimensional matroidal fans $\text{trop}(Y)$ where Y is a projective plane.

Notation: If Y is a projective plane in $(n-1)$ -dimensional projective space, we consider $\text{trop}(Y)$ in $\mathbb{R}^n/\langle 1 \rangle$. Moreover, for the relative realization space of C with respect to Y we only consider algebraic curves of degree $\deg(C)$ in Y which tropicalize to C .

Procedures:

D.13.3.1 realizationDim

Procedure from library realizationMatroids.lib (see [Section D.13.3 \[realizationMatroids_lib\]](#), page 1677).

Usage: realizationDim(I,C); where I is a homogeneous linear ideal defining the projective plane $Y = V(I)$ and C is a list of intvectors such that each intvector represents a one-dimensional cone in the tropical fan curve whose relative realizability should be

checked. This representation is done in the following way: the one-dimensional cone K is represented by a vector w whose equivalence class $[w]$ in $\mathbb{R}^n/\langle 1 \rangle$ can be written as $[w] = m*[v]$ where $[v]$ is the primitive generator of K and m is the weight of K .

Returns: the dimension of the relative realization space of the tropical curve C with respect to Y , and -1 if the relative realization space is empty.

Example:

```
LIB "realizationMatroids.lib";
ring r = 0, (x(1..4)), dp;
ideal I = x(1)+x(2)+x(3)+x(4);
list C = list(intvec(2,2,0,0), intvec(0,0,2,1), intvec(0,0,0,1));
//C represents the tropical fan curve which consists of the cones
//cone([(1,1,0,0)]) (with weight 2), cone([(0,0,2,1)]) (with weight 1)
//and cone([(0,0,0,1)]) (with weight 1)
realizationDim(I,C);
↪ -1
```

D.13.3.2 irrRealizationDim

Procedure from library `realizationMatroids.lib` (see [Section D.13.3 \[realizationMatroids.lib\]](#), page 1677).

Usage: `irrRealizationDim(I,C)`; where I is a homogeneous linear ideal defining the projective plane $Y = V(I)$ and C is a list of intvectors such that each intvector represents a one-dimensional cone in the tropical fan curve whose irreducible relative realizability should be checked. This representation is done in the following way: a one-dimensional cone K is represented by a vector w whose equivalence class $[w]$ in $\mathbb{R}^n/\langle 1 \rangle$ can be written as $[w] = m*[v]$ where $[v]$ is the primitive generator of K and m is the weight of K .

Returns: the dimension of the irreducible relative realization space of C with respect to Y , and -1 if the irreducible realization space is empty.

Example:

```
LIB "realizationMatroids.lib";
ring r = 0, (x(1..4)), dp;
ideal I = x(1)+x(2)+x(3)+x(4);
list C = list(intvec(2,2,0,0), intvec(0,0,2,2));
//C represents the tropical fan curve which consists of the cones
//cone([(1,1,0,0)]) and cone([(1,1,0,0)]), both with weight 2
realizationDim(I,C);
↪ 0
irrRealizationDim(I,C);
↪ -1
```

D.13.3.3 realizationDimPoly

Procedure from library `realizationMatroids.lib` (see [Section D.13.3 \[realizationMatroids.lib\]](#), page 1677).

Usage: `realizationDimPoly(I,C)`; where I is a homogeneous linear ideal defining the projective plane $Y = V(I)$ and C is a list of intvectors such that each intvector represents a one-dimensional cone in the tropical fan curve whose relative realizability should be checked. This representation is done in the following way: the one-dimensional cone K is represented by a vector w whose equivalence class $[w]$ in $\mathbb{R}^n/\langle 1 \rangle$ can be written as $[w] = m*[v]$ where $[v]$ is the primitive generator of K and m is the weight of K .

Returns: If the relative realization space of the tropical fan curve C is non-empty, this routine returns the tuple (r,f) , where r is the dimension of the relative realization space and f is an example of a homogeneous polynomial of degree $\deg(C)$ cutting out a curve X in Y which tropicalizes to C . In case the relative realization space is empty, the output is set to -1 .

Example:

```
LIB "realizationMatroids.lib";
ring r = 0,(x(1..4)),dp;
ideal I = x(1)+x(2)+x(3)+x(4);
list C = list(intvec(2,2,0,0),intvec(0,0,2,2));
//C represents the tropical fan curve which consists of the cones
//cone([(1,1,0,0)]) and cone([(1,1,0,0)]), both with weight 2
realizationDimPoly(I,C);
↪ 0 x(1)^2+2*x(1)*x(2)+x(2)^2
C = list(intvec(0,0,0,4),intvec(0,1,3,0),intvec(1,0,1,0),intvec(0,2,0,0),intvec(3,1,0,0));
//C represents the tropical fan curve which consists of the cones
//cone([(0,0,0,1)]) with weight 4,
//cone([(0,1,3,0)]), cone([(1,0,1,0)]) both with weight 1,
//cone([(0,1,0,0)]) with weight 2, and
//cone([(3,1,0,0)]) with weight 1
realizationDimPoly(I,C);
↪ 7 x(1)*x(2)^3+x(1)^3*x(3)+x(2)^3*x(3)+x(1)*x(3)^3
```

D.13.4 tropical.lib

Library: tropical.lib

Purpose: Computations in Tropical Geometry

Authors: Anders Jensen Needergerd, email: jensen@math.tu-berlin.de
 Hannah Markwig, email: hannah@uni-math.gwdg.de
 Thomas Markwig, email: keilen@mathematik.uni-kl.de
 Yue Ren, email: ren@mathematik.uni-kl.de

Warning: - tropicalLifting will only work with LINUX and if in addition gfan is installed.
 - drawTropicalCurve and drawTropicalNewtonSubdivision will only display the tropical curve with LINUX and if in addition latex and xdg-open are installed.
 - For tropicalLifting in the definition of the basering the parameter t from the Puiseux series field $C\{\{t\}\}$ must be defined as a variable, while for all other procedures it must be defined as a parameter.

Theory: Fix some base field K and a bunch of lattice points v_0, \dots, v_m in the integer lattice Z^n , then this defines a toric variety as the closure of $(K^*)^n$ in the projective space P^m , where the torus is embedded via the map sending a point x in $(K^*)^n$ to the point $(x^{v_0}, \dots, x^{v_m})$.

The generic hyperplane sections are just the images of the hypersurfaces in $(K^*)^n$ defined by the polynomials $f = a_0 * x^{v_0} + \dots + a_m * x^{v_m} = 0$. Some properties of these hypersurfaces can be studied via tropicalisation.

For this we suppose that $K = C\{\{t\}\}$ is the field of Puiseux series over the field of complex numbers (or any other field with a valuation into the real numbers). One associates to the hypersurface given by $f = a_0 * x^{v_0} + \dots + a_m * x^{v_m}$ the tropical hypersurface defined by the tropicalisation $\text{trop}(f) = \min\{\text{val}(a_0) + \langle v_0, x \rangle, \dots, \text{val}(a_m) + \langle v_m, x \rangle\}$.

Here, $\langle v, x \rangle$ denotes the standard scalar product of the integer vector v in \mathbb{Z}^n with the vector $x = (x_1, \dots, x_n)$ of variables, so that $\text{trop}(f)$ is a piecewise linear function on \mathbb{R}^n . The corner locus of this function (i.e. the points at which the minimum is attained at least twice) is the tropical hypersurface defined by $\text{trop}(f)$.

The theorem of Newton-Kapranov states that this tropical hypersurface is the same as if one computes pointwise the valuation of the hypersurface given by f . The analogue holds true if one replaces one equation f by an ideal I . A constructive proof of the theorem is given by an adapted version of the Newton-Puiseux algorithm. The hard part is to find a point in the variety over $\mathbb{C}\{\{t\}\}$ which corresponds to a given point in the tropical variety.

It is the purpose of this library to provide basic means to deal with tropical varieties. Of course we cannot represent the field of Puiseux series over \mathbb{C} in its full strength, however, in order to compute interesting examples it will be sufficient to replace the complex numbers \mathbb{C} by the rational numbers \mathbb{Q} and to replace Puiseux series in t by rational functions in t , i.e. we replace $\mathbb{C}\{\{t\}\}$ by $\mathbb{Q}(t)$, or sometimes even by $\mathbb{Q}[t]$. Note, that this in particular forbids rational exponents for the t 's.

Moreover, in Singular no negative exponents of monomials are allowed, so that the integer vectors v_i will have to have non-negative entries. Shifting all exponents by a fixed integer vector does not change the tropicalisation nor does it change the toric variety. Thus this does not cause any restriction.

If, however, for some reason you prefer to work with general v_i , then you have to pass right away to the tropicalisation of the equations, wherever this is allowed – these are linear polynomials where the constant coefficient corresponds to the valuation of the original coefficient and where the non-constant coefficient correspond to the exponents of the monomials, thus they may be rational numbers respectively negative numbers: e.g. if $f = t^{1/2} * x^{-2} * y^3 + 2t * x * y + 4$ then $\text{trop}(f) = \min\{1/2 - 2x + 3y, 1 + x + y, 0\}$.

The main tools provided in this library are as follows:

- `tropicalLifting` implements the constructive proof of the Theorem of Newton-Kapranov and constructs a point in the variety over $\mathbb{C}\{\{t\}\}$ corresponding to a given point in the corresponding tropical variety associated to an ideal I ; the generators of I have to be in the polynomial ring $\mathbb{Q}[t, x_1, \dots, x_n]$ considered as a subring of $\mathbb{C}\{\{t\}\}[x_1, \dots, x_n]$; a solution will be constructed up to given order; note that several field extensions of \mathbb{Q} might be necessary throughout the intermediate computations; the procedures use the external program `gfan`
- `puiseuxExpansion` computes a Newton-Puiseux expansion of a plane curve singularity
- `drawTropicalCurve` visualises a tropical plane curve either given by a polynomial in $\mathbb{Q}(t)[x, y]$ or by a list of linear polynomials of the form $ax + by + c$ with a, b in \mathbb{Z} and c in \mathbb{Q} ; `latex` must be installed on your computer
- `tropicalJInvariant` computes the tropical j -invariant of a tropical elliptic curve
- `jInvariant` computes the j -invariant of an elliptic curve
- `weierstrassForm` computes the Weierstrass form of an elliptic curve

Procedures for tropical lifting: Procedures for drawing tropical curves: General procedures: Procedures for latex conversion: Auxiliary procedures: Procedures from binary library:

D.13.4.1 tropicalLifting

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\], page 1679](#)).

Usage: `tropicalLifting(i,w,ord[,opt]);` i ideal, w intvec, ord int, opt string

Assume:

- i is an ideal in $\mathbb{Q}[t,x_1,\dots,x_n]$, $w=(w_0,w_1,\dots,w_n)$ and $(w_1/w_0,\dots,w_n/w_0)$ is in the tropical variety of i , and ord is the order up to which a point in $V(i)$ over $\mathbb{Q}\{\{t\}\}$ lying over $(w_1/w_0,\dots,w_n/w_0)$ shall be computed;
- w_0 may NOT be ZERO
- the basering should not have any parameters on its own and it should have a global monomial ordering,
e.g. ring $r=0,(t,x(1..n)),dp;$
- the first variable of the basering will be treated as the parameter t in the Puiseux series field
- the optional parameter opt should be one or more strings among the following:
 - 'isZeroDimensional' : the dimension i is zero (not to be checked);
 - 'isPrime' : the ideal is prime over $\mathbb{Q}(t)[x_1,\dots,x_n]$ (not to be checked);
 - 'isInTrop' : $(w_1/w_0,\dots,w_n/w_0)$ is in the tropical variety (not to be checked);
 - 'oldGfan' : uses gfan version 0.2.1 or less
 - 'findAll' : find all solutions of a zero-dimensional ideal over $(w_1/w_0,\dots,w_n/w_0)$
 - 'noAbs' : do NOT use absolute primary decomposition
 - 'puiseux' : $n=1$ and i is generated by one equation
 - 'noResubst' : avoids the computation of the resubstitution

Return: IF THE OPTION 'findAll' WAS NOT SET THEN:
list, containing one lifting of the given point $(w_1/w_0,\dots,w_n/w_0)$ in the tropical variety of i to a point in $V(i)$ over Puiseux series field up to the first ord terms; more precisely:
IF THE OPTION 'noAbs' WAS NOT SET, THEN:
 $l[1]$ = ring $\mathbb{Q}[a]/m[[t]]$
 $l[2]$ = int
 $l[3]$ = intvec
 $l[4]$ = list
 IF THE OPTION 'noAbs' WAS SET, THEN:
 $l[1]$ = ring $\mathbb{Q}[X(1),\dots,X(k)]/m[[t]]$
 $l[2]$ = int
 $l[3]$ = intvec
 $l[4]$ = list
 $l[5]$ = string
 IF THE OPITON 'findAll' WAS SET, THEN:
 list, containing ALL liftings of the given point $((w_1/w_0,\dots,w_n/w_0)$ in the tropical variety of i to a point in $V(i)$ over Puiseux series field up to the first ord terms, if the ideal is zero-dimensional over $\mathbb{Q}\{\{t\}\}$;
 more precisely, each entry of the list is a list l as computed if 'findAll' was NOT set
 WE NOW DESCRIBE THE LIST ENTRIES IF 'findAll' WAS NOT SET:
 - the ring $l[1]$ contains an ideal LIFT, which contains a point in $V(i)$ lying over w up to the first ord terms;
 - and if the integer $l[2]$ is N then t has to be replaced by $t^{1/N}$ in the lift, or alternatively replace t by t^N in the defining ideal
 - if the $k+1$ st entry of $l[3]$ is non-zero, then the k th component of LIFT has to be multiplied $t^{-l[3][k]/l[3][1]}$ AFTER substituting t by $t^{1/N}$

- unless the option 'noResubst' was set, the kth entry of list l[4] is a string which represents the kth generator of the ideal i where the coordinates have been replaced by the result of the lift; the t-order of the kth entry should in principle be larger than the t-degree of LIFT
- if the option 'noAbs' was set, then the string in l[5] defines a maximal ideal in the field $\mathbb{Q}[X(1), \dots, X(k)]$, where $X(1), \dots, X(k)$ are the parameters of the ring in l[1]; the basefield of the ring in l[1] should be considered modulo this ideal

- Remark:**
- it is best to use the procedure displayTropicalLifting to display the result
 - the option 'findAll' cannot be used if 'noAbs' is set
 - if the parameter 'findAll' is set AND the ideal i is zero-dimensional in $\mathbb{Q}\{\{t\}\}[x_1, \dots, x_n]$ then ALL points in $V(i)$ lying over w are computed up to order ord; if the ideal is not-zero dimensional, then only the points in the ideal after cutting down to dimension zero will be computed
 - the procedure requires that the program GFAN is installed on your computer; if you have GFAN version less than 0.3.0 then you must use the optional parameter 'oldGfan'
 - the procedure requires the Singular procedure absPrimdecGTZ to be present in the package primdec.lib, unless the option 'noAbs' is set; but even if absPrimdecGTZ is present it might be necessary to set the option 'noAbs' in order to avoid the costly absolute primary decomposition; the side effect is that the field extension which is computed throughout the recursion might need more than one parameter to be described
 - since \mathbb{Q} is infinite, the procedure finishes with probability one
 - you can call the procedure with $\mathbb{Z}/p\mathbb{Z}$ as base field instead of \mathbb{Q} , but there are some problems you should be aware of:
 - + the Puiseux series field over the algebraic closure of $\mathbb{Z}/p\mathbb{Z}$ is NOT algebraically closed, and thus there may not exist a point in $V(i)$ over the Puiseux series field with the desired valuation; so there is no chance that the procedure produced a sensible output - e.g. if $i = tx^p - tx - 1$
 - + if the dimension of i over $\mathbb{Z}/p\mathbb{Z}(t)$ is not zero the process of reduction to zero might not work if the characteristic is small and you are unlucky
 - + the option 'noAbs' has to be used since absolute primary decomposition in Singular only works in characteristic zero
 - the basefield should either be \mathbb{Q} or $\mathbb{Z}/p\mathbb{Z}$ for some prime p; field extensions will be computed if necessary; if you need parameters or field extensions from the beginning they should rather be simulated as variables possibly adding their relations to the ideal; the weights for the additional variables should be zero

```

D.13.4.2 displayTropicalLifting

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\], page 1679](#)).

Usage: `displaytropcallifting(troplift[,#]); troplift list, # list`

Assume: `troplift` is the output of `tropicalLifting`; the optional parameter `#` can be the string `'subst'`

Return: none

Note: - the procedure displays the output of the procedure `tropicalLifting`
 - if the optional parameter `'subst'` is given, then the lifting is substituted into the ideal and the result is displayed

Example:

```
LIB "tropical.lib";

```

D.13.4.3 puiseuxExpansion

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\], page 1679](#)).

Usage: `puiseuxExpansion(f,n,#)`; f poly, n int, # list

Assume: f is a non-constant polynomial in two variables which is not divisible by the first variable and which is squarefree as a power series over the complex numbers; the base field is either the field of rational numbers or a finite extension thereof; monomial ordering is assumed to be local; the optional parameter # can be the string 'subst'

Return: list, where each entry of the list l describes the Newton-Puiseux parametrisations of one branch of the plane curve singularity at the origin defined by f; only the terms up to order n of each parametrisation are computed

$l[i][1]$ = is a ring

$l[i][2]$ = int

$l[i][3]$ = string

WE NOW DESCRIBE THE LIST ENTRIES $l[i]$ IN MORE DETAIL:

- the ring $l[i][1]$ contains an ideal LIFT and the Newton-Puiseux parametrisation of the branch is given by $x=t^N$ and $y=LIFT[1]$, where $N=l[i][2]$

- if the base field had a parameter and a minimal polynomial, then the new base field will have a parameter and a new minimal polynomial, and $LIFT[2]$ describes how the old parameter can be computed from the new one

- if a field extension with minimal polynomial of degree k was necessary, then to the one extension produced actually k extensions correspond by replacing the parameter a successively by all zeros of the minimal polynomial

- if the option subst was set $l[i][3]$ contains the polynomial where y has been substituted by $y(t^{\{1/N\}})$ as a string

Remark:

- it is best to use the procedure `displayPuisseuxExpansion` to display the result
- the procedure requires the Singular procedure `absPrimdecGTZ` to be present in the package `primdec.lib`
- if f is not squarefree it will be replaced by its squarefree part

Example:

```

⇒
```

D.13.4.5 tropicalCurve

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\], page 1679](#)).

Usage: `tropicalCurve(tp[,#]);` tp list, # optional list

Assume: tp is list of linear polynomials of the form $ax+by+c$ with integers a, b and a rational number c representing a tropical Laurent polynomial defining a tropical plane curve; alternatively tp can be a polynomial in $\mathbb{Q}(t)[x,y]$ defining a tropical plane curve via the valuation map; the basering must have a global monomial ordering, two variables and up to one parameter!

Return: list, each entry $i=1,\dots,\text{size}(l)-1$ corresponds to a vertex in the tropical plane curve defined by tp

- $l[i][1]$ = x-coordinate of the ith vertex
- $l[i][2]$ = y-coordinate of the ith vertex
- $l[i][3]$ = intmat, if j is an entry in the first row of intmat then the ith vertex of the tropical curve is connected to the jth vertex with multiplicity given by the corresponding entry in the second row
- $l[i][4]$ = list of lists, the first entry of a list is a primitive integer vector defining the direction of an unbounded edge emerging from the ith vertex of the graph, the corresponding second entry in the list is the multiplicity of the unbounded edge
- $l[i][5]$ = a polynomial whose monomials mark the vertices in the Newton polygon corresponding to the entries in tp which take the common minimum at the ith vertex – if some coefficient a or b of the linear polynomials in the input was negative, then each monomial has to be shifted by the values in $l[\text{size}(l)][3]$
- $l[\text{size}(l)][1]$ = list, the entries describe the boundary points of the Newton subdivision
- $l[\text{size}(l)][2]$ = list, the entries are pairs of integer vectors defining an interior edge of the Newton subdivision
- $l[\text{size}(l)][3]$ = intvec, the monomials occurring in $l[i][5]$ have to be shifted by this vector in order to represent marked vertices in the Newton polygon

Note: here the tropical polynomial is supposed to be the MINIMUM of the linear forms in tp, unless the optional input `#[1]` is the string 'max'

Example:

```
LIB "tropical.lib";
⇒ Welcome to polymake version
⇒ Copyright (c) 1997-2015
⇒ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
⇒ http://www.polymake.org
ring r=(0,t),(x,y),dp;
poly f=t*(x7+y7+1)+1/t*(x4+y4+x2+y2+x3y+xy3)+1/t7*x2y2;
list graph=tropicalCurve(f);
// the tropical curve has size(graph)-1 vertices
```

```

size(graph)-1;
↳ 7
// the coordinates of the first vertex are graph[1][1],graph[1][2];
graph[1][1],graph[1][2];
↳ -8/3 -8/3
// the first vertex is connected to the vertices
//   graph[1][3][1,1..ncols(graph[1][3])]
intmat M=graph[1][3];
M[1,1..ncols(graph[1][3])];
↳ 2 3
// the weights of the edges to these vertices are
//   graph[1][3][2,1..ncols(graph[1][3])]
M[2,1..ncols(graph[1][3])];
↳ 1 1
// from the first vertex emerge size(graph[1][4]) unbounded edges
size(graph[1][4]);
↳ 1
// the primitive integral direction vector of the first unbounded edge
//   of the first vertex
graph[1][4][1][1];
↳ -1,-1
// the weight of the first unbounded edge of the first vertex
graph[1][4][1][2];
↳ 7
// the monomials which are part of the Newton subdivision of the first vertex
graph[1][5];
↳ x7+y7+x2y2
// connecting the points in graph[size(graph)][1] we get
//   the boundary of the Newton polytope
graph[size(graph)][1];
↳ [1]:
↳ 0,7
↳ [2]:
↳ 7,0
↳ [3]:
↳ 0,0
// an entry in graph[size(graph)][2] is a pair of points
//   in the Newton polytope bounding an inner edge
graph[size(graph)][2][1];
↳ [1]:
↳ 7,0
↳ [2]:
↳ 2,2

```

D.13.4.6 drawTropicalCurve

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\]](#), page 1679).

Usage: `drawTropicalCurve(f,#)`; `f` poly or list, `#` optional list

Assume: `f` is list of linear polynomials of the form $ax+by+c$ with integers `a`, `b` and a rational number `c` representing a tropical Laurent polynomial defining a tropical plane curve; alternatively `f` can be a polynomial in $\mathbb{Q}(t)[x,y]$ defining a tropical plane curve via the valuation map;

the basering must have a global monomial ordering, two variables and up to one parameter!

Return: NONE

Note:

- the procedure creates the files `/tmp/tropicalcurveNUMBER.tex` and `/tmp/tropicalcurveNUMBER.ps`, where NUMBER is a random four digit integer; moreover it displays the tropical curve via `xdg-open`;
- if you wish to remove all these files from `/tmp`, call the procedure `cleanTmp`
- edges with multiplicity greater than one carry this multiplicity
- if `#` is empty, then the tropical curve is computed w.r.t. minimum, if `#[1]` is the string 'max', then it is computed w.r.t. maximum
- if the last optional argument is 'onlytexfile' then only the latex file is produced; this option should be used if `xdg-utils` is not installed on your system
- note that lattice points in the Newton subdivision which are black correspond to markings of the marked subdivision, while lattice points in grey are not marked

Example:

```
LIB "tropical.lib";
⇒ Welcome to polymake version
⇒ Copyright (c) 1997-2015
⇒ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
⇒ http://www.polymake.org

D.13.4.7 drawNewtonSubdivision

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\]](#), page 1679).

Usage: `drawTropicalCurve(f[,#]);` `f` poly, `#` optional list

Assume: `f` is list of linear polynomials of the form $ax+by+c$ with integers `a`, `b` and a rational number `c` representing a tropical Laurent polynomial defining a tropical plane curve; alternatively `f` can be a polynomial in $\mathbb{Q}(t)[x,y]$ defining a tropical plane curve via the valuation map; the basering must have a global monomial ordering, two variables and up to one parameter!

Return: NONE

Note: - the procedure creates the files `/tmp/newtonsubdivisionNUMBER.tex`, and `/tmp/newtonsubdivisionNUMBER.ps`, where `NUMBER` is a random four digit integer;
 moreover it desplays the tropical curve defined by `f` via `xdg-open`; if you wish to remove all these files from `/tmp`, call the procedure `cleanTmp`;
 if `#` is empty, then the tropical curve is computed w.r.t. minimum, if `#[1]` is the string 'max', then it is computed w.r.t. maximum
 - note that lattice points in the Newton subdivision which are black correspond to markings of the marked subdivision, while lattice points in grey are not marked

Example:

D.13.4.8 tropicalJInvariant

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\]](#), page 1679).

Usage: `tropicalJInvariant(f,#)`; `f` poly or list, `#` optional list

Assume: `f` is list of linear polynomials of the form $ax+by+c$ with integers a , b and a rational number c representing a tropical Laurent polynomial defining a tropical plane curve; alternatively `f` can be a polynomial in $\mathbb{Q}(t)[x,y]$ defining a tropical plane curve via the valuation map; the basering must have a global monomial ordering, two variables and up to one parameter!

Return: number, if the graph underlying the tropical curve has precisely one loop then its weighted lattice length is returned, otherwise the result will be -1

Note:

- if the tropical curve is elliptic and its embedded graph has precisely one loop, then the weighed lattice length of the loop is its tropical j-invariant
- the procedure checks if the embedded graph of the tropical curve has genus one, but it does NOT check if the loop can be resolved, so that the curve is not a proper tropical elliptic curve
- if the embedded graph of a tropical elliptic curve has more than one loop, then all but one can be resolved, but this is not observed by this procedure, so it will not compute the j-invariant
- if `#` is empty, then the tropical curve is computed w.r.t. minimum, if `#[1]` is the string 'max', then it is computed w.r.t. maximum
- the tropicalJInvariant of a plane tropical cubic is the 'cycle length' of the cubic

as introduced in the paper: Eric Katz, Hannah Markwig, Thomas Markwig: The j -invariant of a cubic tropical plane curve.

Example:

```
LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),(x,y),dp;
// tropicalJInvariant computes the tropical j-invariant of an elliptic curve
tropicalJInvariant(t*(x3+y3+1)+1/t*(x2+y2+x+y+x2y+xy2)+1/t2*xy);
↳ // ** int division with '/': use 'div' instead in line >> genus=-genus/2\
    ; // we have counted each bounded edge twice<<
↳ 6
// the Newton polygone need not be the standard simplex
tropicalJInvariant(x+y+x2y+xy2+1/t*xy);
↳ // ** int division with '/': use 'div' instead in line >> genus=-genus/2\
    ; // we have counted each bounded edge twice<<
↳ 8
// the curve can have arbitrary degree
tropicalJInvariant(t*(x7+y7+1)+1/t*(x4+y4+x2+y2+x3y+xy3)+1/t7*x2y2);
↳ // ** int division with '/': use 'div' instead in line >> genus=-genus/2\
    ; // we have counted each bounded edge twice<<
↳ 14/3
// the procedure does not realise, if the embedded graph of the tropical
// curve has a loop that can be resolved
tropicalJInvariant(1+x+y+xy+tx2y+txy2);
↳ // ** int division with '/': use 'div' instead in line >> genus=-genus/2\
    ; // we have counted each bounded edge twice<<
↳ 4
// but it does realise, if the curve has no loop at all ...
tropicalJInvariant(x+y+1);
↳ // ** int division with '/': use 'div' instead in line >> genus=-genus/2\
    ; // we have counted each bounded edge twice<<
↳ The embedded graph of the curve has not genus one.
↳ -1
// or if the embedded graph has more than one loop - even if only one
// cannot be resolved
tropicalJInvariant(1+x+y+xy+tx2y+txy2+t3x5+t3y5+tx2y2+t2xy4+t2yx4);
↳ // ** int division with '/': use 'div' instead in line >> genus=-genus/2\
    ; // we have counted each bounded edge twice<<
↳ The embedded graph of the curve has not genus one.
↳ -1
```

D.13.4.9 weierstrassForm

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\], page 1679](#)).

Usage: `weierstrassForm(wf[,#]);` wf poly, # list

Assume: wf is a polynomial whose Newton polygon has precisely one interior lattice point, so that it defines an elliptic curve on the toric surface corresponding to the Newton polygon

Return: poly, the Weierstrass normal form of the polynomial

Note:

- the algorithm for the coefficients of the Weierstrass form is due to Fernando Rodriguez Villegas, villegas@math.utexas.edu
- the characteristic of the base field should not be 2 or 3
- if an additional argument # is given, a simplified Weierstrass form is computed

Example:

```
LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),(x,y),lp;
// f is already in Weierstrass form
poly f=y2+yx+3y-x3-2x2-4x-6;
weierstrassForm(f);
↳ -x3-2*x2+xy-4*x+y2+3*y-6
// g is not, but wg is
poly g=x+y+x2y+xy2+1/t*xy;
poly wg=weierstrassForm(g);
wg;
↳ -x3+2*x2+1/(t)*xy-x+y2
// but it is not yet simple, since it still has an xy-term, unlike swg
poly swg=weierstrassForm(g,1);
swg;
↳ -x3+(8t2-1)/(4t2)*x2-x+y2
// the j-invariants of all three polynomials coincide
jInvariant(g);
↳ (-4096t12+12288t10-13056t8+5632t6-816t4+48t2-1)/(16t10-t8)
jInvariant(wg);
↳ (-4096t12+12288t10-13056t8+5632t6-816t4+48t2-1)/(16t10-t8)
jInvariant(swg);
↳ (-4096t12+12288t10-13056t8+5632t6-816t4+48t2-1)/(16t10-t8)
// the following curve is elliptic as well
poly h=x22y11+x19y10+x17y9+x16y9+x12y7+x9y6+x7y5+x2y3;
// its Weierstrass form is
weierstrassForm(h);
↳ -x3+1728*x+y2+27648
```

D.13.4.10 jInvariant

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\]](#), page 1679).

Usage: `jInvariant(f[,#]);` f poly, # list

Assume:

- f is a polynomial whose Newton polygon has precisely one interior lattice point, so that it defines an elliptic curve on the toric surface corresponding to the Newton polygon
- if the optional argument # is present the base field should be $\mathbb{Q}(t)$ and the optional argument should be one of the following strings:
 - 'ord' : then the return value is of type integer, namely the order of the j-invariant
 - 'split' : then the return value is a list of two polynomials, such that the quotient of these two is the j-invariant

Return: poly, the j-invariant of the elliptic curve defined by poly

Note: the characteristic of the base field should not be 2 or 3, unless the input is a plane cubic

Example:

```
LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),(x,y),dp;
// jInvariant computes the j-invariant of a cubic
jInvariant(x+y+x2y+y3+1/t*xy);
↳ (32768t12+24576t10+3072t8-1024t6-96t4+24t2-1)/(256t12+32t10+11t8-t6)
// if the ground field has one parameter t, then we can instead
// compute the order of the j-invariant
jInvariant(x+y+x2y+y3+1/t*xy,"ord");
↳ -6
// one can compare the order of the j-invariant to the tropical j-invariant
tropicalJInvariant(x+y+x2y+y3+1/t*xy);
↳ // ** int division with '/': use 'div' instead in line >> genus=-genus/2\
; // we have counted each bounded edge twice<<
↳ 6
// the following curve is elliptic as well
poly h=x22y11+x19y10+x17y9+x16y9+x12y7+x9y6+x7y5+x2y3+x14y8;
// its j-invariant is
jInvariant(h);
↳ 912673/528
```

D.13.4.11 conicWithTangents

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\], page 1679](#)).

Usage: `conicWithTangents(points[,#]);` points list, # optional list

Assume: points is a list of five points in the plane over $K(t)$

Return: list, $l[1]$ = the list points of the five given points
 $l[2]$ = the conic f passing through the five points
 $l[3]$ = list of equations of tangents to f in the given points
 $l[4]$ = ideal, tropicalisation of f (i.e. list of linear forms)
 $l[5]$ = a list of the tropicalisation of the tangents
 $l[6]$ = a list containing the vertices of the tropical conic f
 $l[7]$ = a list containing lists with vertices of the tangents
 $l[8]$ = a string which contains the latex-code to draw the tropical conic and its tropicalised tangents
 $l[9]$ = if # is non-empty, this is the same data for the dual conic and the points dual to the computed tangents

Note: the points must be generic, i.e. no three on a line

```

D.13.4.12 tropicalise

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\], page 1679](#)).

Usage: `tropicalise(f,#)`; f polynomial, $\#$ optional list

Assume: f is a polynomial in $\mathbb{Q}(t)[x_1, \dots, x_n]$

Return: list, the linear forms of the tropicalisation of f

Note: if $\#$ is empty, then the valuation of t will be 1,
if $\#$ is the string 'max' it will be -1;
the latter supposes that we consider the maximum of the computed linear forms, the former that we consider their minimum

Example:

```
LIB "tropical.lib";

↳ x+1
↳ [5]:
↳ y+1
↳ [6]:
↳ 0
```

D.13.4.13 tropicaliseSet

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\], page 1679](#)).

Usage: `tropicaliseSet(i)`; i ideal

Assume: i is an ideal in $\mathbb{Q}(t)[x_1, \dots, x_n]$

Return: list, the j th entry is the tropicalisation of the j th generator of i

Example:

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),(x,y),dp;
ideal i=txy-y2+1,2t3x2+1/t*y-t6;
tropicaliseSet(i);

↳     2*x+3
↳   [2]:
↳     y-1
↳   [3]:
↳     6

```

D.13.4.14 tInitialForm

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\], page 1679](#)).

Usage: `tInitialForm(f,w)`; f a polynomial, w an integer vector

Assume: f is a polynomial in $\mathbb{Q}[t,x_1,\dots,x_n]$ and $w=(w_0,w_1,\dots,w_n)$

Return: `poly`, the t -initialform of $f(t,x)$ w.r.t. w evaluated at $t=1$

Note: the t -initialform is the sum of the terms with MAXIMAL weighted order w.r.t. w

Example:

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=0,(t,x,y),dp;
poly f=t4x2+y2-t2xy+t4x-t9;
intvec w=-1,-2,-3;
tInitialForm(f,w);
↳ y2+x

```

D.13.4.15 tInitialIdeal

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\], page 1679](#)).

Usage: `tInitialIdeal(i,w)`; i ideal, w intvec

Assume: i is an ideal in $\mathbb{Q}[t,x_1,\dots,x_n]$ and $w=(w_0,\dots,w_n)$

Return: `ideal ini`, the t -initial ideal of i with respect to w

Example:

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=0,(t,x,y),dp;
ideal i=t2x-y+t3,t2x-y-2t3x;
intvec w=-1,2,0;
// the t-initial forms of the generators are
tInitialForm(i[1],w),tInitialForm(i[2],w);
↳ x-y x-y
// and they do not generate the t-initial ideal of i
tInitialIdeal(i,w);
↳ _[1]=-x+y
↳ _[2]=2xy
↳ _[3]=2x
↳ _[4]=2xy2

```

D.13.4.16 initialForm

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\], page 1679](#)).

Usage: `initialForm(f,w)`; f a polynomial, w an integer vector

Assume: f is a polynomial in $\mathbb{Q}[x_1, \dots, x_n]$ and $w=(w_1, \dots, w_n)$

Return: `poly`, the initial form of $f(x)$ w.r.t. w

Note: the `initialForm` consists of the terms with MAXIMAL weighted order w.r.t. w

Example:

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=0,(x,y),dp;
poly f=x3+y2-xy+x-1;
intvec w=2,3;
initialForm(f,w);
↳ x3+y2

```

D.13.4.17 initialIdeal

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\], page 1679](#)).

Usage: `initialIdeal(i,w)`; i ideal, w intvec

Assume: i is an ideal in $\mathbb{Q}[x_1, \dots, x_n]$ and $w=(w_1, \dots, w_n)$

Return: ideal, the `initialIdeal` of i w.r.t. w

Note: the `initialIdeal` consists of the terms with MAXIMAL weighted order w.r.t. w

Example:

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=0,(x,y),dp;
poly f=x3+y2-xy+x-1;
intvec w=2,3;
initialIdeal(f,w);
↳ _[1]=x3+y2

```

D.13.4.18 texNumber

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\], page 1679](#)).

Usage: `texNumber(f)`; f poly

Return: string, tex command representing leading coefficient of f using `\frac`

Example:

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),x,dp;
texNumber((3t2-1)/t3);
↳ \tfrac{-1+3\cdot t^{2}}{t^{3}}

```

D.13.4.19 texPolynomial

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\], page 1679](#)).

Usage: `texPolynomial(f)`; f poly

Return: string, the tex command representing f

Example:

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),x,dp;
texPolynomial(1/t*x2-t2x+1/t);
↳ \tfrac{1}{t}\cdot x^{2}-t^{2}\cdot x+\tfrac{1}{t}

```

D.13.4.20 texMatrix

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\], page 1679](#)).

Usage: `texMatrix(M)`; M matrix

Return: string, the tex command representing M

Example:

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),x,dp;
matrix M[2][2]=3/2,1/t*x2-t2x+1/t,5,-2x;
texMatrix(M);
↳ \left(\begin{array}{cc}
↳   \tfrac{3}{2} & \tfrac{1}{t}\cdot x^2-t^2\cdot x+\tfrac{1}{t} \\
↳   5 & -2\cdot x \\
↳   \end{array}\right)

```

D.13.4.21 texDrawBasic

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\], page 1679](#)).

Usage: `texDrawBasic(texdraw); list texdraw`

Assume: `texdraw` is a list of strings representing `texdraw` commands (as produced by `texDrawTropical`) which should be embedded into a `texdraw` environment

Return: string, a `texdraw` environment enclosing the input

Note: is called from `conicWithTangents`

Example:

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),(x,y),dp;
poly f=x+y+1;
string texf=texDrawTropical(tropicalCurve(f),list("",1));
texDrawBasic(texf);
↳
↳   \begin{texdraw}
↳     \drawdim cm \relunitscale 0.7 \arrowheadtype t:V
↳     %\linewidth 0.05 \lpatt (0.1 0.4)
↳     %\move (-4 0) \avec (9 0) \move (0 -4) \avec (0 9)
↳     \linewidth 0.1 \lpatt (1 0)

↳     \move (0 0) \fcir f:0.8 r:0.008

```

```

↳      %% HERE ENDS THE CODE FOR THE LATTICE
↳
↳      \end{texdraw}

```

D.13.4.22 texDrawTropical

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\], page 1679](#)).

Usage: `texDrawTropical(graph[,#]);` graph list, # optional list

Assume: graph is the output of `tropicalCurve`

Return: string, the texdraw code of the tropical plane curve encoded by graph

Note:

- if the list # is non-empty, the first entry should be a string; if this string is 'max', then the tropical curve is considered with respect to the maximum
- the procedure computes a scalefactor for the texdraw command which should help to display the curve in the right way; this may, however, be a bad idea if several `texDrawTropical` outputs are put together to form one image; the scalefactor can be prescribed by the further optional entry of type poly
- one can add a string as last optional argument to the list #; it can be used to insert further texdraw commands (e.g. to have a lighter image as when called from inside `conicWithTangents`);
- the list # is optional and may as well be empty

Example:

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org

D.13.4.23 texDrawNewtonSubdivision

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\]](#), page 1679).

Usage: `texDrawNewtonSubdivision(graph[,#]);` graph list, # optional list

Assume: graph is the output of `tropicalCurve`

Return: string, the texdraw code of the Newton subdivision of the tropical plane curve encoded by graph

Note: - the list # may contain optional arguments, of which only one will be considered, namely the first entry of type 'poly'; this entry should be a rational number which specifies the scaling factor to be used; if it is missing, the factor will be computed; the list # may as well be empty
 - note that lattice points in the Newton subdivision which are black correspond to markings of the marked subdivision, while lattice points in grey are not marked

Example:

```
LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org

↳

```

D.13.4.24 texDrawTriangulation

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\]](#), page 1679).

Usage: `texDrawTriangulation(triang,polygon);` triang,polygon list

Assume: polygon is a list of integer vectors describing the lattice points of a marked polygon;
 triang is a list of integer vectors describing a triangulation of the marked polygon
 in the sense that an integer vector of the form (i,j,k) describes the triangle formed by `polygon[i]`, `polygon[j]` and `polygon[k]`

Return: string, a texdraw code for the triangulation described by triang without the texdraw environment

Example:

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
// the lattice polygon spanned by the points (0,0), (3,0) and (0,3)
// with all integer points as markings
list polygon=intvec(1,1),intvec(3,0),intvec(2,0),intvec(1,0),intvec(0,0),
intvec(2,1),intvec(0,1),intvec(1,2),intvec(0,2),intvec(0,3);
// define a triangulation by connecting the only interior point
//      with the vertices

D.13.4.25 radicalMemberShip

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\]](#), page 1679).

Usage: `radicalMemberShip (f,i);` f poly, i ideal

Return: int, 1 if f is in the radical of i, 0 else

Example:

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=0,(x,y),dp;
ideal i=(x+1)*y2;
// y is NOT in the radical of i
radicalMemberShip(y,i);
↳ 0
ring rr=0,(x,y),ds;
ideal i=(x+1)*y2;
// since this time the ordering is local, y is in the radical of i

```

```
radicalMemberShip(y,i);
↳ 1
```

D.13.4.26 tInitialFormPar

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\]](#), page 1679).

Usage: `tInitialFormPar(f,w)`; f a polynomial, w an integer vector

Assume: f is a polynomial in $\mathbb{Q}(t)[x_1, \dots, x_n]$ and $w=(w_1, \dots, w_2)$

Return: poly, the t -initialform of $f(t,x)$ w.r.t. $(1,w)$ evaluated at $t=1$

Note: the t -initialform are the terms with MINIMAL weighted order w.r.t. $(1,w)$

Example:

```
LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),(x,y),dp;
poly f=t4x2+y2-t2xy+t4x-t9;
intvec w=2,3;
tInitialFormPar(f,w);
↳ y2+x
```

D.13.4.27 tInitialFormParMax

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\]](#), page 1679).

Usage: `tInitialFormParMax(f,w)`; f a polynomial, w an integer vector

Assume: f is a polynomial in $\mathbb{Q}(t)[x_1, \dots, x_n]$ and $w=(w_1, \dots, w_2)$

Return: poly, the t -initialform of $f(t,x)$ w.r.t. $(-1,w)$ evaluated at $t=1$

Note: the t -initialform are the terms with MAXIMAL weighted order w.r.t. $(1,w)$

Example:

```
LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),(x,y),dp;
poly f=t4x2+y2-t2xy+t4x-1/t6;
intvec w=2,3;
tInitialFormParMax(f,w);
↳ y2-1
```

D.13.4.28 solveTInitialFormPar

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\]](#), page 1679).

Usage: `solveTInitialFormPar(i)`; i ideal

Assume: i is a zero-dimensional ideal in $\mathbb{Q}(t)[x_1, \dots, x_n]$ generated by the $(1,w)$ -homogeneous elements for some integer vector w - i.e. by the $(1,w)$ -initialforms of polynomials

Return: none

Note: the procedure just displays complex approximations of the solution set of i

Example:

```
LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),(x,y),dp;
ideal i=t2x2+y2,x-t2;
solveTInitialFormPar(i);
↳ [1]:
↳ [1]:
↳ 1
↳ [2]:
↳ -i
↳ [2]:
↳ [1]:
↳ 1
↳ [2]:
↳ i
↳ [1]:
↳ // coefficients: real[i](complex:8 digits, additional 8 digits)/(i^2+1\
)
↳ // number of vars : 2
↳ // block 1 : ordering lp
↳ // : names x y
↳ // block 2 : ordering C
```

D.13.4.29 detropicalise

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\], page 1679](#)).

Usage: `detropicalise(f)`; f poly or f list

Assume: if f is of type `poly` then t is a linear polynomial with an arbitrary constant term and positive integer coefficients as further coefficients;
if f is of type `list` then f is a list of polynomials of the type just described in before

Return: `poly`, the detropicalisation of f ignoring the constant parts

Note: the output will be a monomial and the constant coefficient has been ignored

Example:

```
LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),(x,y),dp;
detropicalise(3x+4y-1);
↳ x3y4
```

D.13.4.30 tDetropicalise

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\], page 1679](#)).

Usage: `tDetropicalise(f)`; f poly or f list

Assume: if f is of type `poly` then f is a linear polynomial with an integer constant term and positive integer coefficients as further coefficients;
if f is of type `list` then it is a list of polynomials of the type just described in before

Return: `poly`, the detropicalisation of f over the field $\mathbb{Q}(t)$

Note: the output will be a term where the coefficient is a Laurent monomial in the variable t

Example:

```
LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),(x,y),dp;
tDetropicalise(3x+4y-1);
↳ 1/(t)*x3y4
```

D.13.4.31 dualConic

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\], page 1679](#)).

Usage: `dualConic(f)`; f poly

Assume: f is an affine conic in two variables x and y

Return: `poly`, the equation of the dual conic

Example:

```
LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=0,(x,y),dp;
poly conic=2x2+1/2y2-1;
dualConic(conic);
↳ 1/2x2+2y2-1
```

D.13.4.32 parameterSubstitute

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\], page 1679](#)).

Usage: `parameterSubstitute(f,N)`; f poly, N int

Assume: f is a polynomial in $\mathbb{Q}(t)[x_1, \dots, x_n]$ describing a plane curve over $\mathbb{Q}(t)$

Return: `poly` f with t replaced by t^N

Example:

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),(x,y),dp;
poly f=t2xy+1/t*y+t3;
parameterSubstitute(f,3);
↳ (t6)*xy+1/(t3)*y+(t9)
parameterSubstitute(f,-1);
↳ 1/(t2)*xy+(t)*y+1/(t3)

```

D.13.4.33 tropicalSubst

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\]](#), page 1679).

Usage: `parameterSubstitute(f,N,L)`; f poly, N int, L list

Assume: f is a polynomial in $\mathbb{Q}(t)[x_1, \dots, x_k]$
and L is a list of the form `var(i_1),poly_1,...,v(i_k),poly_k`

Return: list, the list is the tropical polynomial which we get from f by replacing the i -th variable be the i -th polynomial but in the i -th polynomial the parameter t is replaced by $t^{1/N}$

Example:

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),(x,y),dp;
poly f=t2x+1/t*y-1;
tropicalSubst(f,2,x,x+t,y,tx+y+t2);
↳ [1]:
↳ x-1/2
↳ [2]:
↳ y-1
↳ [3]:
↳ 5/2
// The procedure can be used to study the effect of a transformation of
// the form  $x \rightarrow x+t^b$ , with  $b$  a rational number, on the tropicalisation and
// the  $j$ -invariant of a cubic over the Puiseux series.
f=t7*y3+t3*y2+t*(x3+xy2+y+1)+xy;
// - the  $j$ -invariant, and hence its valuation,
// does not change under the transformation
jInvariant(f,"ord");
↳ -5
// -  $b=3/2$ , then the cycle length of the tropical cubic equals  $-\text{val}(j\text{-inv})$ 
list g32=tropicalSubst(f,2,x,x+t3,y,y);
tropicalJInvariant(g32);
↳ // ** int division with '/': use 'div' instead in line >> genus=-genus/2\
; // we have counted each bounded edge twice<<
↳ 5
// -  $b=1$ , then it is still true, but only just ...
list g1=tropicalSubst(f,1,x,x+t,y,y);

```

```
tropicalJInvariant(g1);
↳ // ** int division with '/': use 'div' instead in line >> genus=-genus/2\
  ; // we have counted each bounded edge twice<<
↳ 5
// - b=2/3, as soon as b<1, the cycle length is strictly less than -val(j-inv)
list g23=tropicalSubst(f,3,x,x+t2,y,y);
tropicalJInvariant(g23);
↳ // ** int division with '/': use 'div' instead in line >> genus=-genus/2\
  ; // we have counted each bounded edge twice<<
↳ 14/3
```

D.13.4.34 randomPolyInT

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\], page 1679](#)).

Usage: `randomPolyInT(d,ug,og[,#]);` d, ug, og int, # list

Assume: the basering has a parameter t

Return: poly, a polynomial of degree d where the coefficients are of the form t^j with j a random integer between ug and og

Note: if an optional argument # is given, then the coefficients are instead either of the form t^j as above or they are zero, and this is chosen randomly

Example:

```
LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),(x,y),dp;
randomPolyInT(3,-2,5);
↳ (t5)*x3+1/(t2)*x2y+(t3)*xy2+(t4)*y3+1/(t)*x2+(t5)*xy+y2+1/(t2)*x+1/(t)*y+\
  1
randomPolyInT(3,-2,5,1);
↳ (t4)*y3+1/(t)*x2+(t2)*xy+(t2)*y2+(t3)*x
```

D.13.4.35 cleanTmp

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\], page 1679](#)).

Usage: `cleanTmp()`

Purpose: some procedures create latex and ps-files in the directory /tmp; in order to remove them simply call `cleanTmp()`;

Return: none

D.13.4.36 groebnerCone

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\], page 1679](#)).

Usage: `groebnerCone(I,w);` I ideal or poly, w intvec or bigintmat

Assume: I a reduced standard basis and w contained in the maximal Groebner cone

Return: cone, the Groebner cone of I with respect to w

Example:

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org

```

D.13.4.37 maximalGroebnerCone

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\]](#), page 1679).

Usage: `maximalGroebnerCone(I)`; I ideal or poly

Assume: I a reduced standard basis

Return: cone, the maximal Groebner cone of I with respect to the current ordering

Example:

```

D.13.4.38 homogeneitySpace

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\]](#), page 1679).

Usage: `homogeneitySpace(I)`; I ideal or poly

Assume: I a reduced standard basis

Return: cone, the set of all weight vectors with respect to whom I is weighted homogeneous

Example:

```

D.13.4.39 initial

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\]](#), page 1679).

Usage: `initial(f,w)`; `f` poly, `w` intvec or bigintmat
 `initial(I,w)`; `I` ideal, `w` intvec or bigintmat

Assume: `I` reduced Groebner basis,
 `w` in the maximal Groebner cone of `I` with respect to the current ordering

Return: poly or ideal, the initial form of `f` or the initial ideal of `I` with respect to `w`

Example:

```

↳ inI[2]=y2+yz+z2
↳ inI[3]=z3

```

D.13.4.40 tropicalVariety

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\]](#), page 1679).

Usage: tropicalVariety(f[,p]); f poly, p optional number
 tropicalVariety(I[,p]); I ideal, p optional number

Assume: I homogeneous, p prime number

Return: fan, the tropical variety of f resp. I with respect to the trivial valuation or the p-adic valuation

Note: set printlevel=1 for output during traversal

Example:

```

D.13.4.41 groebnerFan

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\]](#), page 1679).

Usage: `groebnerFan(f); f poly`
 `groebnerFan(I); I ideal`

Assume: `I` homogeneous

Return: `fan`, the Groebner fan of `f` resp. `I`

Note: set `printlevel=1` for output during traversal

Example:

```

D.13.4.42 groebnerComplex

Procedure from library `tropical.lib` (see [Section D.13.4 \[tropical.lib\]](#), page 1679).

Usage: `groebnerComplex(f,p)`; f poly, p number
 `groebnerComplex(I,p)`; I ideal, p number

Assume: I homogeneous, p prime number

Return: fan, the Groebner complex of f resp. I with respect to the p -adic valuation

Note: set `printlevel=1` for output during traversal

Example:

```

D.14 Miscellaneous libraries

D.14.1 arr_lib

Library: arr.lib

Purpose: a library of algorithms for arrangements of hyperplanes

Authors: Randolph Scholz (rscholz@rhrk.uni-kl.de),
Patrick Serwene (serwene@mathematik.uni-kl.de),
Lukas Kuehne (lf.kuehne@gmail.com)

Overloads:

```

// OPERATORS
= arrAdd assignment
+ arrAdd union of two arrs
[ arrGet access to a single/multiple hyperplane(s) - arrMinus deletes given hyperplanes
from the arr <= arrLEQ comparison
>= arrGEQ comparison
== arrEQ comparison
!= arrNEQ comparison
< arrLNEQ comparison
> arrGNEQ comparison
// TYPECASTING
matrix arr2mat coeff matrix
poly arr2poly defining polynomial
// OTHER
variables arrVariables ideal generated by the variables the arr depends on nvars arrN-
vars number of variables the arr depends on delete arrDelete deletes hyperplanes by
indices print arrPrint prints the arr on the screen
// IDEAL INHERITED FUNCTIONS
homog arrHomog checks if arrangement is homogeneous simplify arrSimplify simplifies

poly multarr2poly defining polynomial
size multarrSize number of hyperplanes with mult. print multarrPrint displays multiarr
delete multarrDelete deletes hyperplane

```

Procedures:

D.14.1.1 arrSet

Procedure from library `arr.lib` (see [Section D.14.1 \[arr_lib\]](#), page 1743).

Usage: `arrSet(A, k, p)`; arr A, int k, poly p;

Return: [arr] Arrangement where the k-th hyperplane is replaced by p.

Note: p must be linear

Example:

```
LIB "arr.lib";
ring R = 0, (x,y,z), dp;
arr A = ideal(x,y,z);
arrSet(A,1,x+1);
↳ _[1]=x+1
↳ _[2]=y
↳ _[3]=z
↳
```

D.14.1.2 type2arr

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\], page 1743](#)).

Usage: type2arr(#); # def

Return: [arr] Arrangement defined by the input

Note: The procedure tries to cast the input to [arr] using `arrAdd`

Example:

```
LIB "arr.lib";
ring R = 0, (x,y,z), dp;
ideal I = x,y,z;
typeof(type2arr(I));
↳ arr
```

D.14.1.3 mat2arr

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\], page 1743](#)).

Usage: mat2arr(M); matrix (M|b)

Return: [arr] interprets the rows of the matrix as the defining polynomial equations of the arrangement where the last column will be considered as the constant terms, i.e. if M is an $m \times (n+1)$ matrix we have $H_i = \text{Ker}(M_{i1}x_1 + \dots + M_{in}x_n + M_{i(n+1)})$ for $i=1\dots m$ and $A = \{H_1, \dots, H_m\}$ the resulting arrangement.

Example:

```
LIB "arr.lib";
ring R = 0, (x,y,z), dp;
matrix M[4][4] = 1,0,1,1,1,1,0,2,0,1,1,3,2,1,1,4;
print(M);
↳ 1,0,1,1,
↳ 1,1,0,2,
↳ 0,1,1,3,
↳ 2,1,1,4
mat2arr(M);
↳ _[1]=x+z+1
↳ _[2]=x+y+2
↳ _[3]=y+z+3
↳ _[4]=2x+y+z+4
↳
```

See also: [Section D.14.1.4 \[mat2arr\], page 1745](#).

D.14.1.4 mat2carr

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: `mat2carr(M)`; matrix M

Return: `[arr]` interprets the rows of the matrix as the defining polynomial equations of the arrangement. I.e. if M is an $m \times n$ matrix we have $H_i = \text{Ker}(M_{i1} \cdot x_1 + \dots + M_{in} \cdot x_n)$ for $i=1 \dots m$ and $A = \{H_1, \dots, H_m\}$ the resulting arrangement.

Example:

```
LIB "arr.lib";
ring R = 0, (x,y,z), dp;
matrix M[4][3] = 1,0,1,1,1,0,0,1,1,2,1,1;
print(M);
↳ 1,0,1,
↳ 1,1,0,
↳ 0,1,1,
↳ 2,1,1
mat2carr(M);
↳ _[1]=x+z
↳ _[2]=x+y
↳ _[3]=y+z
↳ _[4]=2x+y+z
↳
```

See also: [Section D.14.1.3 \[mat2arr\]](#), page 1744.

D.14.1.5 arrPrintMatrix

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: `arrPrintMatrix(arr A)`

Return: `[]` prints `arr` in matrix form

Note: differs `print(matrix(arr A))` since variables included

Example:

```
LIB "arr.lib";
ring R = 0, (x,y,z), dp;
arr A = mat2arr(random(20,5,4));
A;
↳ _[1]=10x+y-2z-12
↳ _[2]=2x-16z-14
↳ _[3]=11y+16z-5
↳ _[4]=-16x-18y-5z+11
↳ _[5]=3x+8y+6
↳
arrPrintMatrix(A);
↳ 10x, y, -2z, -12,
↳ 2x, 0, -16z, -14,
↳ 0, 11y, 16z, -5,
↳ -16x, -18y, -5z, 11,
↳ 3x, 8y, 0, 6
```

D.14.1.6 varMat

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: `varMat(v)`; v intvec

Return: [matrix] M containing the corresponding ring_variables

Example:

```
LIB "arr.lib";
ring R = 0, (x(1..6)), dp;
intvec v = 2,4,6;
varMat(v);
↪ _[1,1]=x(2)
↪ _[2,1]=x(4)
↪ _[3,1]=x(6)
```

See also: [Section D.14.1.9 \[arrLastVar\]](#), page 1747; [Section D.14.1.8 \[arrSwapVar\]](#), page 1746; [Section D.14.1.6 \[varMat\]](#), page 1746; [Section D.14.1.7 \[varNum\]](#), page 1746.

D.14.1.7 varNum

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: `varnum(string s)`;
`varnum(ring_variable)`;

Return: [int] number of given ring variable, or 0 if it does not appear

Note: This procedure has the same functionality as `varNum` from the `dmod.lib` package, but also accepts polys as input.

Example:

```
LIB "arr.lib";
ring R = 0, (x,y,z), dp;
varNum(y);
↪ 2
ring S = 0, (x(1..5),y(1..5)), dp;
varNum("y(3)");
↪ 8
```

See also: [Section D.14.1.9 \[arrLastVar\]](#), page 1747; [Section D.14.1.8 \[arrSwapVar\]](#), page 1746; [Section D.14.1.6 \[varMat\]](#), page 1746; [Section D.14.1.7 \[varNum\]](#), page 1746.

D.14.1.8 arrSwapVar

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: `arrSwapVar(A, i, j)`; arr A , ring_variables/integers i, j

Return: [arr] A where variables i and j are swapped.

Note: if i and/or j are integers the algorithm considers the variables `variables(A)[i]` and/or `variables(A)[j]`

Example:

```
LIB "arr.lib";
ring R = 0, (x,y,z), lp;
arr A = ideal(x+1,x+y,z);
```

```

arrSwapVar(A,x,z);
↳ _[1]=z+1
↳ _[2]=y+z
↳ _[3]=x
↳

```

See also: [Section D.14.1.9 \[arrLastVar\]](#), page 1747; [Section D.14.1.8 \[arrSwapVar\]](#), page 1746; [Section D.14.1.6 \[varMat\]](#), page 1746; [Section D.14.1.7 \[varNum\]](#), page 1746.

D.14.1.9 arrLastVar

Procedure from library `arr.lib` (see [Section D.14.1 \[arr_lib\]](#), page 1743).

Usage: `arrLastVar(A)`; arr A

Return: [int] number of the last variable A uses

Note: useful if you want a list containing all variables $x_1 \dots x_k$ used in A, but you do not want to skip any like variables(A) does.

Example:

```

LIB "arr.lib";
ring R = 0,x(1..10),dp;
arr A = ideal(x(1), x(2), x(3), x(6));
int n = arrLastVar(A);
varMat(1..n);
↳ _[1,1]=x(1)
↳ _[2,1]=x(2)
↳ _[3,1]=x(3)
↳ _[4,1]=x(4)
↳ _[5,1]=x(5)
↳ _[6,1]=x(6)
variables(A);
↳ _[1]=x(1)
↳ _[2]=x(2)
↳ _[3]=x(3)
↳ _[4]=x(6)

```

See also: [Section D.14.1.9 \[arrLastVar\]](#), page 1747; [Section D.14.1.8 \[arrSwapVar\]](#), page 1746; [Section D.14.1.6 \[varMat\]](#), page 1746; [Section D.14.1.7 \[varNum\]](#), page 1746.

D.14.1.10 arrCenter

Procedure from library `arr.lib` (see [Section D.14.1 \[arr_lib\]](#), page 1743).

Usage: `arrCenter(A)`; arr A

Return: [list] L entry 0 if A not centered or entries 1, x, H, where x is any particular point of the center and H is a matrix consisting of vectors which spanning linear intersection space.

If there is exactly one solution, then $H = 0$.

Note: The intersection of all hyperplanes can be expressed in forms of a linear system $Ax=b$, where $(A|b)$ is the coeff. matrix of the arrangement, which is then solved using L-U decomposition

Example:

```

LIB "arr.lib";
ring R = 0, (x,y,z), dp;
arr A= ideal(x,y,x-y+1); // centerless
arrCenter(A);
↳ [1]:
↳ 0
arr B= ideal(x,y,z); // center is a single point
arrCenter(B);
↳ [1]:
↳ 1
↳ [2]:
↳ _[1,1]=0
↳ _[2,1]=0
↳ _[3,1]=0
↳ [3]:
↳ _[1,1]=0
arr C= ideal(x,z,x+z); // center is a line
// here we get a wrong result because the matrix is simplified since A doesn't
// contain any "y" the matrix (A|b) will be 3x3 only.
arrCenter(C);
↳ [1]:
↳ 1
↳ [2]:
↳ _[1,1]=0
↳ _[2,1]=0
↳ _[3,1]=0
↳ [3]:
↳ _[1,1]=0
↳ _[2,1]=-1
↳ _[3,1]=0

```

See also: [Section D.14.1.10 \[arrCenter\], page 1747](#); [Section D.14.1.12 \[arrCentered\], page 1749](#); [Section D.14.1.11 \[arrCentral\], page 1748](#); [Section D.14.1.13 \[arrCentralize\], page 1749](#).

D.14.1.11 arrCentral

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\], page 1743](#)).

Usage: `arrCentral(A); arr A`

Return: `[0,1]` true if `arr` is central (i.e. all planes intersect in 0)

Note: This is the same as `homog(A)`

Example:

```

LIB "arr.lib";
ring R = 0, (x,y,z), dp;
// centered and central
arr A = ideal(x,y,z);
arrCentered(A);
↳ 1
arrCentral(A);
↳ 1
// centered but not central (center: (-1,-1/2, 1))
arr B = ideal(x+1,2y+1,-z+1);
arrCentered(B);

```

```

    ↪ 1
    arrCentral(B);
    ↪ 0

```

See also: [Section D.14.1.10 \[arrCenter\]](#), page 1747; [Section D.14.1.12 \[arrCentered\]](#), page 1749; [Section D.14.1.11 \[arrCentral\]](#), page 1748; [Section D.14.1.13 \[arrCentralize\]](#), page 1749.

D.14.1.12 arrCentered

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: `arrCentered(A); arr A`

Return: `[0,1]` true if A is centered (i.e. intersection of all planes not empty)

Note: The algorithm uses the rank of matrix: $Ax=b$ has a solution iff $\text{rank}(A) = \text{rank}(A|b)$

Example:

```

LIB "arr.lib";
ring R = 0, (x,y,z), dp;
arr A= ideal(x,y,x-y+1);      // centerless
arrCentral(A);
↪ 0
arr B= ideal(x,y,z);         // central with center being the origin
arrCentral(B);
↪ 1
arr C= ideal(x+1,2y+1,-z+1); // central with center (-1,-1/2, 1)
arrCentral(C);
↪ 0

```

See also: [Section D.14.1.10 \[arrCenter\]](#), page 1747; [Section D.14.1.12 \[arrCentered\]](#), page 1749; [Section D.14.1.11 \[arrCentral\]](#), page 1748; [Section D.14.1.13 \[arrCentralize\]](#), page 1749.

D.14.1.13 arrCentralize

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: `arrCentralize(A); arr A`

Return: `[arr]` A after centralization via coordinate change

Note: The coordinate change only does translation, vector of translation is the second output of `arrCenter`

Example:

```

LIB "arr.lib";
ring R = 0, (x,y,z), dp;
arr A = ideal(x-1,y,x-z-1,x-z-1);
arrCentralize(A);
↪ _[1]=x-2
↪ _[2]=y
↪ _[3]=x-z-2
↪

```

See also: [Section D.14.1.10 \[arrCenter\]](#), page 1747; [Section D.14.1.12 \[arrCentered\]](#), page 1749; [Section D.14.1.11 \[arrCentral\]](#), page 1748; [Section D.14.1.13 \[arrCentralize\]](#), page 1749.

D.14.1.14 arrCoordChange

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\], page 1743](#)).

Usage: `arrCoordChange(A, T);` arr A, ($m \times n$ mat) $n \times n$ or $n \times n+1$ matrix T `arrCoordChange(A, T, c);` arr A, $n \times n$ matrix T, $n \times 1$ matrix/vector

Return: [arr]: Arrangement A $[A|b]$ after a coordinate change $f: x \rightarrow Tx + c$ with T invertible i.e. $[A|b] \Rightarrow [AT^{-1}|b+AT^{-1}c]$ since we have
 $f(H) = f(\ker(a_1x_1 + \dots + a_nx_n - b)) = \{f(x) : a'x - b = 0\} = \{y : a'f^{-1}(y) - b = 0\}$
 $= \{y : a'(T^{-1}(y-c)) - b = 0\}$
 $= \{y : a'T^{-1}y - (b + a'T^{-1}c) = 0\}$

Note: There are 3 options how you can give the input (in each case $n \leq \text{nvars}(\text{basering})$) 1. Just a $n \times n$ matrix with
 \Rightarrow Will automatically complete T by a unit matrix and perform $x \rightarrow Tx$ 2. A $n \times n$ matrix T and a $n \times 1$ vector/matrix c with
 \Rightarrow Will automatically complete T and c and perform $x \rightarrow Tx + c$ 3. A $n \times n+1$ matrix T with
 \Rightarrow will use last column as translation vector c

Example:

```
LIB "arr.lib";
ring r = 0, (x,y,z), lp;
arr A = x,y,z;
arrCoordChange(A,1,[0,0,1]); //lifts z-hyperplane by 1 unit
 $\mapsto$   $_{[1]}=x$ 
 $\mapsto$   $_{[2]}=y$ 
 $\mapsto$   $_{[3]}=z-1$ 
 $\mapsto$ 
matrix T[2][2] = [0,1,1,0]; // swaps x and y
arrCoordChange(A,T);
 $\mapsto$   $_{[1]}=y$ 
 $\mapsto$   $_{[2]}=x$ 
 $\mapsto$   $_{[3]}=z$ 
 $\mapsto$ 
matrix c[2][1] = [1,0];
T = concat(T,c); // now swap x and y and add 1 to x afterwards
arrCoordChange(A,T);
 $\mapsto$   $_{[1]}=y$ 
 $\mapsto$   $_{[2]}=x-1$ 
 $\mapsto$   $_{[3]}=z$ 
 $\mapsto$ 
// Note how T doesn't even need to be a full 3x3 base change matrix.
```

See also: [Section D.14.1.14 \[arrCoordChange\], page 1750](#); [Section D.14.1.15 \[arrCoordNormalize\], page 1750](#).

D.14.1.15 arrCoordNormalize

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\], page 1743](#)).

Usage: `arrCoordChange(A, v);`

Return: [arr]: Arrangement after a coordinate change that transforms the arrangement such that after a transformation $x \rightarrow Tx + c$ we have the arrangement has the matrix representation $[AT^{-1}|b+AT^{-1}c]$ such that $[AT^{-1}]_v = I$ and $[b+AT^{-1}c]_v = 0$;

Note: algorithm performs a base change if H_k is homogenous (i.e. has no) constant term and an affine transformation otherwise
 $Ax+b = 0$, Transformation $x = Ty+c$: $AT^{-1}y + AT^{-1}c + b = 0$ Now we want to have $(AT^{-1})_v = I$ and $(AT^{-1}c + b)_v = AT^{-1}_v * c + b_v = 0$

Example:

```
LIB "arr.lib";
ring r = 0, (x,y,z), lp;
arr A = ideal(x,y,z,x+z+4);
intvec v = 1,2,4;
arrCoordNormalize(A,v);
↪ _[1]=x
↪ _[2]=y
↪ _[3]=-x+z-4
↪ _[4]=z
↪
```

See also: [Section D.14.1.14 \[arrCoordChange\]](#), page 1750; [Section D.14.1.15 \[arrCoordNormalize\]](#), page 1750.

D.14.1.16 arrCone

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: `arrCone(A);`
`arrCone(A, ring_variable);` arr A arrangement in variables $x_1 \dots x_n$;

Return: arr, the coned hyperplane Arrangement cA with respect to the given ring_variable, or the last ring_variable if none was given.

Note: The hyperplanes are homogenized w.r.t. v and a new hyperplane $H = \ker(x_{n+1})$ is added.

Example:

```
LIB "arr.lib";
ring R = 0, (x,y,z), dp;
arr A = ideal(x+1, x,x-2,x-1);
arrCone(A, y);
↪ _[1]=x+y
↪ _[2]=x
↪ _[3]=x-2y
↪ _[4]=x-y
↪ _[5]=y
↪
arr B= ideal(x,y,x+y-1);
arrCone(B);
↪ _[1]=x
↪ _[2]=y
↪ _[3]=x+y-z
↪ _[4]=z
↪
```

See also: [Section D.14.1.16 \[arrCone\]](#), page 1751; [Section D.14.1.17 \[arrDecone\]](#), page 1752; [Section D.14.1.21 \[arrEssentialize\]](#), page 1754; [Section D.14.1.20 \[arrIsEssential\]](#), page 1753; [Section D.14.1.19 \[arrRestrict\]](#), page 1753.

D.14.1.17 arrDecone

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: `arrDecone(A, k)`; arrangement A, integer k;

Return: `arr`: the deconed hyperplane Arrangement dA

Note: A has to be non-empty and central. `arrDecone` is an inverse operation to `arrCone` since $A == \text{arrDecone}(\text{arrCone}(A), \text{size}(A)+1)$ for any A. One can also decone a central arrangement with respect to any hyper- plane k, but than a coordinate change is necessary to make $H_k = \ker(x.k)$. Since such a coordinate change is not unique, use `arrCoordchange` to do so.

Example:

```
LIB "arr.lib";
ring R = 0, (x,y,z), dp;
arr A= ideal(x,y,z,x+y-z);
arrDecone(A,3);
  ↪ _[1]=x
  ↪ _[2]=y
  ↪ _[3]=x+y-1
  ↪
```

See also: [Section D.14.1.16 \[arrCone\]](#), page 1751; [Section D.14.1.17 \[arrDecone\]](#), page 1752; [Section D.14.1.21 \[arrEssentialize\]](#), page 1754; [Section D.14.1.20 \[arrIsEssential\]](#), page 1753; [Section D.14.1.19 \[arrRestrict\]](#), page 1753.

D.14.1.18 arrLocalize

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: `arrLocalize(A, v)`; arrangement A, intvec v;

Return: `arr`: the localized arrangement A_X , i.e. A_X only contains the hyperplanes which contain the flat X, which is defined by the equations $A[v]$

Example:

```
LIB "arr.lib";
ring R = 0, (x,y,z), dp;
arr A=arrTypeB(3);
intvec v=5,8;
arr B=arrLocalize(A,v);
B;
  ↪ _[1]=x-y
  ↪ _[2]=x+y
  ↪ _[3]=x
  ↪ _[4]=y
  ↪
```

D.14.1.19 arrRestrict

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Return: `arr`: the restricted hyperplane Arrangement (A^X)

Note: A has to be non-empty.

Remarks: We restrict A to the flat X , defined by the equations in $A[v]$. The restriction will only be performed, if the ideal defining the flat X is monomial (i.e. X is an intersection of coordinate planes). If the optional argument `CC` is given, the arrangement is transformed in such a way that X has the above form.

Example:

```
LIB "arr.lib";
ring S = 0, (x,y,z), dp;
arr A = arrTypeB(3);
A;
  ↪ _[1]=x-y
  ↪ _[2]=x+y
  ↪ _[3]=x-z
  ↪ _[4]=x+z
  ↪ _[5]=x
  ↪ _[6]=y-z
  ↪ _[7]=y+z
  ↪ _[8]=y
  ↪ _[9]=z
  ↪
arrRestrict(A,9);
  ↪ _[1]=x-y
  ↪ _[2]=x+y
  ↪ _[3]=x
  ↪ _[4]=y
  ↪
arrRestrict(A,4,"CC");
  ↪ _[1]=1/2y-z
  ↪ _[2]=1/2y+z
  ↪ _[3]=y
  ↪ _[4]=z
  ↪
intvec v=5,8;
arrRestrict(A,v);
  ↪ _[1]=-z
  ↪
```

See also: [Section D.14.1.16 \[arrCone\]](#), page 1751; [Section D.14.1.17 \[arrDecone\]](#), page 1752; [Section D.14.1.21 \[arrEssentialize\]](#), page 1754; [Section D.14.1.20 \[arrIsEssential\]](#), page 1753; [Section D.14.1.19 \[arrRestrict\]](#), page 1753.

D.14.1.20 arrIsEssential

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: `arrIsEssential(A)`; arrangement A ;

Return: boolean: 1 if `arr` is essential, i.e. rank of maximal element of poset is dimension

Note: A has to be non-empty.

Example:

```
LIB "arr.lib";
ring S = 0,(x,y,z),lp;
arr A = ideal(x,y,z);
arr B = ideal(x+y+z,x,y+z);
arrIsEssential(A);
↳ 1
arrIsEssential(B);
↳ 0
```

See also: [Section D.14.1.16 \[arrCone\]](#), page 1751; [Section D.14.1.17 \[arrDecone\]](#), page 1752; [Section D.14.1.21 \[arrEssentialize\]](#), page 1754; [Section D.14.1.20 \[arrIsEssential\]](#), page 1753; [Section D.14.1.19 \[arrRestrict\]](#), page 1753.

D.14.1.21 arrEssentialize

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: arrEssentialize(A); arrangement A;

Return: essential arrangement by transformation

Note: A has to be non-empty.

Example:

```
LIB "arr.lib";
ring S = 0,(x,y,z),dp;
arr A=arrBraid(3);
arrEssentialize(A);
↳ _[1]=x-y
↳ _[2]=x
↳ _[3]=y
↳
arr B = ideal(x+y+z,x,y+z);
arrEssentialize(B);
↳ _[1]=x+y
↳ _[2]=x
↳ _[3]=y
↳
```

See also: [Section D.14.1.16 \[arrCone\]](#), page 1751; [Section D.14.1.17 \[arrDecone\]](#), page 1752; [Section D.14.1.21 \[arrEssentialize\]](#), page 1754; [Section D.14.1.20 \[arrIsEssential\]](#), page 1753; [Section D.14.1.19 \[arrRestrict\]](#), page 1753.

D.14.1.22 arrBoolean

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: arrBoolean(v); int v

Return: arr, which uses the first v variables of ring for boolean arrangement

Example:

```
LIB "arr.lib";
ring R = 0,x(1..10),dp;
```

```

arrBoolean(7);
↳ _[1]=x(1)
↳ _[2]=x(2)
↳ _[3]=x(3)
↳ _[4]=x(4)
↳ _[5]=x(5)
↳ _[6]=x(6)
↳ _[7]=x(7)
↳

```

See also: [Section D.14.1.22 \[arrBoolean\]](#), page 1754; [Section D.14.1.23 \[arrBraid\]](#), page 1755; [Section D.14.1.28 \[arrEdelmanReiner\]](#), page 1758; [Section D.14.1.26 \[arrRandom\]](#), page 1757; [Section D.14.1.24 \[arrTypeB\]](#), page 1755; [Section D.14.1.25 \[arrTypeD\]](#), page 1756.

D.14.1.23 arrBraid

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: `arrBraid(v); int v`

Return: Type A (braid) arrangement of dimension `v`

Example:

```

LIB "arr.lib";
ring R = 0,x(1..10),dp;
arrBraid(7);
↳ _[1]=x(1)-x(2)
↳ _[2]=x(1)-x(3)
↳ _[3]=x(1)-x(4)
↳ _[4]=x(1)-x(5)
↳ _[5]=x(1)-x(6)
↳ _[6]=x(1)-x(7)
↳ _[7]=x(2)-x(3)
↳ _[8]=x(2)-x(4)
↳ _[9]=x(2)-x(5)
↳ _[10]=x(2)-x(6)
↳ _[11]=x(2)-x(7)
↳ _[12]=x(3)-x(4)
↳ _[13]=x(3)-x(5)
↳ _[14]=x(3)-x(6)
↳ _[15]=x(3)-x(7)
↳ _[16]=x(4)-x(5)
↳ _[17]=x(4)-x(6)
↳ _[18]=x(4)-x(7)
↳ _[19]=x(5)-x(6)
↳ _[20]=x(5)-x(7)
↳ _[21]=x(6)-x(7)
↳

```

See also: [Section D.14.1.22 \[arrBoolean\]](#), page 1754; [Section D.14.1.23 \[arrBraid\]](#), page 1755; [Section D.14.1.28 \[arrEdelmanReiner\]](#), page 1758; [Section D.14.1.26 \[arrRandom\]](#), page 1757; [Section D.14.1.24 \[arrTypeB\]](#), page 1755; [Section D.14.1.25 \[arrTypeD\]](#), page 1756.

D.14.1.24 arrTypeB

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: arrTypeB(v); int v

Return: arrangement, which uses first v variables of ring for reflection arrangement of type B

Example:

```
LIB "arr.lib";
ring R = 0,x(1..10),dp;
arrTypeB(5);
↳ _[1]=x(1)-x(2)
↳ _[2]=x(1)+x(2)
↳ _[3]=x(1)-x(3)
↳ _[4]=x(1)+x(3)
↳ _[5]=x(1)-x(4)
↳ _[6]=x(1)+x(4)
↳ _[7]=x(1)-x(5)
↳ _[8]=x(1)+x(5)
↳ _[9]=x(1)
↳ _[10]=x(2)-x(3)
↳ _[11]=x(2)+x(3)
↳ _[12]=x(2)-x(4)
↳ _[13]=x(2)+x(4)
↳ _[14]=x(2)-x(5)
↳ _[15]=x(2)+x(5)
↳ _[16]=x(2)
↳ _[17]=x(3)-x(4)
↳ _[18]=x(3)+x(4)
↳ _[19]=x(3)-x(5)
↳ _[20]=x(3)+x(5)
↳ _[21]=x(3)
↳ _[22]=x(4)-x(5)
↳ _[23]=x(4)+x(5)
↳ _[24]=x(4)
↳ _[25]=x(5)
↳
```

See also: [Section D.14.1.22 \[arrBoolean\]](#), page 1754; [Section D.14.1.23 \[arrBraid\]](#), page 1755; [Section D.14.1.28 \[arrEdelmanReiner\]](#), page 1758; [Section D.14.1.26 \[arrRandom\]](#), page 1757; [Section D.14.1.24 \[arrTypeB\]](#), page 1755; [Section D.14.1.25 \[arrTypeD\]](#), page 1756.

D.14.1.25 arrTypeD

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: arrTypeD(v); int v

Return: arrangement, which uses first v variables of ring for reflection arrangement of type D

Example:

```
LIB "arr.lib";
ring R = 0,x(1..10),dp;
arrTypeD(5);
↳ _[1]=x(1)-x(2)
↳ _[2]=x(1)+x(2)
↳ _[3]=x(1)-x(3)
↳ _[4]=x(1)+x(3)
↳ _[5]=x(1)-x(4)
```

```

↳ _[6]=x(1)+x(4)
↳ _[7]=x(1)-x(5)
↳ _[8]=x(1)+x(5)
↳ _[9]=x(2)-x(3)
↳ _[10]=x(2)+x(3)
↳ _[11]=x(2)-x(4)
↳ _[12]=x(2)+x(4)
↳ _[13]=x(2)-x(5)
↳ _[14]=x(2)+x(5)
↳ _[15]=x(3)-x(4)
↳ _[16]=x(3)+x(4)
↳ _[17]=x(3)-x(5)
↳ _[18]=x(3)+x(5)
↳ _[19]=x(4)-x(5)
↳ _[20]=x(4)+x(5)
↳

```

D.14.1.26 arrRandom

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: `arrRandom(n,v,N); int n,v,N`

Return: Random arrangement, where m is the number of hyperplanes, n the dimension, d the upper bound for absolute value of coefficients.

Note: You can also write `arr = random(d,m,n)` to create random arrangements

Example:

```

LIB "arr.lib";
ring R = 0,x(1..20),dp;
arrRandom(7,3,15);
↳ _[1]=2*x(1)-6*x(2)-3*x(3)+4*x(5)+x(6)-4*x(7)-3*x(8)-x(9)+x(10)-3*x(11)-6*\
x(12)-x(13)+2*x(14)-6*x(15)-4
↳ _[2]=x(1)-3*x(2)-4*x(3)-7*x(5)-3*x(6)+x(8)-3*x(9)-4*x(10)-x(11)-7*x(12)-2*\
*x(13)-3*x(14)-1
↳ _[3]=4*x(1)+2*x(2)+5*x(3)-x(4)+6*x(5)+5*x(6)-6*x(7)+5*x(8)+x(10)+3*x(11)-\
5*x(12)+2*x(13)+6*x(14)+x(15)+3
↳

```

See also: [Section D.14.1.22 \[arrBoolean\]](#), page 1754; [Section D.14.1.23 \[arrBraid\]](#), page 1755; [Section D.14.1.28 \[arrEdelmanReiner\]](#), page 1758; [Section D.14.1.26 \[arrRandom\]](#), page 1757; [Section D.14.1.24 \[arrTypeB\]](#), page 1755; [Section D.14.1.25 \[arrTypeD\]](#), page 1756.

D.14.1.27 arrRandomCentral

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: `arrRandomCentral(d,m,n); int d,m,n`

Return: Random central arrangement, where m is the number of hyperplanes, n the dimension, d the upper bound for absolute value of coefficients.

Example:

```

LIB "arr.lib";
ring R = 0,x(1..20),dp;
arrRandomCentral(7,3,15);
↳ _[1]=2*x(1)-6*x(2)-3*x(3)+4*x(5)+x(6)-4*x(7)-3*x(8)-x(9)+x(10)-3*x(11)-6*\
x(12)-x(13)+2*x(14)-6*x(15)
↳ _[2]=-4*x(1)+x(2)-3*x(3)-4*x(4)-7*x(6)-3*x(7)+x(9)-3*x(10)-4*x(11)-x(12)-\
7*x(13)-2*x(14)-3*x(15)
↳ _[3]=-x(2)+4*x(3)+2*x(4)+5*x(5)-x(6)+6*x(7)+5*x(8)-6*x(9)+5*x(10)+x(12)+3\
*x(13)-5*x(14)+2*x(15)
↳

```

See also: [Section D.14.1.22 \[arrBoolean\]](#), page 1754; [Section D.14.1.23 \[arrBraid\]](#), page 1755; [Section D.14.1.28 \[arrEdelmanReiner\]](#), page 1758; [Section D.14.1.26 \[arrRandom\]](#), page 1757; [Section D.14.1.24 \[arrTypeB\]](#), page 1755; [Section D.14.1.25 \[arrTypeD\]](#), page 1756.

D.14.1.28 arrEdelmanReiner

Procedure from library `arr.lib` (see [Section D.14.1 \[arr_lib\]](#), page 1743).

Usage: `arrEdelmanReiner();`

Return: the Edelman-Reiner arrangement, which is a free arrangement but the restriction to the 6-th hyperplane is nonfree.
(i.e. counterexample for Orlik-Conjecture)

Note: the active ring must have at least five variables

Example:

```

LIB "arr.lib";
ring r=0,x(1..5),dp;
arrEdelmanReiner();
↳ _[1]=x(1)
↳ _[2]=x(2)
↳ _[3]=x(3)
↳ _[4]=x(4)
↳ _[5]=x(5)
↳ _[6]=x(1)-x(2)-x(3)-x(4)-x(5)
↳ _[7]=x(1)-x(2)-x(3)-x(4)+x(5)
↳ _[8]=x(1)-x(2)-x(3)+x(4)-x(5)
↳ _[9]=x(1)-x(2)-x(3)+x(4)+x(5)
↳ _[10]=x(1)-x(2)+x(3)-x(4)-x(5)
↳ _[11]=x(1)-x(2)+x(3)-x(4)+x(5)
↳ _[12]=x(1)-x(2)+x(3)+x(4)-x(5)
↳ _[13]=x(1)-x(2)+x(3)+x(4)+x(5)
↳ _[14]=x(1)+x(2)-x(3)-x(4)-x(5)
↳ _[15]=x(1)+x(2)-x(3)-x(4)+x(5)
↳ _[16]=x(1)+x(2)-x(3)+x(4)-x(5)
↳ _[17]=x(1)+x(2)-x(3)+x(4)+x(5)
↳ _[18]=x(1)+x(2)+x(3)-x(4)-x(5)
↳ _[19]=x(1)+x(2)+x(3)-x(4)+x(5)
↳ _[20]=x(1)+x(2)+x(3)+x(4)-x(5)
↳ _[21]=x(1)+x(2)+x(3)+x(4)+x(5)
↳

```

See also: [Section D.14.1.22 \[arrBoolean\]](#), page 1754; [Section D.14.1.23 \[arrBraid\]](#), page 1755; [Section D.14.1.28 \[arrEdelmanReiner\]](#), page 1758; [Section D.14.1.26 \[arrRandom\]](#), page 1757; [Section D.14.1.24 \[arrTypeB\]](#), page 1755; [Section D.14.1.25 \[arrTypeD\]](#), page 1756.

D.14.1.29 arrOrlikSolomon

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: `arrOrlikSolomon(A); arr A`

Return: `[ring]` exterior Algebra E as ring with Orlik-Solomon ideal as attribute I. The Orlik-Solomon ideal is generated by the differentials of dependent tuples of hyperplanes. For a complex arrangement the quotient E/I is isomorphic to the cohomology ring of the complement of the arrangement.

Note: In order to access this ideal I activate this exterior algebra with `setring`.

Example:

```
LIB "arr.lib";
ring R = 0, (x,y,z), dp;
arr A = arrTypeB(3);
def E = arrOrlikSolomon(A);
setring E;
//The generators of the Orlik-Solomon-Ideal are:
I;
↳ I[1]=e(7)*e(8)-e(7)*e(9)+e(8)*e(9)
↳ I[2]=e(6)*e(8)-e(6)*e(9)+e(8)*e(9)
↳ I[3]=e(6)*e(7)-e(6)*e(9)+e(7)*e(9)
↳ I[4]=e(4)*e(5)-e(4)*e(9)+e(5)*e(9)
↳ I[5]=e(3)*e(5)-e(3)*e(9)+e(5)*e(9)
↳ I[6]=e(3)*e(4)-e(3)*e(9)+e(4)*e(9)
↳ I[7]=e(6)*e(7)-e(6)*e(8)+e(7)*e(8)
↳ I[8]=e(2)*e(5)-e(2)*e(8)+e(5)*e(8)
↳ I[9]=e(1)*e(5)-e(1)*e(8)+e(5)*e(8)
↳ I[10]=e(1)*e(2)-e(1)*e(8)+e(2)*e(8)
↳ I[11]=e(1)*e(4)-e(1)*e(7)+e(4)*e(7)
↳ I[12]=e(2)*e(3)-e(2)*e(7)+e(3)*e(7)
↳ I[13]=e(2)*e(4)-e(2)*e(6)+e(4)*e(6)
↳ I[14]=e(1)*e(3)-e(1)*e(6)+e(3)*e(6)
↳ I[15]=e(3)*e(4)-e(3)*e(5)+e(4)*e(5)
↳ I[16]=e(1)*e(2)-e(1)*e(5)+e(2)*e(5)
↳ I[17]=-e(2)*e(4)*e(8)+e(2)*e(4)*e(9)-e(2)*e(8)*e(9)+e(4)*e(8)*e(9)
↳ I[18]=-e(1)*e(4)*e(8)+e(1)*e(4)*e(9)-e(1)*e(8)*e(9)+e(4)*e(8)*e(9)
↳ I[19]=-e(2)*e(3)*e(8)+e(2)*e(3)*e(9)-e(2)*e(8)*e(9)+e(3)*e(8)*e(9)
↳ I[20]=-e(1)*e(3)*e(8)+e(1)*e(3)*e(9)-e(1)*e(8)*e(9)+e(3)*e(8)*e(9)
↳ I[21]=-e(2)*e(5)*e(7)+e(2)*e(5)*e(9)-e(2)*e(7)*e(9)+e(5)*e(7)*e(9)
↳ I[22]=-e(1)*e(5)*e(7)+e(1)*e(5)*e(9)-e(1)*e(7)*e(9)+e(5)*e(7)*e(9)

↳ I[54]=-e(2)*e(3)*e(5)+e(2)*e(3)*e(6)-e(2)*e(5)*e(6)+e(3)*e(5)*e(6)
↳ I[55]=-e(1)*e(2)*e(3)+e(1)*e(2)*e(4)-e(1)*e(3)*e(4)+e(2)*e(3)*e(4)

```

See also: [Section D.14.1.29 \[arrOrlikSolomon\]](#), page 1759.

D.14.1.30 arrDer

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: `arrDer(A); arr A , multarr A`

Return: [module] The module `Der(A)` of derivations of the (multi-)arrangement `A`, i.e. the derivations tangent to each hyperplane of `A` (resp. with multiplicities)

Note: This is only defined for central (multi-)arrangements

Example:

```

LIB "arr.lib";
ring R = 0,(x,y,z),dp;
arr A3 = arrBoolean(3);
arr B3 = arrTypeB(3);
arr G = ideal(x,y,z,x+y+z);
//The derivation module of the Boolean 3-arrangement:
arrDer(A3);
↳ _[1]=z*gen(3)
↳ _[2]=y*gen(2)
↳ _[3]=x*gen(1)
//The derivation module of the Braid 3-arrangement:
arrDer(B3);
↳ _[1]=x*gen(1)+y*gen(2)+z*gen(3)
↳ _[2]=x2y*gen(2)-y3*gen(2)+x2z*gen(3)-z3*gen(3)
↳ _[3]=x2y2z*gen(3)-x2z3*gen(3)-y2z3*gen(3)+z5*gen(3)
//The derivation module of the generic arrangement:
arrDer(G);
↳ _[1]=x*gen(1)+y*gen(2)+z*gen(3)
↳ _[2]=yz*gen(3)-yz*gen(2)
↳ _[3]=xz*gen(3)+yz*gen(2)+z2*gen(3)

```

```

↳  $_{[4]} = xy \cdot \text{gen}(2) + y^2 \cdot \text{gen}(2) + yz \cdot \text{gen}(2)$ 

```

See also: [Section D.14.1.30 \[arrDer\]](#), page 1760; [Section D.14.1.32 \[arrExponents\]](#), page 1761; [Section D.14.1.31 \[arrIsFree\]](#), page 1761.

D.14.1.31 arrIsFree

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: `arrIsFree(A)`; `arr A`, `multarr A`

Return: `[0,1]` 1 if the (multi-)arrangement is free, i.e. $\text{Der}(A)$ is a free module

Note: only defined for central arrangements

Example:

```

LIB "arr.lib";
ring R = 0, (x,y,z), dp;
arr A3 = arrBoolean(3);
arr B3 = arrTypeB(3);
arr G = ideal(x,y,z,x+y+z);
arrIsFree(A3);
↳ 1
arrIsFree(B3);
↳ 1
arrIsFree(G);
↳ 0

```

See also: [Section D.14.1.30 \[arrDer\]](#), page 1760; [Section D.14.1.32 \[arrExponents\]](#), page 1761; [Section D.14.1.31 \[arrIsFree\]](#), page 1761.

D.14.1.32 arrExponents

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: `arrExponents(A)`; `arr A`, `multarr A`

Return: `[intvec]` The exponents of a free (multi-) arrangement, i.e. the degrees of a basis of $D(A)$ the derivation module.

Note: only defined for central arrangements

Example:

```

LIB "arr.lib";
ring R = 0, (x,y,z), dp;
arr A3 = arrBoolean(3);
arr B3 = arrTypeB(3);
arr G = ideal(x,y,z,x+y+z);
arrExponents(A3);
↳ 1,1,1
arrExponents(B3);
↳ 1,3,5

```

See also: [Section D.14.1.30 \[arrDer\]](#), page 1760; [Section D.14.1.32 \[arrExponents\]](#), page 1761; [Section D.14.1.31 \[arrIsFree\]](#), page 1761.

D.14.1.33 arr2multarr

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\], page 1743](#)).

Usage: `multArrFromIntvec(arr A, intvec v);`

Return: `[multarr]` multiarrangement MA, which is the arrangement A with multiplicities v

Note: the size of v must match the number of hyperplanes of the arrangement A

Example:

```
LIB "arr.lib";
ring R = 0, (x,y,z), dp;
arr A = arrTypeB(3);          A;
↳ _[1]=x-y
↳ _[2]=x+y
↳ _[3]=x-z
↳ _[4]=x+z
↳ _[5]=x
↳ _[6]=y-z
↳ _[7]=y+z
↳ _[8]=y
↳ _[9]=z
↳
intvec v=2:9;                v;
↳ 2,2,2,2,2,2,2,2,2
multarr MA=arr2multarr(A,v);
MA;
↳ _[1]=(x-y)^2
↳ _[2]=(x+y)^2
↳ _[3]=(x-z)^2
↳ _[4]=(x+z)^2
↳ _[5]=(x)^2
↳ _[6]=(y-z)^2
↳ _[7]=(y+z)^2
↳ _[8]=(y)^2
↳ _[9]=(z)^2
↳
```

See also: [Section D.14.1.33 \[arr2multarr\], page 1762](#); [Section D.14.1.34 \[multarr2arr\], page 1762](#).

D.14.1.34 multarr2arr

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\], page 1743](#)).

Usage: `multarr2arr(multarr A, intvec v);`

Return: `[arr]` arrangement A, with all multiplicities removed

Example:

```
LIB "arr.lib";
ring r = 0, (x,y,z), dp;
multarr A=x2y3z5;          A;
↳ _[1]=(x)^2
↳ _[2]=(y)^3
↳ _[3]=(z)^5
↳
```

```

arr AS = multarr2arr(A); AS;
↳ _[1]=x
↳ _[2]=y
↳ _[3]=z
↳

```

See also: [Section D.14.1.33 \[arr2multarr\]](#), page 1762; [Section D.14.1.34 \[multarr2arr\]](#), page 1762.

D.14.1.35 multarrRestrict

Procedure from library `arr.lib` (see [Section D.14.1 \[arr_lib\]](#), page 1743).

Return: [multarr] the restricted hyperplane Multi-Arrangement (A^X) with multiplicities i.e. counting how often one element of the restricted arrangement occurs as intersection of hyperplane of the first arrangement. This definition is due to Guenter M. Ziegler.

Note: A has to be non-empty.

Remarks: We restrict A to the flat X, defined by the equations in $A[v]$. The restriction will only be performed, if the ideal defining the flat X is monomial (i.e. X is an intersection of coordinate planes). If the optional argument CC is given, the arrangement is transformed in such a way that X has the above form.

Example:

```

LIB "arr.lib";
ring R = 0,x(1..5),dp;
arr A = arrEdelmanReiner(); A;
↳ _[1]=x(1)
↳ _[2]=x(2)
↳ _[3]=x(3)
↳ _[4]=x(4)
↳ _[5]=x(5)
↳ _[6]=x(1)-x(2)-x(3)-x(4)-x(5)
↳ _[7]=x(1)-x(2)-x(3)-x(4)+x(5)
↳ _[8]=x(1)-x(2)-x(3)+x(4)-x(5)
↳ _[9]=x(1)-x(2)-x(3)+x(4)+x(5)
↳ _[10]=x(1)-x(2)+x(3)-x(4)-x(5)
↳ _[11]=x(1)-x(2)+x(3)-x(4)+x(5)
↳ _[12]=x(1)-x(2)+x(3)+x(4)-x(5)
↳ _[13]=x(1)-x(2)+x(3)+x(4)+x(5)
↳ _[14]=x(1)+x(2)-x(3)-x(4)-x(5)
↳ _[15]=x(1)+x(2)-x(3)-x(4)+x(5)
↳ _[16]=x(1)+x(2)-x(3)+x(4)-x(5)
↳ _[17]=x(1)+x(2)-x(3)+x(4)+x(5)
↳ _[18]=x(1)+x(2)+x(3)-x(4)-x(5)
↳ _[19]=x(1)+x(2)+x(3)-x(4)+x(5)
↳ _[20]=x(1)+x(2)+x(3)+x(4)-x(5)
↳ _[21]=x(1)+x(2)+x(3)+x(4)+x(5)
↳
multarr AR = multarrRestrict(A,6,"CC"); AR;
↳ _[1]=(x(2)+1/4*x(3)+1/4*x(4)+1/4*x(5))^2
↳ _[2]=(x(2)+4*x(3)-x(4)-x(5))^2
↳ _[3]=(x(2)-x(3)+4*x(4)-x(5))^2
↳ _[4]=(x(2)-x(3)-x(4)+4*x(5))^2
↳ _[5]=(x(2)-x(3)-x(4)-x(5))^2

```

```

↳ _[6]=(x(2)-x(3)-x(4)+3/2*x(5))^1
↳ _[7]=(x(2)-x(3)+3/2*x(4)-x(5))^1
↳ _[8]=(x(2)-x(3)+3/2*x(4)+3/2*x(5))^1
↳ _[9]=(x(2)-x(3)+2/3*x(4)+2/3*x(5))^1
↳ _[10]=(x(2)+3/2*x(3)-x(4)-x(5))^1
↳ _[11]=(x(2)+3/2*x(3)-x(4)+3/2*x(5))^1
↳ _[12]=(x(2)+2/3*x(3)-x(4)+2/3*x(5))^1
↳ _[13]=(x(2)+3/2*x(3)+3/2*x(4)-x(5))^1
↳ _[14]=(x(2)+2/3*x(3)+2/3*x(4)-x(5))^1
↳ _[15]=(x(2)+2/3*x(3)+2/3*x(4)+2/3*x(5))^1
↳

```

See also: [Section D.14.1.19 \[arrRestrict\]](#), page 1753; [Section D.14.1.36 \[multarrMultRestrict\]](#), page 1764; [Section D.14.1.35 \[multarrRestrict\]](#), page 1763.

D.14.1.36 multarrMultRestrict

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: `multarrMultRestrict(A, k)`; multiarrangement A, integer k;

Return: `[multarr]` the restricted hyperplane Multi-Arrangement ($A^{\wedge}H_k$) with multiplicities, i.e. counting with multiplicities how often one element of the restricted arrangement occurs as intersection of hyperplane of the first multiarrangement. This definition is due to Guenter M. Ziegler.

Note: A has to be non-empty.

Remarks: The restriction will only be performed, if $H_k = \ker(x_i)$ for some i. One can also restrict an arrangement with respect to any hyperplane k, but than a coordinate change is necessary first to make $H_k = \ker(x_k)$. Since such a coordinate change is not unique, please use `arrCoordchange` to do so.

Example:

```

LIB "arr.lib";
ring R = 0, (x,y,z), dp;
multarr A =ideal(x2,y2,z2, (x-y)^3, (x-z)^2, (y-z));   A;
↳ _[1]=(x)^2
↳ _[2]=(y)^2
↳ _[3]=(z)^2
↳ _[4]=(x-y)^3
↳ _[5]=(x-z)^2
↳ _[6]=(y-z)^1
↳
//The restriction of the multiarrangement is:
multarr AR = multarrMultRestrict(A,1);   AR;
↳ _[1]=(y)^5
↳ _[2]=(z)^4
↳ _[3]=(y-z)^1
↳

```

See also: [Section D.14.1.19 \[arrRestrict\]](#), page 1753; [Section D.14.1.36 \[multarrMultRestrict\]](#), page 1764; [Section D.14.1.35 \[multarrRestrict\]](#), page 1763.

D.14.1.37 arrFlats

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: size(A); A arr

Return: [arrposet] Intersection lattice

Example:

```
LIB "arr.lib";
ring R = 0,(x(1..5)),dp;
arrFlats(arrBraid(5));
↳
↳
↳ === Computing poset ===

See also: [Section D.14.1.37 \[arrFlats\]](#), page 1764.

D.14.1.38 arrLattice

Procedure from library `arr.lib` (see [Section D.14.1 \[arr_lib\]](#), page 1743).

Usage: `arrLattice(arr ARR)`

Return: [arrposet] intersection poset of the arrangement

Note: The algorithm works by a bottom up approach, i.e. it calculates the

Example:

```

LIB "arr.lib";
ring r;
arrLattice(arrTypeB(3));
↳
↳
↳ === Computing poset ===
↳
↳
↳ rank 2: found 13 flats in 0s
↳ rank 3: found 1 flats in 0s

↳

```

See also: [Section D.14.1.37 \[arrFlats\]](#), page 1764; [Section D.14.1.38 \[arrLattice\]](#), page 1766.

D.14.1.39 moebius

Procedure from library `arr.lib` (see [Section D.14.1 \[arr_lib\]](#), page 1743).

Usage: moebius(arrposet P)

Return: [arrposet] fills in the moebius values of the flats in the poset

Example:

```
LIB "arr.lib";
ring R = 0,(x,y,z,t),dp;
arr A = arrBraid(4);
arrposet P = arrLattice(A);
↳
↳
↳ === Computing poset ===

↳ Moebius values:
↳ ===== rank 1: 6 flats =====
```

```

↳ (-1), (-1), (-1), (-1), (-1), (-1),
↳ ===== rank 2: 7 flats =====
↳ (2), (2), (1), (2), (1), (1), (2),
↳ ===== rank 3: 1 flats =====
↳ (-6),
↳ ===== rank 4: 0 flats =====
↳

```

See also: [Section D.14.1.39 \[moebius\]](#), page 1766.

D.14.1.40 arrCharPoly

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: `arrCharPoly(arr A)`

Return: [intvec] coefficients of the characteristic polynomial of A in increasing order

Remarks: The algorithm only returns the coefficients of the characteristic polynomial since they are whole numbers but the basering could be something different.

Example:

```

LIB "arr.lib";
ring R = 0, (x,y,z,u,v), dp;
arr A = arrBraid(5);
intvec v = arrCharPoly(A);
x*(x-1)*(x-2)*(x-3)*(x-4);
↳ x5-10x4+35x3-50x2+24x
v;
↳ 24, -50, 35, -10, 1

```

See also: [Section D.14.1.40 \[arrCharPoly\]](#), page 1768; [Section D.14.1.41 \[arrPoincare\]](#), page 1768.

D.14.1.41 arrPoincare

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: `arrPoincare(A); arr A`

Return: [intvec] The Poincare polynomial as integer vector of the arrangement, which is equal to the second kind Poincare-Series of the Orlik-Solomon Algebra.

Example:

```

LIB "arr.lib";
ring R = 0, (x,y,z,u,v), dp;
arr A = arrBraid(5);
intvec v = arrPoincare(A);
(1+x)*(1+2x)*(1+3x)*(1+4x);
↳ 24x4+50x3+35x2+10x+1
v;
↳ 1, 10, 35, 50, 24

```

See also: [Section D.14.1.43 \[arrBoundedChambers\]](#), page 1769; [Section D.14.1.42 \[arrChambers\]](#), page 1769; [Section D.14.1.41 \[arrPoincare\]](#), page 1768.

D.14.1.42 arrChambers

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: `arrChambers(A); arr A`

Return: [int] The number of chambers of an arrangement, which is equal to the evaluation of the Poincare polynomial at 1.

Example:

```
LIB "arr.lib";
ring R = 0, (x,y), dp;
arr A = ideal(x,y,x+y-1);
arrChambers(A);
↳ 7
```

See also: [Section D.14.1.43 \[arrBoundedChambers\]](#), page 1769; [Section D.14.1.42 \[arrChambers\]](#), page 1769; [Section D.14.1.41 \[arrPoincare\]](#), page 1768.

D.14.1.43 arrBoundedChambers

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: `arrBoundedChambers(A); arr A`

Return: [int] The number of bounded chambers of an arrangement, which is equal to the evaluation of the Poincare polynomial at -1.

Example:

```
LIB "arr.lib";
ring R = 0, (x,y), dp;
arr A = ideal(x,y,x+y-1);
arrBoundedChambers(A);
↳ 1
```

See also: [Section D.14.1.43 \[arrBoundedChambers\]](#), page 1769; [Section D.14.1.42 \[arrChambers\]](#), page 1769; [Section D.14.1.41 \[arrPoincare\]](#), page 1768.

D.14.1.44 printMoebius

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 1743).

Usage: `printMoebius(A); arr A`

Return: [] displays the moebius values of all the flats in the poset

Remarks: Mainly used for debugging.

Example:

```
LIB "arr.lib";
ring R = 0, (x,y,z,t), dp;
arr A = arrBraid(4);
arrposet P = arrLattice(A);
↳
↳
↳ === Computing poset ===
↳
↳
↳ rank 2: found 7 flats in 0s

D.14.2 customstd_lib

Library: customstd.lib

Purpose: Load customstd.so

Authors: Hans Schoenemann, hannes at mathematik.uni-kl.de
Yue Ren, ren at mathematik.uni-kl.de

Overview: This library offers customly modified standard bases algorithms in order to increase the performance of other algorithms. If you require a customly modified standard bases algorithm, please contact the authors.

Procedures:

D.14.2.1 monomialabortstd

Procedure from library `customstd.lib` (see [Section D.14.2 \[customstd.lib\], page 1770](#)).

Usage: `monomialabortstd(I);` I ideal

Purpose: computes a standard basis and aborts if a monomial generator is found. Returns all standard basis elements that have been computed.

Note: Due to sequencing of the standard basis computation:
- If aborted, there is no guarantee that the monomial is the final standard bases element
- If ideal has a monomial generator, there is no guarantee that the computation aborts because of it

Example:

```
LIB "customstd.lib";
LIB "poly.lib";
ring r = 0, (x,y,z,u,v), dp;
// yields normal standard basis since no monomial is found
ideal I = homog(cyclic(4),v);
monomialabortstd(I);
↳ _[1]=x+y+z+u
↳ _[2]=y2+2yu+u2
↳ _[3]=yz2+z2u-yu2-u3
↳ _[4]=yzu2+z2u2-yu3+zu3-u4-v4
↳ _[5]=yu4+u5-yv4-uv4
↳ _[6]=z3u2+z2u3-zv4-uv4
↳ _[7]=z2u4+yzv4-yuv4+zuv4-2u2v4
// will not start standard basis computation in the first place,
// as one of the generators is a monomial
I = v, homog(cyclic(4),v);
monomialabortstd(I);
↳ _[1]=v
// aborts standard basis computation when it encounters monomial u
// note that u is not the final element in the standard basis!!!
I = x+y+z, homog(cyclic(4),v);
monomialabortstd(I);
↳ _[1]=u
↳ _[2]=x+y+z+u
// aborts standard basis computation when it encounters monomial z2
// note that it is not the monomial generator x which lead to the abortion!!!
I = x, homog(cyclic(4),v);
monomialabortstd(I);
↳ _[1]=y+z+u
↳ _[2]=x+y+z+u
↳ _[3]=z2
```

D.14.2.2 satstd

Procedure from library `customstd.lib` (see [Section D.14.2 \[customstd.lib\]](#), page 1770).

Usage: `satstd(I[,J]);` I ideal, J optional ideal

Assume: J generated by variables

Purpose: computes a standard basis of I and, if possible, divides each polynomial during the computation by the variables in J. By default, J is assumed to be the ideal generated by all variables.

Note: Even if I contains a monomial generated by the variables in J, there is no guarantee that it is found during the computation. If it is found, however, 1 is immediately returned.

Note: The result is a standard basis of the saturation wrt. the product of the variables in J

Example:

```
LIB "customstd.lib";
ring r = 0, (x,y,z,u,v), dp;
ideal I = x2+x,y2+y,z2+z;
// returns normal standard basis, no changes during (trivial) computation
satstd(I,ideal(u,v));
⇒ _[1]=z2+z
⇒ _[2]=y2+y
⇒ _[3]=x2+x
// returns x+1 instead of x2+x
satstd(I,ideal(x));
⇒ _[1]=x+1
⇒ _[2]=z2+z
⇒ _[3]=y2+y
// returns standard basis with elements of degree up to 8 (instead of 16)
deg(satstd(I^8));
⇒ 8
```

D.14.3 phindex.lib

Library : `phindex.lib`

Purpose: Procedures to compute the index of real analytic vector fields

Author: Victor Castellanos

Note: To compute the Poincare-Hopf index of a real analytic vector field with an algebraically isolated singularity at 0 (w. an a. i. s), we use the algebraic formula for the degree of the real analytic map germ found by Eisenbud-Levine in 1997. This result was also proved by Khimshiashvili. If the isolated singularity is non algebraically isolated and the vector field has similar reduced complex zeroes of codimension 1, we use a formula as the Eisenbud-Levine found by Victor Castellanos, in both cases is necessary to use a local order (ds, \dots). To compute the signature of a quadratic form (or symmetric matrix) we use the method of Lagrange.

Procedures:

D.14.3.1 signatureL

Procedure from library `phindex.lib` (see [Section D.14.3 \[phindex.lib\]](#), page 1772).

Usage: `signatureL(M[,r]);` M symmetric matrix, r int (optional).

Return: the signature of M of type int or if r is given and $!=0$ then intvec with (signature, nr. of +, nr. of -) is returned.

Theory: Given the matrix M , we construct the quadratic form associated. Afterwards we use the method of Lagrange to compute the signature. The law of inertia for a real quadratic form $A(x,x)$ says that in a representation of $A(x,x)$ as a sum of independent squares $A(x,x)=\sum_{i=1}^r a_i X_i^2$.

The number of positive and the number of negative squares are independent of the choice of representation. The signature $-s-$ of $A(x,x)$ is the difference between the number $-pi-$ of positive squares and the number $-nu-$ of negative squares in the representation of $A(x,x)$. The rank $-r-$ of M (or $A(x,x)$) and the signature $-s-$ determine the numbers $-pi-$ and $-nu-$ uniquely, since $r=pi+nu$, $s=pi-nu$.

The method of Lagrange is a procedure to reduce any real quadratic form to a sum of squares.

Ref. Gantmacher, The theory of matrices, Vol. I, Chelsea Publishing Company, NY 1960, page 299.

Example:

```
LIB "phindex.lib";
ring r=0, (x), ds;
matrix M[5][5]=0,0,0,1,0,0,1,0,0,-1,0,0,1,0,0,1,0,0,3,0,0,-1,0,0,1;
signatureL(M,1); //The rank of M is 3+1=4
  ↪ 2,3,1
matrix H[5][5]=0,-7,0,1,0,-7,1,0,0,-1,0,0,1,0,0,1,0,0,-3,5,0,-1,0,5,1;
signatureL(H);
  ↪ 1
```

D.14.3.2 signatureLqf

Procedure from library `phindex.lib` (see [Section D.14.3 \[phindex.lib\]](#), page 1772).

Usage: `signatureLqf(h);` h quadratic form (poly type).

Return: the signature of h of type int or if r is given and $!=0$ then intvec with (signature, nr. of +, nr. of -) is returned.

Theory: To compute the signature we use the method of Lagrange. The law of inertia for a real quadratic form $h(x,x)$ says that in a representation of $h(x,x)$ as a sum of independent squares $h(x,x)=\sum_{i=1}^r a_i X_i^2$ the number of positive and the number of negative squares are independent of the choice of representation. The signature $-s-$ of $h(x,x)$ is the difference between the number $-pi-$ of positive squares and the number $-nu-$ of negative squares in the representation of $h(x,x)$. The rank $-r-$ of $h(x,x)$ and the signature $-s-$ determine the numbers $-pi-$ and $-nu-$ uniquely, since $r=pi+nu$, $s=pi-nu$.

The method of Lagrange is a procedure to reduce any real quadratic form to a sum of squares.

Ref. Gantmacher, The theory of matrices, Vol. I, Chelsea Publishing Company, NY 1960, page 299.

Example:

```
LIB "phindex.lib";
ring r=0,(x(1..4)),ds;
poly Ax=4*x(1)^2+x(2)^2+x(3)^2+x(4)^2-4*x(1)*x(2)-4*x(1)*x(3)+4*x(1)*x(4)+4*x(2)*x(3);
signatureLqf(Ax,1); //The rank of Ax is 3+1=4
↳ 2,3,1
poly Bx=2*x(1)*x(4)+x(2)^2+x(3)^2;
signatureLqf(Bx);
↳ 2
```

D.14.3.3 PH_ais

Procedure from library `phindex.lib` (see [Section D.14.3 \[phindex.lib\]](#), page 1772).

Usage: PH_ais(I); I ideal of coordinates of the vector field.

Return: the Poincare-Hopf index of type int.

Note: the isolated singularity must be algebraically isolated.

Theory: The Poincare-Hopf index of a real vector field X at the isolated singularity 0 is the degree of the map $(X/|X|) : S_\epsilon \rightarrow S$, where S is the unit sphere, and the spheres are oriented as $(n-1)$ -spheres in \mathbb{R}^n . The degree depends only on the germ, X , of X at 0 . If the vector field X is real analytic, then an invariant of the germ is its local ring

$$Q_x = \mathbb{R}[[x_1, \dots, x_n]] / I_x$$

where $\mathbb{R}[[x_1, \dots, x_n]]$ is the ring of germs at 0 of real-valued analytic functions on \mathbb{R}^n , and I_x is the ideal generated by the components of X . The isolated singularity of X is algebraically isolated if the algebra Q_x is finite dimensional as real vector space, geometrically this means that 0 is also an isolated singularity for the complexified vector field. In this case the Poincare-Hopf index is the signature of the non degenerate bilinear form \langle, \rangle obtained by composition of the product in the algebra Q_x with a linear functional map

$$\langle, \rangle : (Q_x) \times (Q_x) \xrightarrow{(\cdot)} Q_x \xrightarrow{(L)} \mathbb{R}$$

with $L(J_0) > 0$, where J_0 is the residue class of the Jacobian determinant in Q_x . Here, we use a natural linear functional defined as follows. Suppose that $E = \{E_1, \dots, E_r\}$ is a basis of Q_x , then J_0 can be written as

$$J_0 = a_1 E_{j_1} + \dots + a_k E_{j_k}, \quad j_s \in \{1, \dots, r\}, \quad s = 1..k, \quad k \leq r, \quad \text{where } a_s \text{ are constant.}$$

The linear functional $L: Q_x \rightarrow \mathbb{R}$ is defined as $L(E_{j_1}) = (a_1) / |a_1| = \text{sign of } a_1$,

the other elements of the base are sent to 0 .

Refs. -Eisenbud & Levine, An algebraic formula for the degree of a C^∞ map germ, *Ann. Math.*, 106, (1977), 19-38.

-Khimshiashvili, On a local degree of a smooth map, *Trudi Tbilisi Math. Inst.*, (1980), 105-124.

Example:

```
LIB "phindex.lib";
ring r=0,(x,y,z),ds;
ideal I=x3-3xy2,-y3+3yx2,z3;
PH_ais(I);
↳ 3
```

D.14.3.4 PH_nais

Procedure from library `phindex.lib` (see [Section D.14.3 \[phindex.lib\]](#), page 1772).

Usage: `PH_nais(I)`; I ideal of coordinates of the vector field.

Return: the Poincare-Hopf index of type `int`.

Note: the vector field must be a non algebraically isolated singularity at 0, with reduced complex zeros of codimension 1.

Theory: Suppose that 0 is an algebraically isolated singularity of the real analytic vector field X , geometrically this corresponds to the fact that the complexified vector field has positive dimension singular locus, algebraically this mean that the local ring $Q_x = R[[x_1..x_n]]/I_x$ where $R[[x_1..x_n]]$ is the ring of germs at 0 of real-valued analytic functions on \mathbb{R}^n , and I_x is the ideal generated by the components of X is infinite dimensional as real vector space. In the case that X has a reduced hypersurface as complex zeros we have the next. There exist a real analytic function $f: \mathbb{R}^n \rightarrow \mathbb{R}$, and a real analytic vector field Y s. t. $X=fY$. The function f does not change of sign out of 0 and

$$M_x = R[[x_1..x_n]]/(I_x : \text{radical}(I_x))$$

is a finite dimensional sub-algebra of Q_x . The Poincare-Hopf index of X at 0 is the sign of f times the signature of the non degenerate bilinear form \langle, \rangle obtained by composition of the product in the algebra M_x with a linear functional map

$$\langle, \rangle : (M_x)_x(M_x) \rightarrow M_x \xrightarrow{(L)} \mathbb{R}$$

with $L(J_p) > 0$, where J_p is the residue class of the Jacobian determinant of X , JX , over f^n , $JX/(f^n)$ in M_x . Here, we use a natural linear functional defined as follows. Suppose that $E = \{E_1, \dots, E_r\}$ is a basis of M_x , then J_p is writing as $J_p = a_1 E_{j_1} + \dots + a_k E_{j_k}$, $j_s \in \{1..r\}$, $s=1..k$, $k \leq r$, where a_s are constant. The linear functional $L: M \rightarrow \mathbb{R}$ is defined as $L(E_{j_1}) = (a_1)/|a_1| = \text{sign of } a_1$, the other elements of the base are sent to 0.

-Castellanos -Vargas, V. The index of non algebraically isolated singularity, Bol. Soc. Mat. Mexicana, (3)

Vol. 8, 2002, 141-147.

Example:

```
LIB "phindex.lib";
ring r=0,(x,y,z),ds;
ideal I=x5-2x3y2-3xy4+x3z2-3xy2z2,-3x4y-2x2y3+y5-3x2yz2+y3z2,x2z3+y2z3+z5;
PH_nais(I);
↪ -3
```

D.14.4 polybori_lib

Library: `polybori.lib`

Purpose: A Singular Library Interface for PolyBoRi

Authors: Maximilian Kammermeier: Max0791@gmx.de
Susanne Scherer: sscherer90@yahoo.de

Overview: A library for using `PolyBoRi` in the SINGULAR interface, with procedures that convert structures (polynomials, rings, ideals) in both directions. Therefore, it is possible to

compute boolean groebner basis via [Section D.14.4.1 \[boolean_std\]](#), page 1776. Polynomials can be converted to zero-suppressed decision diagrams (zdd) and vice versa.

For usability it defines the PolyBoRi types `bideal`, `bpoly`, and `bring` which are equivalent to Singular's `ideal`, `poly`, and `ring`, as well as `bset` which corresponds to the type `zdd` introduced here. In addition `bvar(i)` constructs the Boolean variable corresponding to `var(i)` from current ring;

For convenience, the corresponding types can be converted explicitly or implicitly while assigning. Also several SINGULAR operators were overloaded: `bring` comes with `nvars`, `bpoly` implements `lead`, `leadmonom` and `leadcoef`. Objects of this type may be added and multiplied, too. Finally, `bideal` yields `std` and `size` as well as addition and element access.

Hence, by using these types PolyBoRi functionality can be carried out seamlessly in SINGULAR:

```
> LIB "polybori.lib";
> ring r0=2,x(1..4),lp;
> def x=bvar; // enforce Boolean variables

> bpoly f1=x(1)+x(4);
> bpoly f2=x(1)+x(3)*x(1);
> bideal bI=list(f1,f2);

> std(bI);
_ [1] = x(1) + x(4)
_ [2] = x(3)*x(4) + x(4)
```

Note: For using this library SINGULAR's python interface must be available on your system. Please `./configure --with-python` when building SINGULAR for this purpose.

There are prebuilt binary packages for PolyBoRi available from <http://polybori.sf.net/>.

For building your own PolyBoRi please ensure that you have `scons` and a development version of the boost libraries installed on you system. Then you may execute the following commands in a `bash`-style shell to build PolyBoRi available to `python`:

```
PBDIR=/path/to/custom/polybori
wget http://downloads.sf.net/project/polybori/polybori/\
0.8.2/polybori-0.8.2.tar.gz
tar -xvzf polybori-0.8.2.tar.gz
cd polybori-0.8.2
scons install PREFIX=$PBDIR PYINSTALLPREFIX=$PBDIR/python
export PYTHONPATH=$PBDIR/python:$PYTHONPATH
```

References:

See <http://polybori.sf.net> for details about PolyBoRi.

Procedures: See also: [Section 3.8 \[Libraries\]](#), page 55; [Section 4.22 \[User defined types\]](#), page 133; [Section 4.26 \[pyobject\]](#), page 139.

D.14.4.1 boolean_std

Procedure from library `polybori.lib` (see [Section D.14.4 \[polybori_lib\]](#), page 1775).

Usage: `boolean_std(Is); Is ideal`

Return: Singular ideal of the boolean groebner basis of `Is`

Example:

```
LIB "polybori.lib";
⇨ // ** args must be 1 in      system("install", "bideal",  "ideal",  bid\
    eal2ideal, 4);
ring r0=2,x(1..4),lp;
poly f1=x(1)^2+2*x(2)*(x(3))-x(4)^3;
poly f2=x(1)^2-x(3)*x(1);
poly f3=x(2)+5-2*x(1);
poly f4=x(1)*x(2)-x(3);
ideal I=f1,f2,f3,f4;
boolean_std(I);          // implicitly add x(i)^2-x(i)
⇨ _[1] = x(1) + x(4)
⇨ _[2] = x(3) + x(4)
⇨ _[3] = x(2) + 1
⇨
bideal bI=I;            // alternative syntax
bideal re = std(bI);   // Continue PolyBoRi computations
std(re[1..2]);
⇨ _[1] = x(1) + x(4)
⇨ _[2] = x(3) + x(4)
⇨
ring r1=0,x,Dp;
poly f1=x3+2*x+1;
poly f2=x10-x5+2x;
poly f3=19;
ideal I=f1,f2,f3;
boolean_std(I);
⇨ _[1] = 1
⇨
ring r2=32003,(x,y,z),Dp;
poly f1=xz+y+20*x^2*y;
poly f2=32002*xy+xz2+y;
ideal I=f1,f2;
boolean_std(I);
⇨ _[1] = x*z
⇨ _[2] = y
⇨
ring r2=32003,(x,y,z),Dp;
⇨ // ** redefining r2 (ring r2=32003,(x,y,z),Dp;)
poly f1=xyz+20*x^2*y-3*xz+15;
poly f2=32002*xy+z2;
poly f3=19*x5y;
ideal I=f1,f2,f3;
boolean_std(I);
⇨ _[1] = 1
⇨
```

D.14.4.2 boolean_poly_ring

Procedure from library `polybori.lib` (see [Section D.14.4 \[polybori.lib\], page 1775](#)).

D.14.4.3 boolean_constant

Procedure from library `polybori.lib` (see [Section D.14.4 \[polybori.lib\], page 1775](#)).

Usage: `boolean_constant(const[, rb]);` `const` constant and `rb` boolean ring

Return: default: constant `const` in the representation of the boolean ring
`rb==boolean_poly_ring(basering);` optional input: `rb=boolean ring rb`

Example:

```
LIB "polybori.lib";
↪ // ** args must be 1 in      system("install", "bideal", "ideal", bid\
    eal2ideal, 4);
ring r=7,(x,y),Dp;
pyobject rb=boolean_poly_ring(r);
boolean_constant(int(3));
↪ 1
typeof(boolean_constant(int(3)));
↪ pyobject
boolean_constant(int(0));
↪ 0
typeof(boolean_constant(int(0)));
↪ pyobject
```

See also: [Section D.14.4.7 \[boolean_ideal\], page 1780](#); [Section D.14.4.1 \[boolean_std\], page 1776](#).

D.14.4.4 boolean_poly

Procedure from library `polybori.lib` (see [Section D.14.4 \[polybori.lib\], page 1775](#)).

Usage: `boolean_poly(ps[, dir, rb]);` `ps` polynomial, `dir` integer zero or one, `rb` boolean ring

Return: default: polynomial `ps` in the representation of the boolean ring
`rb==boolean_poly_ring(basering);` optional input: boolean ring `rb`

Note: via the optional input `dir`, one can choose the computation method (either direct[`dir==0`] or recursive[`dir==1`]). default: recursive

Example:

```
LIB "polybori.lib";
↪ // ** args must be 1 in      system("install", "bideal", "ideal", bid\
    eal2ideal, 4);
ring r=0,x(1..5),Dp;
poly f=x(2)*(x(3)-x(1))+x(4)*x(5);
bring rb=r;
boolean_poly(f);
↪ x(1)*x(2) + x(2)*x(3) + x(4)*x(5)
boolean_poly(f,0);
↪ x(1)*x(2) + x(2)*x(3) + x(4)*x(5)
boolean_poly(f,0,boolean_poly_ring(r));
↪ x(1)*x(2) + x(2)*x(3) + x(4)*x(5)
boolean_poly(f,0,rb);
↪ x(1)*x(2) + x(2)*x(3) + x(4)*x(5)
```

```

poly g=0;
boolean_poly(g);
↳ 0
poly g=1;
↳ // ** redefining g (poly g=1;)
boolean_poly(g);
↳ 1

```

See also: [Section D.14.4.7 \[boolean_ideal\]](#), page 1780; [Section D.14.4.1 \[boolean_std\]](#), page 1776.

D.14.4.5 direct_boolean_poly

Procedure from library `polybori.lib` (see [Section D.14.4 \[polybori_lib\]](#), page 1775).

Usage: `boolean_poly(ps[, rb]);` ps polynomial, rb boolean ring

Return: default: polynomial ps in the representation of the boolean ring
`rb==boolean_poly_ring(basering);` optional input: boolean ring rb

Example:

```

LIB "polybori.lib";
↳ // ** args must be 1 in      system("install", "bideal", "ideal", bid\
    eal2ideal, 4);
ring r0=2,x(1..4),lp;
bring rb=r0;
poly f=x(1)^2+2*x(2)*(x(3))-x(4)^3;
direct_boolean_poly(f);
↳ x(1) + x(4)
direct_boolean_poly(f,rb);
↳ x(1) + x(4)
ring r1=0,x,Dp;
poly f=x3+2x+1;
direct_boolean_poly(f);
↳ x + 1
ring r2=32003,(x,y,z),Dp;
poly f=xyz+20*x^2*y-3*xz+15;
direct_boolean_poly(f);
↳ x*y*z + x*z + 1

```

See also: [Section D.14.4.7 \[boolean_ideal\]](#), page 1780; [Section D.14.4.1 \[boolean_std\]](#), page 1776.

D.14.4.6 recursive_boolean_poly

Procedure from library `polybori.lib` (see [Section D.14.4 \[polybori_lib\]](#), page 1775).

Usage: `boolean_poly(ps[, rb]);` ps polynomial, rb boolean ring

Return: default: polynomial ps in the representation of the boolean ring
`rb==boolean_poly_ring(basering);` optional input: rb boolean ring

Example:

```

LIB "polybori.lib";
↳ // ** args must be 1 in      system("install", "bideal", "ideal", bid\
    eal2ideal, 4);
ring r0=2,x(1..4),lp;
poly f=x(1)^2+2*x(2)*(x(3))-x(4)^3;
recursive_boolean_poly(f);

```

```

↳ x(1) + x(4)
ring r1=0,x,Dp;
poly f=x3+2x+1;
recursive_boolean_poly(f);
↳ x + 1
ring r2=32003,(x,y,z),Dp;
def br2=boolean_poly_ring(r2);
bring bbr2=r2;
poly f=xyz+20*x^2*y-3*xz+15;
recursive_boolean_poly(f,br2);
↳ x*y*z + x*z + 1
recursive_boolean_poly(f,bbr2);
↳ x*y*z + x*z + 1

```

See also: [Section D.14.4.7 \[boolean_ideal\]](#), page 1780; [Section D.14.4.1 \[boolean_std\]](#), page 1776.

D.14.4.7 boolean_ideal

Procedure from library `polybori.lib` (see [Section D.14.4 \[polybori_lib\]](#), page 1775).

Usage: `boolean_ideal(Is[, rb]);` Is Ideal, rb boolean ring

Return: default: ideal Is in the representation of the boolean ring
`rb==boolean_poly_ring(basing);` optional input: rb boolean ring

Example:

```

LIB "polybori.lib";
↳ // ** args must be 1 in      system("install", "bideal",  "ideal",  bid\
    eal2ideal, 4);
ring r0=2,x(1..4),lp;
poly f1=x(1)^2+2*x(2)*(x(3))-x(4)^3;
poly f2=x(1)^2-x(3)*x(1);
poly f3=x(2)+5-2*x(1);
poly f4=x(1)*x(2)-x(3);
ideal I=f1,f2,f3,f4;
boolean_ideal(I);
↳ _[1] = x(1) + x(4)
↳ _[2] = x(1)*x(3) + x(1)
↳ _[3] = x(2) + 1
↳ _[4] = x(1)*x(2) + x(3)
↳
ring r1=0,x,Dp;
poly f1=x3+2*x+1;
poly f2=x10-x5+2x;
poly f3=19;
ideal I=f1,f2,f3;
boolean_ideal(I);
↳ _[1] = x + 1
↳ _[2] = 0
↳ _[3] = 1
↳
ring r2=32003,(x,y,z),Dp;
bring bbr2=r2;
poly f1=xyz+20*x^2*y-3*xz+15;
poly f2=32002*xy+z2;

```

```

poly f3=19;
ideal I=f1,f2,f3;
boolean_ideal(I);
↳ _[1] = x*y*z + x*z + 1
↳ _[2] = x*y + z
↳ _[3] = 1
↳
boolean_ideal(I,bbr2);
↳ _[1] = x*y*z + x*z + 1
↳ _[2] = x*y + z
↳ _[3] = 1
↳

```

See also: [Section D.14.4.1 \[boolean_std\], page 1776](#).

D.14.4.8 boolean_set

Procedure from library `polybori.lib` (see [Section D.14.4 \[polybori_lib\], page 1775](#)).

Usage: `boolean_set(ss[, rb]);` ss zdd, rb boolean ring

Return: default: boolean set ss in the representation of a Polybori boolean set in the ring `rb==boolean_poly_ring(basering)`; optional input: boolean ring rb

Example:

```

LIB "polybori.lib";
↳ // ** args must be 1 in      system("install", "bideal", "ideal", bid\
    eal2ideal, 4);
ring rs=0,(x,y,z),Dp;
poly ps=(x+1)*(y+1)*(z+1);
zdd fz=ps;
boolean_set(fz);
↳ {{x,y,z}, {x,y}, {x,z}, {x}, {y,z}, {y}, {z}, {}}
poly g=x*y*z+1;
zdd gz=g;
boolean_set(gz);
↳ {{x,y,z}, {}}
ring R=0,(x(1..4)),Dp;
def Rb=boolean_poly_ring(R);
poly h=(x(1)+1)*(x(2)+1)*(x(3)+1)*(x(4)+1);
zdd hz=h;
boolean_set(hz);
↳ {{x(1),x(2),x(3),x(4)}, {x(1),x(2),x(3)}, {x(1),x(2),x(4)}, {x(1),x(2)}, \
    {x(1),x(3),x(4)}, {x(1),x(3)}, {x(1),x(4)}, {x(1)}, {x(2),x(3),x(4)}, {x(\
    2),x(3)}, {x(2),x(4)}, {x(2)}, {x(3),x(4)}, {x(3)}, {x(4)}, {}}

```

See also: [Section D.14.4.7 \[boolean_ideal\], page 1780](#); [Section D.14.4.1 \[boolean_std\], page 1776](#).

D.14.4.9 from_boolean_constant

Procedure from library `polybori.lib` (see [Section D.14.4 \[polybori_lib\], page 1775](#)).

Usage: `from_boolean_constant(pb);` pb pyobject

Return: constant polynomial

Example:

```

LIB "polybori.lib";
⇨ // ** args must be 1 in      system("install", "bideal", "ideal", bid\
    eal2ideal, 4);
ring rs=0,(x,y,z),Dp;
def rsb=boolean_poly_ring(rs);
poly f=(x+y)*x+z;
bpoly pp=f;
from_boolean_constant(0);
⇨ 0
from_boolean_constant(1);
⇨ 1
from_boolean_constant(pp);
⇨ 1

```

See also: [Section D.14.4.7 \[boolean_ideal\]](#), page 1780; [Section D.14.4.1 \[boolean_std\]](#), page 1776.

D.14.4.10 from_boolean_poly

Procedure from library `polybori.lib` (see [Section D.14.4 \[polybori_lib\]](#), page 1775).

Usage: `from_boolean_poly(ps[, dir]);` ps polynomial, dir integer zero or one

Return: default: polynomial ps in the representation of the boolean ring

Note: via the optional input dir, one can choose the computation method (either `direct[dir==0]` or `recursive[dir==1]`). default: direct

Example:

```

LIB "polybori.lib";
⇨ // ** args must be 1 in      system("install", "bideal", "ideal", bid\
    eal2ideal, 4);
ring r=0,(x,y,z),Dp;
def rb=boolean_poly_ring(r);
poly f=x^2+2*y+5*z^4;
bpoly pp=f;
from_boolean_poly(pp);
⇨ x+z
from_boolean_poly(pp,1);
⇨ x+z
ring r2=5,(x,y,z),Dp;
def rb2=boolean_poly_ring(r2);
poly f2=x+y+z;
bpoly pp2=f2;
from_boolean_poly(pp);
⇨ x+z
from_boolean_poly(pp,1);
⇨ x+z

```

See also: [Section D.14.4.7 \[boolean_ideal\]](#), page 1780; [Section D.14.4.1 \[boolean_std\]](#), page 1776.

D.14.4.11 direct_from_boolean_poly

Procedure from library `polybori.lib` (see [Section D.14.4 \[polybori_lib\]](#), page 1775).

Usage: `from_boolean_poly(pb);` pb boolean polynomial

Return: polynomial in Singular

Example:

```

LIB "polybori.lib";
↳ // ** args must be 1 in      system("install", "bideal",  "ideal",  bid\
    eal2ideal, 4);
ring r=0,(x,y,z),Dp;
pyobject rb=boolean_poly_ring(r);
poly f=x^2+2*y^3+3*z^3;
bpoly pp=f;
direct_from_boolean_poly(pp);
↳ x+z
poly g=0;
bpoly pp=g;
↳ // ** redefining pp (bpoly pp=g;)
direct_from_boolean_poly(pp);
↳ 0

```

See also: [Section D.14.4.7 \[boolean_ideal\]](#), page 1780; [Section D.14.4.4 \[boolean_poly\]](#), page 1778; [Section D.14.4.2 \[boolean_poly_ring\]](#), page 1778; [Section D.14.4.1 \[boolean_std\]](#), page 1776; [Section D.14.4.13 \[from_boolean_ideal\]](#), page 1783.

D.14.4.12 recursive_from_boolean_poly

Procedure from library `polybori.lib` (see [Section D.14.4 \[polybori.lib\]](#), page 1775).

Usage: `recursive_from_boolean_poly(pb)`; `pb` boolean polynomial

Return: polynomial in Singular

Example:

```

LIB "polybori.lib";
↳ // ** args must be 1 in      system("install", "bideal",  "ideal",  bid\
    eal2ideal, 4);
ring rs=0,(x,y,z),Dp;
def rsb=boolean_poly_ring(rs);
poly f=(x+y)*x+z;
bpoly pp=f;
recursive_from_boolean_poly(pp);
↳ xy+x+z
ring rs2=2,(x,y,z),Dp;
def rsb2=boolean_poly_ring(rs2);
poly f2=(x+y)*x+x;
bpoly pp2=f2;
recursive_from_boolean_poly(pp);
↳ xy+x+z

```

See also: [Section D.14.4.7 \[boolean_ideal\]](#), page 1780; [Section D.14.4.4 \[boolean_poly\]](#), page 1778; [Section D.14.4.2 \[boolean_poly_ring\]](#), page 1778; [Section D.14.4.13 \[from_boolean_ideal\]](#), page 1783; [Section D.14.4.10 \[from_boolean_poly\]](#), page 1782.

D.14.4.13 from_boolean_ideal

Procedure from library `polybori.lib` (see [Section D.14.4 \[polybori.lib\]](#), page 1775).

Usage: `from_boolean_ideal(I)`; `I` boolean ideal

Return: ideal in Singular

Example:

```

LIB "polybori.lib";
⇨ // ** args must be 1 in      system("install", "bideal",  "ideal",  bid\
    eal2ideal, 4);
ring rs=0,(x,y,z),Dp;
def rb3=boolean_poly_ring(rs);
poly f1=x+y;
poly f2=x+z;
bpoly pp =f1;
bpoly p = f2;
bideal Ib;
list K=(p,pp);
Ib=K;
from_boolean_ideal(Ib);
⇨ _[1]=x+z
⇨ _[2]=x+y
ring rs2=5,(x,y,z),Dp;
def rb4=boolean_poly_ring(rs2);
poly p1=x+y;
poly p2=x+z;
poly p3=y+z;
bpoly p = p1;
⇨ // ** redefining p (bpoly p = p1;)
bpoly pp = p2;
⇨ // ** redefining pp (bpoly pp = p2;)
bpoly ppp = p3;
bideal Ib;
⇨ // ** redefining Ib (bideal Ib;)
list K=(p,pp,ppp);
⇨ // ** redefining K (list K=(p,pp,ppp);)
Ib=K;
from_boolean_ideal(Ib);
⇨ _[1]=x+y
⇨ _[2]=x+z
⇨ _[3]=y+z

```

See also: [Section D.14.4.7 \[boolean_ideal\]](#), page 1780; [Section D.14.4.4 \[boolean_poly\]](#), page 1778; [Section D.14.4.2 \[boolean_poly_ring\]](#), page 1778; [Section D.14.4.1 \[boolean_std\]](#), page 1776; [Section D.14.4.10 \[from_boolean_poly\]](#), page 1782.

D.14.4.14 from_boolean_set

Procedure from library `polybori.lib` (see [Section D.14.4 \[polybori_lib\]](#), page 1775).

Usage: `from_boolean_set(sb)`; sb boolean set

Return: Boolean set sb in the representation of a zdd

Example:

```

LIB "polybori.lib";
⇨ // ** args must be 1 in      system("install", "bideal",  "ideal",  bid\
    eal2ideal, 4);
ring r=0,(x,y,z),Dp;
poly f=(x+1)*(y+1)*(z+1);
bpoly fb=f;

```

```

bset fs=fb;
from_boolean_set(fs);
↳ zdd:
↳ x1(x2(x3+1)+
↳ x3+1)+
↳ x2(x3+1)+
↳ x3+1
↳
poly g=x*y*z+1;
bpoly gb=g;
bset gs=gb;
from_boolean_set(gs);
↳ zdd:
↳ x1(x2(x3))+1
↳
ring R=0,(x(1..4)),Dp;
poly h=(x(1)+1)*(x(2)+1)*(x(3)+1)*(x(4)+1);
pyobject hb=boolean_poly(h);
def hs=hb.set();
from_boolean_set(hs);
↳ zdd:
↳ x1(x2(x3(x4+1)+
↳ x4+1)+
↳ x3(x4+1)+
↳ x4+1)+
↳ x2(x3(x4+1)+
↳ x4+1)+
↳ x3(x4+1)+
↳ x4+1
↳

```

See also: [Section D.14.4.7 \[boolean_ideal\]](#), page 1780; [Section D.14.4.1 \[boolean_std\]](#), page 1776.

D.14.4.15 bvar

Procedure from library `polybori.lib` (see [Section D.14.4 \[polybori_lib\]](#), page 1775).

Usage: `bvar(i); int i`

Return: `i`-th variable of Boolean ring corresponding to current basering

Example:

```

LIB "polybori.lib";
↳ // ** args must be 1 in      system("install", "bideal", "ideal", bid\
  eal2ideal, 4);
ring r = 2,(x,y,z),Dp;
bvar(1); // -> x
↳ x
↳

```

See also: [Section D.14.4.2 \[boolean_poly_ring\]](#), page 1778; [Section 5.1.160 \[var\]](#), page 279.

D.14.4.16 poly2zdd

Procedure from library `polybori.lib` (see [Section D.14.4 \[polybori_lib\]](#), page 1775).

Usage: poly2zdd(poly ps); polynomial ps

Return: polynomial ps in zdd representation

Example:

```
LIB "polybori.lib";
⇨ // ** args must be 1 in      system("install", "bideal",  "ideal",  bid\
    eal2ideal, 4);
ring r=0,x(1..5),Dp;
poly f=(x(1)+1)*(x(2)+1)*(x(3)+1)*x(4)*x(5);
poly2zdd(f);
⇨ zdd:
⇨  x1(x2(x3(x4(x5)))+
⇨      x4(x5))+
⇨      x3(x4(x5))+
⇨      x4(x5))+
⇨  x2(x3(x4(x5)))+
⇨      x4(x5))+
⇨      x3(x4(x5))+
⇨      x4(x5)
⇨
poly g=x(3);
poly2zdd(g);
⇨ zdd:
⇨  x3
⇨
```

See also: [Section D.14.4.4 \[boolean_poly\]](#), page 1778; [Section D.14.4.14 \[from_boolean_set\]](#), page 1784.

D.14.4.17 zdd2poly

Procedure from library `polybori.lib` (see [Section D.14.4 \[polybori_lib\]](#), page 1775).

Usage: zdd2poly(ss); zero-supressed decision diagram ss

Return: zdd ss in polynomial representation

Example:

```
LIB "polybori.lib";
⇨ // ** args must be 1 in      system("install", "bideal",  "ideal",  bid\
    eal2ideal, 4);
ring r=0,x(1..5),Dp;
poly f=(x(1)+1)*(x(2)+1)*(x(3)+1)*x(4)*x(5);
zdd2poly(poly2zdd(f));
⇨ x(1)*x(2)*x(3)*x(4)*x(5)+x(1)*x(2)*x(4)*x(5)+x(1)*x(3)*x(4)*x(5)+x(2)*x(3\
    )*x(4)*x(5)+x(1)*x(4)*x(5)+x(2)*x(4)*x(5)+x(3)*x(4)*x(5)+x(4)*x(5)
poly g=x(3);
zdd2poly(poly2zdd(g));
⇨ x(3)
poly g=0;
⇨ // ** redefining g (poly g=0;)
zdd2poly(poly2zdd(0));
⇨ 0
poly g=1;
⇨ // ** redefining g (poly g=1;)
```

```
zdd2poly(poly2zdd(01));
↳ 1
```

See also: [Section D.14.4.8 \[boolean_set\]](#), page 1781; [Section D.14.4.10 \[from_boolean_poly\]](#), page 1782.

D.14.4.18 disp_zdd

Procedure from library `polybori.lib` (see [Section D.14.4 \[polybori_lib\]](#), page 1775).

Usage: `disp_zdd(ss)`; zero-supressed decision diagram `ss`

Return: string containing visualization of `ss`

Note: the resulting string is the visualization of the polynomial that corresponds to `ss`, but with a additional structure that comes from the `zdd`. Every reached else- Branch induces a new line in the string.

Example:

```
LIB "polybori.lib";
↳ // ** args must be 1 in      system("install", "bideal",  "ideal",  bid\
  eal2ideal, 4);
ring r1=0,(x,y,z),Dp;
poly f1=xyz+xy+xz+yz+y+z+x+1;
zdd s1=f1;
disp_zdd(s1);
↳ x1(x2(x3+1)+
↳      x3+1)+
↳      x2(x3+1)+
↳      x3+1
ring r2=0,x(1..6),Dp;
poly f2=x(1)+x(2)+x(3)+x(5)^2+x(6);
zdd s2=f2;
disp_zdd(s2);
↳ x1+
↳      x2+
↳      x3+
↳      x5+
↳      x6
ring r4=0,x(1..6),Dp;
poly f2=x(1)+1;
zdd s2=f2;
↳ // ** redefining s2 (zdd s2=f2;)
disp_zdd(s2);
↳ x1+1
ring r2=0,x(1..6),Dp;
↳ // ** redefining r2 (ring r2=0,x(1..6),Dp;)
poly f2=x(1)*x(2)*(x(3)-x(5)^2*x(6))+3*x(4)*x(5)-3;
zdd s2=f2;
↳ // ** redefining s2 (zdd s2=f2;)
disp_zdd(s2);
↳ x1(x2(x3+
↳      x5(x6)))
↳      x4(x5)+1
poly f4=0;
```

```

zdd s4=f4;
disp_zdd(s4);
↳ 0
poly f5=1;
zdd s5=f5;
disp_zdd(s5);
↳ 1

```

See also: [Section D.14.4.16 \[poly2zdd\]](#), page 1785; [Section D.14.4.17 \[zdd2poly\]](#), page 1786.

D.15 Experimental libraries

This sections collect libraries in the beta test phase. Everything in these libraries may change.

For the minimal requirements and guidelines see [Section 3.8 \[Libraries\]](#), page 55.

Comments should be send to the author of the library directly.

D.15.1 autgradalg_lib

Library: autgradalg.lib

Purpose: Compute automorphism groups of pointedly graded algebras and of Mori dream spaces.

Authors: Simon Keicher

Overview: This library provides a framework for computing automorphisms of integral, finitely generated algebras that are graded by a finitely generated abelian group. This library also contains functions to compute automorphism groups of Mori dream spaces. The results are ideals I such that the respective automorphism group is isomorphic to the subgroup $V(I)$ in some $GL(n)$.

Assumptions:

* the algebra R is given as factor algebra S/I with a graded polynomial ring $S = KK[T_1, \dots, T_r]$. We will always assume that the basering is S and it is given over the rationals QQ or a number field $QQ(a)$. * R must be minimally presented, i.e., I is contained in $\langle T_1, \dots, T_r \rangle^2$. * S (and hence R) are graded via 'setBaseMultigrading(Q)' from 'multigrading.lib'. The last rows of the matrix Q are interpreted over $\mathbb{Z}/a_i\mathbb{Z}$ if the respective entry of the list TOR is a_i and has been provided as parameter to the respective function. (See the functions for more details.) * For all $1 \leq i \leq r$: $I_{\{w_i\}} = 0$ where $w_i := \deg(T_i)$. * the grading is pointed, i.e., no generator has degree 0 and the cone over all generator degrees is pointed. * For Mori dream spaces X , we assume them to be given as $X = X(R, w)$ with the Cox ring R of X (given as the algebra R before) and an ample class w in the grading group K with the torsion entries removed.

Note: we require the user to execute 'LIB'gfanlib.so' before using this library.

Procedures:

Note: the following functions were taken from 'quotsingcox.lib' by M.Donten-Bury and S.Keicher: 'hilbBas'.

D.15.1.1 autKS

Procedure from library `autgradalg.lib` (see [Section D.15.1 \[autgradalg_lib\]](#), page 1788).

Usage: autKS(TOR); TOR: optional list of elementary divisors in case of torsion.

Assume: the basering is multigraded having used the command `setBaseMultigrading(Q)` from 'multigrading.lib'.

Purpose: Compute the subgroup $\text{Aut}_K(S)$ of $\text{GL}(n)$ of graded automorphisms of the polynomial ring S (the basering).

Return: returns a ring S and exports an ideal `Iexported` in the coordinate ring $S = K[Y_{ij}]$ of $\text{GL}(n)$ such that $\text{Aut}_K(S) = V(I)$.

Example:

```
LIB "autgradalg.lib";
////////////////////////////////////
// example: fano 15:
intmat Q[1][5] = 3,3,2,2,1;
ring R = 0,T(1..5),dp;

D.15.1.2 autGradAlg

Procedure from library `autgradalg.lib` (see [Section D.15.1 \[autgradalg.lib\]](#), page 1788).

Usage: `autGradAlg(I, TOR)`; I is an ideal, TOR is an optional list of integers representing the torsion part of the grading group.

Assume: minimally presented, degrees of the generators of I are the minimal degrees, basering multigraded pointedly, $I_w = 0$ for all $w = \deg(\text{var}(i))$

Return: a ring. Also exports an ideal `Jexported` and a list `stabExported`.

Example:

```

LIB "autgradalg.lib";
intmat Q[1][3] =
1,1,1;
ring R = 0,T(1..3), dp;
setBaseMultigrading(Q);
ideal I = 0; //T(1)*T(2) + T(3)*T(4);
def RR = autGradAlg(I);
↳ // coefficients: QQ
↳ // number of vars : 12
↳ //      block 1 : ordering dp
↳ //      : names      T(1) T(2) T(3) Y(1) Y(2) Y(3) Y(4) Y(5) Y(\
6) Y(7) Y(8) Y(9)
↳ //      block 2 : ordering C
↳ // ** redefining adMons ( list adMons;)
setring RR;

```

```

```

D.15.1.3 autGenWeights

Procedure from library `autgradalg.lib` (see [Section D.15.1 \[autgradalg.lib\]](#), page 1788).

Usage: `autGenWeights(Q)`: Q is an intmat (columns must contain a lattice basis).

Assume: the cone over Q must be pointed and the columns of Q contain a lattice basis; there must be no 0-columns in Q . We assume that, in the torsion case, the torsion rows of Q are reduced (for example, a row of Q standing for entries in $\mathbb{Z}\mathbb{Z}/5\mathbb{Z}\mathbb{Z}$ must not contain elements > 5 or < 0).

Purpose: computes generators for the subgroup $\text{aut}(\Omega_S)$ of $\text{GL}(n, \mathbb{Z}\mathbb{Z})$ that consists of all invertible integer $k \times k$ matrices which fix the set Ω_S of degrees of the variables of the basering S . The set of columns of Q equals Ω_S .

Reference:

Remark 3.1.

Return: a list of integral matrices A with $|\det A| = 1$ such that $A \cdot \{\text{columns of } Q\} = \{\text{columns of } Q\}$.

Example:

```

LIB "autgradalg.lib";
// torsion example
// ZZ + ZZ/5ZZ:
intmat Q[2][5] =

```

```
1,1,1,1,1,
2,3,1,4,0;

```

D.15.1.4 stabilizer

Procedure from library `autgradalg.lib` (see [Section D.15.1 \[autgradalg.lib\]](#), page 1788).

Usage: `stabilizer(RL, A, BB, AMON, n0)`: `RL` is an ideal, `A` a matrix (standing for a subgroup of $GL(n)$), `BB` is an `intmat` (standing for an automorphism of the grading group), `AMON` a list of monomials corresponding to the rows/columns of `A`, `n0` an integer such that the first `n0` variables of the basering are the $T(i)$, optional: a list of elementary divisors if there is torsion.

Assume: the basering must be graded (see `setBaseMultigrading()`) and the cone over the degrees of the variables must be pointed; there mustn't be 0-degrees. The vector `w` must be an element of the cone over the degrees of the variables. Moreover, `B` must be such that it permutes the degrees of the variables and the degrees of the generators of `RL`.

Purpose: returns relations such that $A * I = I$.

Return: a ring. Also exports an ideal Jexported and a list stabExported.

Example:

```
LIB "autgradalg.lib";
//////////
// example: fano 15:
intmat Q[1][5] = 3,3,2,2,1;
ring R = 0,T(1..5),dp;
// attach degree matrix Q to R:
setBaseMultigrading(Q);
ideal I = T(1)*T(2) + T(3)^2*T(4) + T(5)^6;
def RR = stabilizer(I);
↳ // coefficients: QQ
↳ // number of vars : 50
↳ //          block 1 : ordering dp

D.15.1.5 autXhat

Procedure from library `autgradalg.lib` (see [Section D.15.1 \[autgradalg.lib\]](#), page 1788).

Usage: `autXhat(RL, w0, TOR)`: RL is an ideal, w an intvec, TOR a list of integers

Assume: the basering is multigraded, the elements of TOR stand for the torsion rows of the matrix `getVariableWeights()`, w is an ample class or the free part of such a class.

Purpose: compute an ideal J such that $V(J)$ in some $GL(n)$ is isomorphic to the H-equivariant automorphisms $\widehat{X} \rightarrow \widehat{X}$.

Example:

```

LIB "autgradalg.lib";
intmat Q[3][5] =
1,1,1,1,1,
1,-1,0,0,1,
1,1,1,0,0;
list TOR = 2;
ring R = 0,T(1..5),dp;
setBaseMultigrading(Q);
ideal I = T(1)*T(2) + T(3)^2 + T(4)^2;
list TOR = 2;
↳ // ** redefining TOR (list TOR = 2;)
intvec w0 = 2,1,0;
def RR = autXhat(I, w0, TOR);
↳ // coefficients: QQ

D.15.1.6 autX

Procedure from library `autgradalg.lib` (see [Section D.15.1 \[autgradalg_lib\]](#), page 1788).

Usage: `autX(RL, w, TOR)`; RL: ideal, w: intvec, TOR: optional list of integers.

Purpose: compute generators for the hopf algebra $O(\text{Aut}(X))$ of the Mori dream space X given by $\text{Cox}(X) := \text{basing}/\text{RL}$ and the ample class w .

Assume: there is no torsion.

Return: a ring. Also exports an ideal `Iexported`.

Example:

```
LIB "autgradalg.lib";
//////////
// PP2
// intmat Q[1][4] =
//   1,1,1,1;
//
// ring R = 0,T(1..ncols(Q)),dp;
//
// // attach degree matrix Q to R:
// setBaseMultigrading(Q);
// ideal I = 0;
// intvec w0 = 1;
//
// def RR = autX(I, w0);
// setring RR;
// Iexported;
//
// basering;
// dim(std(Iexported));
//
// kill RR, Q, R;
//
// quit;
// //////////
// // example 3.14 from the paper
// intmat Q[3][5] =
//   1,1,1,1,1,
//   1,-1,0,0,1,
//   1,1,1,0,0;
//
// list TOR = 2;
// ring R = 0,T(1..5),dp;
//
// // attach degree matrix Q to R:
// setBaseMultigrading(Q);
//
// ideal I = T(1)*T(2) + T(3)^2 + T(4)^2;
// list TOR = 2;
//
// intvec w0 = 2,1,0;
// def RR = autX(I, w0, TOR);
// setring RR;
//
// kill RR, Q, R;
```

D.15.2 brillnoether_lib

Library: brillnoether.lib

Purpose: Riemann-Roch spaces of divisors on curves

Authors: I. Stenger: stenger@mathematik.uni-kl.de
Janko Boehm boehm@mathematik.uni-kl.de

Procedures:

D.15.2.1 RiemannRochBN

Procedure from library `brillnoether.lib` (see [Section D.15.2 \[brillnoether.lib\]](#), page 1805).

Usage: RiemannRochBN(C,I,J); ideal C, ideal I, ideal J

Assume: C is a homogeneous ideal defining a projective curve. If C is a non-planar curve, then C is assumed to be nonsingular. This assumption is not checked. The ideals I and J represent a divisor D on C.

Return: A vector space basis of the Riemann-Roch space of D, stored in a list `RRBasis`. The list `RRBasis` contains a list `IH` and a form `F`. The vector space basis of $L(D)$ consists of all rational functions G/F , where G is an element of `IH`.

Example:

```

D.15.3 chern.lib

Library: chern.lib

Purpose: Symbolic Computations with Chern classes, Computation of Chern classes

Author: Oleksandr Iena, o.g.yena@gmail.com, yena@mathematik.uni-kl.de

Overview: A toolbox for symbolic computations with Chern classes. The Aluffi's algorithms for computation of characteristic classes of algebraic varieties (Segre, Fulton, Chern-Schwartz-MacPherson classes) are implemented as well.

References:

- [1] Aluffi, Paolo Computing characteristic classes of projective schemes. *Journal of Symbolic Computation*, 35 (2003), 3-19. [2] Iena, Oleksandr, On symbolic computations with Chern classes: remarks on the library `chern.lib` for Singular, <http://hdl.handle.net/10993/22395>, 2015.

Procedures:

D.15.3.1 `symm`

Procedure from library `chern.lib` (see [Section D.15.3 \[`chern.lib`\], page 1806](#)).

Usage: `symm(l [,n]);` `l` a list of polynomials, `n` integer

Return: list of polynomials

Purpose: computes the list of elementary symmetric functions in the entries of `l`

Note: makes sense only for a list of polynomials

Example:

```
LIB "chern.lib";
// elementary symmetric functions in x, y, z:
ring r = 0, (x, y, z), dp;
list l=(x, y, z);
print(symm(l));
↳ [1]:
↳ x+y+z
↳ [2]:
↳ xy+xz+yz
↳ [3]:
↳ xyz
//now let us compute only the first two symmetric polynomials in a(1), ... , a(10)
ring q= 0,(a(1..10)), dp;
list l=a(1..10);
print(symm(l, 2));
↳ [1]:
↳ a(1)+a(2)+a(3)+a(4)+a(5)+a(6)+a(7)+a(8)+a(9)+a(10)
↳ [2]:
↳ a(1)*a(2)+a(1)*a(3)+a(2)*a(3)+a(1)*a(4)+a(2)*a(4)+a(3)*a(4)+a(1)*a(5)+\
a(2)*a(5)+a(3)*a(5)+a(4)*a(5)+a(1)*a(6)+a(2)*a(6)+a(3)*a(6)+a(4)*a(6)+a(5)\
)*a(6)+a(1)*a(7)+a(2)*a(7)+a(3)*a(7)+a(4)*a(7)+a(5)*a(7)+a(6)*a(7)+a(1)*a\
(8)+a(2)*a(8)+a(3)*a(8)+a(4)*a(8)+a(5)*a(8)+a(6)*a(8)+a(7)*a(8)+a(1)*a(9)\
+a(2)*a(9)+a(3)*a(9)+a(4)*a(9)+a(5)*a(9)+a(6)*a(9)+a(7)*a(9)+a(8)*a(9)+a(\
1)*a(10)+a(2)*a(10)+a(3)*a(10)+a(4)*a(10)+a(5)*a(10)+a(6)*a(10)+a(7)*a(10\
)+a(8)*a(10)+a(9)*a(10)
```

D.15.3.2 symNsym

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `symNsym(f, c)`; f polynomial; c list of polynomials

Return: list with 2 poly entries

Purpose: computes a symmetric and a non-symmetric part of f in terms of the elementary symmetric functions from c as well a non-symmetric remainder

Note: constants are not considered symmetric

Example:

```
LIB "chern.lib";
ring r=0, (x,y,z, c(1..3)), dp;
list l=c(1..3);
// The symmetric part of f = 3x2 + 3y2 + 3z2 + 7xyz + y
// in terms of the elementary symmetric functions c(1), c(2), c(3)
// and the remainder
poly f = 3x2 + 3y2 + 3z2 + 7xyz + y;
print( symNsym(f, l) );
⇒ [1]:
⇒ 3*c(1)^2-6*c(2)+7*c(3)
⇒ [2]:
⇒ y
// Take a symmetric polynomial in variables x and z
f=x2+xz+z2;
// Express it in terms of the elementary symmetric functions
print( symNsym(f, l)[1]);
⇒ c(1)^2-c(2)
```

D.15.3.3 CompleteHomog

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `CompleteHomog(N, c)`; N integer, c list of polynomials

Return: list of polynomials

Purpose: computes the list of the complete homogeneous symmetric polynomials in terms of the elementary symmetric polynomials (entries of c)

Note:

Example:

```
LIB "chern.lib";
ring r = 0, (x(1..3)), dp;
list l=x(1..3);
//Complete homogeneous symmetric polynomials up to degree 3 in variables x(1), x(2),
print( CompleteHomog(3, l) );
⇒ [1]:
⇒ 1
⇒ [2]:
⇒ x(1)
⇒ [3]:
```

```

↳ x(1)^2-x(2)
↳ [4]:
↳ x(1)^3-2*x(1)*x(2)+x(3)

```

D.15.3.4 segre

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\]](#), page 1806).

Usage: `segre(c[, N]);` c list of polynomials, N integer

Return: list of polynomials

Purpose: computes the list of the Segre classes up to degree N in terms of the Chern classes from c

Note:

Example:

```

LIB "chern.lib";
ring r = 0, (c(1..3)), dp;
list l=c(1..3);
//Segre classes up to degree 5 in Chern classes c(1), c(2), c(3)
print( segre(l, 5) );
↳ [1]:
↳ -c(1)
↳ [2]:
↳ c(1)^2-c(2)
↳ [3]:
↳ -c(1)^3+2*c(1)*c(2)-c(3)
↳ [4]:
↳ c(1)^4-3*c(1)^2*c(2)+c(2)^2+2*c(1)*c(3)
↳ [5]:
↳ -c(1)^5+4*c(1)^3*c(2)-3*c(1)*c(2)^2-3*c(1)^2*c(3)+2*c(2)*c(3)

```

D.15.3.5 chern

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\]](#), page 1806).

Usage: `chern(s);` s list of polynomials

Return: list of polynomials

Purpose: computes the list of the Chern classes up to degree N in terms of the Segre classes from s

Note:

Example:

```

LIB "chern.lib";
ring r = 0, (s(1..3)), dp;
list l=s(1..3);
// Chern classes in Segre classes s(1), s(2), s(3)
print( chern(l) );
↳ [1]:
↳ -s(1)
↳ [2]:
↳ s(1)^2-s(2)

```

```

⇒ [3]:
⇒ -s(1)^3+2*s(1)*s(2)-s(3)
// This procedure is inverse to segre(...). Indeed:
print( segre(chern(1), 3) );
⇒ [1]:
⇒ s(1)
⇒ [2]:
⇒ s(2)
⇒ [3]:
⇒ s(3)

```

D.15.3.6 chNum

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\]](#), page 1806).

Usage: `chNum(N, c)`; N integer, c list

Return: list

Purpose: computes the Chern numbers of a vector bundle with Chern classes c on a complex manifold (variety) of dimension N ,
the zeroes corresponding to the higher zero Chern classes are ignored

Note: computes basically the partitions of N
in summands not greater than the length of c

Example:

```

LIB "chern.lib";
ring r = 0, (c(1..2)), dp;
list l=c(1..2);
// Let c(1) be a variable of degree 1, let c(2) be a variable of degree 2.
// The monomials in c(1) and c(2) of weighted degree 5 are:
print( chNum( 5, l ) );
⇒ [1]:
⇒ c(1)^5
⇒ [2]:
⇒ c(1)^3*c(2)
⇒ [3]:
⇒ c(1)*c(2)^2
// Compare the result to the output of chNumbers(...):
print( chNumbers(5, l) );
⇒ [1]:
⇒ c(1)^5
⇒ [2]:
⇒ c(1)^3*c(2)
⇒ [3]:
⇒ c(1)*c(2)^2
⇒ [4]:
⇒ 0
⇒ [5]:
⇒ 0
⇒ [6]:
⇒ 0
⇒ [7]:
⇒ 0

```

D.15.3.7 chNumbers

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `chNumbers(r, c)`; r integer, c list

Return: list

Purpose: computes the Chern numbers of a vector bundle with Chern classes c on a complex manifold (variety) of dimension r

Note: computes basically the partitions of r

Example:

```
LIB "chern.lib";
ring r = 0, (c(1..3)), dp;
list l=c(1..3);
// The Chern numbers of a vector bundle with Chern classes c(1), c(2), c(3)
// on a 3-fold:
print( chNumbers( 3, l ) );
⇒ [1]:
⇒ c(1)^3
⇒ [2]:
⇒ c(1)*c(2)
⇒ [3]:
⇒ c(3)
// If the highest Chern class is zero, the Chern numbers are:
l=c(1..2);
print( chNumbers( 3, l ) );
⇒ [1]:
⇒ c(1)^3
⇒ [2]:
⇒ c(1)*c(2)
⇒ [3]:
⇒ 0
// Compare this to the output of chNum(...):
print( chNum( 3, l ) );
⇒ [1]:
⇒ c(1)^3
⇒ [2]:
⇒ c(1)*c(2)
```

D.15.3.8 sum_of_powers

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `sum_of_powers(k, l)`; k non-negative integer, l list of polynomials

Return: polynomial

Purpose: computes the sum of k -th powers of the entries of l

Note: returns 0 if k is negative

Example:

```
LIB "chern.lib";
ring r = 0, (x, y, z), dp;
list l=x, y, z;
```

```
//sum of 7-th powers of x, y, z
print( sum_of_powers(7, l) );
↳ x7+y7+z7
```

D.15.3.9 powSumSym

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `powSumSym(l [,N]);` l a list of polynomials, N integer

Return: list of polynomials

Purpose: computes the expressions for the sums of powers [up to degree N] in terms of the elementary symmetric polynomials (entries of l),

Note: returns the terms of the Chern character multiplied by the corresponding factorials

Example:

```
LIB "chern.lib";
// the expressions of the first 3 sums of powers of 3 variables a(1), a(2), a(3)
// in terms of the elementary symmetric polynomials c(1), c(2), c(3):
ring r = 0, (c(1..3)), dp;
list l=(c(1..3));
print(powSumSym(l));
↳ [1]:
↳ c(1)
↳ [2]:
↳ c(1)^2-2*c(2)
↳ [3]:
↳ c(1)^3-3*c(1)*c(2)+3*c(3)
// The first 5 sums in the same situation
print(powSumSym(l, 5));
↳ [1]:
↳ c(1)
↳ [2]:
↳ c(1)^2-2*c(2)
↳ [3]:
↳ c(1)^3-3*c(1)*c(2)+3*c(3)
↳ [4]:
↳ c(1)^4-4*c(1)^2*c(2)+2*c(2)^2+4*c(1)*c(3)
↳ [5]:
↳ c(1)^5-5*c(1)^3*c(2)+5*c(1)*c(2)^2+5*c(1)^2*c(3)-5*c(2)*c(3)
```

D.15.3.10 chAll

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `chAll(l [,N]);` l a list of polynomials, N integer

Return: list of polynomials

Purpose: computes the list of terms of positive degree [up to degree N] of the Chern character, where the entries of l are considered as the Chern classes

Note: makes sense only for a list of polynomials

Example:

```

LIB "chern.lib";
// Chern character (terms of degree 1, 2, 3)
// corresponding to the Chern classes c(1), c(2), c(3):
ring r = 0, (c(1..3)), dp;
list l=(c(1..3));
print(chAll(1));
⇒ [1]:
⇒ c(1)
⇒ [2]:
⇒ 1/2*c(1)^2-c(2)
⇒ [3]:
⇒ 1/6*c(1)^3-1/2*c(1)*c(2)+1/2*c(3)
// terms up to degree 5 in the same situation
print(chAll(1, 5));
⇒ [1]:
⇒ c(1)
⇒ [2]:
⇒ 1/2*c(1)^2-c(2)
⇒ [3]:
⇒ 1/6*c(1)^3-1/2*c(1)*c(2)+1/2*c(3)
⇒ [4]:
⇒ 1/24*c(1)^4-1/6*c(1)^2*c(2)+1/12*c(2)^2+1/6*c(1)*c(3)
⇒ [5]:
⇒ 1/120*c(1)^5-1/24*c(1)^3*c(2)+1/24*c(1)*c(2)^2+1/24*c(1)^2*c(3)-1/24*c(
(2)*c(3)

```

D.15.3.11 chAllInv

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\]](#), page 1806).

Usage: `chAllInv(l)`; `l` a list of polynomials

Return: list of polynomials

Purpose: procedure inverse to `chAll()`, computes the list of Chern classes from the list of terms of positive degree of the Chern character

Note: makes sense only for a list of polynomials

Example:

```

LIB "chern.lib";
// first 3 Chern classes in terms of the first 3 terms
// of the Chern character Chern ch(1), ch(2), ch(3):
ring r = 0, (ch(1..3)), dp;
list l=(ch(1..3));
print(chAllInv(1));
⇒ [1]:
⇒ ch(1)
⇒ [2]:
⇒ 1/2*ch(1)^2-ch(2)
⇒ [3]:
⇒ 1/6*ch(1)^3-ch(1)*ch(2)+2*ch(3)
// let's see that chAllInv() is inverse to chAll()
print( chAll( chAllInv(1) ) );
⇒ [1]:

```

```

⇒ ch(1)
⇒ [2]:
⇒ ch(2)
⇒ [3]:
⇒ ch(3)

```

D.15.3.12 chHE

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `chHE(c)`; `c` list of polynomials

Return: polynomial

Purpose: computes the highest relevant term of the Chern character

Note: uses the elimination and is extremely inefficient,
is included just for comparison with `chAll(c)`

Example:

```

LIB "chern.lib";
ring r = 0, (c(1..3)), dp;
list l=c(1..3);
//the third degree term of the Chern character
print( chHE(l) );
⇒ -1/6*c(1)^3+1/2*c(1)*c(2)-1/2*c(3)

```

D.15.3.13 ChernRootsSum

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `ChernRootsSum(a, b)`; `a, b` lists of polynomials

Return: list of polynomials

Purpose: computes the Chern roots of the direct (Whitney) sum of a vector bundle with Chern roots `a` and a vector bundle with Chern roots `b`

Note:

Example:

```

LIB "chern.lib";
ring r = 0, (a(1..3), b(1..2)), dp;
// assume a(1), a(2), a(3) are the Chern roots of a vector bundle E
// assume b(1), b(2) are the Chern roots of a vector bundle F
list l=a(1..3);
list L=b(1..2);
// the Chern roots of their direct sum is
print( ChernRootsSum(l, L) );
⇒ [1]:
⇒ a(1)
⇒ [2]:
⇒ a(2)
⇒ [3]:
⇒ a(3)
⇒ [4]:
⇒ b(1)
⇒ [5]:
⇒ b(2)

```

D.15.3.14 chSum

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `chSum(c, C)`; `c, C` lists of polynomials

Return: list of polynomials

Purpose: computes the Chern classes of a direct sum of two vector bundles

Note:

Example:

```
LIB "chern.lib";
ring r = 0, (c(1..3), C(1..2)), dp;
// Let E be a vector bundle with Chern classes c(1), c(2), c(3).
// Let F be a vector bundle with Chern classes C(1), C(2).
list l=c(1..3);
list L=C(1..2);
// Then the Chern classes of their direct sum are
print( chSum(l, L) );
⇒ [1]:
⇒ c(1)+C(1)
⇒ [2]:
⇒ c(1)*C(1)+c(2)+C(2)
⇒ [3]:
⇒ c(2)*C(1)+c(1)*C(2)+c(3)
⇒ [4]:
⇒ c(3)*C(1)+c(2)*C(2)
⇒ [5]:
⇒ c(3)*C(2)
```

D.15.3.15 ChernRootsDual

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `ChernRootsDual(l)`; `l` a list of polynomials

Return: list of polynomials

Purpose: computes the Chern roots of the dual vector bundle of a vector bundle with Chern roots from `l`

Note:

Example:

```
LIB "chern.lib";
ring r = 0, (a(1..3)), dp;
// assume a(1), a(2), a(3) are the Chern roots of a vector bundle
list l=a(1..3);
// the Chern roots of the dual vector bundle
print( ChernRootsDual(l) );
⇒ [1]:
⇒ -a(1)
⇒ [2]:
⇒ -a(2)
⇒ [3]:
⇒ -a(3)
```

D.15.3.16 chDual

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `chDual(c)`; `c` list of polynomials

Return: list of polynomials

Purpose: computes the list of Chern classes of the dual vector bundle

Note:

Example:

```
LIB "chern.lib";
// Chern classes of a vector bundle that is dual to a vector bundle
// with Chern classes c(1), c(2), c(3)
ring r=0, (c(1..3)), dp;
list l=c(1..3);
print(chDual(l));
↳ [1]:
↳ -c(1)
↳ [2]:
↳ c(2)
↳ [3]:
↳ -c(3)
```

D.15.3.17 ChernRootsProd

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `ChernRootsProd(a, b)`; `a, b` lists of polynomials

Return: list of polynomials

Purpose: computes the Chern roots of the tensor product of a vector bundle with Chern roots `a` and a vector bundles with Chern roots `b`

Note:

Example:

```
LIB "chern.lib";
ring r=0, (a(1..2), b(1..3)), dp;
list l=a(1..2);
list L=b(1..3);
// Chern roots of the tensor product of a vector bundle with Chern roots a(1), a(2)
// and a vector bundle with Chern roots b(1), b(2), b(3)
print(ChernRootsProd(l, L));
↳ [1]:
↳ a(1)+b(1)
↳ [2]:
↳ a(1)+b(2)
↳ [3]:
↳ a(1)+b(3)
↳ [4]:
↳ a(2)+b(1)
↳ [5]:
↳ a(2)+b(2)
↳ [6]:
↳ a(2)+b(3)
```

D.15.3.18 chProd

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `chProd(r, c, R, C [, N]);` r, R polynomials (integers); c, C lists of polynomials, N integer

Return: list of polynomials

Purpose: computes the list of Chern classes of the product of two vector bundles in terms of their ranks and Chern classes [up to degree N]

Note:

Example:

```
LIB "chern.lib";
ring H = 0, ( r, R, c(1..3), C(1..2) ), dp;
list l=c(1..3);
list L=C(1..2);
// the Chern classes of the tensor product of a vector bundle E of rank 3
// with Chern classes c(1), c(2), c(3)
// and a vector bundle F of rank 2 with Chern classes C(1) and C(2):
print( chProd(3, l, 2, L) );
⇒ [1]:
⇒ 2*c(1)+3*C(1)
⇒ [2]:
⇒ c(1)^2+5*c(1)*C(1)+3*C(1)^2+2*c(2)+3*C(2)
⇒ [3]:
⇒ 2*c(1)^2*C(1)+4*c(1)*C(1)^2+C(1)^3+2*c(1)*c(2)+4*c(2)*C(1)+4*c(1)*C(2)\
+6*C(1)*C(2)+2*c(3)
⇒ [4]:
⇒ c(1)^2*C(1)^2+c(1)*C(1)^3+3*c(1)*c(2)*C(1)+3*c(2)*C(1)^2+2*c(1)^2*C(2)\
+6*c(1)*C(1)*C(2)+3*C(1)^2*C(2)+c(2)^2+2*c(1)*c(3)+3*c(3)*C(1)+3*C(2)^2
⇒ [5]:
⇒ c(1)*c(2)*C(1)^2+c(2)*C(1)^3+2*c(1)^2*C(1)*C(2)+2*c(1)*C(1)^2*C(2)+c(2)\
)^2*C(1)+2*c(1)*c(3)*C(1)+3*c(3)*C(1)^2+2*c(1)*c(2)*C(2)+2*c(1)*C(2)^2+3*\
C(1)*C(2)^2+2*c(2)*c(3)-6*c(3)*C(2)
⇒ [6]:
⇒ c(1)*c(3)*C(1)^2+c(3)*C(1)^3+c(1)*c(2)*C(1)*C(2)+c(2)*C(1)^2*C(2)+c(1)\
^2*C(2)^2+c(1)*C(1)*C(2)^2+c(2)*c(3)*C(1)+c(2)^2*C(2)-2*c(1)*c(3)*C(2)-3*\
c(3)*C(1)*C(2)-2*c(2)*C(2)^2+C(2)^3+c(3)^2
// the first two Chern classes of the tensor product
// of a vector bundle E of rank r with Chern classes c(1) and c(2)
// and a vector bundle G of rank R with Chern classes C(1) and C(2)
// this gives the Chern classes of a tensor product on a complex surface
l=c(1..2);
L=C(1..2);
print( chProd(r, l, R, L, 2) );
⇒ [1]:
⇒ R*c(1)+r*C(1)
⇒ [2]:
⇒ 1/2*R^2*c(1)^2+r*R*c(1)*C(1)+1/2*r^2*C(1)^2-1/2*R*c(1)^2-1/2*r*C(1)^2+\
R*c(2)-c(1)*C(1)+r*C(2)
```

D.15.3.19 chProdE

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

- Usage:** `chProdE(c, C)`; `c, C` lists of polynomials
- Return:** list of polynomials
- Purpose:** computes the list of Chern classes of the product of two vector bundles in terms of their Chern classes
- Note:** makes sense only for (lists of) polynomials;
uses elimination, hence very inefficient;
included only for comparison with `chProd(...)`

Example:

```
LIB "chern.lib";
ring H = 0, ( c(1..3), C(1..2) ), dp;
list l=c(1..3);
list L=C(1..2);
// the Chern classes of the tensor product of a vector bundle E of rank 3
// with Chern classes c(1), c(2), c(3)
// and a vector bundle F of rank 2 with Chern classes C(1) and C(2):
print( chProdE(l, L) );
⇒ [1]:
⇒ 2*c(1)+3*C(1)
⇒ [2]:
⇒ -c(1)^2-5*c(1)*C(1)-3*C(1)^2-2*c(2)-3*C(2)
⇒ [3]:
⇒ -2*c(1)^2*C(1)-4*c(1)*C(1)^2-C(1)^3-2*c(1)*c(2)-4*c(2)*C(1)-4*c(1)*C(2)
  )-6*C(1)*C(2)-2*c(3)
⇒ [4]:
⇒ -c(1)^2*C(1)^2-c(1)*C(1)^3-3*c(1)*c(2)*C(1)-3*c(2)*C(1)^2-2*c(1)^2*C(2)
  )-6*c(1)*C(1)*C(2)-3*C(1)^2*C(2)-c(2)^2-2*c(1)*c(3)-3*c(3)*C(1)-3*C(2)^2
⇒ [5]:
⇒ -c(1)*c(2)*C(1)^2-c(2)*C(1)^3-2*c(1)^2*C(1)*C(2)-2*c(1)*C(1)^2*C(2)-c(\
  2)^2*C(1)-2*c(1)*c(3)*C(1)-3*c(3)*C(1)^2-2*c(1)*c(2)*C(2)-2*c(1)*C(2)^2-3\
  *C(1)*C(2)^2-2*c(2)*c(3)+6*c(3)*C(2)
⇒ [6]:
⇒ -c(1)*c(3)*C(1)^2-c(3)*C(1)^3-c(1)*c(2)*C(1)*C(2)-c(2)*C(1)^2*C(2)-c(1\
  )^2*C(2)^2-c(1)*C(1)*C(2)^2-c(2)*c(3)*C(1)-c(2)^2*C(2)+2*c(1)*c(3)*C(2)+3\
  *c(3)*C(1)*C(2)+2*c(2)*C(2)^2-C(2)^3-c(3)^2
```

D.15.3.20 chProdL

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\]](#), page 1806).

- Usage:** `chProdL(r, c, R, C)`; `r, R` integers; `c, C` lists of polynomials
- Return:** list
- Purpose:** computes the list of Chern classes of the product of two vector bundles in terms of their Chern classes
- Note:** Implementation of the formula of Lascoux, the Schur polynomials are computed using the second Jacobi-Trudi formula (in terms of the Chern classes)

Example:

```
LIB "chern.lib";
// The Chern classes of the tensor product of a vector bundle of rank 3
// with Chern classes c(1), c(2), c(3) and a vector bundle of rank 1 with
```

```

// Chern class C(1)
ring r = 0, ( c(1..3), C(1)), dp;
list c=c(1..3);
list C=C(1);
print( chProdL(3,c,1,C) );
↳ [1]:
↳   c(1)+3*C(1)
↳ [2]:
↳   2*c(1)*C(1)+3*C(1)^2+c(2)
↳ [3]:
↳   c(1)*C(1)^2+C(1)^3+c(2)*C(1)+c(3)

```

D.15.3.21 chProdLP

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `chProdLP(r, c, R, C)`; r, R integers; c, C lists of polynomials

Return: polynomial

Purpose: computes the total Chern class of the product of two vector bundles in terms of their ranks and Chern classes

Note: Implementation of the formula of Lascoux, the Schur polynomials are computed using the second Jacobi-Trudi formula (in terms of the Chern classes)

Example:

```

LIB "chern.lib";
// The total Chern class of the tensor product of a vector bundle of rank 3
// with Chern classes c(1), c(2), c(3) and a vector bundle of rank 1 with
// Chern class C(1)
ring r = 0, ( c(1..3), C(1)), ws(1,2,3, 1);
list c=c(1..3);
list C=C(1);
print( chProdLP(3,c,1,C) );
↳ 1+c(1)+3*C(1)+c(2)+2*c(1)*C(1)+3*C(1)^2+c(3)+c(2)*C(1)+c(1)*C(1)^2+C(1)^3

```

D.15.3.22 chProdM

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `chProdM(r, c, R, C)`; r, R integers; c, C lists of polynomials

Return: list

Purpose: computes the list of Chern classes of the product of two vector bundles in terms of their Chern classes

Note: Implementation of the formula of Manivel

Example:

```

LIB "chern.lib";
// The Chern classes of the tensor product of a vector bundle of rank 3
// with Chern classes c(1), c(2), c(3) and a vector bundle of rank 1 with
// Chern class C(1)
ring r = 0, ( c(1..3), C(1)), dp;
list c=c(1..3);

```

```

list C=C(1);
print( chProdM(3,c,1,C) );
↳ [1]:
↳ c(1)+3*C(1)
↳ [2]:
↳ 2*c(1)*C(1)+3*C(1)^2+c(2)
↳ [3]:
↳ c(1)*C(1)^2+C(1)^3+c(2)*C(1)+c(3)

```

D.15.3.23 chProdMP

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\]](#), page 1806).

Usage: `chProdMP(r, c, R, C)`; r, R integers; c, C lists of polynomials

Return: polynomial

Purpose: computes the total Chern class of the product of two vector bundles in terms of their ranks and Chern classes

Note: Implementation of the formula of Lascoux, the Schur polynomials are computed using the second Jacobi-Trudi formula (in terms of the Chern classes)

Example:

```

LIB "chern.lib";
// The total Chern class of the tensor product of a vector bundle of rank 3
// with Chern classes c(1), c(2), c(3) and a vector bundle of rank 1 with
// Chern class C(1)
ring r = 0, ( c(1..3), C(1) ), ws(1,2,3, 1);
list c=c(1..3);
list C=C(1);
print( chProdMP(3,c,1,C) );
↳ 1+c(1)+3*C(1)+c(2)+2*c(1)*C(1)+3*C(1)^2+c(3)+c(2)*C(1)+c(1)*C(1)^2+C(1)^3

```

D.15.3.24 ChernRootsHom

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\]](#), page 1806).

Usage: `ChernRootsHom(a, b)`; a, b lists of polynomials

Return: list of polynomials

Purpose: for a vector bundle E with Chern roots a and a vector bundle F with Chern roots b , computes the Chern roots of $\text{Hom}(E, F)$

Note:

Example:

```

LIB "chern.lib";
ring r=0, (a(1..2), b(1..3)), dp;
list l=a(1..2);
list L=b(1..3);
// Let E be a vector bundle with Chern roots a(1), a(2),
// let F be a vector bundle with Chern roots b(1), b(2), b(3).
// Then the Chern roots of Hom(E, F) are
print(ChernRootsHom(l, L));
↳ [1]:

```

```

↳ -a(1)+b(1)
↳ [2]:
↳ -a(1)+b(2)
↳ [3]:
↳ -a(1)+b(3)
↳ [4]:
↳ -a(2)+b(1)
↳ [5]:
↳ -a(2)+b(2)
↳ [6]:
↳ -a(2)+b(3)

```

D.15.3.25 chHom

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\]](#), page 1806).

Usage: `chHom(r, c, R, C [, N]);` `r, R` polynomials (integers); `c, C` lists of polynomials, `N` integer

Return: list of polynomials

Purpose: computes [up to degree `N`] the list of Chern classes of the vector bundle $\text{Hom}(E, F)$ in terms of the ranks and the Chern classes of E and F

Note:

Example:

```

LIB "chern.lib";
ring H = 0, ( r, R, c(1..3), C(1..2) ), dp;
list l=c(1..3);
list L=C(1..2);
// the Chern classes of Hom(E, F) for a vector bundle E of rank 3
// with Chern classes c(1), c(2), c(3)
// and a vector bundle F of rank 2 with Chern classes C(1) and C(2):
print( chHom(3, l, 2, L) );
↳ [1]:
↳ -2*c(1)+3*C(1)
↳ [2]:
↳ c(1)^2-5*c(1)*C(1)+3*C(1)^2+2*c(2)+3*C(2)
↳ [3]:
↳ 2*c(1)^2*C(1)-4*c(1)*C(1)^2+C(1)^3-2*c(1)*c(2)+4*c(2)*C(1)-4*c(1)*C(2)\
+6*C(1)*C(2)-2*c(3)
↳ [4]:
↳ c(1)^2*C(1)^2-c(1)*C(1)^3-3*c(1)*c(2)*C(1)+3*c(2)*C(1)^2+2*c(1)^2*C(2)\
-6*c(1)*C(1)*C(2)+3*C(1)^2*C(2)+c(2)^2+2*c(1)*c(3)-3*c(3)*C(1)+3*C(2)^2
↳ [5]:
↳ -c(1)*c(2)*C(1)^2+c(2)*C(1)^3+2*c(1)^2*C(1)*C(2)-2*c(1)*C(1)^2*C(2)+c(\
2)^2*C(1)+2*c(1)*c(3)*C(1)-3*c(3)*C(1)^2-2*c(1)*c(2)*C(2)-2*c(1)*C(2)^2+3*\
*c(1)*C(2)^2-2*c(2)*c(3)+6*c(3)*C(2)
↳ [6]:
↳ c(1)*c(3)*C(1)^2-c(3)*C(1)^3-c(1)*c(2)*C(1)*C(2)+c(2)*C(1)^2*C(2)+c(1)\
^2*C(2)^2-c(1)*C(1)*C(2)^2-c(2)*c(3)*C(1)+c(2)^2*C(2)-2*c(1)*c(3)*C(2)+3*\
c(3)*C(1)*C(2)-2*c(2)*C(2)^2+C(2)^3+c(3)^2
// the first two Chern classes of Hom(E, F) for a vector bundle E of rank r
// with Chern classes c(1) and c(2)
// and a vector bundle G of rank R with Chern classes C(1) and C(2)

```

```

// this gives the Chern classes of a tensor product on a complex surface
l=c(1..2);
L=C(1..2);
print( chHom(r, l, R, L, 2 ) );
↳ [1]:
↳   -R*c(1)+r*C(1)
↳ [2]:
↳   1/2*R^2*c(1)^2-r*R*c(1)*C(1)+1/2*r^2*C(1)^2-1/2*R*c(1)^2-1/2*r*C(1)^2+\
R*c(2)+c(1)*C(1)+r*C(2)

```

D.15.3.26 ChernRootsSymm

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: ChernRootsSymm(m, l); m integer, l a list of polynomials

Return: list of polynomials

Purpose: computes the Chern roots of m-th symmetric power of a vector bundle with Chern roots from l

Note:

Example:

```

LIB "chern.lib";
ring r=0, (a(1..3)), dp;
list l=a(1..3);
// the Chern roots of the second symmetric power of a vector bundle
// with Chern roots a(1), a(2), a(3)
print( ChernRootsSymm(2, l) );
↳ [1]:
↳   2*a(1)
↳ [2]:
↳   a(1)+a(2)
↳ [3]:
↳   a(1)+a(3)
↳ [4]:
↳   2*a(2)
↳ [5]:
↳   a(2)+a(3)
↳ [6]:
↳   2*a(3)

```

D.15.3.27 ChernRootsWedge

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: ChernRootsWedge(m, l); m integer, l a list of polynomials

Return: list of polynomials

Purpose: computes the Chern roots of m-th exterior power of a vector bundle with Chern roots from l

Note: makes sense only for list of polynomials

Example:

```

LIB "chern.lib";
ring r=0, (a(1..3)), dp;
list l=a(1..3);
// the Chern roots of the second exterior power of a vector bundle
// with Chern roots a(1), a(2), a(3)
print( ChernRootsWedge(2, l) );
⇒ [1]:
⇒ a(2)+a(3)
⇒ [2]:
⇒ a(1)+a(3)
⇒ [3]:
⇒ a(1)+a(2)

```

D.15.3.28 chSymm

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `chSymm(k, r, c[, pos]);` k, r integers, c list of polynomials, pos list of integers

Return: list with entries: int N , list of polynomials l

Purpose: computes the rank and the Chern classes of the symmetric power of a vector bundle

Note: for the second symmetric power `chSymm2L(...)` could be faster

Example:

```

LIB "chern.lib";
ring r=0, (c(1..5)), dp;
list l=c(1..5);
// the rank and the Chern classes of the second symmetric power of a vector bundle of rank 5
print( chSymm(2, 3, l) );
⇒ [1]:
⇒ 6
⇒ [2]:
⇒ [1]:
⇒ 4*c(1)
⇒ [2]:
⇒ -c(1)^2-c(2)
⇒ [3]:
⇒ -c(1)^3-11/2*c(1)*c(2)-7/2*c(3)
⇒ [4]:
⇒ -c(1)^2*c(2)-2/3*c(2)^2-7/3*c(1)*c(3)
⇒ [5]:
⇒ -c(1)*c(2)^2-2*c(1)^2*c(3)-c(2)*c(3)
⇒ [6]:
⇒ -c(1)*c(2)*c(3)+c(3)^2
// the rank and the first 3 Chern classes
// of the second symmetric power of a vector bundle of rank 5
print( chSymm(2, 5, 1, 1, 2, 3) );
⇒ [1]:
⇒ 15
⇒ [2]:
⇒ [1]:
⇒ 6*c(1)
⇒ [2]:

```

```

↳      -c(1)^2-1/2*c(2)
↳      [3]:
↳      -c(1)^3-31/16*c(1)*c(2)-9/16*c(3)

```

D.15.3.29 chSymm2L

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `chSymm2L(r, c)`; `r` integer, `c` list of polynomials

Return: list of polynomials

Purpose: computes the Chern classes of the second symmetric power of a vector bundle

Note: Implementation of the formula of Lascoux, the Schur polynomials are computed using the second Jacobi-Trudi formula (in terms of the Chern classes)

Example:

```

LIB "chern.lib";
ring r=0, (c(1..2)), dp;
list l=c(1..2);
// the Chern classes of the second symmetric power of a vector bundle of rank 2
print( chSymm2L(2, l));
↳ [1]:
↳      3
↳ [2]:
↳      [1]:
↳      3*c(1)
↳      [2]:
↳      2*c(1)^2+4*c(2)
↳ [3]:
↳      4*c(1)*c(2)

```

D.15.3.30 chSymm2LP

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `chSymm2LP(r, c)`; `r` integer, `c` list of polynomials

Return: poly

Purpose: computes the total Chern class of the second symmetric power of a vector bundle

Note: Implementation of the formula of Lascoux, the Schur polynomials are computed using the second Jacobi-Trudi formula (in terms of the Chern classes)

Example:

```

LIB "chern.lib";
ring r=0, (c(1..2)), ws(1, 2);
list l=c(1..2);
// the total Chern class of the second symmetric power of a vector bundle of rank 2
print( chSymm2LP(2, l));
↳ 1+3*c(1)+2*c(1)^2+4*c(2)+4*c(1)*c(2)

```

D.15.3.31 chWedge

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `chWedge(k, r, c [,pos]);` k, r integers, c list of polynomials, pos list of integers

Return: list with entries: int N , list of polynomials l

Purpose: computes the rank and the Chern classes of the exterior power of a vector bundle

Note: for the second exterior power `chWedge2L(...)` could be faster

Example:

```
LIB "chern.lib";
ring r=0, (c(1..5)), dp;
list l=c(1..5);
// the rank and the Chern classes of the second exterior power of a vector bundle of
print( chWedge(2, 3, l) );
↳ [1]:
↳ 3
↳ [2]:
↳ [1]:
↳ 2*c(1)
↳ [2]:
↳ c(1)^2+c(2)
↳ [3]:
↳ c(1)*c(2)-c(3)
// the rank and the first 3 Chern classes
// of the fourth exterior power of a vector bundle of rank 5
print( chWedge(4, 5, l, 1, 2, 3) );
↳ [1]:
↳ 5
↳ [2]:
↳ [1]:
↳ 4*c(1)
↳ [2]:
↳ 6*c(1)^2+c(2)
↳ [3]:
↳ 4*c(1)^3+3*c(1)*c(2)-c(3)
```

D.15.3.32 chWedge2L

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `chWedge2L(r, c);` r integer, c list of polynomials

Return: list of polynomials

Purpose: computes the Chern classes of the second exterior power of a vector bundle

Note: Implementation of the formula of Lascoux, the Schur polynomials are computed using the second Jacobi-Trudi formula (in terms of the Chern classes)

Example:

```
LIB "chern.lib";
ring r=0, (c(1..3)), dp;
list l=c(1..3);
// the Chern classes of the second exterior power of a vector bundle of rank 3
```

```

print(chWedge2L(3, 1));
↳ [1]:
↳ 3
↳ [2]:
↳ [1]:
↳ 2*c(1)
↳ [2]:
↳ c(1)^2+c(2)
↳ [3]:
↳ c(1)*c(2)-c(3)

```

D.15.3.33 chWedge2LP

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `chWedge2LP(r, c)`; r integer, c list of polynomials

Return: `poly`

Purpose: computes the total Chern class of the second exterior power of a vector bundle

Note: Implementation of the formula of Lascoux, the Schur polynomials are computed using the second Jacobi-Trudi formula (in terms of the Chern classes)

Example:

```

LIB "chern.lib";
ring r=0, (c(1..3)), ws(1,2,3);
list l=c(1..3);
// the total Chern class of the second exterior power of a vector bundle of rank 3
print(chWedge2LP(3, 1));
↳ 1+2*c(1)+c(1)^2+c(2)+c(1)*c(2)-c(3)

```

D.15.3.34 todd

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `todd(l [, n])`; l a list of polynomials, n integer

Return: list of polynomials

Purpose: computes [the first n] terms of the Todd class

Note: returns an empty list if l is empty

Example:

```

LIB "chern.lib";
// the terms of the Todd class up to degree 5
// in terms of the Chern classes c(1), c(2), c(3), c(4), c(5)
ring r=0, (c(1..5)), dp;
list l=c(1..5);
print( todd( l ) );
↳ [1]:
↳ 1/2*c(1)
↳ [2]:
↳ 1/12*c(1)^2+1/12*c(2)
↳ [3]:
↳ 1/24*c(1)*c(2)

```

```

⇒ [4]:
⇒ -1/720*c(1)^4+1/180*c(1)^2*c(2)+1/240*c(2)^2+1/720*c(1)*c(3)-1/720*c(4\
)
⇒ [5]:
⇒ -1/1440*c(1)^3*c(2)+1/480*c(1)*c(2)^2+1/1440*c(1)^2*c(3)-1/1440*c(1)*c\
(4)
// in the same situation compute only first two terms
print( todd(1, 2) );
⇒ [1]:
⇒ 1/2*c(1)
⇒ [2]:
⇒ 1/12*c(1)^2+1/12*c(2)
// compute the first 5 terms corresponding to the Chern classes c(1), c(2)
l=c(1..2);
print( todd(1, 5) );
⇒ [1]:
⇒ 1/2*c(1)
⇒ [2]:
⇒ 1/12*c(1)^2+1/12*c(2)
⇒ [3]:
⇒ 1/24*c(1)*c(2)
⇒ [4]:
⇒ -1/720*c(1)^4+1/180*c(1)^2*c(2)+1/240*c(2)^2
⇒ [5]:
⇒ -1/1440*c(1)^3*c(2)+1/480*c(1)*c(2)^2

```

D.15.3.35 toddE

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\]](#), page 1806).

Usage: `toddE(l)`; `l` a list of polynomials

Return: polynomial

Purpose: computes the highest relevant term of the Todd class

Note: returns an empty list if `l` is empty,
very inefficient because the elimination is used, included for comparison with `todd(c)`

Example:

```

LIB "chern.lib";
// first 3 terms of the Todd class in terms of the Chern classes c(1), c(2), c(3)
ring r=0, (c(1..3)), dp;
list l;
//first term
l=c(1);
print( toddE( l ) );
⇒ 1/2*c(1)
// second term
l=c(1..2);
print( toddE( l ) );
⇒ -c(1)^2-c(2)
// third term
l=c(1..3);
print( toddE( l ) );
⇒ -c(1)*c(2)

```

D.15.3.36 Bern

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `Bern(n)`; n non-negative integer

Return: list of numbers

Purpose: computes the list of (second) Bernoulli numbers from $B(0)$ to $B(n)$

Note: needs a base ring to be defined, returns an empty list if n is negative, uses the Akiyama-Tanigawa algorithm

Example:

```

LIB "chern.lib";
// first 10 Bernoulli numbers: B(0), ..., B(9)
ring r=0,(t), dp;
print( Bern(9) );
↳ [1]:
↳ 1
↳ [2]:
↳ 1/2
↳ [3]:
↳ 1/6
↳ [4]:
↳ 0
↳ [5]:
↳ -1/30
↳ [6]:
↳ 0
↳ [7]:
↳ 1/42
↳ [8]:
↳ 0
↳ [9]:
↳ -1/30
↳ [10]:
↳ 0

```

D.15.3.37 tdCf

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `tdCf(n)`; n integer

Return: list of rational numbers

Purpose: computes up to degree n the coefficients of the Todd class of a line bundle

Note:

Example:

```

LIB "chern.lib";
// first 5 coefficients
ring r=0,(t), dp;
print( tdCf(4) );
↳ [1]:
↳ 1

```

```

↳ [2] :
↳ 1/2
↳ [3] :
↳ 1/12
↳ [4] :
↳ 0
↳ [5] :
↳ -1/720

```

D.15.3.38 tdTerms

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `tdTerms(n, f)`; n integer, f polynomial

Return: list of polynomials

Purpose: computes the terms of the Todd class of the line bundle with the Chern root f

Note:

Example:

```

LIB "chern.lib";
ring r=0, (t), ls;;
// the terms of the Todd class of a line bundle with Chern root t up to degree 4
print( tdTerms(4, t) );
↳ [1] :
↳ 1
↳ [2] :
↳ 1/2t
↳ [3] :
↳ 1/12t2
↳ [4] :
↳ 0
↳ [5] :
↳ -1/720t4

```

D.15.3.39 tdFactor

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `tdFactor(n, a)`; n integer, a polynomial

Return: polynomial

Purpose: computes up to degree n the Todd class of the line bundle corresponding to the Chern root t

Note: returns 0 if n is negative

Example:

```

LIB "chern.lib";
// the Todd class up to degree 4
ring r=0,(t), ls;
print( tdFactor(4, t) );
↳ 1+1/2t+1/12t2-1/720t4

```

D.15.3.40 cProj

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `cProj(n)`; n integer

Return: list of integers

Purpose: computes the terms of positive degree of the total Chern class of the tangent bundle on the complex projective space

Note:

Example:

```

LIB "chern.lib";
ring r=0, (t), dp;
// the coefficients of the total Chern class of the complex projective line
print( cProj(1) );
↳ [1]:
↳ 2
// the coefficients of the total Chern class of the complex projective line
print( cProj(2) );
↳ [1]:
↳ 3
↳ [2]:
↳ 3
// the coefficients of the total Chern class of the complex projective line
print( cProj(3) );
↳ [1]:
↳ 4
↳ [2]:
↳ 6
↳ [3]:
↳ 4

```

D.15.3.41 chProj

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `chProj(n)`; n integer

Return: list of (rational) numbers

Purpose: computes the terms of the Chern character of the tangent bundle on the complex projective space

Note:

Example:

```

LIB "chern.lib";
ring r=0, (t), dp;
// the coefficients of the Chern character of the complex projective line
print( chProj(1) );
↳ [1]:
↳ 1
↳ [2]:
↳ 2
// the coefficients of the Chern character of the complex projective plane

```

```

print( chProj(2) );
↳ [1]:
↳ 2
↳ [2]:
↳ 3
↳ [3]:
↳ 3/2
// the coefficients of the Chern character of the complex 3-dimensional projective space
print( chProj(3) );
↳ [1]:
↳ 3
↳ [2]:
↳ 4
↳ [3]:
↳ 2
↳ [4]:
↳ 2/3

```

D.15.3.42 tdProj

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `tdProj(n)`; n integer

Return: list of (rational) numbers

Purpose: computes the terms of the Todd class
of the (tangent bundle of the) complex projective space

Note:

Example:

```

LIB "chern.lib";
ring r=0, (t), dp;
// the coefficients of the Todd class of the complex projective line
print( tdProj(1) );
↳ [1]:
↳ 1
↳ [2]:
↳ 1
// the coefficients of the Todd class of the complex projective line
print( tdProj(2) );
↳ [1]:
↳ 1
↳ [2]:
↳ 3/2
↳ [3]:
↳ 1
// the coefficients of the Todd class of the complex projective line
print( tdProj(3) );
↳ [1]:
↳ 1
↳ [2]:
↳ 2
↳ [3]:

```

```

⇒ 11/6
⇒ [4]:
⇒ 1

```

D.15.3.43 eulerChProj

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\]](#), page 1806).

Usage: `eulerChProj(n, r, c)`; n integer, r polynomial (or integer), c list of polynomials

Return: polynomial

Purpose: computes the Euler characteristic of a vector bundle on P_n in terms of its rank and Chern classes

Note:

Example:

```

LIB "chern.lib";
ring h=0, (r, c(1..3)), ws(0,1,2,3);
list l=c(1..3);
// the Euler characteristic of a vector bundle on the projective line
print( eulerChProj(1, r, l) );
⇒ r+c(1)
// the Euler characteristic of a vector bundle on the projective plane
print( eulerChProj(2, r, l) );
⇒ r+3/2*c(1)+1/2*c(1)^2-c(2)
// the Euler characteristic of a vector bundle on P_3
print( eulerChProj(3, r, l) );
⇒ r+11/6*c(1)+c(1)^2-2*c(2)+1/6*c(1)^3-1/2*c(1)*c(2)+1/2*c(3)
// assume now that we have a bundle framed at a subplane of P_3
// this implies c(1)=c(2)=0
l= 0, 0, c(3);
// the Euler characteristic is
print( eulerChProj(3, r, l) );
⇒ r+1/2*c(3)
// which implies that c(3) must be even in this case

```

D.15.3.44 chNumbersProj

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\]](#), page 1806).

Usage: `chNumbersProj(n)`; n integer

Return: list of integers

Purpose: computes the Chern numbers of the projective space P_n

Note:

Example:

```

LIB "chern.lib";
ring h=0, (t), dp;
// The Chern numbers of the projective plane P_2:
print( chNumbersProj(2) );
⇒ [1]:
⇒ 9

```

```

↳ [2]:
↳ 3
// The Chern numbers of P_3:
print( chNumbersProj(3) );
↳ [1]:
↳ 64
↳ [2]:
↳ 24
↳ [3]:
↳ 4

```

D.15.3.45 classpoly

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `classpoly(l, t)`; `l` list of polynomials, `t` polynomial

Return: polynomial

Purpose: computes the polynomial in `t` with coefficients being the entries of `l`

Note:

Example:

```

LIB "chern.lib";
ring r=0, (c(1..5), t), ds;
list l=c(1..5);
// get the polynomial c(1)*t + c(2)*t^2 + ... + c(5)*t^5
print( classpoly(l, t) );
↳ c(1)*t+c(2)*t^2+c(3)*t^3+c(4)*t^4+c(5)*t^5

```

D.15.3.46 chernPoly

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `chernPoly(c, t)`; `c` list of polynomials, `t` polynomial

Return: polynomial

Purpose: computes the Chern polynomial in `t`

Note: does the same as `toddPoly(...)`

Example:

```

LIB "chern.lib";
ring r=0, (c(1..5), t), ds;
list l=c(1..5);
// get the Chern polynomial 1 + c(1)*t + c(2)*t^2 + ... + c(5)*t^5
print( chernPoly(l, t) );
↳ 1+c(1)*t+c(2)*t^2+c(3)*t^3+c(4)*t^4+c(5)*t^5

```

D.15.3.47 chernCharPoly

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `chernCharPoly(r, ch, t)`; `r` polynomial, `ch` list of polynomials, `t` polynomial

Return: polynomial

Purpose: computes the polynomial in t corresponding to the Chern character

Note:

Example:

```
LIB "chern.lib";
ring h=0, (r, ch(1..5), t), ds;
list l=ch(1..5);
// get the polynomial r + ch(1)*t + ch(2)*t^2 + ... + ch(5)*t^5
print( chernCharPoly(r, l, t) );
↪ r+ch(1)*t+ch(2)*t^2+ch(3)*t^3+ch(4)*t^4+ch(5)*t^5
```

D.15.3.48 toddPoly

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\]](#), page 1806).

Usage: `toddPoly(td, t)`; `td` list of polynomials, `t` polynomial

Return: polynomial

Purpose: computes the polynomial in t corresponding to the Todd class

Note: does the same as `chernPoly(...)`

Example:

```
LIB "chern.lib";
ring r=0, (td(1..5), c(1..5), t), ds;
list l=td(1..5);
// get the polynomial 1 + td(1)*t + td(2)*t^2 + ... + td(5)*t^5
print( toddPoly(l, t) );
↪ 1+td(1)*t+td(2)*t^2+td(3)*t^3+td(4)*t^4+td(5)*t^5
```

D.15.3.49 rHRR

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\]](#), page 1806).

Usage: `rHRR(N, ch, td)`; `N` integer, `ch`, `td` lists of polynomials

Return: polynomial

Purpose: computes the the main ingredient of the right-hand side of the Hirzebruch-Riemann-Roch formula

Note: in order to get the right-hand side of the HRR formula
one needs to be able to compute the degree of the output of this procedure

Example:

```
LIB "chern.lib";
ring r=0, (td(0..3), ch(0..3)), dp;
// Let ch(0), ch(1), ch(2), ch(3) be the terms of the Chern character
// of a vector bundle E on a 3-fold X.
list c = ch(0..3);
// Let td(0), td(1), td(2), td(3) be the terms of the Todd class of X.
list t = td(0..3);
// Then the highest term of the product ch(E).td(X) is:
print( rHRR(3, c, t) );
↪ td(3)*ch(0)+td(2)*ch(1)+td(1)*ch(2)+td(0)*ch(3)
```

D.15.3.50 SchurS

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `SchurS(I, S)`; I list of integers representing a partition, S list of polynomials

Return: poly

Purpose: computes the Schur polynomial in the Segre classes S (of the dual vector bundle), i.e., in the complete homogeneous symmetric polynomials, with respect to the partition I

Note: if S are the Segre classes of the tautological bundle on a grassmanian, this gives the cohomology class of a Schubert cycle

Example:

```
LIB "chern.lib";
// The Schur polynomial corresponding to the partition 1,2,4
// and the Segre classes 1, s(1), s(2),..., s(6)
ring r=0,(s(1..6)), dp;
list I=1,2,4;
list S=s(1..6);
print( SchurS(I, S) );
↪ s(1)*s(2)*s(4)-s(1)^2*s(5)-s(3)*s(4)+s(1)*s(6)
// compare this with the Schur polynomial computed using Chern classes
list C=chDual(chern(S));
print( SchurCh(I, C) );
↪ s(1)*s(2)*s(4)-s(1)^2*s(5)-s(3)*s(4)+s(1)*s(6)
```

D.15.3.51 SchurCh

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `SchurCh(I, C)`; I list of integers representing a partition, C list of polynomials

Return: poly

Purpose: computes the Schur polynomial in the Chern classes C, i.e., in the elementary symmetric polynomials, with respect to the partition I

Note: if C are the Chern classes of the tautological bundle on a grassmanian, this gives the cohomology class of a Schubert cycle

Example:

```
LIB "chern.lib";
// The Schur polynomial corresponding to the partition 1,2,4
// and the Chern classes c(1), c(2), c(3)
ring r=0,(c(1..3)), dp;
list I=1,2,4;
list C=c(1..3);
print( SchurCh(I, C) );
↪ c(1)^2*c(2)*c(3)-c(2)^2*c(3)-c(1)*c(3)^2
// Compare this with the Schur polynomial computed using Segre classes
list S=segre( chDual( list(c(1..3)) ), 6 );
print(SchurS(I,S));
↪ c(1)^2*c(2)*c(3)-c(2)^2*c(3)-c(1)*c(3)^2
```

D.15.3.52 part

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `part(m, n);` m positive integer, n non-negative integer

Return: list of lists

Purpose: computes all partitions of integers not exceeding n into m non-negative summands

Note: if n is negative or m is non-positive, the list with one empty entry is returned

Example:

```
LIB "chern.lib";
// partitions into 3 summands of numbers not exceeding 1
print( part(3, 1) );
⇒ [1]:
⇒ [1]:
⇒ 0
⇒ [2]:
⇒ 0
⇒ [3]:
⇒ 0
⇒ [2]:
⇒ [1]:
⇒ 0
⇒ [2]:
⇒ 0
⇒ [3]:
⇒ 1
⇒ [3]:
⇒ [1]:
⇒ 0
⇒ [2]:
⇒ 1
⇒ [3]:
⇒ 1
⇒ [4]:
⇒ [1]:
⇒ 1
⇒ [2]:
⇒ 1
⇒ [3]:
⇒ 1
```

D.15.3.53 dualPart

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `dualPart(I [,N]);` I list of integers, N integer

Return: list of integers

Purpose: computes the partition dual (conjugate) to I

Note: the result is extended by zeroes to length N if an optional integer parameter N is given and the length of the computed dual partition is smaller than N

Example:

```
LIB "chern.lib";
// dual partition to (1, 3, 4):
list I = 1, 3, 4;
print( dualPart(I) );
⇒ [1]:
⇒ 1
⇒ [2]:
⇒ 2
⇒ [3]:
⇒ 2
⇒ [4]:
⇒ 3
```

D.15.3.54 PartC

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `PartC(I, m)`; I list of integers, m integer

Return: list of integers

Purpose: computes the complement of a partition with respect to m

Note: returns the zero partition if the maximal element of the partition is smaller than m

Example:

```
LIB "chern.lib";
// Complement of the partition (1, 3, 4) with respect to 5
list I = 1, 3, 4;
print( PartC(I, 5) );
⇒ [1]:
⇒ 1
⇒ [2]:
⇒ 2
⇒ [3]:
⇒ 4
```

D.15.3.55 partOver

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `partOver(n, J)`; n integer, J list of integers (partition)

Return: list of lists

Purpose: computes the partitions over a given one with summands not exceeding n

Note:

Example:

```
LIB "chern.lib";
// Partitions over the partition (3, 3, 4) with summands not exceeding 4
list I = 3, 3, 4;
print( partOver(4, I) );
⇒ [1]:
⇒ [1]:
```

```

↳      3
↳     [2]:
↳      3
↳     [3]:
↳      4
↳    [2]:
↳     [1]:
↳      3
↳     [2]:
↳      4
↳     [3]:
↳      4
↳    [3]:
↳     [1]:
↳      4
↳     [2]:
↳      4
↳     [3]:
↳      4

```

D.15.3.56 partUnder

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: `partUnder(J)`; J list of integers (partition)

Return: list of lists

Purpose: computes the partitions under a given one

Note:

Example:

```

LIB "chern.lib";
// Partitions under the partition (0, 1, 1)
list I = 0, 1, 1;
print( partUnder(I) );
↳ [1]:
↳  [1]:
↳   0
↳  [2]:
↳   0
↳  [3]:
↳   0
↳ [2]:
↳  [1]:
↳   0
↳  [2]:
↳   0
↳  [3]:
↳   1
↳ [3]:
↳  [1]:
↳   0
↳  [2]:

```

```

↳      1
↳      [3]:
↳      1

```

D.15.3.57 SegreA

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: SegreA(I); I an ideal

Return: list of integers

Purpose: computes the Segre classes of the subscheme defined by I

Note:

Example:

```

LIB "chern.lib";
// Consider a 3-dimensional projective space
ring r = 0, (x, y, z, w), dp;
// Consider 3 non-coplanar lines trough one point and compute the Segre class
ideal I=xy, xz, yz;
I;
↳ I[1]=xy
↳ I[2]=xz
↳ I[3]=yz
SegreA(I);
↳ [1]:
↳ 0
↳ [2]:
↳ 0
↳ [3]:
↳ 3
↳ [4]:
↳ -10
// Now consider 3 coplanar lines trough one point and its Segre class
ideal J=w, x*y*(x+y);
J;
↳ J[1]=w
↳ J[2]=x2y+xy2
SegreA(J);
↳ [1]:
↳ 0
↳ [2]:
↳ 0
↳ [3]:
↳ 3
↳ [4]:
↳ -12

```

D.15.3.58 FultonA

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\], page 1806](#)).

Usage: FultonA(I); I an ideal

Return: list of integers

Purpose: computes the Fulton classes of the subscheme defined by I

Note:

Example:

```
LIB "chern.lib";
// Consider a 3-dimensional projective space
ring r = 0, (x, y, z, w), dp;
// Consider 3 non-coplanar lines trough one point and compute the Fulton class
ideal I=xy, xz, yz;
I;
↪ I[1]=xy
↪ I[2]=xz
↪ I[3]=yz
FultonA(I);
↪ [1]:
↪ 0
↪ [2]:
↪ 0
↪ [3]:
↪ 3
↪ [4]:
↪ 2
// Now consider 3 coplanar lines trough one point and its Fulton class
ideal J=w, x*y*(x+y);
J;
↪ J[1]=w
↪ J[2]=x2y+xy2
FultonA(J);
↪ [1]:
↪ 0
↪ [2]:
↪ 0
↪ [3]:
↪ 3
↪ [4]:
↪ 0
```

D.15.3.59 CSMA

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\]](#), page 1806).

Usage: CSMA(I); I an ideal

Return: list of integers

Purpose: computes the Chern-Schwartz-MacPherson classes of the variety defined by I

Note:

Example:

```
LIB "chern.lib";
// consider the projective plane with homogeneous coordinates x, y, z
ring r = 0, (x, y, z), dp;
// the Chern-Schwartz-MacPherson class of a smooth cubic:
ideal I=x3+y3+z3;
```

```

I;
↳ I[1]=x3+y3+z3
CSMA(I);
↳ [1]:
↳ 0
↳ [2]:
↳ 3
↳ [3]:
↳ 0
// the Chern-Schwartz-MacPherson class of singular cubic
// that is a union of 3 non-collinear lines:
ideal J=x*y*z;
J;
↳ J[1]=xyz
CSMA(J);
↳ [1]:
↳ 0
↳ [2]:
↳ 3
↳ [3]:
↳ 3
// the Chern-Schwartz-MacPherson class of singular cubic
// that is a union of 3 lines passing through one point
ideal K=x*y*(x+y);
K;
↳ K[1]=x2y+xy2
CSMA(K);
↳ [1]:
↳ 0
↳ [2]:
↳ 3
↳ [3]:
↳ 4

```

D.15.3.60 EulerAff

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\]](#), page 1806).

Usage: EulerAff(I); I an ideal

Return: integer

Purpose: computes the Euler characteristic of the affine variety defined by I

Note:

Example:

```

LIB "chern.lib";
ring r = 0, (x, y), dp;
// compute the Euler characteristic of the affine elliptic curve y^2=x^3+x+1;
ideal I=y2-x3-x-1;
EulerAff(I);
↳ 3

```

D.15.3.61 EulerProj

Procedure from library `chern.lib` (see [Section D.15.3 \[chern.lib\]](#), page 1806).

Usage: EulerProj(I); I an ideal

Return: integer

Purpose: computes the highest degree term of the Chern-Schwartz-MacPherson class of the variety defined by I, which equals the Euler characteristic

Note: uses CSMA(...)

Example:

```
LIB "chern.lib";
// consider the projective plane with homogeneous coordinates x, y, z
ring r = 0, (x, y, z), dp;
// Euler characteristic of a smooth cubic:
ideal I=x3+y3+z3;
I;
↳ I[1]=x3+y3+z3
EulerProj(I);
↳ 3
// Euler characteristic of 3 non-collinear lines:
ideal J=x*y*z;
J;
↳ J[1]=xyz
EulerProj(J);
↳ 3
// Euler characteristic of 3 lines passing through one point
ideal K=x*y*(x+y);
K;
↳ K[1]=x2y+xy2
EulerProj(K);
↳ 3
```

D.15.4 cimonom_lib

Library: cimonom.lib

Purpose: Determines if the toric ideal of an affine monomial curve is a complete intersection

Authors: I.Bermejo, ibermejo@ull.es
I.Garcia-Marco, iggarcia@ull.es
J.-J.Salazar-Gonzalez, jjsalaza@ull.es

Overview: A library for determining if the toric ideal of an affine monomial curve is a complete intersection with NO NEED of computing explicitly a system of generators of such ideal. It also contains procedures to obtain the minimum positive multiple of an integer which is in a semigroup of positive integers. The procedures are based on a paper by Isabel Bermejo, Ignacio Garcia and Juan Jose Salazar-Gonzalez: 'An algorithm to check whether the toric ideal of an affine monomial curve is a complete intersection', Preprint.

Procedures: See also: [Section C.6.4 \[Integer programming\]](#), page 711.

D.15.4.1 `BelongSemig`

Procedure from library `cimonom.lib` (see [Section D.15.4 \[cimonom.lib\], page 1842](#)).

Usage: `BelongSemig (n,v[,sup]);` n bigint, v and sup intvec

Return: In the default form, it returns 1 if n is in the semigroup generated by the elements of v or 0 otherwise. If the argument sup is added and in case n belongs to the semigroup generated by the elements of v , it returns a monomial in the variables $\{x(i) \mid i \text{ in } sup\}$ of degree n if we set $\deg(x(sup[j])) = v[j]$.

Assume: v and sup positive integer vectors of same size, sup has no repeated entries, $x(i)$ has to be an indeterminate in the current ring for all i in sup .

Example:

```
LIB "cimonom.lib";
ring r=0,x(1..5),dp;
int a = 125;
intvec v = 13,17,51;
intvec sup = 2,4,1;
BelongSemig(a,v,sup);
↪ x(2)^7*x(4)^2
BelongSemig(a,v);
↪ 1
```

D.15.4.2 `MinMult`

Procedure from library `cimonom.lib` (see [Section D.15.4 \[cimonom.lib\], page 1842](#)).

Usage: `MinMult (a, b);` a integer, b integer vector.

Return: an integer k , the minimum positive integer such that ka belongs to the semigroup generated by the integers in b .

Assume: a is a positive integer, b is a positive integers vector.

Example:

```
LIB "cimonom.lib";
"int a = 46;";
↪ int a = 46;
"intvec b = 13,17,59;";
↪ intvec b = 13,17,59;
"MinMult(a,b);";
↪ MinMult(a,b);
int a = 46;
intvec b = 13,17,59;
MinMult(a,b);
↪ 3
"// 3*a = 8*b[1] + 2*b[2]"
```

D.15.4.3 `CompInt`

Procedure from library `cimonom.lib` (see [Section D.15.4 \[cimonom.lib\], page 1842](#)).

Usage: `CompInt(d);` d intvec.

Return: 1 if the toric ideal $I(d)$ is a complete intersection or 0 otherwise.

Assume: d is a vector of positive integers.

Note: If `printlevel > 0`, additional info is displayed in case $I(d)$ is a complete intersection: if `printlevel \geq 1`, it displays a minimal set of generators of the toric ideal formed by quasihomogeneous binomials. Moreover, if `printlevel \geq 2` and $\gcd(d) = 1$, it also shows the Frobenius number of the semigroup generated by the elements in d .

Example:

```
LIB "cimonom.lib";
printlevel = 0;
intvec d = 14,15,10,21;
CompInt(d);
 $\mapsto$  1
printlevel = 3;
d = 36,54,125,150,225;
CompInt(d);
 $\mapsto$  // Toric ideal:
 $\mapsto$  id[1]=-x(1)^3+x(2)^2
 $\mapsto$  id[2]=-x(4)^3+x(5)^2
 $\mapsto$  id[3]=-x(3)^3+x(4)*x(5)
 $\mapsto$  id[4]=-x(1)^11*x(2)+x(4)^3
 $\mapsto$  // Frobenius number of the numerical semigroup:
 $\mapsto$  793
 $\mapsto$  1
d = 45,70,75,98,147;
CompInt(d);
 $\mapsto$  0
```

D.15.5 classify2_lib

Library: classify2.lib

Purpose: Classification of isolated singularities

Authors: Janko Boehm, email: boehm@mathematik.uni-kl.de
Magdaleen Marais, email: magdaleen.marais@up.ac.za
Gerhard Pfister, email: pfister@mathematik.uni-kl.de

Overview: We classify isolated singularities of corank ≤ 2 and modality ≤ 2 with respect to right-equivalence over the complex numbers according to Arnold's list. We determine the type and, for positive modality, the parameter.

V.I. Arnold has described normal forms and has developed a classifier for, in particular, all isolated hypersurface singularities over the complex numbers up to modality 2. Building on a series of 105 theorems, this classifier determines the type of the given singularity. However, for positive modality, this does not fix the right equivalence class of the singularity, since the values of the moduli parameters are not specified.

This library implements an alternative classification algorithm for isolated hypersurface singularities of corank and modality up to two. For a singularity given by a polynomial over the rationals, the algorithm determines its right equivalence class by specifying a polynomial representative in Arnold's list of normal forms. In particular, the algorithm also determines values for the moduli parameters.

The implementation is based on the paper

Janko Boehm, Magdaleen Marais, Gerhard Pfister: A Classification Algorithm for Complex Singularities of Corank and Modality up to Two, Singularities and Computer Algebra - Festschrift for Gert-Martin Greuel on the Occasion of his 70th Birthday, Springer 2017, <http://arxiv.org/abs/1604.04774>, https://doi.org/10.1007/978-3-319-28829-1_2

There are functions for determining a normal form equation and for determining the complex type of the singularity.

Procedures: See also: [Section D.6.3 \[classify_lib\], page 1262](#); [Section D.15.31 \[realclassify_lib\], page 2199](#).

D.15.5.1 complexClassify

Procedure from library `classify2.lib` (see [Section D.15.5 \[classify2_lib\], page 1844](#)).

Usage: `complexClassify(f)`; `fl` Poly

Assume: `fl` is a bivariate polynomial defining a curve singularity at (0,0) of modality ≤ 2 and corank ≤ 2 . The ordering of the basering must be local.

Return: A normal form equation `g` for `fl` represented by an element of type `NormalFormEquation`.

Note: So far the final scaling step is not implemented, so to obtain a normal form equation it may be necessary to do a transformation of the form $x \rightarrow \lambda_1 x$, $y \rightarrow \lambda_2 y$

Note: Case X9 is not implemented yet. In this case an error is returned stating that it is case X9.

`g.normalFormEquation.in` stores the polynomial ring containing the normal form equation.

`g.normalFormEquation.value` is the normal form equation.

To access the normal form equation as a polynomial do:

```
def S = g.normalFormEquation.in;
setring S;
poly nf = g.normalFormEquation.value;
```

Example:

```
LIB "classify2.lib";
ring R = 0, (x,y), ds;
Poly f = -16065*y^9*x-5103*y^9-128*x^7-595*y^9*x^4+6*y^5-21*y^9*x^5-2187*y^7+4*x^2*y;
NormalFormEquation F = complexClassify(f);
```

```

F;
↳ Corank = 2
↳ Normalform equation of type = Y[8,7]
↳ Normalform equation = x2y2-y7+x8
↳ Milnor number = 16
↳ Modality = 1
↳ Parameter term = x2y2
↳ Determinacy <= 8
↳
def S = F.normalFormEquation.in;
setring S;
poly nf = F.normalFormEquation.value;

```

D.15.5.2 complexType

Procedure from library `classify2.lib` (see [Section D.15.5 \[classify2_lib\]](#), page 1844).

Usage: `complexType(fl); fl Poly`

Assume: `fl` is a bivariate polynomial defining a curve singularity at $(0,0)$ of modality and corank ≤ 2 . The ordering of the basering must be local.

Return: A list with the complex type of `fl` and the modality.

Example:

```

LIB "classify2.lib";
ring R = 0, (x,y), ds;
Poly f = -16065*y^9*x-5103*y^9-128*x^7-595*y^9*x^4+6*y^5-21*y^9*x^5-2187*y^7+4*x^2*y;
complexType(f);

D.15.6 classify_aeq_lib

Library: `classifyAeq.lib`

Purpose: Simple Space Curve singularities in characteristic 0

Authors: Faira Kanwal Janjua fairakanwaljanjua@gmail.com
 Gerhard Pfister pfister@mathematik.uni-kl.de Khawar Mehmood
 khawar1073@gmail.com NEU

Overview: A library for classifying the simple singularities with respect to A equivalence in characteristic 0. Simple Surface singularities in characteristic 0 have been classified by Bruce and Gaffney [4] resp. Gibson and Hobbs [1] with respect to A equivalence. If the input is one of the simple singularities in [1] it returns a normal form otherwise a zero ideal (i.e not simple).

Procedures:**D.15.6.1 sagbiAlg**

Procedure from library `classify_aeq.lib` (see [Section D.15.6 \[classify_aeq.lib\], page 1846](#)).

Return: An ideal.The sagbi bases of I.

Example:

```
LIB "classify_aeq.lib";
ring R=0,t,ds;
ideal I=t8,t10+t13,t12+t15;
sagbiAlg(I);
↳ _[1]=t8
↳ _[2]=t10+t13
↳ _[3]=t12+t15
↳ _[4]=t23-t29
↳ _[5]=t27
I=t8,t10+t13,t12+2t15;
sagbiAlg(I);
↳ _[1]=t8
↳ _[2]=t10+t13
↳ _[3]=t12+2t15
↳ _[4]=t27-3t33
↳ _[5]=t29
```

D.15.6.2 sagbiMod

Procedure from library `classify_aeq.lib` (see [Section D.15.6 \[classify_aeq.lib\], page 1846](#)).

Return: An ideal. the sagbi bases for the differential module.

Example:

```
LIB "classify_aeq.lib";
ring r=0,t,Ds;
ideal G=t8,t10+t13,t12+t15,t23-t29,t27;
ideal I=diff(G,t);
sagbiMod(I,G);
↳ _[1]=t7
↳ _[2]=t9+13/10t12
↳ _[3]=t11+5/4t14
↳ _[4]=t20
↳ _[5]=t22-29/23t28
↳ _[6]=t24
↳ _[7]=t26
↳ _[8]=t28
```

D.15.6.3 semiGroup

Procedure from library `classify_aeq.lib` (see [Section D.15.6 \[classify_aeq.lib\], page 1846](#)).

Return: list L; list with three entries associated to the algebra generated by the sagbi basis:
 generators of the semigroup
 the conductor
 the semigroup

Example:

```
LIB "classify_aeq.lib";
ring R=0,t,ds;
ideal I=t8,t10+t13,t12+t15,t23-t29,t27;
semiGroup(I);
↳ [1]:
↳ 8,10,12,23,27
↳ [2]:
↳ 30
↳ [3]:
↳ 0,8,10,12,16,18,20,22,23,24,26,27,28,30
I=t8,t10+t13,t12+2t15,t27-3t33,t29;
semiGroup(I);
↳ [1]:
↳ 8,10,12,27,29
↳ [2]:
↳ 34
↳ [3]:
↳ 0,8,10,12,16,18,20,22,24,26,27,28,29,30,32,34
```

D.15.6.4 semiMod

Procedure from library `classify_aeq.lib` (see [Section D.15.6 \[classify_aeq.lib\], page 1846](#)).

Return: list K;
 K[1]min generators of the semialgebra.
 K[2]conductor of the algebra.
 K[3]generators for the semialgebra.
 K[4]min generators of the module.
 K[5]conductor of the module.
 K[6]semigroup of the module.

Example:

```
LIB "classify_aeq.lib";
ring r=0,t,Ds;
ideal G=t4,t7+t10;
ideal I=diff(G,t);
ideal k=sagbiMod(I,G);
semiMod(k,G);
↳ [1]:
↳ 4,7
↳ [2]:
↳ 18
↳ [3]:
↳ 0,4,7,8,11,12,14,15,16,18
```

```

↳ [4] :
↳   3,6,16
↳ [5] :
↳   13
↳ [6] :
↳   3,6,7,10,11,13

```

D.15.6.5 planeCur

Procedure from library `classify_aeq.lib` (see [Section D.15.6 \[classify_aeq.lib\], page 1846](#)).

Return: An ideal. Ideal is one of the singularity in the list of Bruce and Gaffney [4]

Example:

```

LIB "classify_aeq.lib";
ring R=0,t,Ds;
ideal I=t4+4t5+6t6+8t7+13t8+12t9+10t10+12t11+6t12+4t13+4t14+t16,t7+7t8+22t9+51t10+11t11+1828t18+2011t19+2165t20+2163t21+1982t22+1806t23+1491t24+1141t25+889t26+588t27+379t28;
planeCur(I);
↳ // ** redefining K (          intvec q=4,7;list K;)
↳  _[1]=t4
↳  _[2]=t7+t9

```

D.15.6.6 spaceCur

Procedure from library `classify_aeq.lib` (see [Section D.15.6 \[classify_aeq.lib\], page 1846](#)).

Return: an ideal. Ideal is one of the singularity in the list of C.G.Gibson and C.A.Hobbs.

Example:

```

LIB "classify_aeq.lib";
ring R=0,t,Ds;
ideal I=t3+3t4+3t5+t6,t13+14t14+92t15+377t16+1079t17+2288t18+3718t19+4719t20+4719t21-18t22+18t23+18t24+18t25+18t26+18t27+18t28;
spaceCur(I);
↳  _[1]=t3
↳  _[2]=t13+t14

```

D.15.6.7 HHnormalForm

Procedure from library `classify_aeq.lib` (see [Section D.15.6 \[classify_aeq.lib\], page 1846](#)).

Usage: HHnormalForm(I), I= $\langle x(t), y(t) \rangle$ an ideal, # optional, a bound for the conductor

Compute: computes the Hefez-Hernandez normal form of the ideal I= $\langle x(t), y(t) \rangle$

Return: a list L with 5 entries

L[1] the Hefei-Hernandez normal form of the ideal I= $\langle x(t), y(t) \rangle$ L[2] the semi group Gamma

L[3] the semi module Lambda

L[4] 0 if Lambda=Gamma or lambda= $\min(\text{Lambda}-\text{Gamma})$ -n, the Zariski number

L[5] the integers i, $i > \text{lambda}$, $i+n$ not in Lambda, 0 if this set is empty

Example:

```

LIB "classify_aeq.lib";
ring r=0,t,Ds;
ideal I=t6+3t7,t8+t13+t19;

```

```

HHnormalForm(I);
↳ [1]:
↳   _[1]=t6
↳   _[2]=t8-4t9+425/6t11-823/32t13
↳ [2]:
↳   0,6,8,12,14,16,18,20,22,24,25,26,28,30,31,32,33,34,36
↳ [3]:
↳   0,6,8,12,14,15,16,18,20
↳ [4]:
↳   9
↳ [5]:
↳   11,13

```

D.15.6.8 modSagbiAlg

Procedure from library `classify_aeq.lib` (see [Section D.15.6 \[classify_aeq_lib\]](#), page 1846).

Usage: `modSagbiAlg(I,i)`; I is an ideal, i an integer (optional).

Return: ideal, a sagbi basis for I using modular methods.

Purpose: Computes a sagbi basis for the ideal given by the generators in I using modular techniques.

If second argument is 0 then the result is not verified.

Example:

```

LIB "classify_aeq.lib";
ring R=0,t,ds;
ideal I=t8,t10+t13,t12+t15;
modSagbiAlg(I,0);
↳ _[1]=t8
↳ _[2]=t10+t13
↳ _[3]=t12+t15
↳ _[4]=t23-t29
↳ _[5]=t27
modSagbiAlg(I);
↳ _[1]=t8
↳ _[2]=t10+t13
↳ _[3]=t12+t15
↳ _[4]=t23-t29
↳ _[5]=t27

```

D.15.7 classifyMapGerms_lib

Library: `classifyMapGerms.lib`

Authors: Gerhard Pfister, pfister@mathematik.uni-kl.de
 Deeba Afzal, deebafzal@gmail.com
 Shamsa Kanwal, lotus_zone16@yahoo.com

Overview: A library for computing the standard basis of the tangent space at the orbit of an algebraic group action. The tangent space is usually described as the sum of two modules over different rings. It computes the standard basis using modular methods and parallel modular methods. It also computes the normal form of the germ given by Riegers classification.

- [4] Rieger, J. H.: Families of maps from the plane to the plane. J. London Math. Soc. (2) 36(1987), no. 2. 351-369.

Procedures:**D.15.7.1 coDimMap**

Procedure from library `classifyMapGerms.lib` (see [Section D.15.7 \[classifyMapGerms.lib\]](#), [page 1850](#)).

Usage: `coDimMap(I, #)`; I =ideal, $\#$ =list

Compute: a bound of the A-determinacy of the map germ defined by I .

Return: a list in which 1st entry gives the bound of the A-determinacy and the second entry gives the codimension of the map germ defined by I .

Note: if $\#$ is empty it computes A^e -codimension(the extended codimension).

Example:

```
LIB "classifyMapGerms.lib";
ring R=0,(x,y),(c,ds);
poly f1=x;
poly f2=xy+y5+y7;
poly f11=f1+f2*f1;
poly f22=f2+f1^2;
map phi=basing,x+y,y+y2;
f1=phi(f11);
f2=phi(f22);
ideal I=f1,f2;
coDimMap(I);
↳ [1]:
↳ 14
↳ [2]:
↳ 2
coDimMap(I,1);
↳ [1]:
↳ 15
↳ [2]:
↳ 4
```

D.15.7.2 coDim

Procedure from library `classifyMapGerms.lib` (see [Section D.15.7 \[classifyMapGerms.lib\]](#), [page 1850](#)).

Usage: `coDim(module M, module N, ideal I, int bound, list #)`; M is a submodule in A^r over the basering $=:A$, N is a submodule in R^r over the subring R of the basering generated by the entries of I

Compute: computes the K -vectorspace dimension of $A^r/M+N+\text{maxideal}(\text{bound}) * A^r$

Return: an integer

Note: if $\#$ is not empty the bound is corrected by computing determinacy

Example:

```
LIB "classifyMapGerms.lib";
ring R=0,(x,y),(c,ds);
poly f1=x;
poly f2=xy+y5+y7;
poly f11=f1+f2*f1;
poly f22=f2+f1^2;
map phi=basing,x+y,y+y2;
f1=phi(f11);
f2=phi(f22);
ideal I=f1,f2;
module M=maxideal(1)*jacob(I);
module N=I*freemodule(2);
coDim(M,N,I,15);
↪ 6
```

D.15.7.3 vStd

Procedure from library `classifyMapGerms.lib` (see [Section D.15.7 \[classifyMapGerms.lib\]](#), page 1850).

Usage: `vStd(M, N, I, bound)`; M is a submodule in A^r over the basering $=:A$, N is a submodule in R^r over the subring R of the basering generated by the entries of I

Compute: a standard basis of $M+N+\text{maxideal}(\text{bound}) * A^r$

Return: a list whose first entry gives a list where each entry is a generator of standard basis and second entry gives a list of generators after the reduced echelon form

Example:

```
LIB "classifyMapGerms.lib";
ring R=0,(x,y),(c,ds);
poly f1=x;
poly f2=xy+y5+y7;
poly f11=f1+f2*f1;
poly f22=f2+f1^2;
map phi=basing,x+y,y+y2;
f1=phi(f11);
f2=phi(f22);
ideal I=f1,f2;
module M=maxideal(1)*jacob(I);
module N=I*freemodule(2);
vStd(M,N,I,15);

D.15.7.4 modVStd

Procedure from library `classifyMapGerms.lib` (see [Section D.15.7 \[classifyMapGerms.lib\]](#), page 1850).

Usage: `modVStd((M, N, I, bound, #);` M is a submodule in A^r over the basering $=:A$, N is a submodule in R^r over the subring R of the basering generated by the entries of I

Compute: a standard basis of $A^r/M+N+\text{maxideal}(\text{bound}) \cdot A^r$ using modular version

Return: a list whose first entry gives a list where each entry is a generator of standard basis and second entry gives a list of generators after the reduced echelon form

Note: if $\#$ is not empty the bound is corrected by computing determinacy

Example:

```

LIB "classifyMapGerms.lib";
ring R=0,(x,y),(c,ds);
poly f1=x;
poly f2=xy+y5+y7;
poly f11=f1+f2*f1;
poly f22=f2+f1^2;
map phi=basing,x+y,y+y2;
f1=phi(f11);
f2=phi(f22);
ideal I=f1,f2;
module M=maxideal(1)*jacob(I);
module N=I*freemodule(2);
modVStd(M,N,I,15);

D.15.7.5 modVStd0

Procedure from library `classifyMapGerms.lib` (see [Section D.15.7 \[classifyMapGerms.lib\]](#), [page 1850](#)).

Usage: `modVStd0((M, N, I, bound, #);` M is a submodule in A^r over the basering $=:A$, N is a submodule in R^r over the subring R of the basering generated by the entries of I

Compute: a standard basis of $M+N+\text{maxideal}(\text{bound}) \cdot A^r$ using the parallel modular version

Return: a list whose `ist` entry gives a list where each entry is a generator of standard basis and second entry gives a list of generators after the reduced echelon form

Note: if `#` is not empty the bound is corrected by computing determinacy

Example:

```

LIB "classifyMapGerms.lib";
ring R=0,(x,y),(c,ds);
poly f1=x;
poly f2=xy+y5+y7;
poly f11=f1+f2*f1;
poly f22=f2+f1^2;
map phi=basing,x+y,y+y2;
f1=phi(f11);
f2=phi(f22);
ideal I=f1,f2;
module M=maxideal(1)*jacob(I);
module N=I*freemodule(2);
modVStd0(M,N,I,15);

D.15.7.6 classifySimpleMaps

Procedure from library `classifyMapGerms.lib` (see [Section D.15.7 \[classifyMapGerms.lib\]](#), [page 1850](#)).

Usage: `classifySimpleMaps(I)`; I=an ideal with 2 generators in a polynomial ring with 2 variables and local ordering defining a map germ C^2 to C^2

Compute: The normal form of the germ in Riegers classification if it is simple

Return: normal form of I, of type ideal

Note: If I is not simple it returns (0,0)

Example:

```

LIB "classifyMapGerms.lib";
ring R=0,(x,y),(c,ds);
poly f1=x;
poly f2=xy+y5+y7;
poly f11=f1+f2*f1;
poly f22=f2+f1^2;
map phi=basing,x+y,y+y2;
f1=phi(f11);
f2=phi(f22);
ideal I=f1,f2;
classifySimpleMaps(I);
↳  _[1]=x
↳  _[2]=xy+y5+y7

```

D.15.7.7 classifySimpleMaps1

Procedure from library `classifyMapGerms.lib` (see [Section D.15.7 \[classifyMapGerms.lib\]](#), [page 1850](#)).

Usage: `classifySimpleMaps1(I)`; I=an ideal with 2 generators in a polynomial ring with 2 variables and local ordering defining a map germ C^2 to C^2

Compute: The normal form of the germ in Riegers classification if it is simple

Return: normal form of I, of type ideal

Note: If I is not simple it returns (0,0)

Example:

```
LIB "classifyMapGerms.lib";
ring R=0,(x,y),(c,ds);
poly f1=x;
poly f2=xy+y5+y7;
poly f11=f1+f2*f1;
poly f22=f2+f1^2;
map phi=basing,x+y,y+y2;
f1=phi(f11);
f2=phi(f22);
ideal I=f1,f2;
classifySimpleMaps1(I);
↪ _[1]=x
↪ _[2]=xy+y5+y7
```

D.15.7.8 classifyUnimodalMaps

Procedure from library `classifyMapGerms.lib` (see [Section D.15.7 \[classifyMapGerms.lib\]](#), [page 1850](#)).

Usage: `classifyUnimodalMaps(I)`; I an ideal with 2 generators in a polynomial ring with 2 variables and local ordering defining a map germ C^2 to C^2

Compute: The normal form of the germ in Riegers classification if it is simple

Return: normal form of I, of type ideal

Note: If I is not unimodal it returns (0,0)

Example:

```
LIB "classifyMapGerms.lib";
ring R=0,(x,y),(c,ds);
poly f1=x;
poly f2=xy+y6+y9;
poly f11=f1+f2*f1;
poly f22=f2+f1^2;
map phi=basing,x+y,y+y2;
f1=phi(f11);
f2=phi(f22);
ideal I=f1,f2;
classifyUnimodalMaps(I);
↪ _[1]=x
↪ _[2]=xy+y6+y9
```

D.15.8 combinat.lib

Library: `combinat.lib`

Purpose: Some useful functions

Authors: J. Boehm, boehm @ mathematik.uni-kl.de

Overview: Some useful basic functions from combinatorics.

Procedures:

D.15.8.1 intersectLists

Procedure from library `combinat.lib` (see [Section D.15.8 \[combinat.lib\]](#), page 1869).

Usage: `intersectLists(L,M)`; L list, M list

Return: list, containing all elements of L which are elements of M

Theory: we require the elements of the lists to have a compare operator `==`.

Example:

```
LIB "combinat.lib";
intersectLists(list(1,1,2,2,3),list(2,3,3,4));
↳ [1]:
↳ 2
↳ [2]:
↳ 3
intersectLists(list(1,1,2,2,3),list(1,1,2,2,3));
↳ [1]:
↳ 1
↳ [2]:
↳ 2
↳ [3]:
↳ 3
```

D.15.8.2 sublists

Procedure from library `combinat.lib` (see [Section D.15.8 \[combinat.lib\]](#), page 1869).

Usage: `sublists(L)`; L list

Assume: L is a list

Return: list of all sublists of L.

Example:

```
LIB "combinat.lib";
list L = 1,2,3,4,5;
sublists(L);
↳ [1]:
↳ empty list
↳ [2]:
↳ [1]:
↳ 1
↳ [3]:
↳ [1]:
↳ 2
↳ [4]:
↳ [1]:
↳ 1
↳ [2]:
↳ 2

D.15.8.3 member

Procedure from library `combinat.lib` (see [Section D.15.8 \[combinat.lib\]](#), page 1869).

Usage: `member(e,L); e def, L list`

Return: 1 if e is an element of L , 0 otherwise

Theory: we require the elements involved to have a compare operator `==`.

Example:

```

LIB "combinat.lib";
member(1,list(1,4,5));
↳ 1

```

D.15.9 curveInv_lib

Library: `curveInv.lib`

Purpose: A library for computing invariants of curves

Author: Peter Chini, chini@rhrk.uni-kl.de

Overview: This library provides a collection of procedures for computing invariants of curve singularities. Invariants that can be computed are: - the delta invariant
- the multiplicity of the conductor: the length of $\text{Normalization}(\mathbb{R})/C$, where C denotes the conductor
- the Deligne number
- the colength of derivations along the normalization - the length of $\text{Der}(\text{Normalization}(\mathbb{R}/I)) / \mathbb{R}/I$

In addition, it is possible to compute the conductor of a ring $S = \mathbb{R}/I$, where \mathbb{R} is a (localized) polynomial ring.

Theory: Computing the Deligne number of curve singularities and an algorithmic framework for differential algebras in SINGULAR;
Chapter 5 - Master's Thesis of Peter Chini - August 2015

Procedures:**D.15.9.1 curveDeltaInv**

Procedure from library `curveInv.lib` (see [Section D.15.9 \[curveInv.lib\]](#), page 1874).

Usage: `curveDeltaInv(I)`; I ideal

Assume: I is a radical ideal, $\dim(R/I) = 1$

Return: the delta invariant of R/I

Note: - output -1 means: delta invariant is infinite
 - the optional parameter can be used if the normalization has already been computed.
 If a list L contains the output of the procedure `normal` (with options `prim`, `wd` and `usingif` if the ring has a mixed ordering), apply `curveDeltaInv(I,L)`

Example:

```
LIB "curveInv.lib";
ring R = 0,(x,y,z),ds;
////////////////////////////////////
// Finite delta invariant //
////////////////////////////////////
ideal I = x2y-y2z,x2-y2+z2;
curveDeltaInv(radical(I));
↳ 9
////////////////////////////////////
// Infinite delta invariant //
////////////////////////////////////
ideal J = xyz;
curveDeltaInv(radical(J));
↳ -1
```

See also: [Section D.15.9.2 \[curveConductorMult\]](#), page 1875; [Section D.15.9.3 \[curveDeligneNumber\]](#), page 1876.

D.15.9.2 curveConductorMult

Procedure from library `curveInv.lib` (see [Section D.15.9 \[curveInv.lib\]](#), page 1874).

Usage: `curveConductorMult(I)`; I ideal

Assume: I is a radical ideal, $\dim(R/I) = 1$

Return: the multiplicity of the conductor

Note: the optional parameter can be used if the normalization has already been computed.
 If a list L contains the output of the procedure `normal` (with options `prim`, `wd` and `usingif` if the ring has a mixed ordering), apply `curveConductorMult(I,L)`

Example:

```
LIB "curveInv.lib";
////////////////////////////////////
// Mutltiplicity of the conductor of curves //
////////////////////////////////////
ring R = 0,(x,y,z),ds;
// Example 1:
ideal I = x2-y4z,z3y2+xy2;
```

```

I = std(radical(I));
curveConductorMult(I);
↳ 23
// Example 2:
ideal I = x*(y+z)^3 - y^3, x^2y^2 + z^5;
↳ // ** redefining I (ideal I = x*(y+z)^3 - y^3, x^2y^2 + z^5;)
I = std(radical(I));
curveConductorMult(I);
↳ 19
kill R;
////////////////////////////////////
// Mutltiplicity of the conductor of Gorenstein curve //
////////////////////////////////////
ring R = 0,(x,y),ds;
ideal I = xy;
// In such a case, the conductor multiplicity c satisfies: c = 2*delta
// Delta invariant:
curveDeltaInv(I);
↳ 1
// Conductor Multiplicity:
curveConductorMult(I);
↳ 2

```

See also: [Section D.4.18.15 \[normalConductor\]](#), page 1030.

D.15.9.3 curveDeligneNumber

Procedure from library `curveInv.lib` (see [Section D.15.9 \[curveInv.lib\]](#), page 1874).

Usage: `curveDeligneNumber(I);` I ideal

Assume: I is a radical ideal, $\dim(R/I) = 1$

Return: the Deligne number of R/I

Remarks: The Deligne number e satisfies by definition: $e = 3\delta - m$. So the algorithm splits the computation into two parts: one part computes the delta invariant, the other part the colength of derivations m .

Note: the optional parameter can be used if the normalization has already been computed. If a list L contains the output of the procedure `normal` (with options `prim`, `wd` and `usingif` if the ring has a mixed ordering), apply `curveDeligneNumber(I,L)`

Example:

```

LIB "curveInv.lib";
////////////////////////////////////
// Deligne number of curves //
////////////////////////////////////
// Example 1:
ring R = 0,(x,y,z),ds;
ideal I = x^2-y^4z,z^3y^2+xy^2;
I = std(radical(I));
curveDeligneNumber(I);
↳ 30
// Example 2:
ring S = 0,(x,y),ds;

```

```

ideal I = (x+y)*(x2-y3);
curveDeligneNumber(I);
↳ 5
// Example 3:
ideal J = (x2-y3)*(x2+y2)*(x-y);
curveDeligneNumber(J);
↳ 15
// Let us also compute the milnor number of this complete intersection:
milnor(J);
↳ 17
// We see that the Milnor number is bigger than the Deligne number. Hence, this
// curve cannot be quasi homogeneous. This can also be verified by Saitos criterion:
reduce(J[1],std(jacob(J[1])));
↳ -1/5y6+19/50y7

```

See also: [Section D.15.9.4 \[curveColengthDerivations\]](#), page 1877; [Section D.15.9.1 \[curveDeltaInv\]](#), page 1875.

D.15.9.4 curveColengthDerivations

Procedure from library `curveInv.lib` (see [Section D.15.9 \[curveInv.lib\]](#), page 1874).

Usage: `curveColengthDerivations(I)`; I ideal

Assume: I is a radical ideal

Return: the colength of derivations of R/I

Remarks: The procedure goes through all branches and computes the colength of derivations there. Then the d-dimension of the minimal primes is computed. After that, everything is summed up.

Note: the optional parameter can be used if the normalization has already been computed. If a list L contains the output of the procedure `normal` (with options `prim`, `wd` and `usingif` if the ring has a mixed ordering), apply `curveColengthDerivations(I,L)`

Example:

```

LIB "curveInv.lib";
////////////////////////////////////
// colength of derivations of curves //
////////////////////////////////////
// Example 1:
ring R = 0,(x,y,z),ds;
ideal I = x2-y4z,z3y2+xy2;
I = std(radical(I));
curveColengthDerivations(I);
↳ 9
// Example 2:
ring S = 0,(x,y),ds;
ideal I = (x+y)*(x2-y3);
curveColengthDerivations(I);
↳ 4
// Example 3:
ideal J = (x2-y3)*(x2+y2)*(x-y);
curveColengthDerivations(J);
↳ 15

```

D.15.10 deRham_lib

Library: deRham.lib

Purpose: Computation of deRham cohomology

Authors: Cornelia Rottner, rottner@mathematik.uni-kl.de

Overview: A library for computing the de Rham cohomology of complements of complex affine varieties.

References:

- [OT] Oaku, T.; Takayama, N.: Algorithms of D-modules - restriction, tensor product, localization, and local cohomology groups}, J. Pure Appl. Algebra 156, 267-308 (2001)

- [W3] Walther, U.: Computing the cup product structure for complements of complex affine varieties, J. Pure Appl. Algebra 164, 247-273 (2001)

Procedures:

D.15.10.1 deRhamCohomology

Procedure from library `deRham.lib` (see [Section D.15.10 \[deRham_lib\]](#), page 1878).

Usage: `deRhamCohomology(L[,choices])`; L a list consisting of polynomials, choices optional list consisting of one up to three strings
 The optional strings may be one of the strings
 -'noCE': compute quasi-isomorphic complexes without using Cartan-Eilenberg resolutionsq
 -'Vdres': compute quasi-isomorphic complexes using Cartan-Eilenberg resolutions; the CE resolutions are computed via `V_d`-homogenization and without using Schreyer's method
 -'Sres': compute quasi-isomorphic complexes using Cartan-Eilenberg resolutions in the homogenized Weyl algebra via Schreyer's method
 one of the strings
 -'iterativeloc': compute localizations by factorizing the polynomials and successive localization of the factors
 -'no iterativeloc': compute localizations by directly localizing the product and one of the strings
 -'onlybounds': computes bounds for the minimal and maximal interger roots of the global b-function
 -'exactroots' computes the minimal and maximal integer root of the global b-function
 The default is 'noCE', 'iterativeloc' and 'onlybounds'.

Assume: -The basering must be a polynomial ring over the field of rational numbers

Return: list, where the *i*th entry is the (*i*-1)st de Rham cohomology group of the complement of the complex affine variety given by the polynomials in L

Example:

```

LIB "deRham.lib";
ring r = 0, (x,y,z), dp;
list L=(xy,xz);
deRhamCohomology(L);
↳ [1]:
↳ 1
↳ [2]:
↳ 1
↳ [3]:
↳ 0
↳ [4]:
↳ 1
↳ [5]:
↳ 1

```

D.15.10.2 MVComplex

Procedure from library `deRham.lib` (see [Section D.15.10 \[deRham.lib\], page 1878](#)).

Usage: MVComplex(L); L a list of polynomials

Assume: -Basing is a polynomial ring with n vvariables and rational coefficients -L is a list of non-constant polynomials

Return: ring W: the n th Weyl algebra
W contains a list MV, which represents the Mayer-Vietrois complex $(C^{\sim i}, d^{\sim i})$ of the polynomials contained in L as follows:
the $C^{\sim i}$ are given by $D_n \sim n \text{cols}(C[2^*i-1]) / \text{im}(C[2^*i-1])$ and the differentials $d^{\sim i}$ are given by $C[2^*i]$

Example:

```

LIB "deRham.lib";
ring r = 0, (x,y,z), dp;
list L=xy,xz;
def C=MVComplex(L);
setring C;
MV;
↳ [1]:
↳ _[1,1]=D(3)
↳ _[1,2]=0
↳ _[2,1]=x(1)*D(1)+1
↳ _[2,2]=0
↳ _[3,1]=-x(2)*D(2)-1
↳ _[3,2]=0
↳ _[4,1]=0
↳ _[4,2]=D(2)
↳ _[5,1]=0
↳ _[5,2]=x(1)*D(1)+1
↳ _[6,1]=0
↳ _[6,2]=-x(3)*D(3)-1
↳ [2]:
↳ _[1,1]=-x(1)*x(3)
↳ _[2,1]=x(1)*x(2)
↳ [3]:
↳ _[1,1]=x(2)*D(2)+1

```

```

↳   _[2,1]=x(1)*D(1)+2
↳   _[3,1]=-x(3)*D(3)-1
↳   [4] :
↳   _[1,1]=0

```

D.15.11 `divisors.lib`

Library: `divisors.lib`

Purpose: Divisors and P-Divisors

Authors: Janko Boehm `boehm@mathematik.uni-kl.de`
 Lars Kastner `kastner@math.fu-berlin.de`
 Benjamin Lorenz `blorenz@math.uni-frankfurt.de`
 Hans Schoenemann `hannes@mathematik.uni-kl.de`
 Yue Ren `ren@mathematik.uni-kl.de`

Overview: We implement a class `divisor` on an algebraic variety and methods for computing with them. Divisors are represented by tuples of ideals defining the positive and the negative part. In particular, we implement the group structure on divisors, computing global sections and testing linear equivalence.

In addition to this we provide a class `formaldivisor` which implements integer formal sums of divisors (not necessarily prime). A formal divisor can be evaluated to a divisor, and a divisor can be decomposed into a formal sum.

Finally we provide a class `pdivisor` which implements polyhedral formal sums of divisors (P-divisors) where the coefficients are assumed to be polyhedra with fixed tail cone. There is a function to evaluate a P-divisor on a vector in the dual of the tail cone. The result will be a formal divisor.

References:

For the class `divisor` we closely follow Macaulay2's tutorial on divisors.

Procedures:

D.15.11.1 `makeDivisor`

Procedure from library `divisors.lib` (see [Section D.15.11 \[divisors.lib\]](#), page 1880).

Usage: `makeDivisor(I ,J)`; I = ideal, J = ideal.

Assume: I and J are ideals in a qring Q of a smooth irreducible variety X such that any ideal in Q satisfies the S2 condition.

Return: a divisor on X

Theory: The procedure will eliminate all components which are not of codimension 1. The S2 condition requires that every proper nonzero principal ideal has pure codimension 1.

Example:

```

LIB "divisors.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=31991,(x,y,z),dp;

```

```
ideal I = y^2*z - x*(x-z)*(x+3*z);
qring Q = std(I);
divisor P = makeDivisor(ideal(x,z),ideal(1));
```

D.15.11.2 divisorplus

Procedure from library `divisors.lib` (see [Section D.15.11 \[divisors.lib\]](#), page 1880).

Usage: `divisorplus(A ,B);` $A + B$; $A =$ divisor, $B =$ divisor.

Assume: A and B are divisors on X .

Return: a divisor on X

Theory: The procedure will compute the product of the numerator and denominator ideals, respectively.

Example:

```
LIB "divisors.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=31991,(x,y,z),dp;
ideal I = y^2*z - x*(x-z)*(x+3*z);
qring Q = std(I);
divisor A = makeDivisor(ideal(x,z),ideal(1));
divisor B = makeDivisor(ideal(x,y),ideal(1));
A+B;
↳ (x,yz) - (1)
↳
```

D.15.11.3 multdivisor

Procedure from library `divisors.lib` (see [Section D.15.11 \[divisors.lib\]](#), page 1880).

Usage: `multdivisor(n ,A);` A^n ; $n =$ integer, $A =$ divisor.

Assume: n is an integer and A is a divisor on X .

Return: a divisor on X

Theory: The procedure will compute the n -th power of the numerator and denominator ideals, respectively.

Example:

```
LIB "divisors.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=31991,(x,y,z),dp;
ideal I = y^2*z - x*(x-z)*(x+3*z);
qring Q = std(I);
divisor A = makeDivisor(ideal(x,z),ideal(1));
```

```

A;
↳ (z,x) - (1)
↳
divisor D = multdivisor(4,A);
D;
↳ (z2,xz) - (1)
↳
A*4;
↳ (z2,xz) - (1)
↳

```

D.15.11.4 negativedivisor

Procedure from library `divisors.lib` (see [Section D.15.11 \[divisors.lib\]](#), page 1880).

Usage: `negativedivisor(A); A*(-1); A = divisor.`

Assume: `A` is a divisor on `X`.

Return: a divisor on `X`

Theory: The procedure will interchange the numerator and denominator ideals.

Example:

```

LIB "divisors.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=31991,(x,y,z),dp;
ideal I = y^2*z - x*(x-z)*(x+3*z);
qring Q = std(I);
divisor A = makeDivisor(ideal(x,z),ideal(1));
A;
↳ (z,x) - (1)
↳
divisor D = negativedivisor(A);
D;
↳ (1) - (z,x)
↳

```

D.15.11.5 normalForm

Procedure from library `divisors.lib` (see [Section D.15.11 \[divisors.lib\]](#), page 1880).

Usage: `normalForm(A); A = divisor.`

Assume: `A` is a divisor on `X`.

Return: different representative of the same divisor on `X`

Theory: The procedure will cancel common components of numerator and denominator.

Example:

```

LIB "divisors.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=31991,(x,y,z),dp;
ideal I = y^2*z - x*(x-z)*(x+3*z);
qring Q = std(I);
divisor A = makeDivisor(ideal(x,z),ideal(1));
divisor B = makeDivisor(ideal(x,y),ideal(1));
divisor D = (A+B)+multdivisor(-1,B);
D;
↳ (x,yz) - (y,x)
↳
normalForm(D);
↳ (z,x) - (1)
↳

```

D.15.11.6 isEqualDivisor

Procedure from library `divisors.lib` (see [Section D.15.11 \[divisors.lib\]](#), page 1880).

Usage: `isEqualDivisor(A,B)`; A = divisor, B = divisor.

Assume: A and B are divisors on X.

Return: int 0 or 1, checks equality of A and B.

Theory: The procedure will compute the normal forms of A and B and compare.

Example:

```

LIB "divisors.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=31991,(x,y,z),dp;
ideal I = y^2*z - x*(x-z)*(x+3*z);
qring Q = std(I);
divisor A = makeDivisor(ideal(x,z),ideal(1));
divisor B = makeDivisor(ideal(x,y),ideal(1));
divisor D = (A+B)+multdivisor(-1,B);
isEqualDivisor(A,D);
↳ 1

```

D.15.11.7 globalSections

Procedure from library `divisors.lib` (see [Section D.15.11 \[divisors.lib\]](#), page 1880).

Usage: `globalSections(A)`; A = divisor.

Assume: A is a divisor on X.

Return: a list with a basis of the space of global sections of D.

Theory: We assume that the qring of X satisfies the S2-condition and that X is smooth. We compute $\text{sat}((f^*J) : I) / f$ where $D = (I)-(J)$.

Example:

```
LIB "divisors.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=31991,(x,y,z),dp;
ideal I = y^2*z - x*(x-z)*(x+3*z);
qring Q = std(I);
divisor P = makeDivisor(ideal(x,z),ideal(1));
divisor D = multdivisor(4,P);
globalSections(D);
↳ [1]:
↳   _[1]=x2
↳   _[2]=z2
↳   _[3]=yz
↳   _[4]=xz
↳ [2]:
↳   z2
```

D.15.11.8 degreeDivisor

Procedure from library `divisors.lib` (see [Section D.15.11 \[divisors.lib\]](#), page 1880).

Usage: `degreeDivisor(A)`; $A = \text{divisor}$.

Assume: A is a divisor on X .

Return: The degree of A .

Theory: We compute difference of the degrees of the numerator and denominator ideals.

Example:

```
LIB "divisors.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=31991,(x,y,z),dp;
ideal I = y^2*z - x*(x-z)*(x+3*z);
qring Q = std(I);
divisor P = makeDivisor(ideal(x,z),ideal(1));
degreeDivisor(P);
↳ 1
```

D.15.11.9 linearlyEquivalent

Procedure from library `divisors.lib` (see [Section D.15.11 \[divisors.lib\]](#), page 1880).

Usage: `linearlyEquivalent(A,B)`; $A = \text{divisor}$, $B = \text{divisor}$.

Assume: A and B are divisors on X .

Return: list if A and B a linearly equivalent and int 0 otherwise.

Theory: Checks whether A-B is principle. If yes, returns a list L=(f,g) where $A - B = (f/g)$.

Example:

```
LIB "divisors.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=31991,(x,y,z),dp;
ideal I = y^2*z - x*(x-z)*(x+3*z);
qring Q = std(I);
divisor A = makeDivisor(ideal(x,z),ideal(1));
divisor B = makeDivisor(ideal(x,y),ideal(1));
linearlyEquivalent(A,B);
↳ 0
linearlyEquivalent(multdivisor(2,A),multdivisor(2,B));
↳ [1]:
↳ x
↳ [2]:
↳ z
```

D.15.11.10 effective

Procedure from library `divisors.lib` (see [Section D.15.11 \[divisors.lib\]](#), page 1880).

Usage: `effective(A)`; A = divisor.

Assume: A is a divisor on X which is linearly equivalent to an effective divisor.

Return: divisor on X.

Theory: We compute an effective divisor linearly equivalent to A.

Example:

```
LIB "divisors.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=31991,(x,y,z),dp;
ideal I = y^2*z - x*(x-z)*(x+3*z);
qring Q = std(I);
divisor A = makeDivisor(ideal(x,z),ideal(1));
divisor B = makeDivisor(ideal(x,y),ideal(1));
divisor D = divisorplus(multdivisor(2,B),negativedivisor(A));
effective(D);
↳ (z,x) - (1)
↳
```

D.15.11.11 makeFormalDivisor

Procedure from library `divisors.lib` (see [Section D.15.11 \[divisors.lib\]](#), page 1880).

Usage: `makeFormalDivisor(L)`; $L = \text{list}$.

Assume: L is a list of tuples of an integer and a divisor.

Return: a formal divisor on X

Theory: Represents an integer formal sum of divisors.

Example:

```
LIB "divisors.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=31991,(x,y,z),dp;
ideal I = y^2*z - x*(x-z)*(x+3*z);
qring Q = std(I);
divisor A = makeDivisor(ideal(x,z),ideal(1));
divisor B = makeDivisor(ideal(x,y),ideal(1));
makeFormalDivisor(list(list(-5,A),list(2,B)));
↳ -5*( (z,x) - (1) )
↳ +2*( (y,x) - (1) )
↳
```

D.15.11.12 `evaluateFormalDivisor`

Procedure from library `divisors.lib` (see [Section D.15.11 \[divisors.lib\]](#), page 1880).

Usage: `evaluateFormalDivisor(D)`; $D = \text{formal divisor}$.

Assume: D is a formal divisor on X .

Return: a divisor on X

Theory: Will evaluate the formal sum.

Example:

```
LIB "divisors.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=31991,(x,y,z),dp;
ideal I = y^2*z - x*(x-z)*(x+3*z);
qring Q = std(I);
divisor A = makeDivisor(ideal(x,z),ideal(1));
divisor B = makeDivisor(ideal(x,y),ideal(1));
formaldivisor fE= makeFormalDivisor(list(list(-5,A),list(2,B)));
evaluateFormalDivisor(fE);
↳ (x,y2) - (z2,x2z)
↳
```

D.15.11.13 formaldivisorplus

Procedure from library `divisors.lib` (see [Section D.15.11 \[divisors.lib\], page 1880](#)).

Usage: `formaldivisorplus(A ,B);` $A + B$; $A =$ formaldivisor, $B =$ formaldivisor.

Assume: A and B are formal divisors on X .

Return: a formal divisor on X

Theory: The procedure will add the formal sums.

Example:

```
LIB "divisors.lib";

D.15.11.14 negativeformaldivisor

Procedure from library `divisors.lib` (see [Section D.15.11 \[divisors.lib\], page 1880](#)).

Usage: `negativeformaldivisor(A);` $A =$ formaldivisor.

Assume: A is a formaldivisor on X .

Return: a formal divisor on X

Theory: The procedure will change the signs of the coefficients.

Example:

```
LIB "divisors.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=31991,(x,y,z),dp;
ideal I = y^2*z - x*(x-z)*(x+3*z);
qring Q = std(I);
divisor A = makeDivisor(ideal(x,z),ideal(1));
divisor B = makeDivisor(ideal(x,y),ideal(1));
formaldivisor fE= makeFormalDivisor(list(list(-5,A),list(2,B)));
negativeformaldivisor(fE);
↳ 5*( (z,x) - (1) )
↳ -2*( (y,x) - (1) )
↳
```

D.15.11.15 multformaldivisor

Procedure from library `divisors.lib` (see [Section D.15.11 \[divisors.lib\]](#), page 1880).

Usage: `multformaldivisor(n ,A)`; A^n ; $n = \text{integer}$, $A = \text{formaldivisor}$.

Assume: n is an integer and A is a formal divisor on X .

Return: a formal divisor on X

Theory: The procedure will multiply the formal sum with n .

Example:

```
LIB "divisors.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=31991,(x,y,z),dp;
ideal I = y^2*z - x*(x-z)*(x+3*z);
qring Q = std(I);
divisor A = makeDivisor(ideal(x,z),ideal(1));
divisor B = makeDivisor(ideal(x,y),ideal(1));
formaldivisor fE= makeFormalDivisor(list(list(-5,A),list(2,B)));
fE*2;
↳ -10*( (z,x) - (1) )
↳ +4*( (y,x) - (1) )
↳
```

D.15.11.16 degreeFormalDivisor

Procedure from library `divisors.lib` (see [Section D.15.11 \[divisors.lib\]](#), page 1880).

Usage: `degreeFormalDivisor(A)`; $A = \text{formaldivisor}$.

Assume: A is a formaldivisor on X .

Return: The degree of A.

Theory: We compute degrees of the summands and return the weighted sum.

Example:

```
LIB "divisors.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=31991,(x,y,z),dp;
ideal I = y^2*z - x*(x-z)*(x+3*z);
qring Q = std(I);
divisor A = makeDivisor(ideal(x,z),ideal(1));
divisor B = makeDivisor(ideal(x,y),ideal(1));
formaldivisor fE= makeFormalDivisor(list(list(-5,A),list(2,B)));
degreeFormalDivisor(fE);
↳ -3
```

D.15.11.17 makePDivisor

Procedure from library `divisors.lib` (see [Section D.15.11 \[divisors.lib\]](#), page 1880).

Usage: `makePDivisor(L)`; $L = \text{list}$.

Assume: L is a list of tuples of a integral polyhedron and a divisor such that all polyhedra have the same tail cone.

Return: a pdivisor on X

Theory: Represents an polyhedral formal sum of divisors.

Example:

```
LIB "divisors.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=31991,(x,y,z),dp;
ideal I = y^2*z - x*(x-z)*(x+3*z);
qring Q = std(I);
divisor A = makeDivisor(ideal(x,z),ideal(1));
divisor B = makeDivisor(ideal(x,y),ideal(1));
intmat M[4][4]= 1,4,0,0,
1,0,3,0,
0,0,0,2,
1,1,1,1;
polytope PP = polytopeViaPoints(M);
makePDivisor(list(list(PP,A),list(PP,B)));
↳ tail=<cone>
↳ summands=<list>
```

D.15.11.18 evaluatePDivisor

Procedure from library `divisors.lib` (see [Section D.15.11 \[divisors.lib\]](#), page 1880).

Usage: evaluatePDivisor(D,v); D = pdivisor, v = intvec.

Assume: D is a polyhedral divisor on X and v is a point in the dual of the tailcone of the coefficients.

Return: a formal divisor on X

Theory: Will evaluate the polyhedral sum to an integer formal sum.

Example:

```
LIB "divisors.lib";
↳ Welcome to polymake version

D.15.11.19 pdivisorplus

Procedure from library `divisors.lib` (see [Section D.15.11 \[divisors.lib\]](#), page 1880).

Usage: pdivisorplus(A ,B); A + B; A = pdivisor, B = pdivisor.

Assume: A and B are polyhedral divisors on X.

Return: a pdivisor on X

Theory: The procedure will add the polyhedral formal sums by doing Minkowski sums.

Example:

```

D.15.12 fmodstd_lib

Library: fmodstd.lib

Purpose: Groebner bases of ideals in polynomial rings over rational function fields

Authors: D.K. Boku boku@mathematik.uni-kl.de
W. Decker decker@mathematik.uni-kl.de
C. Fieker fieker@mathematik.uni-kl.de

Overview: A library for computing a Groebner basis of an ideal in a polynomial ring over an algebraic function field $Q(T) := Q(t_1, \dots, t_m)$ using modular methods and sparse multivariate rational interpolation, where the t_i are transcendental over Q . The idea is as follows: Given an ideal I in $Q(T)[X]$, we map I to J via the map sending T to $Tz := (t_1z + s_1, \dots, t_mz + s_m)$ for a suitable point s in $Q^m \setminus \{(0, \dots, 0)\}$ and for some extra variable z so that J is an ideal in $Q(Tz)[X]$. For a suitable point b in $Z^m \setminus \{(0, \dots, 0)\}$, we map J to K via the map sending (T, z) to (b, z) , where $b := (b_1, \dots, b_m)$ (usually the b_i 's are distinct primes), so that K is an ideal in $Q(z)[X]$. For such a rational point b , we compute a Groebner basis G_b of K using modular algorithms [1] and univariate rational interpolation [2,7]. The procedure is repeated for many rational points b until their number is sufficiently large to recover the correct coefficients in $Q(T)$. Once we have these points, we obtain a set of polynomials G by applying the sparse multivariate rational interpolation algorithm from [4] coefficient-wise to the list of Groebner bases G_b in $Q(z)[X]$, where this algorithm makes use of the following algorithms: univariate polynomial interpolation [2], univariate rational function reconstruction [7], and multivariate polynomial interpolation [3]. The last algorithm uses the well-known Berlekamp/Massey algorithm [5] and its early termination version [6]. The set G is then a Groebner basis of I with high probability.

Procedures:**D.15.12.1 fareypoly**

Procedure from library `ffmodstd.lib` (see [Section D.15.12 \[ffmodstd.lib\]](#), page 1891).

Usage: `fareypoly(f, g[, m]);` f poly, g poly, m int

Return: a list l where r/t ($r:=l[1]$, $t:=l[2]$) is a univariate rational function such that $r/t = g \bmod f$, $\gcd(r,t)=\gcd(f,t)=1$ and $\deg(r) + \deg(t) < \deg(f)$

Note: An optional parameter m can be provided to define the way how t is normalized. If $m = 0$ (default), then the leading coefficient of t is 1. Otherwise, assuming the polynomial t has a non-zero constant term, the procedure returns the uniquely determined rational function r/t where the constant term in t is equal to 1.

If the ground ring has n variables and f and g are in a polynomial ring $k[\text{var}(i)]$ (k is a field) for some $i \leq n$, then the function r/t is returned as an element in $k(\text{var}(i))$.

In positive characteristic, the condition $r/t = g \bmod f$ may not be satisfied. The degree $\deg(f)$ of f must be higher than the degree $\deg(g)$ of g .

Example:

```
LIB "ffmodstd.lib";
ring rr=23,x,dp;
poly g = 10x5-5x4+3x3+3x2-x-11;

See also: [Section 5.1.36 \[farey\], page 179](#); [Section D.15.12.2 \[polyInterpolation\], page 1893](#).

D.15.12.2 polyInterpolation

Procedure from library `ffmodstd.lib` (see [Section D.15.12 \[ffmodstd.lib\], page 1891](#)).

Usage: `polyInterpolation(d, e[, n, L]);` d list, e list, n int, L list

Return: a list `L_p` where `f:=L_p[1]` is a polynomial of degree at most `size(d)-1` which satisfies the conditions `f(d[i])=e[i]` for all i, `L_p[2]` is the product of all `(var(n)-d[i])` for `1 <= i <= size(d)` and `L_p[3]=d`.

Note: The procedure applies the Newton interpolation algorithm to the pair `(d,e)` and returns the output w.r.t. the first variable (default) of the ground ring. If an optional parameter `n`, `1<=n<=N` (`N` is the number of variables in the current basering), is given, then the procedure returns the list `L_p` w.r.t. the `n`-th variable. Moreover, if the number of points `(d'[i],e'[i])` is not large enough to obtain the target polynomial, `L = polyInterpolation(d', e', n)` can be provided as an optional parameter to add more interpolation points. The elements in the first list must be distinct.

Example:

```

LIB "ffmodstd.lib";
ring rr=23,(x,y),dp;
list d = 1,2,3,4;
list e = -1,10,3,8;
polyInterpolation(d,e);

↳ 5

```

D.15.12.3 BerlekampMassey

Procedure from library `ffmodstd.lib` (see [Section D.15.12 \[ffmodstd.lib\]](#), page 1891).

Usage: BerlekampMassey(L, i[, M]); L list, i int, M list

Return: a list `Tr` where $f := \text{Tr}[1]$ is the minimal polynomial (w.r.t. the i -th variable) generated by the sequence $(L[j])$, $1 \leq j \leq \text{Tr}[2]$, if the length of the sequence is long enough. In this case, the coefficients c_i of the polynomial f satisfy the relation $-L[j+t] = c_0 * L[j] + \dots + c_{t-1} * L[j+t-1]$ for all $j \geq 1$ where $t = \text{deg}(f)$.

Note: The procedure applies the Berlekamp/Massey algorithm to the sequence $L[j]$ (elements from the field Q) for $j > 0$ and returns a polynomial f . If the polynomial f splits into linear factors with no multiplicity greater than one, then we say that the length of the sequence L is long enough. If this polynomial does not split into linear factors, an optional parameter $M = \text{BerlekampMassey}(L, i)$ can be provided to add more elements to the sequence.

Example:

```
LIB "ffmodstd.lib";
ring rr=0,x,dp;
list L = 150,3204,79272,2245968;
list Tr = BerlekampMassey(L,1);
Tr[1];
  => 117288/209x2-10662/209x+1
factorize(Tr[1]); //not linearly factored
  => [1]:
  =>   _[1]=1/209
  =>   _[2]=117288x2-10662x+209
  => [2]:
  =>   1,1
list L1 = 70411680, 2352815424, 81496927872;
Tr = BerlekampMassey(L1,1,Tr); // increase the length of L by size(L1)
Tr[1];
  => x3-66x2+1296x-7776
factorize(Tr[1]); //linearly factored and has distinct roots
  => [1]:
  =>   _[1]=1
  =>   _[2]=x-18
  =>   _[3]=x-36
  =>   _[4]=x-12
  => [2]:
  =>   1,1,1,1
Tr[2]; //the length of the sequence required to generate Tr[1]
  => 6
```

D.15.12.4 sparseInterpolation

Procedure from library `ffmodstd.lib` (see [Section D.15.12 \[ffmodstd.lib\]](#), page 1891).

Usage: `sparseInterpolation(Br, La, lpr, n[, m]);` `Br` poly, `La` list, `lpr` list, `n` int, `m` int

Return: a polynomial B in the polynomial ring $\mathbb{Q}[\text{var}(n+1), \dots, \text{var}(n+\text{size}(\text{lpr}))]$ satisfying the relation $\text{La}[i] = B(\text{lpr}[1]^i, \dots, \text{lpr}[\text{size}(\text{lpr})]^i)$.

Note: The polynomial Br in $\mathbb{Q}[\text{var}(n)]$ is the minimal polynomial obtained by applying the SINGULAR command [Section D.15.12.3 \[BerlekampMassey\], page 1894](#) to the sequence $(\text{La}[j])$, $1 \leq j \leq \text{size}(\text{La})$. By default the exponent i starts from 1. However, if the optional parameter $m \geq 0$ is provided, then it starts from m . The list lpr must be a list of distinct primes.

Example:

```
LIB "ffmodstd.lib";
ring rr=0,(x,y),dp;
list lpr = 2,3; // assign 2 for x and 3 for y
list La = 150,3204,79272,2245968,70411680, 2352815424, 81496927872;
// La[i] = number(subst(f,y,lpr[1]^i,z,lpr[2]^i)); for f = x2y2+2x2y+5xy2 and i=1,..
poly Br = BerlekampMassey(La,1)[1];
Br;
↪ x3-66x2+1296x-7776
sparseInterpolation(Br,La,lpr,0); // reconstruct f default
↪ x2y2+2x2y+5xy2
La = 97,275,793,2315,6817;
// La[i] = number(subst(g,y,lpr[1]^i,z,lpr[2]^i)); for g = x+y and i=4,...,8
Br = BerlekampMassey(La,1)[1];
Br;
↪ x2-5x+6
sparseInterpolation(Br,La,lpr,0,4);
↪ x+y
```

See also: [Section D.15.12.3 \[BerlekampMassey\], page 1894](#).

D.15.12.5 ffmodStd

Procedure from library `ffmodstd.lib` (see [Section D.15.12 \[ffmodstd.lib\], page 1891](#)).

Usage: `ffmodStd(I); I ideal`

Return: Groebner basis of I over an algebraic function field

Example:

```
LIB "ffmodstd.lib";
ring Ra=(0,a),(x,y,z),dp;
ideal I = (a^2+2)*x^2*y+a*y*z^2, x*z^2+(a+1)*x^2-a*y^2;
ffmodStd(I);
↪ _[1]=xz2+(a+1)*x2+(-a)*y2
↪ _[2]=(a2+2)*x2y+(a)*yz2
↪ _[3]=(a2+2)*yz4+(a4+4a2+4)*xy3+(a4+a3+2a2+2a)*y3+(a3+2a2+a)*yz2
ideal J = x^2*y+y*z^2, x*z^2+x^2-y^2;
ffmodStd(J);
↪ _[1]=xz2+x2-y2
↪ _[2]=x2y+yz2
↪ _[3]=yz4+xy3+y3+yz2
ring R1=(0,a,b),(x,y,z),dp;
ideal I = x^2*y^3*z+2*a*x*y*z^2+7*y^3,
x^2*y^4*z+(a-7b)*x^2*y*z^2-x*y^2*z^2+2*x^2*y*z-12*x+by,
(a2+b-2)*y^5*z+(a+5b)*x^2*y^2*z-b*x*y^3*z-x*y^3+y^4+2*a2*y^2*z,
a*x^2*y^2*z-x*y^3*z+3a*x*y*z^3+(-a+4)*y^3*z^2+4*z^2-bx;
```

```

ffmodStd(I);
↪ _[1]=12*x+(-b)*y
↪ _[2]=48*z2+(-b2)*y
↪ _[3]=y2z
↪ _[4]=y3

```

See also: [Section D.15.28.2 \[nfmodStd\]](#), page 2179.

D.15.13 finitediff_lib

Issues:

- installation of qepcadfilter.pl needs to be solved
- tests for (nearly) all procedures are missing
- global variables needs to be cleaned
- temporary files needs to be cleaned
- temporary file names need to be unique (think about multiple instances)
- pollution of global Top namespace must be solved
- u is not a good name for a procedure

Library: finitediff.lib

Purpose: procedures to compute finite difference schemes for linear differential equations

Author: Christian Dingler

Overview: Using qepcad/qepcadsystem from this library requires the program qepcad to be installed. You can download qepcad from <http://www.usna.edu/CS/qepcadweb/B/QEPCAD.html>

Procedures:

D.15.13.1 visualize

Procedure from library finitediff.lib (see [Section D.15.13 \[finitediff_lib\]](#), page 1897).

Usage: visualize(f); f of type poly.

Return: type string; translates the polynomial form of a finite difference scheme into an indexed one as often seen in literature

Example:

```

LIB "finitediff.lib";
list D="Ux","Ut","U";
list P="a";
list V="t","x";
setinitials(V,D,P);
scheme(u(Ut)+a*u(Ux),trapezoid(Ux,U,x),backward(Ut,U,t));
↪ (dx)*x+(dx)
visualize(_);
↪ (dx)*U(0,1)+(dx)*U(0,0)

```

D.15.13.2 u

Procedure from library `finitediff.lib` (see [Section D.15.13 \[finitediff.lib\], page 1897](#)).

Usage: `u(D[,#]);` D a string that occurs in the list of @derivatives, # an optional list of integers.

Return: type vector; gives the vector, that corresponds with $\text{gen}(n)^*m$, where m is the monomial defined by #

Example:

```
LIB "finitediff.lib";
list D="Ux","Uy","Ut","U";
list P="a","b";
list V="t","x","y";
setinitials(V,D,P);
u(Ux);
↳ [1]
u(Ux,2,3,7);
↳ [t^2*x^3*y^7]
u(Uy)+u(Ut)-u(Ux);
↳ [-1,1,1]
u(U)*234-dx*dt*dy*3*u(Uy);
↳ [0,(-3*dt*dx*dy),0,234]
```

D.15.13.3 scheme

Procedure from library `finitediff.lib` (see [Section D.15.13 \[finitediff.lib\], page 1897](#)).

Usage: `scheme([v1,...,vn]);` v1,...,vn of type vector

Return: poly

Purpose: performs substitutions by the means of Groebner basis computation of the submodule, generated by the input vectors, then intersects the intermediate result with the suitable component in order to get a finite difference scheme

Note: works only for a single PDE, for the case of a system use `matrixsystem`

Example:

```
LIB "finitediff.lib";
list D="Ux","Ut","U";
list P="a";
list V="t","x";
setinitials(V,D,P);
def s1=scheme(u(Ut)+a*u(Ux),backward(Ux,U,x),forward(Ut,U,t));
s1;
↳ (-a*dt+dx)/(dx)*x+(a*dt)/(dx)
```

D.15.13.4 laxfrT

Procedure from library `finitediff.lib` (see [Section D.15.13 \[finitediff.lib\], page 1897](#)).

Usage: `laxfrT(U1,U2,var);` U1, U2 are the names of occurring derivatives, var is a variable in the basering;

Return: type vector; gives a predefined approximation of the Lax-Friedrich-approximation for the derivation in the timevariable as often used in literature;

Note: see also `laxfrX`, `setinitials`, `scheme`; Warning: `laxfrT` is not to be interchanged with `laxfrX`

Example:

```
LIB "finitediff.lib";
list D="Ux","Ut","U";
list P="a";
list V="t","x";
setinitials(V,D,P);
laxfrT(Ux,U,x);
↪ [(dt)*x,0,-t*x+1/2*x^2+1/2]
```

D.15.13.5 laxfrX

Procedure from library `finitediff.lib` (see [Section D.15.13 \[finitediff.lib\]](#), page 1897).

Usage: `laxfrX(U1,U2,var)`; `U1`, `U2` are the names of occurring derivatives, `var` is a variable in the basering;

Return: type vector; gives a predefined approximation of the Lax-Friedrich-approximation for the derivation in one of the spatial variables as often used in literature;

Note: see also `laxfrT`, `setinitials`, `scheme`; Warning: `laxfrX` is not to be interchanged with `laxfrT`

Example:

```
LIB "finitediff.lib";
list D="Ux","Ut","U";
list P="a";
list V="t","x";
setinitials(V,D,P);
laxfrX(Ux,U,x);
↪ [(2*dx)*x,0,-x^2+1]
```

D.15.13.6 forward

Procedure from library `finitediff.lib` (see [Section D.15.13 \[finitediff.lib\]](#), page 1897).

Usage: `forward(U1,U2,var)`; `U1`, `U2` are the names of occurring derivatives, `var` is a variable in the basering;

Return: type vector; gives a predefined approximation of the forward approximation as often used in literature;

Note: see also `laxfrT`, `setinitials`, `scheme`;

Example:

```
LIB "finitediff.lib";
list D="Ut","Ux","Uy","U";
list V="t","x","y";
list P="a","b";
setinitials(V,D,P);
forward(Ux,U,x);
↪ [0,(dx),0,-x+1]
forward(Uy,U,y);
↪ [0,0,(dy),-y+1]
forward(Ut,U,t);
↪ [(dt),0,0,-t+1]
```

D.15.13.7 backward

Procedure from library `finitediff.lib` (see [Section D.15.13 \[finitediff.lib\], page 1897](#)).

Usage: `backward(U1,U2,var)`; U1, U2 are the names of occurring derivatives, var is a variable in the basering;

Return: type vector; gives a predefined approximation of the backward approximation as often used in literature;

Note: see also `forward,laxfrT,setinitials,scheme`;

Example:

```
LIB "finitediff.lib";
list D="Ut","Ux","Uy","U";
list V="t","x","y";
list P="a","b";
setinitials(V,D,P);
backward(Ux,U,x);
↪ [0,(dx)*x,0,-x+1]
backward(Uy,U,y);
↪ [0,0,(dy)*y,-y+1]
backward(Ut,U,t);
↪ [(dt)*t,0,0,-t+1]
```

D.15.13.8 central1st

Procedure from library `finitediff.lib` (see [Section D.15.13 \[finitediff.lib\], page 1897](#)).

Usage: `central1st(U1,U2,var)`; U1, U2 are the names of occurring derivatives, var is a variable in the basering;

Return: type vector; gives a predefined approximation of the first-order-central-approximation as often used in literature;

Note: see also `forward,laxfrT,setinitials,scheme`;

Example:

```
LIB "finitediff.lib";
list D="Ut","Ux","Uy","U";
list V="t","x","y";
list P="a","b";
setinitials(V,D,P);
central1st(Ux,U,x);
↪ [0,(2*dx)*x,0,-x^2+1]
central1st(Uy,U,y);
↪ [0,0,(2*dy)*y,-y^2+1]
```

D.15.13.9 central2nd

Procedure from library `finitediff.lib` (see [Section D.15.13 \[finitediff.lib\], page 1897](#)).

Usage: `central2nd(U1,U2,var)`; U1, U2 are the names of occurring derivatives, var is a variable in the basering;

Return: type vector; gives a predefined approximation of the second-order-central-approximation as often used in literature;

Note: see also `forward,laxfrT,setinitials,scheme`;

Example:

```
LIB "finitediff.lib";
list D="Uxx","Ux","Utt","Ut","U";
list P="lambda";
list V="t","x";
setinitials(V,D,P);
central2nd(Uxx,U,x);
↪ [(dx^2)*x,0,0,0,-x^2+2*x-1]
central2nd(Utt,U,t);
↪ [0,0,(dt^2)*t,0,-t^2+2*t-1]
```

D.15.13.10 trapezoid

Procedure from library `finitediff.lib` (see [Section D.15.13 \[finitediff.lib\]](#), page 1897).

Usage: `trapezoid(U1,U2,var)`; `U1`, `U2` are the names of occurring derivatives, `var` is a variable in the basering;

Return: type vector; gives a predefined approximation of the trapezoid-approximation as often used in literature;

Note: see also `forward,laxfrT,setinitials,scheme`;

Example:

```
LIB "finitediff.lib";
list D="Uxx","Ux","Utt","Ut","U";
list P="lambda";
list V="t","x";
setinitials(V,D,P);
trapezoid(Uxx,Ux,x);
↪ [(dx)/2*x+(dx)/2,-x+1]
trapezoid(Ux,U,x);
↪ [0,(dx)/2*x+(dx)/2,0,0,-x+1]
```

D.15.13.11 midpoint

Procedure from library `finitediff.lib` (see [Section D.15.13 \[finitediff.lib\]](#), page 1897).

Usage: `midpoint(U1,U2,var)`; `U1`, `U2` are the names of occurring derivatives, `var` is a variable in the basering;

Return: type vector; gives a predefined approximation of the midpoint-approximation as often used in literature;

Note: see also `forward,laxfrT,setinitials,scheme`;

Example:

```
LIB "finitediff.lib";
list D="Uxx","Ux","Utt","Ut","U";
list P="lambda";
list V="t","x";
setinitials(V,D,P);
midpoint(Ux,U,x);
↪ [0,(2*dx)*x,0,0,-x^2+1]
```

D.15.13.12 pyramid

Procedure from library `finitediff.lib` (see [Section D.15.13 \[finitediff.lib\]](#), page 1897).

Usage: `pyramid(U1,U2,var)`; U1, U2 are the names of occurring derivatives, var is a variable in the basering;

Return: type vector; gives a predefined approximation of the pyramid-approximation as often used in literature;

Note: see also `forward,laxfrT,setinitials,scheme`;

Example:

```
LIB "finitediff.lib";
list D="Uxx","Ux","Utt","Ut","U";
list P="lambda";
list V="t","x";
setinitials(V,D,P);
pyramid(Ux,U,x);
⇒ [0,(dx)/3*x^2+(dx)/3*x+(dx)/3,0,0,-x^3+x]
```

D.15.13.13 setinitials

Procedure from library `finitediff.lib` (see [Section D.15.13 \[finitediff.lib\]](#), page 1897).

Usage: `setinitials(V,D[,P])`; V,D,P are lists with strings as elements

Return: no return value: sets the dependence order of the occurring derivatives, constructs the suitable ring to compute in containing user chosen parameters, sets new basering

Note: P is optional, used to introduce some additional parameters into the ring. The Sine and Cosine values needed for the fourier transformation are symbolically introduced under the names `string(c)+nameof(variable)`, i.e. if x is any spatial variable then `cx:=cosine(dx*ksi)`, when regarding the fourier transform after ksi (for sine respectively). Artificial parameters I,T,Px,Py are introduced for the later eigenvalue analysis. Variables can be transformed into parameters of similar name

Example:

```
LIB "finitediff.lib";
list D="Ut","Ux","Uy","U";
list V="t","x","y";
list P="alpha","beta","gamma";
setinitials(V,D,P);////does not show the ring, since there is no output
basing;////does show the ring
⇒ // coefficients: QQ(I, T, Px, Py, Cx, Cy, Sx, Sy, alpha, beta, gamma, dt,\
    dx, dy)
⇒ // number of vars : 8
⇒ //      block  1 : ordering c
⇒ //      block  2 : ordering lp
⇒ //      : names    i t x y cx cy sx sy
⇒ // quotient ring from ideal
⇒ _[1]=cy^2+sy^2-1
⇒ _[2]=cx^2+sx^2-1
⇒ _[3]=i^2+1
```

D.15.13.14 errormap

Procedure from library `finitediff.lib` (see [Section D.15.13 \[finitediff.lib\]](#), page 1897).

Usage: `errormap(f)`; f of type `poly`

Return: type `poly`; performs the fouriertransformation of a single polynomial

Example:

```
LIB "finitediff.lib";
list D="Ux","Ut","U";
list P="a";
list V="t","x";
setinitials(V,D,P);
scheme(u(Ut)+a*u(Ux),central1st(Ux,U,x),backward(Ut,U,t));
↳ (2*dx)*x
errormap(_);
↳ (2*dx)*i*sx+(2*dx)*cx
```

D.15.13.15 matrixsystem

Procedure from library `finitediff.lib` (see [Section D.15.13 \[finitediff.lib\]](#), page 1897).

Usage: `matrixsystem(M,A)`; where the $M=M_t, M_1, \dots, M_n$ is a list with square matrices of the same dimension as entries, and $A=A_t, A_1, \dots, A_n$ gives the corresponding approximations for the several variables (t, x_1, \dots, x_n) as vector. Intended to solve $M_t \cdot U_t + M_1 \cdot U_{x_1} + \dots + M_n \cdot U_{x_n} = 0$ as a linear system of partial differential equations numerically by a finite difference scheme;

Return: type `matrix`; gives back the matrices B_1, B_2 that represent the finite difference scheme, partitioned into different time levels in the form: $B_1 \cdot U(t=N) = B_2 \cdot U(t < N)$, where N is the maximal occurring degree (timelevel) of t .

Example:

```
LIB "finitediff.lib";
list D="Ut","Ux","Uy","U";
list V="t","x","y";
list P="a","b";
setinitials(V,D,P);
list Mat=unitmat(2),unitmat(2);
list Appr=forward(Ut,U,t),forward(Ux,U,x);
matrixsystem(Mat,Appr);
↳ _[1,1]=-1/(dt)*t-1/(dx)*x+(dt+dx)/(dt*dx)
↳ _[1,2]=0
↳ _[2,1]=0
↳ _[2,2]=-1/(dt)*t-1/(dx)*x+(dt+dx)/(dt*dx)
```

D.15.13.16 timestep

Procedure from library `finitediff.lib` (see [Section D.15.13 \[finitediff.lib\]](#), page 1897).

Usage: `timestep(M)`; M a square matrix with polynomials over the basering as entries;

Return: type `list`; gives two matrices M_1, M_2 that are the splitting of M with respect to the degree of the variable t in the entries, where the first list-entry M_1 consists of the polynomials of the highest timelevel and M_2 of the lower levels in the form: $M=0 \Rightarrow M_1=M_2$, i.e. $M_1-M_2=M$

Note: intended to be used for the finite-difference-scheme-construction and partition into the several time steps

Example:

```
LIB "finitediff.lib";
list D="Ut","Ux","Uy","U";
list V="t","x","y";
list P="a","b";
setinitials(V,D,P);
list Mat=unitmat(2),unitmat(2);
list Apr=forward(Ut,U,t),forward(Ux,U,x);
matrixsystem(Mat,Apr);
⇒ _[1,1]=-1/(dt)*t-1/(dx)*x+(dt+dx)/(dt*dx)
⇒ _[1,2]=0
⇒ _[2,1]=0
⇒ _[2,2]=-1/(dt)*t-1/(dx)*x+(dt+dx)/(dt*dx)
timestep(_);
⇒ [1]:
⇒ _[1,1]=t
⇒ _[1,2]=0
⇒ _[2,1]=0
⇒ _[2,2]=t
⇒ [2]:
⇒ _[1,1]=(-dt)/(dx)*x+(dt+dx)/(dx)
⇒ _[1,2]=0
⇒ _[2,1]=0
⇒ _[2,2]=(-dt)/(dx)*x+(dt+dx)/(dx)
```

D.15.13.17 fouriersystem

Procedure from library `finitediff.lib` (see [Section D.15.13 \[finitediff_lib\]](#), page 1897).

Usage: `fouriersystem(M,A)`; M a list of matrices, A a list of approximations;

Return: type list; each entry is some matrix obtained by performing the substitution of the single approximations into the system of pde's, partitioning the equation into the several timesteps and fouriertransforming these parts

Example:

```
LIB "finitediff.lib";
list D="Ut","Ux","Uy","U";
list V="t","x","y";
list P="a","b";
setinitials(V,D,P);
matrix M[2][2]=0,-a,-a,0;
list Mat=unitmat(2),M;
list Apr=forward(Ut,U,t),trapezoid(Ux,U,x);
def s=fouriersystem(Mat,Apr);s;
⇒ [1]:
⇒ [1]:
⇒ [1,1]=(I*T*Sx+T*Cx)
⇒ [1,2]=0
⇒ [2,1]=0
```

```

⇒      _[2,2]=(I*T*Sx+T*Cx)
⇒      [2]:
⇒      _[1,1]=(I*Sx+Cx)
⇒      _[1,2]=(2*I*Sx*a*dt+2*Cx*a*dt-2*a*dt)/(dx)
⇒      _[2,1]=(2*I*Sx*a*dt+2*Cx*a*dt-2*a*dt)/(dx)
⇒      _[2,2]=(I*Sx+Cx)
⇒      [2]:
⇒      [1]:
⇒      _[1]=(I*T*Sx+T*Cx)
⇒      [2]:
⇒      _[1]=(-2*I*Sx*a*dt+I*Sx*dx-2*Cx*a*dt+Cx*dx+2*a*dt)/(dx)
⇒      _[2]=(2*I*Sx*a*dt+I*Sx*dx+2*Cx*a*dt+Cx*dx-2*a*dt)/(dx)
⇒ [2]:
⇒ [1]:
⇒ [1]:
⇒ (T^2)
⇒ [2]:
⇒ [1]:
⇒ (-8*Cx*a^2*dt^2+4*Cx*a*dt*dx+8*a^2*dt^2-4*a*dt*dx+dx^2)/(dx^2)
⇒ [2]:
⇒ (-8*Cx*a^2*dt^2-4*Cx*a*dt*dx+8*a^2*dt^2+4*a*dt*dx+dx^2)/(dx^2)

```

D.15.13.18 PartitionVar

Procedure from library `finitediff.lib` (see [Section D.15.13 \[finitediff.lib\]](#), page 1897).

Usage: PartitionVar(f); f a poly in the basering;

Return: type poly; gives back a list L=f1,f2 obtained by the partition of f into two parts f1,f2 with $\text{deg_var}_n(f1) > 0$ $\text{deg_var}_n(f2)=0$

Example:

```

LIB "finitediff.lib";
list D="Ut","Ux","Uy","U";
list V="t","x","y";
list P="a","b";
setinitials(V,D,P);////does not show the ring, since there is no output
basing;////does show the ring
⇒ // coefficients: QQ(I, T, Px, Py, Cx, Cy, Sx, Sy, a, b, dt, dx, dy)
⇒ // number of vars : 8
⇒ //      block  1 : ordering c
⇒ //      block  2 : ordering lp
⇒ //      : names      i t x y cx cy sx sy
⇒ // quotient ring from ideal
⇒ _[1]=cy^2+sy^2-1
⇒ _[2]=cx^2+sx^2-1
⇒ _[3]=i^2+1
poly f=t**3*cx**2-cy**2*dt+i**3*sx;
PartitionVar(f,1); ////i is the first variable
⇒ [1]:
⇒ i^3*sx
⇒ [2]:
⇒ t^3*cx^2+(-dt)*cy^2

```

D.15.13.19 ComplexValue

Procedure from library `finitediff.lib` (see [Section D.15.13 \[finitediff.lib\]](#), page 1897).

Usage: `ComplexValue(f)`; f a poly in the basering;

Return: type poly; gives back the formal complex-value of f , where `var(1)` is regarded as the imaginary unit. Does only make sense, if the proc `<setinitials>` is executed before `-> nvars <= npars`

Example:

```
LIB "finitediff.lib";
list D="Ut","Ux","Uy","U";
list V="t","x","y";
list P="a","b";
setinitials(V,D,P);////does not show the ring, as there is no output
basing;////does show the ring
↳ // coefficients: QQ(I, T, Px, Py, Cx, Cy, Sx, Sy, a, b, dt, dx, dy)
↳ // number of vars : 8
↳ //          block 1 : ordering c
↳ //          block 2 : ordering lp
↳ //          : names      i t x y cx cy sx sy
↳ // quotient ring from ideal
↳ _[1]=cy^2+sy^2-1
↳ _[2]=cx^2+sx^2-1
↳ _[3]=i^2+1
poly f=t**3*cx**2-cy**2*dt+i**3*sx;
f;
↳ i^3*sx+t^3*cx^2+(-dt)*cy^2
ComplexValue(f);
↳ t^6*sx^4-2*t^6*sx^2+t^6+(-2*dt)*t^3*sx^2*sy^2+(2*dt)*t^3*sx^2+(2*dt)*t^3*\
sy^2+(-2*dt)*t^3+sx^2+(dt^2)*sy^4+(-2*dt^2)*sy^2+(dt^2)
```

D.15.13.20 VarToPar

Procedure from library `finitediff.lib` (see [Section D.15.13 \[finitediff.lib\]](#), page 1897).

Usage: `VarToPar(f)`; f a poly in the basering;

Return: type poly; gives back the poly obtained by substituting `var(i)` by `par(i)`, for all variables. Does only make sense, if the proc `<setinitials>` is executed before `-> nvars <= npars`;

Example:

```
LIB "finitediff.lib";
list D="Ut","Ux","Uy","U";
list V="t","x","y";
list P="a","b";
setinitials(V,D,P);////does not show the ring, as there is no output
basing;////does show the ring
↳ // coefficients: QQ(I, T, Px, Py, Cx, Cy, Sx, Sy, a, b, dt, dx, dy)
↳ // number of vars : 8
↳ //          block 1 : ordering c
↳ //          block 2 : ordering lp
↳ //          : names      i t x y cx cy sx sy
↳ // quotient ring from ideal
↳ _[1]=cy^2+sy^2-1
```

```

↳ _[2]=cx^2+sx^2-1
↳ _[3]=i^2+1
poly f=t**3*cx**2-cy**2*dt+i**3*sx;
f;
↳ i^3*sx+t^3*cx^2+(-dt)*cy^2
VarToPar(f);
↳ (I^3*Sx+T^3*Cx^2-Cy^2*dt)

```

D.15.13.21 ParToVar

Procedure from library `finitediff.lib` (see [Section D.15.13 \[finitediff.lib\]](#), page 1897).

Usage: `ParToVar(f)`; f a poly in the basering;

Return: type poly; gives back the poly obtained by substituting `par(i)` by `var(i)`, for the first `nvars(basering)` parameters. Does only make sense, if `setinitials` is executed before \rightarrow `nvars <= npars`. Is the opposite action to `VarToPar`, see example `ParToVar`;

Example:

```

LIB "finitediff.lib";
list D="Ut","Ux","Uy","U";
list V="t","x","y";
list P="a","b";
setinitials(V,D,P);////does not show the ring, as there is no output
basing;////does show the ring
↳ // coefficients: QQ(I, T, Px, Py, Cx, Cy, Sx, Sy, a, b, dt, dx, dy)
↳ // number of vars : 8
↳ //          block 1 : ordering c
↳ //          block 2 : ordering lp
↳ //          : names      i t x y cx cy sx sy
↳ // quotient ring from ideal
↳ _[1]=cy^2+sy^2-1
↳ _[2]=cx^2+sx^2-1
↳ _[3]=i^2+1

```

D.15.13.22 qepcad

Procedure from library `finitediff.lib` (see [Section D.15.13 \[finitediff.lib\]](#), page 1897).

Usage: `qepcad(f)`; f a poly in the basering;

Return: type list; gives back some constraints that are equivalent to $f < 1$ (computed by QEP-CAD);

Example:

```

LIB "finitediff.lib";
list D="Ux","Ut","U";
list P="a";
list V="t","x";
setinitials(V,D,P);
def s1=scheme(u(Ut)+a*u(Ux),laxfrX(Ux,U,x),laxfrT(Ut,U,x));
s1;
↳ (-a*dt+dx)/(2*dx)*x^2+(a*dt+dx)/(2*dx)
def s2=errormap(s1);
s2;
↳ (-a*dt+dx)/(dx)*i*cx*sx+(a*dt-dx)/(dx)*sx^2+1
def s3=ComplexValue(s2);s3;

```

D.15.13.23 qepcadsystem

Procedure from library `finitediff.lib` (see [Section D.15.13 \[finitediff_lib\]](#), page 1897).

Usage: `qepcadsystem(f); l` a list;

Return: list

Purpose: gives back some constraints that are equivalent to the eigenvalues of the matrices in the list `l` being < 1 (computed by QEPCAD)

Example:

```

LIB "finitediff.lib";
list D="Ut","Ux","Uy","U";
list V="t","x","y";
list P="a","b";
setinitials(V,D,P);
matrix M[2][2]=0,-a,-a,0;
list Mat=unitmat(2),M;
list Appr=forward(Ut,U,t),forward(Ux,U,x);

D.15.14 goettsche_lib

Library: goettsche.lib

Purpose: Drezet's formula for the Betti numbers of the moduli space of Kronecker modules, Goettsche's formula for the Betti numbers of the Hilbert scheme of points on a surface, Macdonald's formula for the symmetric product

Author: Oleksandr Iena, o.g.yena@gmail.com

References:

- [1] Drezet, Jean-Marc Cohomologie des varié'te's de modules de hauteur nulle. Mathematische Annalen: 281, 43-85, (1988).

- [3] Macdonald, I. G., The Poincare polynomial of a symmetric product, Mathematical proceedings of the Cambridge Philosophical Society: 58, 563 - 568, (1962).

Procedures:

D.15.14.1 GoettscheF

Procedure from library `goettsche.lib` (see [Section D.15.14 \[goettsche_lib\]](#), page 1909).

Usage: GoettscheF(z, t, n, b); z, t polynomials, n integer, b list of non-negative integers

Return: polynomial in z and t

Purpose: computes the Goettsche's formula up to degree n in t

Note: zero is returned if $n < 0$ or b is not a list of non-negative integers or if there are not enough Betti numbers

Example:

```
LIB "goettsche.lib";
ring r=0, (t, z), ls;
// consider the projective plane with Betti numbers 1,0,1,0,1
list b=1,0,1,0,1;
// get the Goettsche's formula up to degree 3
print( GoettscheF(z, t, 3, b) );
⇒ 1+t+tz2+tz4+t2+2t2z2+3t2z4+2t2z6+t2z8+t3+2t3z2+5t3z4+6t3z6+5t3z8+2t3z10+t\
3z12
```

D.15.14.2 PPolyH

Procedure from library `goettsche.lib` (see [Section D.15.14 \[goettsche.lib\], page 1909](#)).

Usage: `PPolyH(z, n, b)`; z polynomial, n integer, b list of non-negative integers

Return: polynomial in z

Purpose: computes the Poincare polynomial of the Hilbert scheme of n points on a surface with Betti numbers b

Note: zero is returned if $n < 0$ or b is not a list of non-negative integers or if there are not enough Betti numbers

Example:

```
LIB "goettsche.lib";
ring r=0, (z), ls;
// consider the projective plane P_2 with Betti numbers 1,0,1,0,1
list b=1,0,1,0,1;
// get the Poincare polynomial of the Hilbert scheme of 3 points on P_2
print( PPolyH(z, 3, b) );
⇒ 1+2z2+5z4+6z6+5z8+2z10+z12
```

D.15.14.3 BettiNumsH

Procedure from library `goettsche.lib` (see [Section D.15.14 \[goettsche.lib\], page 1909](#)).

Usage: `BettiNumsH(n, b)`; n integer, b list of non-negative integers

Return: list of non-negative integers

Purpose: computes the Betti numbers of the Hilbert scheme of n points on a surface with Betti numbers b

Note: an empty list is returned if $n < 0$ or b is not a list of non-negative integers or if there are not enough Betti numbers

Example:

```
LIB "goettsche.lib";
ring r=0, (z), ls;
// consider the projective plane P_2 with Betti numbers 1,0,1,0,1
```

```

list b=1,0,1,0,1;
// get the Betti numbers of the Hilbert scheme of 3 points on P_2
print( BettiNumsH(3, b) );

↳ 1

```

D.15.14.4 MacdonaldF

Procedure from library `goettsche.lib` (see [Section D.15.14 \[goettsche.lib\], page 1909](#)).

Usage: `MacdonaldF(z, t, n, b)`; z, t polynomials, n integer, b list of non-negative integers

Return: polynomial in z and t with integer coefficients

Purpose: computes the Macdonald's formula up to degree n in t

Note: zero is returned if $n < 0$ or b is not a list of non-negative integers

Example:

```

LIB "goettsche.lib";
ring r=0, (t, z), ls;
// consider the projective plane with Betti numbers 1,0,1,0,1
list b=1,0,1,0,1;
// get the Macdonald's formula up to degree 3
print( MacdonaldF(z, t, 3, b) );
↳ 1+t+tz2+tz4+t2+t2z2+2t2z4+t2z6+t2z8+t3+t3z2+2t3z4+2t3z6+2t3z8+t3z10+t3z12

```

D.15.14.5 PPolyS

Procedure from library `goettsche.lib` (see [Section D.15.14 \[goettsche.lib\], page 1909](#)).

Usage: `PPolyS(z, n, b)`; z polynomial, n integer, b list of non-negative integers

Return: polynomial in z with integer coefficients

Purpose: computes the Poincare polynomial of the n -th symmetric power of a variety with Betti numbers b

Note: zero is returned if $n < 0$ or b is not a list of non-negative integers

Example:

```
LIB "goettsche.lib";
ring r=0, (z), ls;
// consider the projective plane P_2 with Betti numbers 1,0,1,0,1
list b=1,0,1,0,1;
// get the Poincare polynomial of the third symmetric power of P_2
print( PPolyS(z, 3, b) );
↪ 1+z2+2z4+2z6+2z8+z10+z12
```

D.15.14.6 BettiNumsS

Procedure from library `goettsche.lib` (see [Section D.15.14 \[goettsche.lib\], page 1909](#)).

Usage: `BettiNumsS(n, b)`; n integer, b list of non-negative integers

Return: list of non-negative integers

Purpose: computes the Betti numbers of the n -th symmetric power of a variety with Betti numbers b

Note: an empty list is returned if $n < 0$ or b is not a list of non-negative integers

Example:

```
LIB "goettsche.lib";
ring r=0, (z), ls;
// consider a complex torus T (elliptic curve) with Betti numbers 1,2,1
list b=1,2,1;
// get the Betti numbers of the second symmetric power of T
print( BettiNumsS(2, b) );

D.15.14.7 PPolyN

Procedure from library `goettsche.lib` (see [Section D.15.14 \[goettsche.lib\], page 1909](#)).

Usage: `PPolyN(t, q, m, n)`; t polynomial, q, m, n integers

Return: polynomial in t

Purpose: computes the Poincare polynomial of the moduli space of Kronecker modules $N(q; m, n)$

Note: if m and n are not coprime, the result does not necessary make sense

Example:

```

LIB "goettsche.lib";
ring r=0, (t), ls;
// get the Poincare polynomial of N(3; 2, 3)
print( PPolyN(t, 3, 2, 3) );
↳ 1+t2+3t4+3t6+3t8+t10+t12

```

D.15.14.8 BettiNumsN

Procedure from library `goettsche.lib` (see [Section D.15.14 \[goettsche.lib\], page 1909](#)).

Usage: `BettiNumsN(q, m, n)`; q, m, n integers

Return: list of integers

Purpose: computes the Betti numbers of the moduli space of Kronecker modules $N(q; m, n)$

Note: if m and n are not coprime, the result does not necessary make sense

Example:

```

LIB "goettsche.lib";
ring r=0, (t), dp;

```

```

// get the Betti numbers of N(3; 2, 3)

D.15.15 graal.lib

Library: graal.lib

Purpose: localization at prime ideals and their associated graded rings

Author: Magdalen Marais, magdalen@aims.ac.za
Yue Ren, ren@mathematik.uni-kl.de

Overview: This library is on a computational treatment of localizations at prime ideals and their associated graded rings based on a work of Mora. Not only does it construct a ring isomorphic to the localization of an affine coordinate ring at a prime ideal, the algorithms in this library aim to exploit the topology in the localization by computing first and foremost in the associated graded ring and lifting the result to the localization afterwards.

Features include a check for regularity and the resolution of ideals.

References:

Mora, Teo: La queste del Saint Gr_a(A_L): A computational approach to local algebra
Marais, Magdalen and Ren, Yue: Mora's holy graal: Algorithms for computing in localizations at prime ideals

Procedures:

D.15.15.1 graalMixed

Procedure from library `graal.lib` (see [Section D.15.15 \[graal.lib\]](#), page 1914).

Usage: `graalMixed(L,t)`; L ideal, t int (optional)

Return: `graalBearer` with all the necessary structures for our machinery if t specified and $t > 0$, puts an upper time limit on finding a necessary transformation to map an intermediate ideal into general position.

Note: assumes that the current basering is a domain and that L is a prime ideal.

Example:

```
LIB "graal.lib";
// see [Mora] Example 6.5
ring Q = 0,(x,y,z),dp;
ideal H = y2-xz;
qring A = std(H);
ideal L = x3-yz,x2y-z2;
graalBearer Gr = graalMixed(L); Gr;
↳ affine coordinate ring:
↳ (QQ),(x,y,z),(dp(3),C)
↳ mod <y2-xz>
↳
↳ ideal defining the subvariety:
↳ <x3-yz,x2y-z2>
↳
↳ A1:
↳ (0,z),(Y(1),Y(2),x,y),(ds(2),c,dp(2))
↳ mod <x^3+(-z)*y-Y(1),x^2*y+(-z^2)-Y(2),y^2+(-z)*x,(z)*Y(1)-Y(2)*y>
↳ graal:
↳ (0,z),(Y(1),Y(2),y),(c,dp(2),lp(1))
↳ mod <(z)*Y(1)-Y(2)*y,y^5+(-z^4)>
↳ where
↳ Y(1) represents generator x3-yz
↳ Y(2) represents generator x2y-z2
↳ and x,y in A1 are mapped to 1/(z)*y^2,y in Graal
↳
```

D.15.15.2 dimensionOfLocalization

Procedure from library `graal.lib` (see [Section D.15.15 \[graal.lib\]](#), page 1914).

Usage: `dimensionOfLocalization(L)`; L ideal or `graalBearer`

Return: int, the dimension of the localization A_L of A at L.

Example:

```
LIB "graal.lib";
ring Q = 0,(X(1),X(2)),dp;
ideal H = X(2)^2-(X(1)-1)*X(1)*(X(1)+1);
ideal J = std(X(1),X(2));
↳ // ** _ is no standard basis
qring A = std(H);
ideal L = fetch(Q,J);
graalBearer Gr = graalMixed(L);
// def fA = Gr.fA; setring fA;
dimensionOfLocalization(Gr); // = 1
```

```

↳ // ** redefining scriptIn (    ideal scriptIn = Gr.scriptIn;)
↳ 1

```

D.15.15.3 systemOfParametersOfLocalization

Procedure from library `graal.lib` (see [Section D.15.15 \[graal.lib\]](#), page 1914).

Usage: `systemOfParametersOfLocalization(def L);` L ideal or `graalBearer`

Return: ideal, a system of parameter of the localization A_L of A at L .

Example:

```

LIB "graal.lib";
ring Q = 0, (X(1), X(2)), dp;
ideal H = X(2)^2 - (X(1)-1)*X(1)*(X(1)+1);
ideal J = X(1), X(2);
qring A = std(H);
ideal L = fetch(Q, J);
graalBearer Gr = graalMixed(L);
systemOfParametersOfLocalization(Gr); // = 1
↳ // ** redefining J (    ideal J = Gr.J; ideal ret;)
↳ _[1]=X(2)

```

D.15.15.4 isLocalizationRegular

Procedure from library `graal.lib` (see [Section D.15.15 \[graal.lib\]](#), page 1914).

Usage: `isLocalizationRegular(def L);` L ideal or `graalBearer`

Return: int, 1 if the localization A_L of A at L is regular,
0 otherwise.

Example:

```

LIB "graal.lib";
ring Q = 0, (X(1), X(2)), dp;
ideal H = X(2)^2 - (X(1)-1)*X(1)*(X(1)+1);
ideal J = X(1), X(2);
qring A = std(H);
ideal L = fetch(Q, J);
graalBearer Gr = graalMixed(L);
isLocalizationRegular(Gr); // = 1
↳ 1

```

D.15.15.5 warkedPreimageStd

Procedure from library `graal.lib` (see [Section D.15.15 \[graal.lib\]](#), page 1914).

Usage: `warkedPreimageStd(wM);` M warkedModule

Return: given wM consisting of:

- wM.Gr a `graalBearer` containing all relevant global structures
- wM.modQ0y generating set G of a module M over \mathbb{Q}_0y
- wM.stdmodQ0y empty
- wM.qQ0y empty
- wM.modKy corresponding generating set H of M_{in} over Ky
- wM.stdmodKy empty
- wM.qKy empty
- wM.w weights on M

returns the same warkedModule, except following differences: - wM.stdmodQ0y contains a subset G such that for any standard basis L of the kernel $G + L$ is a standard basis of $\text{modQ0y} + \text{kernel}$

- wM.qQ0y contains a transformation matrix such that $\text{stdmodAy} = \text{QAy} * \text{modQ0y}$
- wM.stdmodKy contains a standardbasis of modKy
- wM.qKy contains a transformation matrix such that $\text{stdmodKy} = \text{QKy} * \text{modKy}$

Note: the standard basis of modAy is computed by lifting a corresponding Groebner basis of modKy

Example:

```
LIB "graal.lib";
ring Q = 0,(x,y,z),dp;
ideal H = y2-xz;
qring A = std(H);
ideal L = x3-yz,x2y-z2;
graalBearer Gr = graalMixed(L);
def Q0y = Gr.Q0y; setring Q0y;
module M = (Y(1)*y+y^2-1)*gen(1)+(Y(2)*z+z^2-1)*gen(2), Y(1)*y*gen(1)+Y(2)*z*gen(2);
/* This is M: */
print(matrix(M));
↳ y^2-1+Y(1)*y,      Y(1)*y,
↳ (z^2-1)+(z)*Y(2), (z)*Y(2)
intvec w = 1,1,1;
warkedModule wM;
wM.Gr = Gr;
wM.modQ0y = M;
wM.w = w;
def Ky = Gr.Ky; setring Ky;
module Min = (y^2-1)*gen(1)+(z^2-1)*gen(2),Y(1)*y*gen(1)+Y(2)*z*gen(2);
/* This is M_in: */
print(matrix(Min));
↳ y^2-1,      Y(1)*y,
↳ (z^2-1), (z)*Y(2)
wM.modKy = Min;
/* warkedPreimageStd yields the same standard basis as std: */
warkedModule wN = warkedPreimageStd(wM); wN;
↳ // ** redefining scriptIin ( ideal scriptIin = Gr.scriptIin;)
↳ // ** redefining scriptI ( ideal scriptI = Gr.scriptI;)
↳ // ** redefining a ( poly a = L[1][1,1];)
↳ module over Q^0[Y] = (0,z),(Y(1),Y(2),x,y),(ds(2),c,dp(2)) / <0>:
↳ y^2-1+Y(1)*y,      Y(1)*y,
↳ (z^2-1)+(z)*Y(2), (z)*Y(2)
↳ standard basis:
↳ _[1,1],_[1,2],0,          0,          0,          0,

↳ (z^2-1), (z)*Y(2)
↳ weights on the unit vectors: 1,1,1
↳
setring Q0y;
module stdM = std(M);
```

```

print(matrix(stdM));
  ↪ y^2-1+Y(1)*y,    Y(1)-Y(1)^2*y,Y(1)^2*y^2,
  ↪ (z^2-1)+(z)*Y(2),_ [2,2],          _ [2,3]

```

D.15.15.6 resolutionInLocalization

Procedure from library `graal.lib` (see [Section D.15.15 \[graal.lib\]](#), page 1914).

Usage: `resolutionInLocalization(I,L)`; I ideal, L ideal or `graalBearer`

Return: the resolution of $I \cdot A_L$, where A_L is the localization of the current basering (possibly a quotient ring) at a prime ideal L.

Example:

```

LIB "graal.lib";
ring Q = 0, (x,y,z,w), dp;
ideal circle = (x-1)^2+y^2-3,z;
ideal twistedCubic = xz-y^2,yw-z^2,xw-yz,z;
ideal I = std(intersect(circle,twistedCubic));
// the resolution is more complicated due to the twisted cubic
res(I,0);
  ↪ 1      4      5      2
  ↪ Q <--  Q <--  Q <--  Q
  ↪
  ↪ 0      1      2      3
  ↪ resolution not minimized yet
  ↪
  // however if we localize outside of the twisted cubic,
  // it should become very easy again.
ideal L = std(I+ideal(x-1));
graalBearer Gr = graalMixed(L); Gr;
  ↪ affine coordinate ring:
  ↪ (QQ), (x,y,z,w), (dp(4),C)
  ↪
  ↪ ideal defining the subvariety:
  ↪ <z,x-1,y^2w-3w,y^4-3y^2>
  ↪
  ↪ A1:
  ↪ (0,w), (Y(1),Y(2),Y(3),Y(4),x,y,z), (ds(4),c,dp(3))
  ↪ mod <(w)*y^2+(-3*w)-Y(3),x-1-Y(2),z-Y(1), (3*w)*Y(3)+(-w^2)*Y(4)+Y(3)\
  ↪ ^2>
  ↪ graal:
  ↪ (0,w), (Y(1),Y(2),Y(3),Y(4),z), (c,dp(4),lp(1),L(1048575))
  ↪ mod <3*Y(3)+(-w)*Y(4),z^2+10*z-2>
  ↪ where
  ↪ Y(1) represents generator z
  ↪ Y(2) represents generator x-1
  ↪ Y(3) represents generator y^2w-3w
  ↪ Y(4) represents generator y^4-3y^2
  ↪ and x,y,z in A1 are mapped to 1,1/3*z+5/3,0 in Graal
  ↪
markedResolution mr = resolutionInLocalization(I,Gr);
  ↪ // ** full resolution in a qring may be infinite, setting max length to 5

```

```

mr;

D.15.16 gitfan_lib

Library: gitfan.lib

Purpose: Compute GIT-fans.

Authors: Janko Boehm, boehm at mathematik.uni-kl.de
 Simon Keicher, keicher at mail.mathematik.uni-tuebingen.de
 Yue Ren, ren at mathematik.uni-kl.de

Overview: This library allows you to calculate GIT-fans, torus orbits and GKZ-fans.

In provides features to make use of symmetries of the torus action under consideration.

The main procedure is GITfan which can be directly applied to an ideal and a grading matrix encoding the torus action, and returns a fan, the associated GIT-fan. We also provide various procedures implementing substeps of the algorithm to deal with large computations.

The library uses the package 'gfanlib' by Anders N. Jensen.

For notation, background, and algorithms see [BKR16].

Functions produce debug output if printlevel is positive.

Elements of the symmetric group S_n of type permutation can be created by the function permutationFromIntvec.

The images of $1, \dots, n$ can be obtained by `permutationToIntvec`. Composition of permutations can be done by the `*`-Operator, also powers can be computed in the usual way.

Types: permutation; Permutation in map representation.

Procedures:**D.15.16.1 isAface**

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\]](#), page 1919).

Usage: `isAface(a,gam0)`; a: ideal, gam0:intvec

Purpose: Checks whether gam0 is an a-face w.r.t. the ideal a.

Return: int

Example:

```
LIB "gitfan.lib";
ring R = 0,(T(1..4)),dp;
ideal I = T(1)*T(2)-T(4);
intvec w = 1,4;
intvec v = 1,2,4;
isAface(I,w); // should be 0
↪ 0
isAface(I,v); // should be 1
↪ 1
```

D.15.16.2 afaces

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\]](#), page 1919).

Usage: `afaces(a [,L])`; a: ideal, L: list of intvecs

Purpose: Returns a list of all a-faces (considered as intvecs of 0 and 1, where the i-th entry is 1 if the cone has the i-th unit basis vector as a generator), if L is specified only the faces of the simplex listed in L are considered (e.g. representatives with respect to a group action).

Return: a list of intvecs

Example:

```
LIB "gitfan.lib";
ring R = 0,T(1..3),dp;
ideal a = T(1)+T(2)+T(3);
list F = afaces(a);
print(F);
↪ [1]:

ideal J =

```

```

T(5)*T(10)-T(6)*T(9)+T(7)*T(8),
T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);
list F4 = afaces(J);
print(size(F4));
↳ 172

```

D.15.16.3 fullDimImages

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\], page 1919](#)).

Usage: `fullDimImages(afaces, Q)`; `afaces`: list, `Q`: intmat

Purpose: Determines the a-faces (represented as intvecs) from the list `afaces` which have a full-dimensional projection with respect to `Q`.

Return: a list of intvecs

Example:

```

LIB "gitfan.lib";
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =
T(5)*T(10)-T(6)*T(9)+T(7)*T(8),
T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);
intmat Q[5][10] =
1, 1, 1, 1, 0, 0, 0, 0, 0, 0,
1, 0, 0, 0, 1, 1, 1, 0, 0, 0,
0, 1, 1, 0, 0, 0, -1, 1, 0, 0,
0, 1, 0, 1, 0, -1, 0, 0, 1, 0,
0, 0, 1, 1, -1, 0, 0, 0, 0, 1;
list AF= afaces(J,nrows(Q));
size(AF);
↳ 81
size(fullDimImages(AF,Q));
↳ 36

```

D.15.16.4 minimalAfaces

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\], page 1919](#)).

Usage: `minimalAfaces(listOfAfaces)`; `listOfAfaces`: list

Purpose: Returns a list of all minimal a-faces. Note that `listOfAfaces` must only contain a-faces which project to full dimension.

Return: a list of intvecs

Example:

```

LIB "gitfan.lib";
setcores(4);
↳ 4

```

```

ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =
T(5)*T(10)-T(6)*T(9)+T(7)*T(8),
T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);
intmat Q[5][10] =
1, 1, 1, 1, 0, 0, 0, 0, 0, 0,
1, 0, 0, 0, 1, 1, 1, 0, 0, 0,
0, 1, 1, 0, 0, 0, -1, 1, 0, 0,
0, 1, 0, 1, 0, -1, 0, 0, 1, 0,
0, 0, 1, 1, -1, 0, 0, 0, 0, 1;
list AF= afaces(J,nrows(Q));
size(AF);
↳ 81
AF=fullDimImages(AF,Q);
size(AF);
↳ 36
AF=minimalAfaces(AF);
size(AF);
↳ 25

```

D.15.16.5 orbitCones

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\], page 1919](#)).

Usage: `orbitCones(AF, Q[, d]);` AF: list of intvecs, Q: intmat, d: int

Purpose: Returns the list consisting of all cones $Q(\text{gam}0)$ where $\text{gam}0$ in AF. If the optional argument `d` is given then the function returns only the orbit cones of dimension at least `d`

Return: a list of cones

Example:

```

LIB "gitfan.lib";
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =
T(5)*T(10)-T(6)*T(9)+T(7)*T(8),
T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);
intmat Q[5][10] =
1, 1, 1, 1, 0, 0, 0, 0, 0, 0,
1, 0, 0, 0, 1, 1, 1, 0, 0, 0,
0, 1, 1, 0, 0, 0, -1, 1, 0, 0,
0, 1, 0, 1, 0, -1, 0, 0, 1, 0,
0, 0, 1, 1, -1, 0, 0, 0, 0, 1;
list AF= afaces(J);
print(size(AF));
↳ 172
list OC = orbitCones(AF,Q);
size(OC);

```

↪ 172

D.15.16.6 GITcone

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\], page 1919](#)).

Usage: `GITcone(OCcones, w)`; `OCcones`: list of orbit cones, `w`: `bigintmat` with one row

Purpose: Returns the intersection of all orbit cones containing `w`.

Return: `cone,intvec` with the GIT cone containing `w`, and the hash of this cone (the indices of the orbit cones contributing to the intersection)

Example:

```
LIB "gitfan.lib";
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =
T(5)*T(10)-T(6)*T(9)+T(7)*T(8),
T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);
intmat Q[5][10] =
1, 1, 1, 1, 0, 0, 0, 0, 0, 0,
1, 0, 0, 0, 1, 1, 1, 0, 0, 0,
0, 1, 1, 0, 0, 0, -1, 1, 0, 0,
0, 1, 0, 1, 0, -1, 0, 0, 1, 0,
0, 0, 1, 1, -1, 0, 0, 0, 0, 1;
list AF= afaces(J,nrows(Q));
AF=fullDimImages(AF,Q);
AF = minimalAfaces(AF);
list OC = orbitCones(AF,Q);
bigintmat w[1][nrows(Q)];
for(int i = 1; i <= nrows(Q); i++){
w = w + Q[1..nrows(Q),i];
}
GITcone(OC,w);
↪ AMBIENT_DIM

```

D.15.16.7 GITfan

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\], page 1919](#)).

Usage: `GITfan(J,Q [, G])`; `J`:ideal, `Q`:`intmat`, `G`:list

Purpose: Computes the GIT fan associated to `J` and `Q`. Optionally a symmetry group action on the column space of `Q` can be specified.

Return: a fan, the GIT fan.

Note: The procedure uses parallel computation for the construction of the GIT-cones. The a-faces are not computed in parallel. This can be done by calling the `aface` procedure specifying a list of simplex faces. If used with the optional argument `G`, the orbit decomposition of the simplex of columns of `Q` is computed. Refer to the Singular documentation on how to do this more efficiently using GAP.

Example:

```
LIB "gitfan.lib";
setcores(4);
↳ 4
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =
T(5)*T(10)-T(6)*T(9)+T(7)*T(8),
T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);
intmat Q[5][10] =
1, 1, 1, 1, 0, 0, 0, 0, 0, 0,
1, 0, 0, 0, 1, 1, 1, 0, 0, 0,
0, 1, 1, 0, 0, 0, -1, 1, 0, 0,
0, 1, 0, 1, 0, -1, 0, 0, 1, 0,
0, 0, 1, 1, -1, 0, 0, 0, 0, 1;
fan GIT = GITfan(J,Q);
intmat Q[5][10] =
↳ // ** redefining Q (intmat Q[5][10] =)
1, 1, 1, 1, 0, 0, 0, 0, 0, 0,
1, 0, 0, 0, 1, 1, 1, 0, 0, 0,
0, 1, 1, 0, 0, 0, -1, 1, 0, 0,
0, 1, 0, 1, 0, -1, 0, 0, 1, 0,
0, 0, 1, 1, -1, 0, 0, 0, 0, 1;
list simplexSymmetryGroup = G25Action();
fan GIT2 = GITfan(J,Q,simplexSymmetryGroup);
```

D.15.16.8 GITfanFromOrbitCones

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\]](#), page 1919).

Usage: `GITfanFromOrbitCones(OC, Q, Qgamma [, file1, file2]);` `OC`:list, `Q`:bigintmat, `Qgamma`:cone, `file1`:string, `file2`:string

Purpose: Returns the common refinement of the cones given in the list `OC` which is supposed to contain the orbit cones intersected with `Qgamma`. The optional argument can be used to specify one or two strings with file names, where the first file will contain the hashes of the GIT-cones and the second argument the actual cones in their H-representation. To obtain the whole GIT-fan `Qgamma` has to be take the cone generated by the columns of `Q`.

Return: a list containing the bigint hashes of the GIT cones.

Example:

```
LIB "gitfan.lib";
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
```

```

ideal J =
T(5)*T(10)-T(6)*T(9)+T(7)*T(8),
T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);
intmat Q[5][10] =
1, 1, 1, 1, 0, 0, 0, 0, 0, 0,
1, 0, 0, 0, 1, 1, 1, 0, 0, 0,
0, 1, 1, 0, 0, 0, -1, 1, 0, 0,
0, 1, 0, 1, 0, -1, 0, 0, 1, 0,
0, 0, 1, 1, -1, 0, 0, 0, 0, 1;
list AF= afaces(J,nrows(Q));
AF=fullDimImages(AF,Q);
AF = minimalAfaces(AF);
list OC = orbitCones(AF,Q);
cone Qgamma = coneViaPoints(transpose(Q));
list GIT = GITfanFromOrbitCones(OC,Q,Qgamma);
size(GIT);
↳ 76

```

D.15.16.9 GITfanParallel

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\], page 1919](#)).

Usage: `GITfanParallel(OC, Q, Qgamma [, file1]);` OC:list, Q:intmat, Qgamma:cone, file1:string

Purpose: Returns the common refinement of the cones given in the list OC which is supposed to contain the orbit cones intersected with Qgamma. The optional argument can be used to specify a name for a file which will contain the hashes of the GIT-cones. To obtain the whole GIT-fan Qgamma has to be take the cone generated by the columns of Q.

Return: a list containing the bigint hashes of the GIT cones.

Note: The proceduce uses parallel computation for the construction of the GIT-cones.

Example:

```

LIB "gitfan.lib";
setcores(4);
↳ 4
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =
T(5)*T(10)-T(6)*T(9)+T(7)*T(8),
T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);
intmat Q[5][10] =
1, 1, 1, 1, 0, 0, 0, 0, 0, 0,
1, 0, 0, 0, 1, 1, 1, 0, 0, 0,
0, 1, 1, 0, 0, 0, -1, 1, 0, 0,
0, 1, 0, 1, 0, -1, 0, 0, 1, 0,
0, 0, 1, 1, -1, 0, 0, 0, 0, 1;
list AF= afaces(J);

```

```

print(size(AF));
↳ 172
list OC = orbitCones(AF,Q);
cone Qgamma = coneViaPoints(transpose(Q));
list GIT = GITfanParallel(OC,Q,Qgamma);
size(GIT);
↳ 76

```

D.15.16.10 GKZfan

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\], page 1919](#)).

D.15.16.11 movingCone

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\], page 1919](#)).

Usage: `movingCone(Q)`; `Q`: `intmat`

Purpose: Computes the moving cone from the grading matrix, with the degrees in the columns of `Q`.

Return: a cone

Example:

```

LIB "gitfan.lib";
intmat Q[5][10] =
1, 1, 1, 1, 0, 0, 0, 0, 0, 0,
1, 0, 0, 0, 1, 1, 1, 0, 0, 0,
0, 1, 1, 0, 0, 0, -1, 1, 0, 0,
0, 1, 0, 1, 0, -1, 0, 0, 1, 0,
0, 0, 1, 1, -1, 0, 0, 0, 0, 1;
cone mov = movingCone(Q);

```

D.15.16.12 computeAfaceOrbits

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\]](#), page 1919).

Usage: `computeAfaceOrbits(AF,G)`; AF list of intvecs, G: list of permutations

Purpose: Computes the orbits of the afaces in the list AF under the group action in G, where G is a list of permutations. We assume that the elements of G form a group and the first entry corresponds to the neutral element.

Return: a list of lists of intvecs

Example:

```

LIB "gitfan.lib";
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =
T(5)*T(10)-T(6)*T(9)+T(7)*T(8),
T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);
intmat Q[5][10] =
1, 1, 1, 1, 0, 0, 0, 0, 0, 0,
1, 0, 0, 0, 1, 1, 1, 0, 0, 0,
0, 1, 1, 0, 0, 0, -1, 1, 0, 0,
0, 1, 0, 1, 0, -1, 0, 0, 1, 0,
0, 0, 1, 1, -1, 0, 0, 0, 0, 1;
list simplexSymmetryGroup = G25Action();
list simplexOrbitRepresentatives = intvec( 1, 2, 3, 4, 5 ),
intvec( 1, 2, 3, 5, 6 ),
intvec( 1, 2, 3, 5, 7 ),
intvec( 1, 2, 3, 5, 10 ),
intvec( 1, 2, 3, 7, 9 ),
intvec( 1, 2, 6, 9, 10 ),
intvec( 1, 2, 3, 4, 5, 6 ),
intvec( 1, 2, 3, 4, 5, 10 ),
intvec( 1, 2, 3, 5, 6, 8 ),
intvec( 1, 2, 3, 5, 6, 9 ),
intvec( 1, 2, 3, 5, 7, 10 ),
intvec( 1, 2, 3, 7, 9, 10 ),
intvec( 1, 2, 3, 4, 5, 6, 7 ),
intvec( 1, 2, 3, 4, 5, 6, 8 ),
intvec( 1, 2, 3, 4, 5, 6, 9 ),
intvec( 1, 2, 3, 5, 6, 9, 10 ),
intvec( 1, 2, 3, 4, 5, 6, 7, 8 ),
intvec( 1, 2, 3, 4, 5, 6, 9, 10 ),
intvec( 1, 2, 3, 4, 5, 6, 7, 8, 9 ),
intvec( 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 );

```

D.15.16.13 minimalAfaceOrbits

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\]](#), page 1919).

Usage: `minimalAfaceOrbits(afaceOrbits);` afaceOrbits: list

Purpose: Returns a list of all minimal a-face orbits.

Return: a list of intvecs

Example:

```

LIB "gitfan.lib";
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =
T(5)*T(10)-T(6)*T(9)+T(7)*T(8),
T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);
intmat Q[5][10] =
1, 1, 1, 1, 0, 0, 0, 0, 0, 0,
1, 0, 0, 0, 1, 1, 1, 0, 0, 0,
0, 1, 1, 0, 0, 0, -1, 1, 0, 0,
0, 1, 0, 1, 0, -1, 0, 0, 1, 0,
0, 0, 1, 1, -1, 0, 0, 0, 0, 1;
list simplexSymmetryGroup = G25Action();
list simplexOrbitRepresentatives = intvec( 1, 2, 3, 4, 5 ),
intvec( 1, 2, 3, 5, 6 ),
intvec( 1, 2, 3, 5, 7 ),
intvec( 1, 2, 3, 5, 10 ),
intvec( 1, 2, 3, 7, 9 ),
intvec( 1, 2, 6, 9, 10 ),
intvec( 1, 2, 3, 4, 5, 6 ),
intvec( 1, 2, 3, 4, 5, 10 ),
intvec( 1, 2, 3, 5, 6, 8 ),
intvec( 1, 2, 3, 5, 6, 9 ),
intvec( 1, 2, 3, 5, 7, 10 ),
intvec( 1, 2, 3, 7, 9, 10 ),
intvec( 1, 2, 3, 4, 5, 6, 7 ),
intvec( 1, 2, 3, 4, 5, 6, 8 ),
intvec( 1, 2, 3, 4, 5, 6, 9 ),
intvec( 1, 2, 3, 5, 6, 9, 10 ),
intvec( 1, 2, 3, 4, 5, 6, 7, 8 ),
intvec( 1, 2, 3, 4, 5, 6, 9, 10 ),
intvec( 1, 2, 3, 4, 5, 6, 7, 8, 9 ),
intvec( 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 );
list afaceOrbitRepresentatives=afaces(J,simplexOrbitRepresentatives);
list fulldimAfaceOrbitRepresentatives=fullDimImages(afaceOrbitRepresentatives,Q);
list afaceOrbits=computeAfaceOrbits(fulldimAfaceOrbitRepresentatives,simplexSymmetryGroup);
apply(afaceOrbits,size);

```

```

↳ 10 15 10 1
list minAfaceOrbits = minimalAfaceOrbits(afaceOrbits);
apply(minAfaceOrbits,size);
↳ 10 15

```

D.15.16.14 orbitConeOrbits

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\], page 1919](#)).

Usage: `orbitConeOrbits(F, Q)`; F: list, Q: intmat

Purpose: Projects a list F of a-face orbits to the orbit cones with respect to Q. The function checks whether the projections are of full dimension and returns an error otherwise.

Return: a list of lists of cones

Example:

```

LIB "gitfan.lib";
// Note that simplexOrbitRepresentatives and simplexSymmetryGroup are subsets of the
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =
T(5)*T(10)-T(6)*T(9)+T(7)*T(8),
T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);
intmat Q[5][10] =
1, 1, 1, 1, 0, 0, 0, 0, 0, 0,
1, 0, 0, 0, 1, 1, 1, 0, 0, 0,
0, 1, 1, 0, 0, 0, -1, 1, 0, 0,
0, 1, 0, 1, 0, -1, 0, 0, 1, 0,
0, 0, 1, 1, -1, 0, 0, 0, 0, 1;
list simplexOrbitRepresentatives = intvec( 1, 2, 3, 4, 5 ),
intvec( 1, 2, 3, 5, 6 ),
intvec( 1, 2, 3, 5, 7 ),
intvec( 1, 2, 3, 5, 10 ),
intvec( 1, 2, 3, 7, 9 ),
intvec( 1, 2, 3, 4, 5, 6, 9, 10 ),
intvec( 1, 2, 3, 4, 5, 6, 7, 8, 9 ),
intvec( 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 );
list afaceOrbitRepresentatives=afaces(J,simplexOrbitRepresentatives);
list simplexSymmetryGroup = permutationFromIntvec(intvec( 1 .. 10 )),
permutationFromIntvec(intvec( 1, 2, 4, 3, 5, 7, 6, 9, 8, 10 )),

permutationFromIntvec(intvec( 1, 4, 3, 2, 7, 6, 5, 10, 9, 8 ));
list fulldimAfaceOrbitRepresentatives=fullDimImages(afaceOrbitRepresentatives,Q);
list afaceOrbits=computeAfaceOrbits(fulldimAfaceOrbitRepresentatives,simplexSymmetryGroup);
apply(afaceOrbits,size);
↳ 3 3 1
list minAfaceOrbits = minimalAfaceOrbits(afaceOrbits);
apply(minAfaceOrbits,size);
↳ 3
list listOfOrbitConeOrbits = orbitConeOrbits(minAfaceOrbits,Q);

```

D.15.16.15 minimalOrbitConeOrbits

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\], page 1919](#)).

Usage: `minimalOrbitConeOrbits(listOfOrbits)`; `listOfOrbits`: list of lists of cones

Purpose: Minimizes a list of orbit cone orbits.

Return: a list of lists of cones

Example:

```
LIB "gitfan.lib";
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =
T(5)*T(10)-T(6)*T(9)+T(7)*T(8),
T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);
intmat Q[5][10] =

```

D.15.16.16 intersectOrbitsWithMovingCone

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\]](#), page 1919).

Usage: `intersectOrbitsWithMovingCone(OCmin, mov)`; OCmin: list of lists of cones, mov: cone

Purpose: Intersects all cones in the orbits in OCmin with mov discarding all orbits of cones which are not of full dimension. The resulting orbits are duplicate free.

Return: a list of lists of cones

Example:

```

LIB "gitfan.lib";
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =
T(5)*T(10)-T(6)*T(9)+T(7)*T(8),
T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);
intmat Q[5][10] =
1, 1, 1, 1, 0, 0, 0, 0, 0, 0,
1, 0, 0, 0, 1, 1, 1, 0, 0, 0,

D.15.16.17 groupActionOnQImage

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\], page 1919](#)).

Usage: `groupActionOnQImage(G,Q)`; G: list of permutations, Q: intmat

Purpose: Given the group G of permutations acting on the simplex on `ncols(Q)` objects, computes the corresponding group action on the image of Q. We assume that the basering has characteristic 0.

Return: list of matrices

Example:

```

LIB "gitfan.lib";
ring R = 0,(x),dp;
intmat Q[5][10] =
1, 1, 1, 1, 0, 0, 0, 0, 0, 0,
1, 0, 0, 0, 1, 1, 1, 0, 0, 0,
0, 1, 1, 0, 0, 0, -1, 1, 0, 0,
0, 1, 0, 1, 0, -1, 0, 0, 1, 0,
0, 0, 1, 1, -1, 0, 0, 0, 0, 1;
list generatorsG = permutationFromIntvec(intvec( 1, 3, 2, 4, 6, 5, 7, 8, 10, 9 )),
permutationFromIntvec(intvec( 5, 7, 1, 6, 9, 2, 8, 4, 10, 3 ));
groupActionOnQImage(generatorsG,Q);
↳ [1]:
↳   1,0,0,0,0,

```

```

↳ 0,0,1,0,0,
↳ 0,0,0,0,1,
↳ 0,0,0,1,0
↳ [2]:
↳ -1,1,1,0,1,
↳ 1,0,0,0,0,
↳ -1,1,0,0,1,
↳ -1,1,1,0,0,
↳ -2,1,1,1,1

```

D.15.16.18 groupActionOnHashes

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan_lib\]](#), page 1919).

Usage: `groupActionOnHashes(Asigma,OCmov)`; Asigma: list, OCmov: list of list of cones

Purpose: From the list of orbits of orbitcones, and the symmetry group representation given by the matrices in Asigma, compute the corresponding permutation representation of the symmetry group on the orbit cones. The permutations are specified in a map representation of length the sum of the size of the orbits of OCmov.

Return: list of permutations

Example:

```

LIB "gitfan.lib";
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =
T(5)*T(10)-T(6)*T(9)+T(7)*T(8),
T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);
intmat Q[5][10] =

D.15.16.19 storeActionOnOrbitConeIndices

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\], page 1919](#)).

Usage: `storeActionOnOrbitConeIndices(generatorsGperm,st)`; `generatorsGperm`: list, `fn`: string

Purpose: Write the action on the set of orbit cones to the file `fn` in Singular readable format.

Return: nothing

D.15.16.20 permutationFromIntvec

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\], page 1919](#)).

Usage: `permutationFromIntvec(sigmaImage)`; `sigmaImage`: intvec

Purpose: Create a permutation from an intvec of images.

Return: permutation

D.15.16.21 permutationToIntvec

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\], page 1919](#)).

Usage: `permutationToIntvec(sigma)`; `sigma`: permutation

Purpose: Convert a permutation to an intvec of images.

Return: intvec

Example:

```

LIB "gitfan.lib";
permutation sigma = permutationFromIntvec(intvec( 1, 2, 4, 3, 5, 7, 6, 9, 8, 10 ));
sigma;
↳ | 1 2 3 4 5 6 7 8 9 10|
↳ | 1 2 4 3 5 7 6 9 8 10|
↳
permutationToIntvec(sigma);
↳ 1,2,4,3,5,7,6,9,8,10

```

D.15.16.22 evaluateProduct

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan_lib\], page 1919](#)).

Usage: `evaluateProduct(generatorsGperm,st)`; `generatorsGperm`: list, `st`: string

Purpose: Evaluates a formal product of variables `xi` in `st`, where `xi` corresponds to the permutation `generatorsGperm[i]`.

Return: permutation

Example:

```

LIB "gitfan.lib";
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =
T(5)*T(10)-T(6)*T(9)+T(7)*T(8),
T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);
intmat Q[5][10] =
1, 1, 1, 1, 0, 0, 0, 0, 0, 0,
1, 0, 0, 0, 1, 1, 1, 0, 0, 0,
0, 1, 1, 0, 0, 0, -1, 1, 0, 0,
0, 1, 0, 1, 0, -1, 0, 0, 1, 0,
0, 0, 1, 1, -1, 0, 0, 0, 0, 1;
list AF= afaces(J);
list OC = orbitCones(AF,Q);
list generatorsG = permutationFromIntvec(intvec( 1, 3, 2, 4, 6, 5, 7, 8, 10, 9 )),
permutationFromIntvec(intvec( 5, 7, 1, 6, 9, 2, 8, 4, 10, 3 ));
list Asigmagens = groupActionOnQImage(generatorsG,Q);
//list actionOnOrbitconeIndicesForGenerators = groupActionOnHashes(Asigmagens,OC);
string elementInTermsOfGenerators =
"(x2^-1*x1^-1)^3*x1^-1";
//evaluateProduct(actionOnOrbitconeIndicesForGenerators, elementInTermsOfGenerators)

```

D.15.16.23 GITfanSymmetric

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan_lib\], page 1919](#)).

Usage: `GITfanSymmetric(OC, Q, Qgamma, actiononorbitcones [, file1, file2])`; `OC`:list, `Q`:bigintmat, `Qgamma`:cone, `actiononorbitcones`: list of intvec, `file1`:string, `file2`:string

Purpose: Returns the common refinement of the cones given in the list `OC` which is supposed to contain the orbit cones intersected with `Qgamma`. The list `actiononorbitcones` is supposed to contain the symmetry group acting as permutations of on the list of orbit cones in `OC`. The optional argument can be used to

specify one or two strings with file names, where the first file will contain the hashes of the GIT-cones and the second argument the actual cones in their H-representation. To obtain the whole GIT-fan Q gamma has to be take the cone generated by the columns of Q .

Return: a list containing the bigint hashes of the GIT cones.

Example:

```
LIB "gitfan.lib";
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =
T(5)*T(10)-T(6)*T(9)+T(7)*T(8),
T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);
intmat Q[5][10] =
1, 1, 1, 1, 0, 0, 0, 0, 0, 0,
1, 0, 0, 0, 1, 1, 1, 0, 0, 0,
0, 1, 1, 0, 0, 0, -1, 1, 0, 0,
0, 1, 0, 1, 0, -1, 0, 0, 1, 0,
0, 0, 1, 1, -1, 0, 0, 0, 0, 1;
list simplexSymmetryGroup = G25Action();
list simplexOrbitRepresentatives = intvec( 1, 2, 3, 4, 5 ),
intvec( 1, 2, 3, 5, 6 ),
intvec( 1, 2, 3, 5, 7 ),
intvec( 1, 2, 3, 5, 10 ),

D.15.16.24 GITfanParallelSymmetric

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\]](#), page 1919).

Usage: `GITfanParallelSymmetric(OC, Q, Qgamma, actiononorbitcones [, file1]);` OC:list, Q:bigintmat, Qgamma:cone, actiononorbitcones: list of intvec, file1:string

Purpose: Returns the common refinement of the cones given in the list OC which is supposed to contain the orbit cones intersected with Qgamma. The list actiononorbitcones is supposed to contain the symmetry group acting as permutations of on the list of orbit cones in OC. The optional argument can be used to specify a name for a file which will contain the hashes of the GIT-cones. To obtain the whole GIT-fan Qgamma has to be take the cone generated by the columns of Q.

Return: a list containing the bigint hashes of the GIT cones.

Note: The procedure uses parallel computation for the construction of the GIT-cones.

Example:

```
LIB "gitfan.lib";
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =
T(5)*T(10)-T(6)*T(9)+T(7)*T(8),
T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);
intmat Q[5][10] =
1, 1, 1, 1, 0, 0, 0, 0, 0, 0,
1, 0, 0, 0, 1, 1, 1, 0, 0, 0,

D.15.16.25 bigintToBinary

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\], page 1919](#)).

Usage: `bigintToBinary(n, r)`: n bigint, r int.

Assume: n is smaller than 2^r .

Return: an intvec, with entries the positions of 1 in the binary representation of n with r bits.

Example:

```

LIB "gitfan.lib";
bigintToBinary(bigint(2)^90-1, 90);
↳ 1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22,23,24,25,26,27,2\

77,78,79,80,81,82,83,84,85,86,87,88,89,90

```

D.15.16.26 binaryToBigint

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\], page 1919](#)).

D.15.16.27 applyPermutationToIntvec

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\], page 1919](#)).

Usage: `applyPermutationToIntvec(v,g)`; v : intvec, g : permutation

Purpose: Apply g to the set of entries of v . The result is a sorted intvec. We assume that the entries of v are valid arguments of g . We do not require that the input is sorted.

Return: intvec.

Example:

```
LIB "gitfan.lib";
permutation g = permutationFromIntvec(intvec(10, 9, 7, 4, 8, 6, 3, 5, 2, 1));
applyPermutationToIntvec(intvec(1, 3, 4, 6, 8),g);
↳ 4,5,6,7,10
```

D.15.16.28 hashToCone

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\], page 1919](#)).

Usage: `hashToCone(v, OC)`: `v` bigint, `OC` list of cones.

Assume: the elements of `OC` are the orbit cones used in the hash representation of the GIT cones.

Return: a cone, the intersection of the cones in `OC` according to the binary representation of the hash `v`.

Example:

```
LIB "gitfan.lib";
setcores(4);
↳ 4
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =
T(5)*T(10)-T(6)*T(9)+T(7)*T(8),
T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);
intmat Q[5][10] =

↳
```

D.15.16.29 hashesToFan

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan.lib\], page 1919](#)).

Usage: hashesToFan(hashes, OC): hashes list of bigint, OC list of cones.

Assume: the elements of OC are the orbit cones used in the hash representation of the GIT cones.

Return: a fan, with maximal cones the intersections of the cones in OC according to the binary representation of the hashes.

Example:

```
LIB "gitfan.lib";
setcores(4);
↪ 4
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =
T(5)*T(10)-T(6)*T(9)+T(7)*T(8),
T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);
intmat Q[5][10] =
1, 1, 1, 1, 0, 0, 0, 0, 0, 0,
1, 0, 0, 0, 1, 1, 1, 0, 0, 0,
0, 1, 1, 0, 0, 0, -1, 1, 0, 0,
0, 1, 0, 1, 0, -1, 0, 0, 1, 0,
0, 0, 1, 1, -1, 0, 0, 0, 0, 1;
list AF= afaces(J,nrows(Q));
AF=fullDimImages(AF,Q);
AF = minimalAfaces(AF);
list OC = orbitCones(AF,Q);
cone Qgamma = coneViaPoints(transpose(Q));
list GIT = GITfanParallel(OC,Q,Qgamma);
fan Sigma = hashesToFan(GIT,OC);
```

D.15.16.30 gitCone

Procedure from library `gitfan.lib` (see [Section D.15.16 \[gitfan_lib\]](#), page 1919).

Usage: gitCone(a, Q, w); a: ideal, Q:bigintmat, w:bigintmat

Purpose: Returns the GIT-cone $\lambda(w)$, i.e. the intersection of all orbit cones containing the vector w .

Note: call this only if you are interested in a single GIT-cone.

Return: a cone.

Example:

```
LIB "gitfan.lib";
intmat Q[3][4] =
1,0,1,0,
0,1,0,1,
0,0,1,1;
ring R = 0,T(1..4),dp;
ideal a = 0;
bigintmat w[1][3] = 3,3,1;
cone lambda = gitCone(a, Q, w);
```

```

rays(lambda);
↳ 1,0,0,
↳ 0,1,0,
↳ 1,1,1
bigintmat w2[1][3] = 1,1,1;
cone lambda2 = gitCone(a, Q, w2);
rays(lambda2);
↳ 1,1,1

```

D.15.17 GND_lib

Library : GND.lib

Author : Adrian Popescu, popescu@mathematik.uni-kl.de

Overview :

A method to compute the General Neron Desingularization in the frame of one dimensional local domains

References:

[1] A. Popescu, D. Popescu, "A method to compute the General Neron Desingularization in the frame of one dimensional local domains", arxiv.org/abs/1508.05511

Procedures:

D.15.17.1 desingularization

Procedure from library GND.lib (see [Section D.15.17 \[GND_lib\], page 1957](#)).

Usage : Returns as output a General Neron Desingularization as in the Paper <http://arxiv.org/abs/1508.05511>

Example:

```

LIB "GND.lib";
//Example 1
ring All = 0, (a1,a2,a3,x1,x2,x3,Y1,Y2,Y3), dp;
int nra = 3;
int nrx = 3;

D.15.18 gradedModules_lib

Library: gradedModules.lib

Purpose: Operations with graded modules/matrices/resolutions

Authors: Oleksandr Motsak <U@D>, where U=motsak, D=mathematik.uni-kl.de
Hanieh Keneshlou <hkeneshlou@yahoo.com>

Overview: The library contains several procedures for constructing and manipulating graded modules/matrices/resolutions. Basics about graded objects can be found in [DL].

Throughout this library graded objects are graded maps, that is, matrices with polynomials, together with grading weights for source and destination. Graded modules are implicitly given as coker of a graded map. Note that in special cases we may also consider submodules in S^r generated by columns of a graded polynomial matrix (or a graded map).

Note: set `assumeLevel` to positive integer value in order to auto-check all assumptions. We denote the current basering by S .

References:

[DL] Decker, W., Lossen, Ch.: Computing in Algebraic Geometry, Springer, 2006

Procedures:

D.15.18.1 `grobj`

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `grobj(M, w[, d])`, matrix/ideal/module M , intvec w , d

Return: graded object with matrix presentation M , row weighting w [and total graded degrees d of columns]

Purpose: create a valid graded object with a given matrix presentation, weighting [and total graded degrees (in case of zero columns)]

Example:

```
LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
def A = grobj( module([x+y, x, 0, 0], [0, x+y, y, 0]), intvec(0,0,0,1) );
grview(A);
↳ Graded homomorphism: r^3 + r(-1) <- r(-1)^2, given by a matrix, with degr\
ees:

```

D.15.18.2 grtest

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `grtest(M[,b])`, anything M, optionally int b

Return: 1 if M is a valid graded object, 0 otherwise

Purpose: validate a graded object. Print an invalid object message if b is not given

Note: M should be an ideal or module or matrix, with weighting attribute 'isHomog' and optionally total graded degrees attribute 'degHomog'. Attributes should be compatible with the presentation matrix.

Example:

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
// the following calls will fail due to tests in grtest:

```

```

grobj( module([x+y, x, 0, 0], [0, x+y, y, 0]), intvec(0,0,0,0) ); // enough row weight
↳ _[1]=x*gen(2)+x*gen(1)+y*gen(1)
↳ _[2]=x*gen(2)+y*gen(3)+y*gen(2)
// grobj( module([x+y, x, 0, 0], [0, x+y, y, 0]), intvec(0,0) ); // not enough row weight
// grobj( module([x,0], [0,0,0], [0, y]), intvec(1,2,3) ); // zero column needs other row
grobj( module([x,0], [0,0,0], [0, y]), intvec(1,2,3), intvec(2, 10, 3) ); // compatible
↳ _[1]=x*gen(1)
↳ _[2]=0
↳ _[3]=y*gen(2)
// grobj( module([x,0], [0,0,0], [0, y]), intvec(1,2,3), intvec(2-1, 10, 3+1) ); // compatible

```

D.15.18.3 grdeg

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `grdeg(M)`, graded object `M`

Return: `intvec` of degrees

Purpose: graded degrees of columns (generators) of `M`, describing the source of `M`

Assume: `M` must be a graded object (matrix/module/ideal/mapping)

Note: if `M` has zero cols it should have `attrib(M,'degHomog')` set.

Example:

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module A = grobj( module([x+y, x, 0, 0], [0, x+y, y, 0]), intvec(0,0,0,1) );
grview(A);
↳ Graded homomorphism:  $r^3 + r(-1) \leftarrow r(-1)^2$ , given by a matrix, with degrees:
↳
↳ ..1 ..2 ....

D.15.18.4 grview

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `grview(M)`, graded object `M`

Return: nothing

Purpose: print the degree/grading data about the GRADED matrix/module/ideal/mapping object `M`

Assume: `M` must be graded

Example:

```
LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module A = grobj( module([x+y, x, 0, 0], [0, x+y, y, 0]), intvec(0,0,0,1) );
grview(A);
↪ Graded homomorphism: r^3 + r(-1) <- r(-1)^2, given by a matrix, with degr\
ees:
↪      ..1 ..2 ....
↪      --- --- +...
↪  0 :  1  -  |..1
↪  0 :  1  1  |..2
↪  0 :  -  1  |..3
↪  1 :  -  -  |..4

D.15.18.5 grshift

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `grshift(A, d)`, graded objects `A`, int `d`

Return: shifted graded object

Purpose: shift the grading on `A` by `d`: $A(i) \rightarrow A(i+d)$

Example:

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module A = grobj( module([x+y, x, 0, 0], [0, x+y, y, 0]), intvec(0,0,0,1) );
grview(A);
↳ Graded homomorphism: r^3 + r(-1) <- r(-1)^2, given by a matrix, with degr\
ees:
↳      ..1 ..2 ....
↳      --- --- +...
↳ 0 :  1   - |..1
↳ 0 :  1   1 |..2
↳ 0 :  -   1 |..3
↳ 1 :  -   - |..4
↳      === ===
↳      1   1

```

```

module S = grshift( A, 6);
grview(S);
↳ Graded homomorphism: r(6)^3 + r(5) <- r(5)^2, given by a matrix, with deg\
rees:
↳      ..1 ..2 ....
↳      --- --- +...
↳ -6 :  1  - |..1
↳ -6 :  1  1 |..2
↳ -6 :  -  1 |..3
↳ -5 :  -  - |..4
↳      === ===
↳      -5 -5
grview( grshift( grzero(), 100 ) ); // does nothing...
↳ !! Warning: shifting '0 <- 0' leaves it as it unchanged!
↳ Graded homomorphism: 0 <- 0, given by zero (0^2) matrix.

```

D.15.18.6 grzero

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `grzero()`

Return: graded object representing $S(0)^1$

Purpose: compute presentation of $S(0)^1$

Example:

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
grview( grobj(freemodule(0), intvec(0:0), intvec(0:0)) );
↳ Graded homomorphism: 0 <- 0, given by zero (0^2) matrix.
grview( grobj(freemodule(0), intvec(0:0)) );
↳ Graded homomorphism: 0 <- 0, given by zero (0^2) matrix.
grview( grzero() );
↳ Graded homomorphism: 0 <- 0, given by zero (0^2) matrix.
// def M = grpower( grshift( grzero(), 3), 2 ); grview(M);

```

D.15.18.7 grtwist

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `grtwist(a,d)`, int a, d

Return: graded object representing $S(d)^a$

Purpose: compute presentation of $S(d)^a$

Example:

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
// grview(grpower( grshift(grzero(), 10), 5 ) );
grview( grtwist (5, 10) );
↳ Graded homomorphism: r(10)^5 <- 0, given by zero (5 x 0) matrix.

```

D.15.18.8 grtwists

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\], page 1960](#)).

Usage: `grtwists(v), intvec v`

Return: graded object representing $S(v[1]) + \dots + S(v[\text{size}(v)])$

Purpose: compute presentation of $S(v[1]) + \dots + S(v[\text{size}(v)])$

Example:

```
LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
grview( grtwists ( intvec(-4, 1, 6 )) );
↳ Graded homomorphism: r(-4) + r(1) + r(6) <- 0, given by zero (3 x 0) matr\
ix.
grview( grtwists ( intvec(0:0) ) );
↳ Graded homomorphism: 0 <- 0, given by zero (0^2) matrix.
```

D.15.18.9 grsum

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\], page 1960](#)).

Usage: `grsum(A, B), graded objects A and B`

Return: graded direct sum of input objects

Purpose: compute the graded direct sum of A and B

Example:

```
LIB "gradedModules.lib";
// if( defined(assumeLevel) ){ int assumeLevel0 = assumeLevel; } else { int assumeLevel0 = 0; }
ring r=32003,(x,y,z),dp;
module A = grobj( module([x+y, x, 0, 0], [0, x+y, y, 0]), intvec(0,0,0,1) );
grview(A);
↳ Graded homomorphism: r^3 + r(-1) <- r(-1)^2, given by a matrix, with degr\
ees:
↳ ..1 ..2 ....
↳ --- --- +...
↳ 0 : 1 - |..1
↳ 0 : 1 1 |..2
↳ 0 : - 1 |..3
↳ 1 : - - |..4
↳ === ===
↳ 1 1
module B = grobj( module([0,x,y]), intvec(15,1,1) );
grview(B);
↳ Graded homomorphism: r(-15) + r(-1)^2 <- r(-2), given by a matrix, with d\
egrees:
↳ ..1 ....
↳ --- +...
↳ 15 : - |..1
↳ 1 : 1 |..2
↳ 1 : 1 |..3
↳ ===
↳ 2
module C = grsum(A,B);
```

```

print(C);
↳ x+y,0, 0,
↳ x, x+y,0,
↳ 0, y, 0,
↳ 0, 0, 0,
↳ 0, 0, 0,
↳ 0, 0, x,
↳ 0, 0, y
homog(C);
↳ 1
grview(C);
↳ Graded homomorphism:  $r^3 + r(-1) + r(-15) + r(-1)^2 \leftarrow r(-1)^2 + r(-2)$ ,  $g \setminus$ 
   given by a matrix, with degrees:
↳      ..1 ..2 ..3 ....
↳      --- --- --- +...
↳ 0 : 1 - - |..1
↳ 0 : 1 1 - |..2
↳ 0 : - 1 - |..3

D.15.18.10 grpowers

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `grpowers(A, p)`, graded object A , int $p > 0$

Return: graded direct power A^p

Purpose: compute the graded direct power A^p

Note: the power p must be positive

Example:

```
LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module A = grobj( module([x+y, x, 0], [0, x+y, y]), intvec(1,1,1) );
grview(A);
↳ Graded homomorphism:  $r(-1)^3 \leftarrow r(-2)^2$ , given by a matrix, with degrees:

D.15.18.11 grtranspose

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `grtranspose(M)`, graded object `M`

Return: graded object

Purpose: graded transpose of `M`

Note: no reordering is performed by this procedure

Example:

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module M = grtwists( intvec(-2, 0, 4, 4) ); grview(M);
↳ Graded homomorphism: r(-2) + r + r(4)^2 <- 0, given by zero (4 x 0) matrix.
module N = grsyz( grtranspose( M ) ); grview(N);
↳ Graded homomorphism: r(2) + r + r(-4)^2 <- r(2) + r + r(-4)^2, given by a \
  diagonal matrix, with degrees:
↳ ..1 ..2 ..3 ..4 ....
↳ --- --- --- --- +...
↳ -2 : 0 - - - |..1
↳ 0 : - 0 - - |..2
↳ 4 : - - 0 - |..3
↳ 4 : - - - 0 |..4
↳      === === === ===
↳      -2 0 4 4
module L = grtranspose(N); grview( L );
↳ Graded homomorphism: r(-2) + r + r(4)^2 <- r(-2) + r + r(4)^2, given by a \
  diagonal matrix, with degrees:
↳ ..1 ..2 ..3 ..4 ....
↳ --- --- --- --- +...
↳ 2 : 0 - - - |..1
↳ 0 : - 0 - - |..2
↳ -4 : - - 0 - |..3
↳ -4 : - - - 0 |..4
↳      === === === ===
↳      2 0 -4 -4
module K = grsyz( L ); grview(K);
↳ Graded homomorphism: r(-2) + r + r(4)^2 <- 0, given by zero (4 x 0) matrix.
  x.
// Corner cases: 0 <- 0!
module Z = grzero(); grview(Z);
↳ Graded homomorphism: 0 <- 0, given by zero (0^2) matrix.
grview( grtranspose( Z ) );
↳ Graded homomorphism: 0 <- 0, given by zero (0^2) matrix.
// Corner cases: * <- 0

```

```

matrix M1[3][0];
module Z1 = grobj( M1, intvec(-1, 0, 1) ); grview(Z1);
↳ Graded homomorphism:  $r(1) + r + r(-1) \leftarrow 0$ , given by zero (3 x 0) matrix.
grview( grtranspose( Z1 ) );
↳ Graded homomorphism:  $0 \leftarrow r(-1) + r + r(1)$ , given by zero (0 x 3) matrix.
// Corner cases:  $0 \leftarrow *$ 
matrix M2[0][3];
module Z2 = grobj( M2, 0:0, intvec(-1, 0, 1) ); grview(Z2);
↳ Graded homomorphism:  $0 \leftarrow r(1) + r + r(-1)$ , given by zero (0 x 3) matrix.
grview( grtranspose( Z2 ) );
↳ Graded homomorphism:  $r(-1) + r + r(1) \leftarrow 0$ , given by zero (3 x 0) matrix.

```

D.15.18.12 grgens

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `grgens(M)`, graded object M (map)

Return: graded object

Purpose: try compute graded generators of `coker(M)` and return them as columns of a graded map.

Note: presentation of resulting generated submodule may be different to M!

Example:

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module M = grtwists( intvec(-2, 0, 4, 4) ); grview(M);
↳ Graded homomorphism:  $r(-2) + r + r(4)^2 \leftarrow 0$ , given by zero (4 x 0) matrix.
module N = grgens(M);
grview( N ); print(N); // fine == M
↳ Graded homomorphism:  $r(-2) + r + r(4)^2 \leftarrow r(-2) + r + r(4)^2$ , given by a
diagonal matrix, with degrees:
↳
..1 ..2 ..3 ..4 ....
↳ --- --- --- --- +...
↳ 2 : 0 - - - |..1
↳ 0 : - 0 - - |..2
↳ -4 : - - 0 - |..3
↳ -4 : - - - 0 |..4
↳
=== === === ===
↳ 2 0 -4 -4
↳ 1,0,0,0,
↳ 0,1,0,0,
↳ 0,0,1,0,
↳ 0,0,0,1
module A = grobj( module([x+y, x, 0, 3], [0, x+y, y, 2], [y, y, z, 1]), intvec(0,0,0,0) );
A = grgroebner(A); grview(A);
↳ Graded homomorphism:  $r^3 + r(-1) \leftarrow r(-1)^3 + r(-2) + r(-3)$ , given by a matrix, with degrees:
↳
..1 ..2 ..3 ..4 ..5 ....
↳ --- --- --- --- --- +...
↳ 0 : 1 1 1 2 - |..1
↳ 0 : 1 - 1 - - |..2

```

```

↳ 0 : 1 1 1 2 3 |..3
↳ 1 : 0 0 0 1 2 |..4
↳      === === === === ===
↳      1 1 1 2 3
module B = grgens(A);
grview( B ); print(B); // Ups :( != A
↳ Graded homomorphism: r(2) <- r^3 + r(-1), given by a matrix, with degrees\
:
↳      ..1 ..2 ..3 ..4 ....
↳      --- --- --- --- +...
↳ -2 : 2 2 2 3 |..1
↳      === === === ===
↳      0 0 0 1
↳ xy-3y2+xz+3yz,-xy+2y2+2xz+2yz,x2-xy-4y2,y3-x2z-2xyz-y2z
grview( grgens( grzero() ) );
↳ Graded homomorphism: 0 <- 0, given by zero (0^2) matrix.

```

D.15.18.13 grpres

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `grpres(M)`, graded object `M` (submodule gens)

Return: graded module (via coker)

Purpose: compute graded presentation matrix of submodule generated by columns of `M`

Example:

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
def A = grgroebner( grobj( module([x+y, x, 0, 3], [0, x+y, y, 2], [y, y, z, 1]), int
grview(A);
↳ Graded homomorphism: r^3 + r(-1) <- r(-1)^3 + r(-2) + r(-3), given by a m\
atrix, with degrees:
↳      ..1 ..2 ..3 ..4 ..5 ....
↳      --- --- --- --- --- +...

```

D.15.18.14 grorder

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `grorder(M)`, graded object or list M

Return: same as input

Purpose: reorder/transform graded object or chain complex M into block form

Assume: M must be a graded object or a list of graded objects

Example:

```

LIB "gradedModules.lib";
"Surface Name: 'rat.d10.g9.quart2' in P^4";
↳ Surface Name: 'rat.d10.g9.quart2' in P^4
int @p=31991; ring R = (@p), (x,y,z,u,v), dp;

D.15.18.16 TestGRRes

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `TestGRRes(name, I)`, string name, ideal I

Return: nothing

Purpose: compute/test/output/order/transpose a graded resolution of I

Example:

```

LIB "gradedModules.lib";
// if( defined(assumeLevel) ){ int assumeLevel0 = assumeLevel; } else { int assumeLevel0 = 0; }
// note: data from random generation 2
string Name = "castelnuovo"; int @p=31991; ring R = (@p),(x,y,z,u,v), dp;ideal I = 5
↳ =====

D.15.18.17 KeneshlouMatrixPresentation

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `KeneshlouMatrixPresentation(intvec a), intvec a.`

Return: graded object

Purpose: matrix presentation for direct sum of ω^ai in form of a graded object

Example:

```

LIB "gradedModules.lib";
ring r = 32003,(x(0..4)),dp;
def N1 = KeneshlouMatrixPresentation(intvec(2,0,0,0,0));
grview(N1);
↪ Graded homomorphism: r^2 <- 0, given by zero (2 x 0) matrix.
def N2 = KeneshlouMatrixPresentation(intvec(0,0,0,0,3));
grview(N2);
↪ Graded homomorphism: r(-1)^3 <- 0, given by zero (3 x 0) matrix.

```

```

def N = KeneshlouMatrixPresentation(intvec(2,0,0,0,3));
grview(N);
↳ Graded homomorphism:  $r^2 + r(-1)^3 \leftarrow 0$ , given by zero (5 x 0) matrix.
def M1 = KeneshlouMatrixPresentation(intvec(0,1,0,0,0));
grview(M1);
↳ Graded homomorphism:  $r(-1)^{10} \leftarrow r(-2)^{10}$ , given by a square matrix, with\
degrees:
↳      ..1 ..2 ..3 ..4 ..5 ..6 ..7 ..8 ..9 .10 ....
↳      --- --- --- --- --- --- --- --- --- --- +...
↳      1 : 1  1  -  -  1  -  -  -  -  -  |..1
↳      1 : 1  -  1  -  -  1  -  -  -  -  |..2
↳      1 : 1  -  -  1  -  -  1  -  -  -  |..3

D.15.18.18 grsyz

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `grsyz(M)`, graded object M

Return: graded object

Purpose: compute graded syzygy of M

Example:

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module A = grgroebner( grobj( module([x+y, x, 0, 3], [0, x+y, y, 2], [y, y, z, 1]),
grview(A);
↳ Graded homomorphism: r^3 + r(-1) <- r(-1)^3 + r(-2) + r(-3), given by a m\
atrix, with degrees:

```

```

↳      ..1 ..2 ..3 ..4 ..5 ....
↳      --- --- --- --- --- +...
↳  0 :  1  1  1  2  - |..1
↳  0 :  1  -  1  -  - |..2
↳  0 :  1  1  1  2  3 |..3
↳  1 :  0  0  0  1  2 |..4
↳      === === === === ===
↳      1  1  1  2  3
grview(grsyz(A));
↳ Graded homomorphism: r(-1)^3 + r(-2) + r(-3) <- r(-2) + r(-3), given by a\
matrix, with degrees:
↳      ..1 ..2 ....
↳      --- --- +...
↳  1 :  1  - |..1
↳  1 :  1  2 |..2
↳  1 :  1  - |..3
↳  2 :  0  1 |..4
↳  3 :  -  0 |..5
↳      === ===
↳      2  3
module X = grgroebner( grobj( module([x]), intvec(2) ) );
grview(X);
↳ Graded homomorphism: r(-2) <- r(-3), given by a diagonal matrix, with deg\
rees:
↳      .1 ...
↳      -- +..
↳  2 :  1 |.1
↳      ==
↳      3
// syzygy module should be zero!
grview(grsyz(X));
↳ Graded homomorphism: r(-3) <- 0, given by zero (1 x 0) matrix.

```

D.15.18.19 grres

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `grres(M, l[, b])`, graded object M, int l, int b

Return: graded resolution = list of graded objects

Purpose: compute graded resolution of M (of length l) and minimise it if b was given

Example:

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module A = grobj( module([x+y, x, 0, 3], [0, x+y, y, 2], [y, y, z, 1]), intvec(0,0,0)
grview(A);
↳ Graded homomorphism: r^3 + r(-1) <- r(-1)^3, given by a matrix, with degr\
ees:
↳      ..1 ..2 ..3 ....
↳      --- --- --- +...
↳  0 :  1  -  1 |..1
↳  0 :  1  1  1 |..2
↳  0 :  -  1  1 |..3

```

```

↳ 1 : 0 0 0 |..4
↳   === === ===
↳   1 1 1
module B = grgroebner(A);
grview(B);
↳ Graded homomorphism:  $r^3 + r(-1) \leftarrow r(-1)^3 + r(-2) + r(-3)$ , given by a matrix, with degrees:
↳   ..1 ..2 ..3 ..4 ..5 ....
↳   --- --- --- --- --- +...
↳ 0 : 1 1 1 2 - |..1
↳ 0 : 1 - 1 - - |..2
↳ 0 : 1 1 1 2 3 |..3
↳ 1 : 0 0 0 1 2 |..4
↳   === === === === ===
↳   1 1 1 2 3
"graded resolution of B: "; def C = grres(B, 0); grview(C);
↳ graded resolution of B:
↳ Graded resolution:

```

```

↳ 2
↳ Graded homomorphism:  $r(-1) + r(-2) + r(-1)^2 + r(-3) \leftarrow 0$ , given by zero \
(5 x 0) matrix.

```

D.15.18.20 grlift

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\], page 1960](#)).

Usage: `grlift(M, N)`, graded objects M and N

Return: transformation matrix (graded object???)

Purpose: compute graded matrix which the generators of submodule $\text{Im}(N)$ in terms of $\text{Im}(M)$.

Example:

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module P=grobj(module([xy,0,xz]),intvec(0,1,0));
grview(P);
↳ Graded homomorphism:  $r + r(-1) + r \leftarrow r(-2)$ , given by a matrix, with degr\
ees:
↳      ..1 ....
↳      --- +...
↳  0 :  2 |..1
↳  1 :  - |..2
↳  0 :  2 |..3
↳      ===
↳      2
module D=grobj(module([y,0,z],[x2+y2,z,0]),intvec(0,1,0));
grview(D);
↳ Graded homomorphism:  $r + r(-1) + r \leftarrow r(-1) + r(-2)$ , given by a matrix, w\
ith degrees:
↳      ..1 ..2 ....
↳      --- --- +...
↳  0 :  1  2 |..1
↳  1 :  -  1 |..2
↳  0 :  1  - |..3

def G=grlift(D,P);
grview(G);
↳ Graded homomorphism:  $r(-1) + r(-2) \leftarrow r(-2)$ , given by a matrix, with degr\
ees:
↳      ..1 ....
↳      --- +...
↳  1 :  1 |..1
↳  2 :  - |..2
↳      ===
↳      2
ASSUME(0, grisqual( grprod(D, G), P ) );

```

D.15.18.21 grprod

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\], page 1960](#)).

Usage: `grprod(M, N)`, graded objects M and N

Return: graded object

Purpose: compute graded product $M * N$ (as composition of maps)

Example:

```
LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module A = grobj( module([x+y, x, 0, 3], [0, x+y, y, 2], [y, y, z, 1]), intvec(0,0,0)
grview(A);
↳ Graded homomorphism:  $r^3 + r(-1) \leftarrow r(-1)^3$ , given by a matrix, with degr\
ees:
↳      ..1 ..2 ..3 ....
↳      --- --- --- +...
↳      0 : 1  -  1 |..1
↳      0 : 1  1  1 |..2

↳      1  1  1  2  3
module B = grsyz(A);
grview(B);
↳ Graded homomorphism:  $r(-1)^3 + r(-2) + r(-3) \leftarrow r(-2) + r(-3)$ , given by a\
matrix, with degrees:
↳      ..1 ..2 ....
↳      --- --- +...
↳      1 : 1  - |..1
↳      1 : 1  2 |..2
↳      1 : 1  - |..3
↳      2 : 0  1 |..4
↳      3 : -  0 |..5
↳      === ===
↳      2  3
print(B);
↳ x, 0,
↳ -y,y2,
↳ -y,0,
↳ 1, -x-2y,
↳ 0, 1
module D = grprod( A, B );
grview(D);
↳ Graded homomorphism:  $r^3 + r(-1) \leftarrow r(-2) + r(-3)$ , given by zero (4 x 2) \
matrix.
```

```

print(D); // must be all zeroes due to syzygy property!
↳ 0,0,
↳ 0,0,
↳ 0,0,
↳ 0,0
ASSUME(0, size(D) == 0);

```

D.15.18.22 grgroebner

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\], page 1960](#)).

Usage: `grgroebner(M)`, graded object M

Return: graded object

Purpose: compute graded groebner basis of M

Example:

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module A = grobj( module([x+y, x, 0, 0], [0, x+y, y, 0]), intvec(0,0,0,1) );
grview(A);
↳ Graded homomorphism:  $r^3 + r(-1) \leftarrow r(-1)^2$ , given by a matrix, with degr\
ees:
↳
↳      ..1 ..2 ....
↳      --- --- +...
↳  0 :  1  -  |..1
↳  0 :  1  1  |..2
↳  0 :  -  1  |..3
↳  1 :  -  -  |..4
↳      === ===
↳      1  1
module B = grgroebner(A);
grview(B);
↳ Graded homomorphism:  $r^3 + r(-1) \leftarrow r(-1)^2$ , given by a matrix, with degr\
ees:
↳
↳      ..1 ..2 ....
↳      --- --- +...
↳  0 :  1  -  |..1
↳  0 :  1  1  |..2
↳  0 :  1  1  |..3
↳  1 :  -  -  |..4
↳      === ===
↳      1  1

```

D.15.18.23 grconcat

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\], page 1960](#)).

Usage: `grconcat(A, B)`, graded objects A and B , $\text{dst}(A) == \text{dst}(B) =: \text{dst}$

Return: graded object

Purpose: construct $\text{src}(A) + \text{src}(B) \longrightarrow \text{dst}$ given by $(A|B)$

Example:

```

LIB "gradedModules.lib";
ring r;
module R=grobj(module([x,y,z]),intvec(0:3));
grview(R);
↳ Graded homomorphism: r^3 <- r(-1), given by a matrix, with degrees:
↳   .1 ...
↳   -- +..
↳  0 : 1 |.1
↳  0 : 1 |.2
↳  0 : 1 |.3
↳   ==
↳   1
module S=grobj(module([x,0,y],[xy,zy+x2,0]),intvec(0:3));
grview(S);
↳ Graded homomorphism: r^3 <- r(-1) + r(-2), given by a matrix, with degree\
  s:
↳   ..1 ..2 ....
↳   --- --- +...
↳  0 : 1  2 |..1
↳  0 : - 2 |..2
↳  0 : 1  - |..3
↳   === ===
↳   1  2
def Q=grconcat(R,S);
grview(Q);
↳ Graded homomorphism: r^3 <- r(-1)^2 + r(-2), given by a square matrix, wi\
  th degrees:
↳   ..1 ..2 ..3 ....
↳   --- --- --- +...
↳  0 : 1  1  2 |..1
↳  0 : 1  - 2 |..2
↳  0 : 1  1  - |..3
↳   === === ===
↳   1  1  2

```

D.15.18.24 grrndmat

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `grrndmat(src,dst[,p,b]), intvec src, dst[, int p, b]`

Return: matrix of polynomials

Purpose: generate random matrix compatible with `src` and `dst` gradings

Note: optional arguments `p, b` are for 'sparsepoly' (by default: 75%, 30000).

Todo: this is experimental at the moment!

Example:

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
print( grrndmat( intvec(0, 1), intvec(1, 2, 3) ) );
↳ 6204y, -7833,
↳ -12498xz+12773z2, 5664z,
↳ -10041x3-11973x2y-5644xy2,-7740xy-5361z2

```

D.15.18.25 grrndmap

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `grrndmap(S,D)`, graded objects S and D

Return: graded object

Purpose: construct a random 0-deg graded homomorphism $\text{src}(S) \rightarrow \text{src}(D)$

Example:

```
LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module D=grobj(module([y,0,z],[x2+y2,z,0]),intvec(0,1,0));
grview(D);
↳ Graded homomorphism: r + r(-1) + r <- r(-1) + r(-2), given by a matrix, w\
ith degrees:
↳      ..1 ..2 ....
↳      --- --- +...
↳      0 :  1  2 |..1
↳      1 :  -  1 |..2
↳      0 :  1  - |..3
↳      === ===
↳      1  2
module S=grobj(module([x,0,y],[xy,zy+x2,0]),intvec(0,0,0));
grview(S);
↳ Graded homomorphism: r^3 <- r(-1) + r(-2), given by a matrix, with degree\
s:
↳      ..1 ..2 ....
↳      --- --- +...
↳      0 :  1  2 |..1
↳      0 :  -  2 |..2
↳      0 :  1  - |..3
↳      === ===
↳      1  2
def H=grrndmap(D,S);
grview(H);
↳ Graded homomorphism: r(-1) + r(-2) <- r(-1) + r(-2), given by a square ma\
trix, with degrees:
↳      ..1 ..2 ....
↳      --- --- +...
↳      1 :  0  1 |..1
↳      2 :  -  0 |..2
↳      === ===
↳      1  2
```

D.15.18.26 grrndmap2

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `grrndmap2(D,S)`, graded objects S and D

Return: graded object

Purpose: construct a random 0-deg graded homomorphism between target of D and S.

Example:

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module D=grobj(module([y,0,z],[x2+y2,z,0]),intvec(0,1,0));
grview(D);
↳ Graded homomorphism:  $r + r(-1) + r \leftarrow r(-1) + r(-2)$ , given by a matrix, with
degrees:
↳      ..1 ..2 ....
↳      --- --- +...
↳  0 :  1  2 |..1
↳  1 :  -  1 |..2
↳  0 :  1  - |..3
↳      === ===
↳      1  2
module S=grobj(module([x,0,y],[xy,zy+x2,0]),intvec(0,0,0));
grview(S);
↳ Graded homomorphism:  $r^3 \leftarrow r(-1) + r(-2)$ , given by a matrix, with degree\
s:
↳      ..1 ..2 ....
↳      --- --- +...
↳  0 :  1  2 |..1
↳  0 :  -  2 |..2
↳  0 :  1  - |..3
↳      === ===
↳      1  2
def G=grrndmap2(D,S);
grview(G);
↳ Graded homomorphism:  $r^3 \leftarrow r + r(-1) + r$ , given by a square matrix, with\
degrees:
↳      .1 .2 .3 ...
↳      -- -- -- +..
↳  0 :  0  1  0 |.1
↳  0 :  0  1  0 |.2
↳  0 :  0  1  0 |.3
↳      == == ==
↳      0  1  0

```

D.15.18.27 grlifting

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `grlifting(M,N)`, graded objects M and N

Return: map of chain complexes (as a list)

Purpose: construct a map of chain complexes between free resolutions of $\text{Img}(M)$ and $\text{Img}(N)$.

Example:

```

LIB "gradedModules.lib";
/*
ring r=32003,(x,y,z),dp;
module P=grobj(module([xy,0,xz]),intvec(0,1,0));
grview(P);
module D=grobj(module([y,0,z],[x2+y2,z,0]),intvec(0,1,0));
grview(D);
def G=grlifting(D,P);

```

```

grview(G);
kill r;
ring r=32003,(x,y,z),dp;
module D=grobj(module([y,0,z],[x2+y2,z,0],[z3,xy,xy2]),intvec(0,1,0));
D = grgroebner(D);
grview( grres(D, 0));
def G=grlifting(D, D);
grview(G);
*/
ring S = 0, (x(0..3)), dp;
list kos = grres(grobj(maxideal(1), intvec(0)), 0);
print( betti(kos), "betti");
↳          0    1    2    3    4

```

D.15.18.28 grlifting2

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `grlifting2(A,B)`, graded objects A and B (matrices defining maps)

Return: map of chain complexes (as a list)

Purpose: construct a map of chain complexes between free resolution of $M=\text{coker}(A)$ and $N=\text{coker}(B)$.

Example:

```

LIB "gradedModules.lib";
ring r;
module P=grobj(module([xy,0,xz]),intvec(0,1,0));
grview(P);
↳ Graded homomorphism: r + r(-1) + r <- r(-2), given by a matrix, with degr\
ees:
↳      ..1 ....
↳      --- +...
↳ 0 : 2 |..1
↳ 1 : - |..2
↳ 0 : 2 |..3
↳      ===
↳      2
module D=grobj(module([y,0,z],[x2+y2,z,0]),intvec(0,1,0));
grview(D);
↳ Graded homomorphism: r + r(-1) + r <- r(-1) + r(-2), given by a matrix, w\
ith degrees:
↳      ..1 ..2 ....
↳      --- --- +...
↳ 0 : 1 2 |..1
↳ 1 : - 1 |..2
↳ 0 : 1 - |..3
↳      === ===
↳      1 2
module PP = grpres(P);
grview(PP);

```

```

↳ Graded homomorphism:  $r(-2) \leftarrow 0$ , given by zero (1 x 0) matrix.
module DD = grpres(D);
grview(DD);
↳ Graded homomorphism:  $r(-1) + r(-2) \leftarrow 0$ , given by zero (2 x 0) matrix.
def T=grlifting2(DD,PP); T;
↳ T[1]=0
↳ T[2]=-5361*gen(1)
// def Z=grlifting2(P,D); Z; // WRONG!!!

```

D.15.18.29 mappingcone

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `mappingcone(M,N)`, M,N graded objects

Return: chain complex (as a list)

Purpose: construct a free resolution of the cokernel of a random map between `Img(M)`, and `Img(N)`.

Example:

```

LIB "gradedModules.lib";
ring r=32003, (x(0..4)),dp;
def A=KeneshlouMatrixPresentation(intvec(0,0,0,0,3));
def M=grgens(A);
grview(M);
↳ Graded homomorphism:  $r(-1)^3 \leftarrow r(-1)^3$ , given by a diagonal matrix, with\
degrees:
↳
  ..1 ..2 ..3 ....
↳  --- --- --- +...
↳  1 :  0  -  - |..1
↳  1 :  -  0  - |..2
↳  1 :  -  -  0 |..3
↳  === === ===
↳      1  1  1
def B=KeneshlouMatrixPresentation(intvec(0,1,0,0,0));
def N=grgens(B);
grview(N);
↳ Graded homomorphism:  $r^5 \leftarrow r(-1)^{10}$ , given by a matrix, with degrees:
↳
  ..1 ..2 ..3 ..4 ..5 ..6 ..7 ..8 ..9 .10 ....
↳  --- --- --- --- --- --- --- --- --- --- +...
↳  0 :  -  -  -  -  -  -  1  1  1  1 |..1
↳  0 :  1  1  -  1  -  -  1  -  -  - |..2

D.15.18.30 grlifting3

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Todo: `grlifting4` was newer and had more documentation than this proc, but was removed...
Please verify and update!

Example:

```

LIB "gradedModules.lib";
ring r=32003, x(0..4),dp;
def A=grtwist(3,1);
grview(A);
↳ Graded homomorphism: r(1)^3 <- 0, given by zero (3 x 0) matrix.
def T=KeneshlouMatrixPresentation(intvec(0,1,0,0,0));
grview(T);
↳ Graded homomorphism: r(-1)^10 <- r(-2)^10, given by a square matrix, with\
degrees:
↳      ..1 ..2 ..3 ..4 ..5 ..6 ..7 ..8 ..9 .10 ....
↳      --- --- --- --- --- --- --- --- --- --- +...
↳      1 :  1  1  -  -  1  -  -  -  -  - |..1
↳      1 :  1  -  1  -  -  1  -  -  -  -  - |..2
↳      1 :  1  -  -  1  -  -  1  -  -  -  - |..3
↳      1 :  -  1  1  -  -  -  -  1  -  -  - |..4

D.15.18.31 mappingcone3

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `mappingcone3(A,B)`, graded objects A and B (matrices defining maps)

Return: chain complex (as a list)

Purpose: construct a free resolution of the cokernel of a random map between $M=\text{coker}(A)$, and $N=\text{coker}(B)$

Example:

```
LIB "gradedModules.lib";
```

```

ring r=32003,x(0..4),dp;
def A=KeneshlouMatrixPresentation(intvec(0,0,0,0,3));
grview(A);
↳ Graded homomorphism:  $r(-1)^3 \leftarrow 0$ , given by zero (3 x 0) matrix.
def T= KeneshlouMatrixPresentation(intvec(0,1,0,0,0));
grview(T);
↳ Graded homomorphism:  $r(-1)^{10} \leftarrow r(-2)^{10}$ , given by a square matrix, with\
degrees:
↳ ..1 ..2 ..3 ..4 ..5 ..6 ..7 ..8 ..9 .10 ....
↳ ---- ---- ---- ---- ---- ---- ---- ---- ---- ---- +...
↳ 1 : 1 1 - - 1 - - - - - |..1

```

D.15.18.32 grrange

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `grrange(M)`, graded object `M`

Return: `intvec`

Purpose: get weights of module units, thus describing the target of `M`

Example:

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module Z = grobj(freemodule(0),intvec(0:0),intvec(0:0));
grrange(Z);
↳
grdeg(Z);
↳
grview(Z);
↳ Graded homomorphism:  $0 \leftarrow 0$ , given by zero ( $0^2$ ) matrix.

```

```

module P=grobj(module([xy,0,xz],intvec(0,1,0)));
grrange(P);
↳ 0,1,0
grdeg(P);
↳ 2
grview(P);
↳ Graded homomorphism:  $r + r(-1) + r \leftarrow r(-2)$ , given by a matrix, with degr\
ees:
↳      ..1 ....
↳      --- +...
↳  0 :  2 |..1
↳  1 :  - |..2
↳  0 :  2 |..3
↳      ===
↳      2

```

D.15.18.33 grneg

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: `grneg(A)`, graded object A

Return: graded object

Purpose: graded map defined by $-A$

Example:

```

LIB "gradedModules.lib";
ring r=0,(x,y,z),dp;
def A=grobj([x2,yz,xyz],intvec(1,1,0));
grview(A);
↳ Graded homomorphism:  $r(-1)^2 + r \leftarrow r(-3)$ , given by a matrix, with degree\
s:
↳      .1 ...
↳      -- +..
↳  1 :  2 |.1
↳  1 :  2 |.2
↳  0 :  3 |.3
↳      ==
↳      3
def F=grneg(A);
grview(F);
↳ Graded homomorphism:  $r(-1)^2 + r \leftarrow r(-3)$ , given by a matrix, with degree\
s:
↳      .1 ...
↳      -- +..
↳  1 :  2 |.1
↳  1 :  2 |.2
↳  0 :  3 |.3
↳      ==
↳      3

```

D.15.18.34 matrixpres

Procedure from library `gradedModules.lib` (see [Section D.15.18 \[gradedModules.lib\]](#), page 1960).

Usage: matrixpres(a), intvec a

Return: graded object

Purpose: matrix presentation for direct sum of ω^ai in form of a graded object

Example:

```
LIB "gradedModules.lib";
ring r = 32003,(x(0..4)),dp;
def R=matrixpres(intvec(1,4,0,0,0));
⇨ // ** redefining j (      int j=size(a)-i;)
grview(R);

D.15.19 hess_lib

Library: hess.lib

Purpose: Riemann-Roch space of divisors on function fields and curves

Authors: I. Stenger: stenger@mathematik.uni-kl.de

Overview: Let f be an absolutely irreducible polynomial in two variables x, y . Assume that f is monic as a polynomial in y . Let $F = \text{Quot}(k[x, y]/f)$ be the function field defined by f . Define $O_F = \text{IntCl}(k[x], F)$ and $O_-(F, \text{inf}) = \text{IntCl}(k[1/x], F)$. We represent a divisor D on F by two fractional ideals I and J of O_F and $O_-(F, \text{inf})$, respectively. The Riemann-Roch space $L(D)$ is then the intersection of I^{-1} and J^{-1} .

Procedures:

D.15.19.1 RiemannRochHess

Procedure from library `hess.lib` (see [Section D.15.19 \[hess.lib\]](#), page 2036).

Note: All fractional ideals must be represented by a list of size two. The first element is an ideal of $k[x, y]$ and the second element the common denominator, i.e., a polynomial of $k[x]$.

Assume: The base ring R must be a ring in two variables, say x, y , or three variables, say x, y, z . If $\text{nvars}(R) = 2$:

- f is an absolutely irreducible polynomial, monic as a polynomial in y .
- List `divisorD` describes a divisor D of $F = \text{Quot}(k[x, y]/f)$. If ($s = \text{"ideals"}$)

D is given in ideal representation, i.e., `divisorD` is a list of size 2.

`divisorD[1]` is the finite ideal of D , i.e., the

fractional ideal of D of $\text{IntCl}(k[x], F)$.

`divisorD[2]` is the infinite ideal of D , i.e.,

the fractional ideal of D of $\text{IntCl}(k[1/x], F)$.

If ($s = \text{"free"}$)

D is given in free representation, i.e., `divisorD` is a list of size 2, containing the finite and infinite places of D with exponents.

`divisorD[i]`, $i = 1, 2$, is a list. Each element of the list is again a list. The first entry is a fractional ideal, and the second an integer, the exponent of the place. If $\text{nvars}(R) = 3$:

- f is an absolutely irreducible homogeneous polynomial describing the projective plane curve corresponding to the function field F . We assume that the dehomogenization of f w.r.t. z is monic as a polynomial in y .

List `divisorD` describes a divisor D of F .

If ($s = \text{"ideals"}$)

D is given in ideal representation, i.e., `divisorD` is a list of size 2. `divisorD[1]` is an ideal of the base ring representing the positive divisor of D and `divisorD[2]` is an ideal of the base ring representing the negative divisor. (i.e. $D = (I) - (J)$).

If (`s = "free"`)

D is given in free representation, i.e., `divisorD` is a list of places of D. `D[i][1]` is an prime ideal and `D[i][2]` an integer, the exponent of the place.

Return: A vector space basis of the Riemann-Roch space of D, stored in a list `RRBasis`. The list `RRBasis` contains a list, say `rbasis`, and a polynomial, say `den`. The basis of $L(D)$ consists of all rational functions g/den , where g is an element of `rbasis`.

Example:

```

D.15.20 methods_lib

Library: methods.lib

Purpose: installing methods in Singular

Authors: J. Boehm, boehm @ mathematik.uni-kl.de

Overview: Methods select the function to execute by the types of the input tuple. The central function is installMethod, which takes a hashtable associating a tuple of input types to function names and creates a corresponding procedure.

HashTables are lists with arbitrary index sets. They can be created by the command hashTable. Their size can be determined by the command size. Values can be extracted by selectKey or the * operator. HashTables can also be added using addHashTables or the + operator.

Methods can be added with the + operator.

Types: Method the class of all methods
 HashTable the class of all hash tables

Procedures:

D.15.21 modules_lib

Library: modules.lib

Purpose: Modules

Authors: J. Boehm, boehm@mathematik.uni-kl.de
 D. Wienholz wienholz@mathematik.uni-kl.de

C. Koenen koenen@rhrk.uni-kl.de
 M. Mayer mayer@mathematik.uni-kl.de

Overview: This library is used for the computation of graded free resolutions with an own graduation of the monomials. For these Resolution is a new class of modules needed. These modules, can be computed via the image, kernel, cokernel of a matrix or the subquotient of two matrices. The used matrices also have a free module as source and target, with graded generators if the matrix is homogenous. A matrix of this new form is created by a normal matrix, source, target and the graduatin, if the matrix is homogenous, are done automatically. With this matrices it is then possible to compute the new class of modules.

This library also offers the oppurtunity to create R-module-homomorphisms between two modules. For these homomorphisms the kernel can be computed an will be returned as a module of the new class.

This is experimental work in progress!!!

Types: Matrix the class of matrices with source and target in form of free modules FreeModule
 free modules representet with the ring and degree Resolution class of graded resolutions

Module modules represented by either the image, coker, kernelof a matrix or the subquotient of two matrices Vector element of a Module

Ideal same as ideal, but with it's own basering saved, used to compute resolutions

Homomorphism class of R-module-homomormphisms

Procedures:

D.15.21.1 id

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: `id(n)`; n integer

Return: returns the n x n identity matrix, with nongraded free modules for source and target

Example:

```
LIB "modules.lib";
ring r;
int n=4;
id(n);
↪      {0} {0} {0} {0}
↪ {0}   1  0  0  0
↪ {0}   0  1  0  0
↪ {0}   0  0  1  0
↪ {0}   0  0  0  1
↪
```

D.15.21.2 zero

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: `zero(n)`; n and m integer

Return: returns the n x m zero matrix, with nongraded free modules for source and target

Example:

```

LIB "modules.lib";
ring r;
int n=4;
int m=3;
zero(n,m);
↳      {0} {0} {0}
↳ {0}   0  0  0
↳ {0}   0  0  0
↳ {0}   0  0  0
↳ {0}   0  0  0
↳

```

D.15.21.3 freeModule

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: `freeModule(r,n,l)`; `r` ring, `n` integer, `l` list

Return: a free Module over the ring `r`, with rank `n`, and degrees `l` for the generators

Note: `-1` for no graduation and `0` to set every degree to `0`

Example:

```

LIB "modules.lib";
ring r;
int n=3;
list l=1,2,3;
freeModule(r,n,l);
↳ 3
↳ r
↳ free Module
↳ Degrees of the generators: {1} {2} {3}
↳

```

D.15.21.4 makeMatrix

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: `makeMatrix(m)`, `m` matrix

RETURN Matrix, with graded source and target if the matrix is homogenous

Example:

```

LIB "modules.lib";
ring r;
matrix m[2][2]=x,y3,z,xz;
m;
↳ m[1,1]=x
↳ m[1,2]=y3
↳ m[2,1]=z
↳ m[2,2]=xz
Matrix M=m;

```

D.15.21.5 makeIdeal

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: makeIdeal(i) or Ideal I=i; i ideal

Return: Ideal with saved basering

Example:

```
LIB "modules.lib";
ring r;
ideal i=x,y,z+x;
i;
↪ i[1]=x
↪ i[2]=y
↪ i[3]=x+z
Ideal I=i;
```

D.15.21.6 Target

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: Target(M); M Matrix

Return: FreeModule, target of the Matrix

Example:

```
LIB "modules.lib";
ring r;
matrix m[2][2]=x,y3,z,xz;
Matrix M=m;
M;
↪ x,y3,
↪ z,xz
↪
Target(M);
↪ 2
↪ r
↪ free Module
↪
```

D.15.21.7 Source

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: Source(M); M Matrix

Return: FreeModule, source of the Matrix

Example:

```
LIB "modules.lib";
ring r;
matrix m[2][2]=x,y3,z,xz;
Matrix M=m;
M;
↪ x,y3,
↪ z,xz
↪
Source(M);
↪ 2
```

```

↳ r
↳ free Module
↳

```

D.15.21.8 printMatrix

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: `printMatrix(M)`; or `M`; `M` Matrix

Return: nothing, prints the matrix with degrees of the generators from target and source

Example:

```

LIB "modules.lib";
ring r;
matrix m[2][2]=x,y3,z,xz;
Matrix M=m;
M;
↳ x,y3,
↳ z,xz
↳

```

D.15.21.9 printFreeModule

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: `printFreeModule(M)`; or `M`; `M` FreeModule

Return: nothing, prints a free Module

Example:

```

LIB "modules.lib";
ring r;
int n=3;
list l=1,2,3;
freeModule(r,n,l);
↳ 3
↳ r
↳ free Module
↳ Degrees of the generators: {1} {2} {3}
↳

```

D.15.21.10 printResolution

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: `printResolution(R)`; or `R`; `R` Resolution

Return: nothing, prints the resolution

Example:

```

LIB "modules.lib";
ring r;
matrix m[1][3]=x,y,z;
Matrix M=m;
Module N=coker(M);
N;

```

```

↳ cokernel | x y z |
↳
↳
Resolution R = Res(N);
R;
↳ 1      3      3      1
↳ r <--  r <--  r <--  r
↳
↳ 0      1      2      3
↳ resolution not minimized yet
↳
↳

```

D.15.21.11 printModule

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Return: nothing, prints the Module

Example:

```

LIB "modules.lib";
ring r;
matrix m[2][2]=x,y2,z,xz;
Matrix M=m;
M;
↳ {1} {2}
↳ {0} x y2
↳ {0} z xz
↳
Module N=image(M);
N;
↳ image | x y2 |
↳      | z xz |
↳
↳

```

D.15.21.12 printHom

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: `printHom(M);` f a Homomorphism

Return: nothing, prints f

Example:

```

LIB "modules.lib";
ring R=0,(x,y),(lp,c);
Matrix M=id(2);
Module src=image(M);
matrix rules[2][2]=x,y,x2,y2;
Module tar=coker(M);
src;
↳ R^2
↳
↳

```

```

tar;
↳ cokernel | 1 0 |
↳          | 0 1 |
↳
↳
rules;
↳ rules[1,1]=x
↳ rules[1,2]=y
↳ rules[2,1]=x2
↳ rules[2,2]=y2
Homomorphism f=homomorphism(rules,src,tar);
f;
↳ | x  y |
↳ | x2 y2 |
↳
↳ cokernel | 1 0 | <--- R^2
↳          | 0 1 |
↳

```

D.15.21.13 mRes

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: `mRes(M,n)`; M Module or Ideal, n integer

Return: Resolution, minimized resolution with graded modules

Note: n is optional, if n is positive only that many steps will be computed use `R.dd[i]`; to return the different modules as image of matrices, `R` Resolution i integer **EXAMPLE.** example `mRes`, shows an example

Example:

```

LIB "modules.lib";
ring r;
matrix m[1][3]=x,y,z;
Matrix M=m;
Module N=coker(M);
N;
↳ cokernel | x y z |
↳
↳
Resolution R = mRes(N);
R;
↳ 1      3      3      1
↳ r <--  r <--  r <--  r
↳
↳ 0      1      2      3
↳
↳
R.dd[2];
↳      {2}  {2}  {2}
↳ {1}   y   x   0
↳ {1}  -z   0   x
↳ {1}   0  -z  -y
↳

```

D.15.21.14 sRes

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: `sRes(M,n)`; M Module or Ideal, n integer

Return: Resolution, with graded modules, computed with Schreyer's method using the function `sres`

Note: n is optional, if n ist positiv only that many steps will be computed use `R.dd[i]`; to return the diffrent modules as image of matrices, R Resolution i integer EXAMPLE. example `sRes`, shows an example

Example:

```
LIB "modules.lib";
ring r;
matrix m[1][3]=x,y,z;
Matrix M=m;
Module N=coker(M);
N;
↳ cokernel | x y z |
↳
↳
Resolution R = sRes(N);
R;
↳ 1      3      3      1
↳ r <--  r <--  r <--  r
↳
↳ 0      1      2      3
↳ resolution not minimized yet
↳
↳
R.dd[2];
↳      {2}  {2}  {2}
↳ {1}   -y  -x   0
↳ {1}    z   0  -x
↳ {1}    0   z   y
↳
```

D.15.21.15 Res

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: `Res(M,n)`; M Module or Ideal, n integer

Return: Resolution, resolution with graded modules

Note: n is optional, if n ist positiv only that many steps will be computed use `R.dd[i]`; to return the diffrent modules as image of matrices, R Resolution i integer EXAMPLE. example `Res`, shows an example

Example:

```
LIB "modules.lib";
ring r;
matrix m[1][3]=x,y,z;
Matrix M=m;
```

```

Module N=coker(M);
N;
↳ cokernel | x y z |
↳
↳
Resolution R = Res(N);
R;
↳ 1      3      3      1
↳ r <--  r <--  r <--  r
↳
↳ 0      1      2      3
↳ resolution not minimized yet
↳
↳
R.dd[2];
↳      {2}  {2}  {2}
↳ {1}  -y  -x  0
↳ {1}   z   0  -x
↳ {1}   0   z   y
↳

```

D.15.21.16 Betti

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: Betti(reso); reso Resolution

Return: intmat, Bettimatrix of the resolution

Note: for a clear overview use `printBetti`

Example:

```

LIB "modules.lib";
ring r;
matrix m[1][3]=x,y,z;
Matrix M=m;
Module N=coker(M);
Resolution R=mRes(N);
R;
↳ 1      3      3      1
↳ r <--  r <--  r <--  r
↳
↳ 0      1      2      3
↳
↳
Betti(R);
↳ 1,3,3,1

```

D.15.21.17 printBetti

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: printBetti(resi), resi Resolution

Return: nothing, prints the Bettimatrix of the Resolution

Example:

```

LIB "modules.lib";
ring r;
matrix m[1][3]=x,y,z;
Matrix M=m;
Module N=coker(M);
Resolution R=mRes(N);
R;
↪ 1      3      3      1

```

D.15.21.18 SetDeg

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: SetDeg(l), l list or intvec

Return: nothing, saves own degrees for the different variables of the basering

Note: should be used after declaration of the ring and shouldn't be changed afterwards

Example:

```

LIB "modules.lib";
ring r;
Deg(x);
↪ 1
list l=2,2,2;
SetDeg(l);
Deg(x);
↪ 2

```

D.15.21.19 Deg

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: same as deg

Note: only needed if custom degrees are set with SetDeg

Example:

```

LIB "modules.lib";
ring r;
Deg(x);
↪ 1
list l=2,2,2;
SetDeg(l);
Deg(x);
↪ 2

```

D.15.21.20 Degree

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: Degree(M); M FreeModule

Return: list, degrees of the generators from the module, if they are graded

Example:

```
LIB "modules.lib";
ring r;
matrix m[2][2]=x,y3,z,xz;
Matrix Ma=m;
FreeModule M=Source(Ma);
M;
↳ 2
↳ r
↳ free Module
↳
Degree(M);
↳ The module isn't graded
```

D.15.21.21 Degrees

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: Degrees(M); M a Module

Return: list, grading of the Module

Example:

```
LIB "modules.lib";
ring r;
matrix ma[2][2]=x,y,x,y;
Matrix m=ma;
Module M=image(m);
M;
↳ image | x y |
↳      | x y |
↳
↳
Degrees(M);
↳ [1]:
↳ 1
↳ [2]:
↳ 1
```

D.15.21.22 subquotient

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: subquotient(gens,rels); gens and rels Matrices

Return: Module, the subquotient of two entered Matrices

Example:

```

LIB "modules.lib";
ring r;
matrix m[2][2]=x,y2,z,xz;
Matrix M=m;
matrix n[2][3]=z2,xyz,x2y2,xy,x3,y4;
Matrix N=n;
M;
↳      {1}  {2}
↳ {0}   x   y2
↳ {0}   z   xz
↳
N;
↳      {2}  {3}  {4}
↳ {0}   z2  xyz  x2y2
↳ {0}   xy  x3   y4
↳
subquotient(M,N);
↳ subquotient ( | x y2 | , | z2 xyz x2y2 | )
↳                | z xz | | xy x3 y4 |
↳
↳

```

D.15.21.23 coker

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: `coker(M)`, `M` a Matrix

Return: Module, the coker of `M`

Example:

```

LIB "modules.lib";
ring r;
matrix m[2][2]=x,y2,z,xz;
Matrix M=m;
M;
↳      {1}  {2}
↳ {0}   x   y2
↳ {0}   z   xz
↳
coker(M);
↳ cokernel | x y2 |
↳           | z xz |
↳
↳

```

D.15.21.24 image

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: `image(M)`; `M` a Matrix

Return: Module, the image of `M`

Example:

```

LIB "modules.lib";
ring r;
matrix m[2][2]=x,y2,z,xz;
Matrix M=m;
M;
↳      {1}  {2}
↳ {0}   x   y2
↳ {0}   z   xz
↳
image(M);
↳ image | x y2 |
↳       | z xz |
↳
↳

```

D.15.21.25 Ker

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: `Ker(M)`; `M` a Matrix

Return: Module, image of a Matrix `N` with `image(N)=Ker(M)`

Example:

```

LIB "modules.lib";
ring r;
matrix m[1][3]=x,y2,z3;
Matrix M=m;
M;
↳      {1}  {2}  {3}
↳ {0}   x   y2  z3
↳
Ker(M);
↳ image | y2 z3 0   |
↳       | -x 0  z3  |
↳       | 0  -x -y2 |
↳
↳

```

D.15.21.26 compareModules

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: `compareModules(M,N)`; or `M==N`; compares two Modules up to isomorphism

Return: 1 or 0, if the are ismomorphic or aren't

Example:

```

LIB "modules.lib";
ring r;
matrix ma[2][2]=x,y,x,y;
Matrix m=ma;
Module M=image(m);
matrix na[2][1]=-y,x;
Matrix n=na;
M;

```

```

↳ image | x y |
↳       | x y |
↳
↳
Module N=image(n);
N;
↳ image | -y |
↳       | x  |
↳
↳
N==M;
↳ 0
N=coker(n);
N;
↳ cokernel | -y |
↳          | x  |
↳
↳
N==M;
↳ 0

```

D.15.21.27 addModules

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\]](#), page 2038).

Usage: `addModules(M,N)`; or `M+N`; M and N Modules

Return: Module, sum of the two Modules

Example:

```

LIB "modules.lib";
ring r;
matrix ma[2][2]=x,y,x2,y2;
Matrix m=ma;
Module M=image(m);
matrix na[2][2]=xy,x2,y2,x;
Matrix n=na;
Module N=image(na);
M;
↳ image | x y |
↳       | x2 y2 |
↳
↳
N;
↳ image | xy x2 |
↳       | y2 x  |
↳
↳
N+M;
↳ image | xy x2 x y |
↳       | y2 x  x2 y2 |
↳
↳

```

D.15.21.28 homomorphism

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: `homomorphism(rules,sources,targets)`; rules a matrix, sources and targets are Modules
Return: Homomorphism

Example:

```
LIB "modules.lib";
ring R=0,(x,y),(lp,c);
Matrix M=id(2);
Module src=image(M);
matrix rules[2][2]=x,y,x2,y2;
Module tar=coker(M);
src;
  ↪ R^2
  ↪
  ↪
tar;
  ↪ cokernel | 1 0 |
  ↪           | 0 1 |
  ↪
  ↪
rules;
  ↪ rules[1,1]=x
  ↪ rules[1,2]=y
  ↪ rules[2,1]=x2
  ↪ rules[2,2]=y2
homomorphism(rules,src,tar);
  ↪ | x  y |
  ↪ | x2 y2 |
  ↪
  ↪ cokernel | 1 0 | <--- R^2
  ↪           | 0 1 |
  ↪
```

D.15.21.29 target

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: `target(f)`; f Homomorphism

Return: Module, the target of f

Example:

```
LIB "modules.lib";
ring R=0,(x,y),(lp,c);
Matrix M=id(2);
Module src=image(M);
matrix rules[2][2]=x,y,x2,y2;
Module tar=coker(M);
src;
  ↪ R^2
  ↪
  ↪
```

```

tar;
↳ cokernel | 1 0 |
↳          | 0 1 |
↳
↳
rules;
↳ rules[1,1]=x
↳ rules[1,2]=y
↳ rules[2,1]=x2
↳ rules[2,2]=y2
Homomorphism f=homomorphism(rules,src,tar);
f;
↳ | x y |
↳ | x2 y2 |
↳
↳ cokernel | 1 0 | <--- R^2
↳          | 0 1 |
↳
target(f);
↳ cokernel | 1 0 |
↳          | 0 1 |
↳
↳

```

D.15.21.30 source

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\]](#), page 2038).

Usage: `source(f)`; `f` Homomorphism

Return: Module, the source of `f`

Example:

```

LIB "modules.lib";
ring R=0,(x,y),(lp,c);
Matrix M=id(2);
Module src=image(M);
matrix rules[2][2]=x,y,x2,y2;
Module tar=coker(M);
src;
↳ R^2
↳
↳
tar;
↳ cokernel | 1 0 |
↳          | 0 1 |
↳
↳
rules;
↳ rules[1,1]=x
↳ rules[1,2]=y
↳ rules[2,1]=x2
↳ rules[2,2]=y2
Homomorphism f=homomorphism(rules,src,tar);

```

```

f;
↳ | x y |
↳ | x2 y2 |
↳
↳ cokernel | 1 0 | <--- R^2
↳          | 0 1 |
↳
source(f);
↳ R^2
↳
↳

```

D.15.21.31 compareMatrix

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: `compareMatrix(M,N)`; or `M==N`; compares two Matrices

Return: 1 or 0, if they are the same or aren't

Example:

```

LIB "modules.lib";
ring r;
matrix ma[2][2]=x,y,x,y;
Matrix M=ma;
matrix na[2][1]=-y,x;
Matrix N=na;
M;
↳      {1} {1}
↳ {0}   x  y
↳ {0}   x  y
↳
N;
↳      {1}
↳ {0}   -y
↳ {0}    x
↳
N==M;
↳ 0
M==M;
↳ 1

```

D.15.21.32 freeModule2Module

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: `freeModule2Module(F)`; F FreeModule

Return: returns F as a Module

Example:

```

LIB "modules.lib";
ring r;
list L = 1,1,1;
FreeModule F = freeModule(r,3,L);
freeModule2Module(F);

```

```

↳ R^3
↳
↳

```

D.15.21.33 makeVector

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Return: a Vector V , element of M with entries v

Example:

```

LIB "modules.lib";
ring r;
Module M = image(id(3));
makeVector([x,y,z],M);
↳ | x |
↳ | y |
↳ | z |
↳
↳

```

D.15.21.34 netVector

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: `netVector(V)`; V Vector

Return: pretty print for Vector

Example:

```

LIB "modules.lib";
ring r;
Module M = image(id(3));
Vector V = makeVector([x,y,z],M);
netVector(V);
↳ | x |
↳ | y |
↳ | z |
↳

```

D.15.21.35 netMatrix

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Return: nothing, prints M

Example:

```

LIB "modules.lib";
ring r;
matrix m[2][2]=x,y2,z,xz;
Matrix M=m;
netMatrix(M);
↳ | x y2 |
↳ | z xz |
↳

```

D.15.21.36 presentation

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Return: Subquotient M converted to `coker(C)`

Example:

```
LIB "modules.lib";
ring R = 0,(x,y),dp;
matrix a[1][2] = x,y;
Matrix A = a;
matrix b[1][2] = x2,y2;
Matrix B = b;
Module M = subquotient(A,B);
presentation(M);
 $\mapsto$  cokernel | 0 x -y |
 $\mapsto$            | y 0 x  |
 $\mapsto$ 
 $\mapsto$ 
```

D.15.21.37 tensorMatrix

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Return: Tensorprodukt of A,B

Example:

```
LIB "modules.lib";
ring r;
matrix m[2][2]=x,y2,z,xz;
matrix n[2][2]=1,2,3,4;
Matrix M = m;
Matrix N = n;
tensorMatrix(M,N);
 $\mapsto$    {1}  {1}  {2}  {2}
 $\mapsto$  {0}   x  2x  y2  2y2
 $\mapsto$  {0}  3x  4x  3y2  4y2
 $\mapsto$  {0}   z  2z   xz  2xz
 $\mapsto$  {0}  3z  4z  3xz  4xz
 $\mapsto$ 
```

D.15.21.38 tensorModule

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Return: Tensorprodukt of M,N

Example:

```
LIB "modules.lib";
ring R = 0,(x,y,z),dp;
matrix a[1][2] = x,y;
Matrix A = a;
matrix b[1][2] = x2,y2;
Matrix B = b;
Module M = subquotient(A,B);
M;
```

```

↳ subquotient (| x y |, | x2 y2 |)
↳
↳
matrix c[2][2]=x,y2,z,xz;
Matrix C=c;
matrix d[2][3]=z2,xyz,x2y2,xy,x3,y4;
Matrix D=d;
Module N = subquotient(C,D);
N;
↳ subquotient (| x y2 |, | z2 xyz x2y2 |)
↳
↳
↳
tensorModule(M,N);
↳ cokernel | 0 x -y 0 0 0 -xyz+y2 0 x2z-xyz 0 y4-xyz2-x2z+xyz+
y2z-y2 0 -xy2z-y3z+xy2+y3+x2z-xyz+xz2+y2 0 \
-y3z+xz2 0 xy2z2-xy2z-y3z+y3 0 \
y4z-y4-x2z2+xyz2+x2z-xyz-y2z+y2 0 xy3z-xy \
3+xy2z+y3z-xy2-y3-x2z+xyz-xz2-y2 0 \
0 0 x2y2z-x2y2+xy2z+y3z-xy2-y3-x2z+xyz-xz2-y2 0 \
|
↳ | y 0 x 0 0 0 0 -xyz+y2 0 x2z-xyz 0 \

y2+y3+x2z-xyz+xz2+y2 0 -y3z+xz2 0 xy2z2-xy2z-y3z+y \
3 0 y4z-y4-x2z2+xyz2+x2z-xyz-y2z+y2 0 \
xy3z-xy3+xy2z+y3z-xy2-y3-x2z+xyz-xz2-y2 \
0 0 0 x2y2z-x2y2+xy2z \
+ y3z-xy2-y3-x2z+xyz-xz2-y2 |
↳ | 0 0 0 0 x -y z2-x 0 0 0 -xy2+z3-z2+x \
0 -y2z+yz2-x2-xy-xz+z2-x 0 \
0 0 -yz3+x2z+yz2-xy 0 \
xy2-z3+z2-x 0 -y2z2+x \
2y+y2z-yz2+x2+xy+xz-z2+x 0 \
xyz-y2z 0 -xyz2+x3+y2z-yz2+x2+xy+xz-z2+x 0 \
|
↳ | 0 0 0 y 0 x 0 z2-x 0 0 0 \
-xy2+z3-z2+x 0 -y2z+yz2-x2 \
-xy-xz+z2-x 0 0 -yz3+x2z+yz2-xy \
0 xy2-z3+z2-x 0 \
-y2z2+x2y+y2z-yz2+x2+xy+xz-z2+x \
0 xyz-y2z 0 -xyz2+x3+y2z-yz \
2+x2+xy+xz-z2+x |
↳
↳

```

D.15.21.39 tensorModFreemod

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\]](#), page 2038).

Return: Tensorprodukt of M,F

Example:

```

LIB "modules.lib";
ring R = 0,(x,y,z),dp;

```

```

matrix a[1][2] = x,y;
Matrix A = a;
matrix b[1][2] = x2,y2;
Matrix B = b;
Module M = subquotient(A,B);
M;
↳ subquotient (| x y |, | x2 y2 |)
↳
↳
FreeModule F = freeModule(R,3,0);
F;
↳ 3
↳ R
↳ free Module
↳ Degrees of the generators: {0} {0} {0}
↳
tensorModFreemod(M,F);
↳ cokernel | 0 0 0 x 0 0 -y 0 0 |
↳          | 0 0 0 0 x 0 0 -y 0 |
↳          | 0 0 0 0 0 x 0 0 -y |
↳          | y 0 0 0 0 0 x 0 0 |
↳          | 0 y 0 0 0 0 0 x 0 |
↳          | 0 0 y 0 0 0 0 0 x |
↳
↳

```

D.15.21.40 tensorFreemodMod

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

D.15.21.41 tensorFreeModule

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Return: Tensorprodukt of M,N

Example:

```

LIB "modules.lib";
ring R = 0,(x,y,z),dp;
FreeModule F = freeModule(R,3,0);
F;
↳ 3
↳ R
↳ free Module
↳ Degrees of the generators: {0} {0} {0}
↳
tensorFreeModule(F,F);
↳ 9
↳ R
↳ free Module
↳

```

D.15.21.42 tensorProduct

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

D.15.21.43 pruneModule

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Return: M in a simplified presentation

Example:

```
LIB "modules.lib";
ring R = 0,(x,y,z),dp;
matrix a[2][3] = -x,-y^2,x^3,y,x,0;
matrix b[1][2] = x^2-y^3,xy;
Matrix A = a;
Matrix B = b;
Module M = coker(A);
Module N = coker(B);
Module H = hom(M,N);
H;
↳ subquotient (| 0 -y -y 0 -x |, | -y3+x2 xy 0 0 |)
↳ | xy -x -x y3 -y2 | | 0 0 -y3+x2 xy |
↳
↳
pruneModule(H);
↳ cokernel | 0 y2 x2 x |
↳ | x 0 0 y3 |
↳
↳
```

D.15.21.44 hom

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Return: calculates $\text{Hom}(M,N)$ as a subquotient and yields an interpretation for the elements

Example:

```
LIB "modules.lib";
"Example:";
↳ Example:
ring R = 0,(x,y,z),dp;
matrix a[2][3] = -x,-y^2,x^3,y,x,0;
matrix b[1][2] = x^2-y^3,xy;
Matrix A = a;
Matrix B = b;
Module M = coker(A);
Module N = coker(B);
hom(M,N);
↳ subquotient (| 0 -y -y 0 -x |, | -y3+x2 xy 0 0 |)
↳ | xy -x -x y3 -y2 | | 0 0 -y3+x2 xy |
↳
↳
```

D.15.21.45 kerHom

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Return: returns the kernel of the given homomorphism

Example:

```

LIB "modules.lib";
ring R=0,(x,y),(lp,c);
Matrix M=id(2);
Module src=image(M);
matrix rules[2][2]=x,y,xy,y2;
Module tar=coker(M);
Homomorphism f=homomorphism(rules,src,tar);
f;
↳ | x y |
↳ | xy y2 |
↳
↳ cokernel | 1 0 | <--- R^2
↳           | 0 1 |
↳
↳ kerHom(f);
↳ image | 0 -1 |
↳       | -1 0 |
↳
↳
↳

```

D.15.21.46 interpret

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\]](#), page 2038).

Return: interpretation of V into some space that is stored in the interpretationlist of $V.space$

Example:

```

LIB "modules.lib";
"example 1:";
↳ example 1:
ring R = 0,(x,y),dp;
matrix a[1][2] = x,y;
Matrix A = a;
matrix b[1][2] = x2,y2;
Matrix B = b;
Module M = subquotient(A,B);
Module C = presentation(M);
Vector V = [x2,y4],C;
interpret(V);
↳ | y5+x3 |
↳
↳
"example 2:";
↳ example 2:
ring S;
matrix gens[2][3] = x2+y-3z4,y+xy,xyz+4,3+z2x,z3-3x+3,2+x+y+z7;
vector v = 2x*[gens[1..2,1]] + (y-z2)*[gens[1..2,2]] + 5*[gens[1..2,3]];
Matrix Gens = gens;
M = subquotient(Gens,zero(2,3));
M.interpretation = list(list(1,1,1),list());
V = v,M;
interpret(V);
↳ -z2+2x+y+5

```

D.15.21.47 interpretInv

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Return: interpretation of V into some Module N (inverse to `interpret`)

Example:

```
LIB "modules.lib";
ring R;
matrix gens[2][3] = x2,xy,4,z2x,3x+3,z;
vector v = 2x*[gens[1..2,1]] + (y-z2)*[gens[1..2,2]] + 5*[gens[1..2,3]];
Matrix Gens = gens;
Module S = subquotient(Gens,zero(2,3));
Module N = coker(id(3));
matrix E = N.generators.hom;
Vector E1 = [1,0,0],N;
Vector E2 = [0,1,0],N;
Vector E3 = [0,0,1],N;
S.interpretation = list(list(E1,E2,E3),list([gens[1..2,1]],[gens[1..2,2]],[gens[1..2,3]]));
Vector V = v,S;

```

D.15.21.48 reduceIntChain

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Return: Module C with minimized (or # steps) interpretation list

Example:

```
LIB "modules.lib";
ring R;
matrix a[5][4];
Module M = coker(a+1);
Module N = simplePrune(simplePrune(simplePrune(simplePrune(M))));
//reduceIntChain(N);
```

D.15.21.49 interpretElem

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Return: interpretation of a Vector with # steps or until can't interpret further

Example:

```

LIB "modules.lib";
ring R;
matrix a[5][4];
Module M = coker(a+1);
Module N = simplePrune(simplePrune(simplePrune(simplePrune(M))));
Vector V = [x+y],N;
interpretElem(V,3);
↪ | 0 |
↪ | 0 |
↪ | 0 |
↪ | x+y |
↪
↪

```

D.15.21.50 interpretList

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Return: interpretation of Elements in some abstract structure defined by the user or into a Module

Example:

```

LIB "modules.lib";
ring R;
matrix a[5][4];
Module M = coker(a+1);
Module N = simplePrune(simplePrune(simplePrune(simplePrune(M))));
Vector V = [x+y],N;
Vector W = [x2+y2+3*z2],N;
Vector U = [x+2y+27z],N;
list L = U,V,W;
//interpretList(L,3);

```

D.15.21.51 compareVectors

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\], page 2038](#)).

Usage: `compareVector(V1,V2);` Vector V1,V2

Return: compares the given Vectors up to equivalence

Example:

```

LIB "modules.lib";
ring r;
matrix m[2][1] = x,-y;
Module M = subquotient(id(2),m);
Vector V = [x,y],M;
Vector W = [0,2y],M;
Vector U = [x,y2],M;
compareVectors(V,W);
↪ 1
compareVectors(U,V);
↪ 0

```

D.15.21.52 simplePrune

Procedure from library `modules.lib` (see [Section D.15.21 \[modules.lib\]](#), page 2038).

Return: Simplified Module with reduced dimension

Example:

```
LIB "modules.lib";
ring R;
matrix a[5][4];
Module M = coker(a+1);
Module N = simplePrune(M);
```

D.15.22 modwalk_lib

Library: `modwalk.lib`

Purpose: Groebner basis conversion

Authors: S. Oberfranz oberfran@mathematik.uni-kl.de

Overview: A library for converting Groebner bases of an ideal in the polynomial ring over the rational numbers using modular methods. The procedures are inspired by the following paper:

Elizabeth A. Arnold: Modular algorithms for computing Groebner bases. *Journal of Symbolic Computation* 35, 403-419 (2003).

Procedures: See also: [Section D.4.7 \[grwalk.lib\]](#), page 945; [Section D.15.34 \[rwalk.lib\]](#), page 2428; [Section D.15.36 \[swalk.lib\]](#), page 2452.

D.15.22.1 modWalk

Procedure from library `modwalk.lib` (see [Section D.15.22 \[modwalk.lib\]](#), page 2063).

Return: a standard basis of I

Note: The procedure computes a standard basis of I (over the rational numbers) by using modular methods.

Example:

```
LIB "modwalk.lib";
ring R1 = 0, (x,y,z,t), dp;
ideal I = 3x3+x2+1, 11y5+y3+2, 5z4+z2+4;
I = std(I);
ring R2 = 0, (x,y,z,t), lp;
ideal I = fetch(R1, I);
ideal J = modWalk(I);
J;
⇨ J[1]=x3+1/3x2+1/3
⇨ J[2]=z4+1/5z2+4/5
⇨ J[3]=y5+1/11y3+2/11
ring S1 = 0, (a,b,c,d), Dp;
ideal I = 5b2, ac2+9d3+3a2+5b, 2a2c+7abd+bcd+4a2, 2ad2+6b2d+7c3+8ad+4c;
I = std(I);
ring S2 = 0, (c,d,b,a), lp;
ideal I = fetch(S1,I);
// I is assumed to be a Dp-Groebner basis.
```

```

// We compute a lp-Groebner basis.
ideal J = modWalk(I,"Dp");
J;

See also: [Section D.2.6.1 \[modular\]](#), page 796.

D.15.22.2 modrWalk

Procedure from library `modwalk.lib` (see [Section D.15.22 \[modwalk.lib\]](#), page 2063).

Return: a standard basis of I

Note: The procedure computes a standard basis of I (over the rational numbers) by using modular methods.

Example:

```
LIB "modwalk.lib";
ring R1 = 0, (x,y,z,t), dp;
ideal I = 3x3+x2+1, 11y5+y3+2, 5z4+z2+4;
I = std(I);
ring R2 = 0, (x,y,z,t), lp;
ideal I = fetch(R1, I);
int radius = 2;
ideal J = modrWalk(I,radius);
J;
↪ J[1]=x3+1/3x2+1/3
↪ J[2]=z4+1/5z2+4/5
↪ J[3]=y5+1/11y3+2/11
ring S1 = 0, (a,b,c,d), Dp;
ideal I = 5b2, ac2+9d3+3a2+5b, 2a2c+7abd+bcd+4a2, 2ad2+6b2d+7c3+8ad+4c;
I = std(I);
ring S2 = 0, (c,d,b,a), lp;
ideal I = fetch(S1,I);
// I is assumed to be a Dp-Groebner basis.
// We compute a lp-Groebner basis.
ideal J = modrWalk(I,radius,"Dp");
J;

See also: [Section D.2.6.1 \[modular\]](#), page 796.

D.15.22.3 modfWalk

Procedure from library `modwalk.lib` (see [Section D.15.22 \[modwalk.lib\]](#), page 2063).

Return: a standard basis of I

Note: The procedure computes a standard basis of I (over the rational numbers) by using modular methods.

Example:

```

LIB "modwalk.lib";
ring R1 = 0, (x,y,z,t), dp;
ideal I = 3x3+x2+1, 11y5+y3+2, 5z4+z2+4;
I = std(I);
ring R2 = 0, (x,y,z,t), lp;
ideal I = fetch(R1, I);
ideal J = modfWalk(I);
J;
↪ J[1]=z4+1/5z2+4/5
↪ J[2]=y5+1/11y3+2/11
↪ J[3]=x3+1/3x2+1/3
ring S1 = 0, (a,b,c,d), Dp;
ideal I = 5b2, ac2+9d3+3a2+5b, 2a2c+7abd+bcd+4a2, 2ad2+6b2d+7c3+8ad+4c;
I = std(I);
ring S2 = 0, (c,d,b,a), lp;
ideal I = fetch(S1,I);
// I is assumed to be a Dp-Groebner basis.
// We compute a lp-Groebner basis.
ideal J = modfWalk(I,"Dp");
J;

See also: [Section D.2.6.1 \[modular\]](#), page 796.

D.15.22.4 modfrWalk

Procedure from library `modwalk.lib` (see [Section D.15.22 \[modwalk.lib\]](#), page 2063).

Return: a standard basis of I

Note: The procedure computes a standard basis of I (over the rational numbers) by using modular methods.

Example:

```

LIB "modwalk.lib";
ring R1 = 0, (x,y,z,t), dp;
ideal I = 3x3+x2+1, 11y5+y3+2, 5z4+z2+4;
I = std(I);
ring R2 = 0, (x,y,z,t), lp;
ideal I = fetch(R1, I);
int radius = 2;
ideal J = modfrWalk(I,radius);
J;
↪ J[1]=z4+1/5z2+4/5
↪ J[2]=y5+1/11y3+2/11
↪ J[3]=x3+1/3x2+1/3
ring S1 = 0, (a,b,c,d), Dp;

```

```

ideal I = 5b2, ac2+9d3+3a2+5b, 2a2c+7abd+bcd+4a2, 2ad2+6b2d+7c3+8ad+4c;
I = std(I);
ring S2 = 0, (c,d,b,a), lp;
ideal I = fetch(S1,I);
// I is assumed to be a Dp-Groebner basis.
// We compute a lp-Groebner basis.
ideal J = modfrWalk(I,radius,"Dp");
J;

D.15.23 multigrading_lib

Todos/Issues:

See <http://code.google.com/p/convex-singular/wiki/Multigrading>

Library: multigrading.lib

Purpose: Multigraded Rings

Authors: Benjamin Bechtold, benjamin.bechtold@googlemail.com
 Rene Birkner, rbirkner@math.fu-berlin.de
 Lars Kastner, lkastner@math.fu-berlin.de
 Simon Keicher, keicher@mail.mathematik.uni-tuebingen.de
 Oleksandr Motsak, U@D, where U={motsak}, D={mathematik.uni-kl.de}
 Anna-Lena Winz, anna-lena.winz@math.fu-berlin.de

Overview: This library allows one to virtually add multigradings to Singular: grade multivariate polynomial rings with arbitrary (fin. gen. Abelian) groups. For more see <http://code.google.com/p/convex-singular/wiki/Multigrading> For theoretical references see:

E. Miller, B. Sturmfels: 'Combinatorial Commutative Algebra' and
 M. Kreuzer, L. Robbiano: 'Computational Commutative Algebra'.

Note: 'multiDegBasis' relies on 4ti2 for computing Hilbert Bases. All groups are finitely generated Abelian

Procedures:

D.15.23.1 setBaseMultigrading

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `setBaseMultigrading(M[, G]);` M is an integer matrix, G is a group (or lattice)

Purpose: attaches weights of variables and grading group to the basering.

Note: M encodes the weights of variables column-wise.

Return: nothing

Example:

```
LIB "multigrading.lib";
ring R = 0, (x, y, z), dp;
// Weights of variables
intmat M[3][3] =
1, 0, 0,
0, 1, 0,
0, 0, 1;
// GradingGroup:
intmat L[3][2] =
1, 1,
1, 3,
1, 5;
// attaches M & L to R (==basing):
setBaseMultigrading(M, L); // Grading: Z^3/L
// Weights are accessible via "getVariableWeights()":
getVariableWeights();
⇒ 1,0,0,
⇒ 0,1,0,
⇒ 0,0,1
// Test all possible usages:
(getVariableWeights() == M) && (getVariableWeights(R) == M) && (getVariableWeights(b
```

```

↳ 1
// Grading group is accessible via "getLattice()":
getLattice();
↳ 1,1,
↳ 1,3,
↳ 1,5
// Test all possible usages:
(getLattice() == L) && (getLattice(R) == L) && (getLattice(basering) == L);
↳ 1
// And its hermite NF via getLattice("hermite"):
getLattice("hermite");
↳ 1,0,
↳ 1,2,
↳ 1,4
// Test all possible usages:
intmat H = hermiteNormalForm(L);
(getLattice("hermite") == H) && (getLattice(R, "hermite") == H) && (getLattice(basering) == L);
↳ 1
kill L, M;
// ----- isomorphic multigrading ----- //
// Weights of variables
intmat M[2][3] =
1, -2, 1,
1, 1, 0;
// Torsion:
intmat L[2][1] =
0,
2;
// attaches M & L to R (==basering):
setBaseMultigrading(M, L); // Grading: Z + (Z/2Z)
// Weights are accessible via "getVariableWeights()":
getVariableWeights() == M;
↳ 1
// Torsion is accessible via "getLattice()":
getLattice() == L;
↳ 1
kill L, M;
// ----- extreme case ----- //
// Weights of variables
intmat M[1][3] =
1, -1, 10;
// Torsion:
intmat L[1][1] =
0;
// attaches M & L to R (==basering):
setBaseMultigrading(M); // Grading: Z^3
// Weights are accessible via "getVariableWeights()":
getVariableWeights() == M;
↳ 1
// Torsion is accessible via "getLattice()":
getLattice() == L;
↳ 1

```

D.15.23.2 getVariableWeights

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `getVariableWeights([R])`

Purpose: get associated multigrading matrix for the basering [or R]

Return: `intmat`, matrix of multidegrees of variables

Example:

```
LIB "multigrading.lib";
ring R = 0, (x, y, z), dp;
// Weights of variables
intmat M[3][3] =
1, 0, 0,
0, 1, 0,
0, 0, 1;
// Grading group:
intmat L[3][2] =
1, 1,
1, 3,
1, 5;
// attaches M & L to R (==basing):
setBaseMultigrading(M, L); // Grading: Z^3/L
// Weights are accessible via "getVariableWeights()":
getVariableWeights() == M;
↳ 1
kill L, M;
// ----- isomorphic multigrading ----- //
// Weights of variables
intmat M[2][3] =
1, -2, 1,
1, 1, 0;
// Grading group:
intmat L[2][1] =
0,
2;
// attaches M & L to R (==basing):
setBaseMultigrading(M, L); // Grading: Z + (Z/2Z)
// Weights are accessible via "getVariableWeights()":
getVariableWeights() == M;
↳ 1
kill L, M;
// ----- extreme case ----- //
// Weights of variables
intmat M[1][3] =
1, -1, 10;
// Grading group:
intmat L[1][1] =
0;
// attaches M & L to R (==basing):
setBaseMultigrading(M); // Grading: Z^3
// Weights are accessible via "getVariableWeights()":
getVariableWeights() == M;
```

↪ 1

D.15.23.3 getGradingGroup

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `getGradingGroup([R])`

Purpose: get associated grading group

Return: group, the grading group

Example:

```
LIB "multigrading.lib";
ring R = 0, (x, y, z), dp;
// Weights of variables
intmat M[3][3] =
1, 0, 0,
0, 1, 0,
0, 0, 1;
// Torsion:
intmat L[3][2] =
1, 1,
1, 3,
1, 5;
// attaches M & L to R (==basing):
setBaseMultigrading(M, L); // Grading: Z^3/L
def G = getGradingGroup();
printGroup( G );
↪ Generators:
↪      1      0      0
↪      0      1      0
↪      0      0      1
↪ Relations:
↪      1      1
↪      1      3
↪      1      5
G[1] == M; G[2] == L;
↪ 1
↪ 1
kill L, M, G;
// ----- isomorphic multigrading ----- //
// Weights of variables
intmat M[2][3] =
1, -2, 1,
1, 1, 0;
// Torsion:
intmat L[2][1] =
0,
2;
// attaches M & L to R (==basing):
setBaseMultigrading(M, L); // Grading: Z + (Z/2Z)
def G = getGradingGroup();
printGroup( G );
↪ Generators:
```

```

↳      1   -2   1
↳      1    1   0
↳ Relations:
↳      0
↳      2
G[1] == M; G[2] == L;
↳ 1
↳ 1
kill L, M, G;
// ----- extreme case ----- //
// Weights of variables
intmat M[1][3] =
1, -1, 10;
// Torsion:
intmat L[1][1] =
0;
// attaches M & L to R (==basing):
setBaseMultigrading(M); // Grading: Z^3
def G = getGradingGroup();
printGroup( G );
↳ Generators:
↳      1   -1   10
↳ Relations:
↳      0
G[1] == M; G[2] == L;
↳ 1
↳ 1
kill L, M, G;

```

D.15.23.4 getLattice

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `getLattice([R[,opt]])`

Purpose: get associated grading group matrix, i.e. generators (cols) of the grading group

Return: `intmat`, the grading group matrix, or
its hermite normal form if an optional argument ("hermiteNormalForm") is given or
smith normal form if an optional argument ("smith") is given

Example:

```

LIB "multigrading.lib";
ring R = 0, (x, y, z), dp;
// Weights of variables
intmat M[3][3] =
1, 0, 0,
0, 1, 0,
0, 0, 1;
// Torsion:
intmat L[3][2] =
1, 1,
1, 3,
1, 5;
// attaches M & L to R (==basing):

```

```

setBaseMultigrading(M, L); // Grading: Z^3/L
// Torsion is accessible via "getLattice()":
getLattice() == L;
↳ 1
// its hermite NF:
print(getLattice("hermite"));
↳      1      0
↳      1      2
↳      1      4
kill L, M;
// ----- isomorphic multigrading ----- //
// Weights of variables
intmat M[2][3] =
1, -2, 1,
1,  1, 0;
// Torsion:
intmat L[2][1] =
0,
2;
// attaches M & L to R (==basing):
setBaseMultigrading(M, L); // Grading: Z + (Z/2Z)
// Torsion is accessible via "getLattice()":
getLattice() == L;
↳ 1
// its hermite NF:
print(getLattice("hermite"));
↳      0
↳      2
kill L, M;
// ----- extreme case ----- //
// Weights of variables
intmat M[1][3] =
1, -1, 10;
// Torsion:
intmat L[1][1] =
0;
// attaches M & L to R (==basing):
setBaseMultigrading(M); // Grading: Z^3
// Torsion is accessible via "getLattice()":
getLattice() == L;
↳ 1
// its hermite NF:
print(getLattice("hermite"));
↳      0

```

D.15.23.5 createGroup

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `createGroup(S, L)`; S, L are integer matrices

Purpose: create the group of the form $(S+L)/L$, i.e.
 S specifies generators, L specifies relations.

Return: group

Example:

```

LIB "multigrading.lib";
intmat S[3][3] =
1, 0, 0,
0, 1, 0,
0, 0, 1;
intmat L[3][2] =
1, 1,
1, 3,
1, 5;
def G = createGroup(S, L); // (S+L)/L
printGroup(G);
↳ Generators:
↳      1      0      0
↳      0      1      0
↳      0      0      1
↳ Relations:
↳      1      1
↳      1      3
↳      1      5
kill S, L, G;
////////////////////////////////////
intmat S[2][3] =
1, -2, 1,
1, 1, 0;
intmat L[2][1] =
0,
2;
def G = createGroup(S, L); // (S+L)/L
printGroup(G);
↳ Generators:
↳      1     -2      1
↳      1      1      0
↳ Relations:
↳      0
↳      2
kill S, L, G;
// ----- extreme case ----- //
intmat S[1][3] =
1, -1, 10;
// Torsion:
intmat L[1][1] =
0;
def G = createGroup(S, L); // (S+L)/L
printGroup(G);
↳ Generators:
↳      1     -1     10
↳ Relations:
↳      0

```

D.15.23.6 createQuotientGroup

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: createGroup(L); L is an integer matrix

Purpose: create the group of the form $(I+L)/L$,
where I is the square identity matrix of size nrows(L) x nrows(L)

Note: L specifies relations between free generators of $Z^{\text{nrows}(L)}$

Return: group

Example:

```
LIB "multigrading.lib";
intmat I[3][3] =
1, 0, 0,
0, 1, 0,
0, 0, 1;
intmat L[3][2] =
1, 1,
1, 3,
1, 5;
// The group  $Z^3 / L$  can be constructed as follows:
// shortcut:
def G = createQuotientGroup(L);
printGroup(G);
↳ Generators:
↳      1      0      0
↳      0      1      0
↳      0      0      1
↳ Relations:
↳      1      1
↳      1      3
↳      1      5
// the general way:
def GG = createGroup(I, L); //  $(I+L)/L$ 
printGroup(GG);
↳ Generators:
↳      1      0      0
↳      0      1      0
↳      0      0      1
↳ Relations:
↳      1      1
↳      1      3
↳      1      5
```

D.15.23.7 createTorsionFreeGroup

Procedure from library multigrading.lib (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: createTorsionFreeGroup(S); S is an integer matrix

Purpose: create the free subgroup generated by S within the
free Abelian group of rank nrows(S)

Return: group

Example:

```

LIB "multigrading.lib";
// ----- extreme case ----- //
intmat S[1][3] =
1, -1, 10;
// Torsion:
intmat L[1][1] =
0;
// The free subgroup generated by elements of S within Z^1
// can be constructed as follows:
// shortcut:
def G = createTorsionFreeGroup(S);
printGroup(G);
↳ Generators:
↳      1   -1   10
↳ Relations:
↳      0
// the general way:
def GG = createGroup(S, L); // (S+L)/L
printGroup(GG);
↳ Generators:
↳      1   -1   10
↳ Relations:
↳      0

```

D.15.23.8 printGroup

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `printGroup(G)`; G is a group

Purpose: prints the group G

Return: nothing

Example:

```

LIB "multigrading.lib";
intmat S[3][3] =
1, 0, 0,
0, 1, 0,
0, 0, 1;
intmat L[3][2] =
1, 1,
1, 3,
1, 5;
def G = createGroup(S, L); // (S+L)/L
printGroup(G);
↳ Generators:
↳      1   0   0
↳      0   1   0
↳      0   0   1
↳ Relations:
↳      1   1
↳      1   3
↳      1   5

```

D.15.23.9 isGroup

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\], page 2082](#)).

Usage: `isGroup(G)`; G a list

Purpose: checks whether G is a valid group

Note: G should be created by `createGroup`
(or `createQuotientGroup`, `createTorsionFreeGroup`)

Return: int, 1 if G is a valid group and 0 otherwise

Example:

```
LIB "multigrading.lib";
intmat S[3][3] =
1, 0, 0,
0, 1, 0,
0, 0, 1;
intmat L[3][2] =
1, 1,
1, 3,
1, 5;
def G = createGroup(S, L); // (S+L)/L
isGroup(G);
↳ 1
printGroup(G);
↳ Generators:
↳      1      0      0
↳      0      1      0
↳      0      0      1
↳ Relations:
↳      1      1
↳      1      3
↳      1      5
```

D.15.23.10 isGroupHomomorphism

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\], page 2082](#)).

Usage: `isGroupHomomorphism(L1,L2,A)`; L1 and L2 are groups, A is an integer matrix

Purpose: checks whether A defines a group homomorphism $\phi: L1 \rightarrow L2$

Return: int, 1 if A defines the homomorphism and 0 otherwise

Example:

```
LIB "multigrading.lib";
intmat L1[4][1]=
0,
0,
0,
2;
intmat L2[3][2]=
0, 0,
2, 0,
0, 3;
```

```

intmat A[3][4] =
1, 2, 3, 0,
7, 0, 0, 0,
1, 2, 0, 3;
print( A );
↳      1      2      3      0
↳      7      0      0      0
↳      1      2      0      3
isGroupHomomorphism(L1, L2, A);
↳ 1
intmat B[3][4] =
1, 2, 3, 0,
7, 0, 0, 0,
1, 2, 0, 2;
print( B );
↳      1      2      3      0
↳      7      0      0      0
↳      1      2      0      2
isGroupHomomorphism(L1, L2, B); // Not a homomorphism!
↳ 0

```

D.15.23.11 isGradedRingHomomorphism

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `isGradedRingHomomorphism(R, f, A)`; ring R, ideal f, group homomorphism A

Purpose: test a multigraded group ring homomorphism defined by a ring map from R to the current ring, given by generators images f and a group homomorphism A between grading groups

Return: int, 1 for TRUE, 0 otherwise

Example:

```

LIB "multigrading.lib";
ring r = 0, (x, y, z), dp;
intmat S1[3][3] =
1, 0, 0,
0, 1, 0,
0, 0, 1;
intmat L1[3][1] =
0,
0,
0;
def G1 = createGroup(S1, L1); // (S1 + L1)/L1
printGroup(G1);
↳ Generators:
↳      1      0      0
↳      0      1      0
↳      0      0      1
↳ Relations:
↳      0
↳      0
↳      0
setBaseMultigrading(S1, L1); // to change...

```

```

ring R = 0, (a, b, c), dp;
intmat S2[2][3] =
1, 0,
0, 1;
intmat L2[2][1] =
0,
2;
def G2 = createGroup(S2, L2);
printGroup(G2);
↳ Generators:
↳      1   0   0
↳      1   0   0
↳ Relations:
↳      0
↳      2
setBaseMultigrading(S2, L2); // to change...
map F = r, a, b, c;
intmat A[nrows(L2)][nrows(L1)] =
1, 0, 0,
3, 2, -6;
// graded ring homomorphism is given by (compatible):
print(F);
↳ F[1]=a
↳ F[2]=b
↳ F[3]=c
print(A);
↳      1   0   0
↳      3   2  -6
isGradedRingHomomorphism(r, ideal(F), A);
↳ 1
def h = createGradedRingHomomorphism(r, ideal(F), A);
print(h);
↳ [1]:
↳ // coefficients: QQ
↳ // number of vars : 3
↳ //           block  1 : ordering dp
↳ //           : names   x y z

↳      0   0   0
isGradedRingHomomorphism(r, ideal(F), B); // FALSE: there is no such homomorphism!

```

```

    ↪ 0
    // Therefore: the following command should return an error
    // createGradedRingHomomorphism(r, ideal(F), B);

```

D.15.23.12 createGradedRingHomomorphism

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `createGradedRingHomomorphism(R, f, A)`; ring R, ideal f, group homomorphism A

Purpose: create a multigraded group ring homomorphism defined by a ring map from R to the current ring, given by generators images f and a group homomorphism A between grading groups

Return: graded ring homomorphism

Example:

```

LIB "multigrading.lib";
ring r = 0, (x, y, z), dp;
intmat S1[3][3] =
1, 0, 0,
0, 1, 0,
0, 0, 1;
intmat L1[3][1] =
0,
0,
0;
def G1 = createGroup(S1, L1); // (S1 + L1)/L1
printGroup(G1);
↪ Generators:
↪      1   0   0
↪      0   1   0
↪      0   0   1
↪ Relations:
↪      0
↪      0
↪      0
setBaseMultigrading(S1, L1); // to change...
ring R = 0, (a, b, c), dp;
intmat S2[2][3] =
1, 0,
0, 1;
intmat L2[2][1] =
0,
2;
def G2 = createGroup(S2, L2);
printGroup(G2);
↪ Generators:
↪      1   0   0
↪      1   0   0
↪ Relations:
↪      0
↪      2
setBaseMultigrading(S2, L2); // to change...
map F = r, a, b, c;

```

```

intmat A[nrows(L2)][nrows(L1)] =
1, 0, 0,
3, 2, -6;
// graded ring homomorphism is given by (compatible):
print(F);
↳ F[1]=a
↳ F[2]=b
↳ F[3]=c
print(A);
↳      1      0      0
↳      3      2     -6
isGradedRingHomomorphism(r, ideal(F), A);
↳ 1
def h = createGradedRingHomomorphism(r, ideal(F), A);
print(h);
↳ [1]:
↳ // coefficients: QQ
↳ // number of vars : 3
↳ //      block  1 : ordering dp
↳ //      : names  x y z
↳ //      block  2 : ordering C
↳ [2]:
↳  _[1]=a
↳  _[2]=b
↳  _[3]=c
↳ [3]:
↳  1,0,0,
↳  3,2,-6

```

D.15.23.13 setModuleGrading

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `setModuleGrading(m, G)`, `m` module/vector, `G` intmat

Purpose: attaches the multiweights of free module generators to 'm'

Warning: The method does not verify whether the multigrading makes the module/vector homogeneous. One can do that using `isHomogeneous(m)`.

Example:

```

LIB "multigrading.lib";
ring R = 0, (x,y), dp;
intmat M[2][2]=
1, 1,
0, 2;
intmat T[2][5]=
1, 2, 3, 4, 0,
0, 10, 20, 30, 1;
setBaseMultigrading(M, T);
ideal I = x, y, xy^5;
intmat V = multiDeg(I);
// V == M; modulo T
print(V);
↳      1      1     10

```

```

↳      0      2      10
module S = syz(I);
S = setModuleGrading(S, V);
getModuleGrading(S) == V;
↳ 1
print(S);
↳ -y,x4y5,
↳ x, 0,
↳ 0, -1
vector v = getGradedGenerator(S, 1);
getModuleGrading(v) == V;
↳ 1
print( multiDeg(v) );
↳ 2,
↳ 2
isHomogeneous(S);
↳ 1
print( multiDeg(S) );
↳      2      10
↳      2      10

```

D.15.23.14 getModuleGrading

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `getModuleGrading(m)`, 'm' module/vector

Return: integer matrix of the multiweights of free module generators attached to 'm'

Example:

```

LIB "multigrading.lib";
ring R = 0, (x,y), dp;
intmat M[2][2]=
1, 1,
0, 2;
intmat T[2][5]=
1, 2, 3, 4, 0,
0, 10, 20, 30, 1;
setBaseMultigrading(M, T);
ideal I = x, y, xy^5;
isHomogeneous(I);
↳ 1
intmat V = multiDeg(I); print(V);
↳      1      1      10
↳      0      2      10
module S = syz(I); print(S);
↳ -y,x4y5,
↳ x, 0,
↳ 0, -1
S = setModuleGrading(S, V);
getModuleGrading(S) == V;
↳ 1
vector v = getGradedGenerator(S, 1);
getModuleGrading(v) == V;

```

```

↳ 1
isHomogeneous(v);
↳ 1
print( multiDeg(v) );
↳ 2,
↳ 2
isHomogeneous(S);
↳ 1
print( multiDeg(S) );
↳      2      10
↳      2      10

```

D.15.23.15 isSublattice

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\], page 2082](#)).

Usage: `isSublattice(L, S)`; L, S are of type `intmat`

Purpose: checks whether the lattice created by L is a sublattice of the lattice created by S.
The procedure checks whether each generator of L is contained in S.

Return: integer, 0 if false, 1 if true

Example:

```

LIB "multigrading.lib";
//ring R = 0,(x,y),dp;
intmat S2[3][3]=
0, 2, 3,
0, 1, 1,
3, 0, 2;
intmat S1[3][2]=
0, 6,
0, 2,
3, 4;
isSublattice(S1,S2); // Yes!
↳ 1
intmat S3[3][1] =
0,
0,
1;
not(isSublattice(S3,S2)); // Yes!
↳ 1

```

D.15.23.16 imageLattice

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\], page 2082](#)).

Usage: `imageLattice(Q,L)`; Q and L are of type `intmat`

Purpose: compute an integral basis for the image of the lattice L under the homomorphism of lattices Q.

Return: `intmat`

Example:

```

LIB "multigrading.lib";
intmat Q[2][3] =
1,2,3,
3,2,1;
intmat L[3][2] =
1,4,
2,5,
3,6;
// should be a 2x2 matrix with columns
// [2,-14], [0,36]
imageLattice(Q,L);
⇒ 2,0,
⇒ 22,36

```

D.15.23.17 intRank

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `intRank(A); intmat A`

Purpose: compute the rank of the integral matrix `A` by computing a hermite normalform.

Returns: `int`

Example:

```

LIB "multigrading.lib";
intmat A[3][4] =
1,0,1,0,
1,2,0,0,
0,0,0,0;
int r = intRank(A);
print(A);
⇒      1      0      1      0
⇒      1      2      0      0
⇒      0      0      0      0
print(r); // Should be 2
⇒ 2
// another example
intmat B[2][2] =
1,2,
1,2;
int d = intRank(B);
print(B);
⇒      1      2
⇒      1      2
print(d); // Should be 1
⇒ 1
kill A, B, r, d;

```

D.15.23.18 kernelLattice

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `kernelLattice(P); intmat P`

Purpose: compute an integral basis for the kernel of the homomorphism of lattices defined by the intmat P.

Returns: intmat

Example:

```
LIB "multigrading.lib";
intmat LL[3][4] =
1,4,7,10,
2,5,8,11,
3,6,9,12;
// should be a 4x2 matrix whose columns
// generate the same lattice as [-1,2,-1,0],[2,-3,0,1]
intmat B = kernelLattice(LL);
print(B);
↳      -1      2
↳       2     -3
↳      -1      0
↳       0      1
// another example
intmat C[2][4] =
1,0,2,0,
0,1,2,0;
// should result in a matrix whose
// columns create the same lattice as
// [-2,-2,1,0],[0,0,0,1]
intmat D = kernelLattice(C);
print(D);
↳      -2      0
↳      -2      0
↳       1      0
↳       0      1
kill B;
```

D.15.23.19 latticeBasis

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `latticeBasis(B);` intmat B

Purpose: compute an integral basis for the lattice defined by the columns of B.

Returns: intmat

Example:

```
LIB "multigrading.lib";
intmat L[3][3] =
1,4,8,
2,5,10,
3,6,12;
intmat B = latticeBasis(L);
print(B); // should result in a matrix whose columns generate the same lattice as [
↳       1      0
↳       2      3
↳       3      6
// another example
```

```

intmat C[2][4] =
1,1,2,0,
2,3,4,0;
// should result in a matrix whose
// columns create the same lattice as
// [0,1],[1,0]
intmat D = latticeBasis(C);
print(D);
↪      1      0
↪      0      1
kill B,L;

```

D.15.23.20 preimageLattice

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\], page 2082](#)).

Usage: `preimageLattice(P, B); intmat P, intmat B`

Purpose: compute an integral basis for the preimage of B under the homomorphism of lattices defined by the intmat P.

Returns: intmat

Example:

```

LIB "multigrading.lib";
intmat P[2][3] =
2,6,10,
4,8,12;
intmat B[2][1] =
1,
0;
// should be a (3x2)-matrix with columns e.g. [1,1,-1] and [0,3,-2] (the generated lattice)
print(preimageLattice(P,B));
↪      1      0
↪      1      3
↪     -1     -2
// another example
intmat W[3][3] =
1,0,0,
0,1,1,
0,2,0;
intmat Z[3][2] =
1,0,
0,1,
0,0;
// should be a (3x2)-matrix with columns e.g. [1,0,0] and [0,0,-1] (the generated lattice)
print(preimageLattice(W,Z));
↪      1      0
↪      0      0
↪      0      1

```

D.15.23.21 projectLattice

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\], page 2082](#)).

Usage: `projectLattice(B); intmat B`

Purpose: A set of vectors in $\mathbb{Z}\mathbb{Z}^m$ is given as the columns of B. Then this function provides a linear map $\mathbb{Z}\mathbb{Z}^m \rightarrow \mathbb{Z}\mathbb{Z}^n$ having the primitive span of B its kernel.

Returns: intmat

Example:

```
LIB "multigrading.lib";
intmat B[4][2] =
1,5,
2,6,
3,7,
4,8;
// should result in a (2x4)-matrix such that the corresponding lattice is created by
// [-1, 2], [-2, 3], [-1, 0] and [0, 1]
print(projectLattice(B));
↪      -1      2      -1      0
↪      2      -3      0      1
// another example
intmat BB[4][2] =
1,0,
0,1,
0,0,
0,0;
// should result in a (2x4)-matrix such that the corresponding lattice is created by
// [0,0], [0,0], [1,0], [0,1]
print(projectLattice(BB));
↪      0      0      1      0
↪      0      0      0      1
// another example
intmat BBB[3][4] =
1,0,1,2,
1,1,0,0,
3,0,0,3;
// should result in the (1x3)-matrix that consists of just zeros
print(projectLattice(BBB));
↪      0      0      0
```

D.15.23.22 intersectLattices

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `intersectLattices(A, B);` intmat A, intmat B

Purpose: compute an integral basis for the intersection of the lattices A and B.

Returns: intmat

Example:

```
LIB "multigrading.lib";
intmat A[3][2] =
1,4,
2,5,
3,6;
intmat B[3][2] =
6,9,
7,10,
```

```

8,11;
// should result in a (3x2)-matrix with columns
// e.g. [0, 3, 6], [-3, 0, 3] (the lattice should be the same)
print(intersectLattices(A,B));
↳      3      0
↳      0      3
↳     -3      6
// another example
intmat C[2][3] =
1,0,0,
3,2,5;
intmat D[2][3] =
4,5,0,
0,5,0;
// should result in a (3x2)-matrix whose columns generate the
// same lattice as [1,5], [0, 20]
print(intersectLattices(C,D));
↳      1      0
↳      5     20

```

D.15.23.23 isIntegralSurjective

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Purpose: test whether the given linear map P of lattices is surjective.

Returns: int, where 0 is false and 1 is true.

Example:

```

LIB "multigrading.lib";
intmat A[2][3] =
1,3,5,
2,4,6;
// should be 0
int b = isIntegralSurjective(A);
print(b);
↳ 0
// another example
intmat B[2][3] =
1,1,5,
2,3,6;
// should be 1
int c = isIntegralSurjective(B);
print(c);
↳ 1
kill A, b, B, c;

```

D.15.23.24 isPrimitiveSublattice

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Purpose: check whether the given set of integral vectors in $\mathbb{Z}\mathbb{Z}^m$, i.e. the columns of A , generate a primitive sublattice in $\mathbb{Z}\mathbb{Z}^m$ (a direct summand of $\mathbb{Z}\mathbb{Z}^m$).

Returns: int, where 0 is false and 1 is true.

Example:

```
LIB "multigrading.lib";
intmat A[3][2] =
1,4,
2,5,
3,6;
// should be 0
int b = isPrimitiveSublattice(A);
print(b);
↳ 0
// another example
intmat B[2][2] =
1,0,
0,1;
// should be 1
int c = isPrimitiveSublattice(B);
print(c);
↳ 1
kill A, b, B, c;
```

D.15.23.25 intInverse

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Purpose: compute the integral inverse of the intmat A.
If $\det(A)$ is neither 1 nor -1 an error is returned.

Returns: intmat

Example:

```
LIB "multigrading.lib";
intmat A[3][3] =
1,1,3,
3,2,0,
0,0,1;
intmat B = intInverse(A);
// should be the unit matrix
print(A * B);
↳      1      0      0
↳      0      1      0
↳      0      0      1
// another example
intmat C[2][2] =
2,1,
3,2;
intmat D = intInverse(C);
// should be the unit matrix
print(C * D);
↳      1      0
↳      0      1
kill A, B, C, D;
```

D.15.23.26 integralSection

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Purpose: for a given linear surjective map P of lattices
this procedure returns an integral section of P .

Returns: `intmat`

Example:

```
LIB "multigrading.lib";
intmat P[2][4] =
1,3,4,6,
2,4,5,7;
// should be a matrix with two columns
// for example: [-2, 1, 0, 0], [3, -3, 0, 1]
intmat U = integralSection(P);
print(U);
↪      -1      1
↪      -2      1
↪       2     -1
↪       0      0
print(P * U);
↪       1      0
↪       0      1
kill U;
```

D.15.23.27 primitiveSpan

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Purpose: compute an integral basis for the minimal primitive
sublattice that contains the given vectors, i.e. the columns of V .

Returns: `int`, where 0 is false and 1 is true.

Example:

```
LIB "multigrading.lib";
intmat V[3][2] =
1,4,
2,5,
3,6;
// should return a (3x2)-matrix whose columns
// generate the same lattice as [1, 2, 3] and [0, 1, 2]
intmat R = primitiveSpan(V);
print(R);
↪       1      0
↪       2      1
↪       3      2
// another example
intmat W[2][2] =
1,0,
0,1;
// should return a (2x2)-matrix whose columns
// generate the same lattice as [1, 0] and [0, 1]
intmat S = primitiveSpan(W);
```

```

print(S);
↪      1      0
↪      0      1
kill V, R, S, W;

```

D.15.23.28 factorgroup

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\], page 2082](#)).

Usage: `factorgroup(G,H); list G, list H`

Purpose: returns a representation of the factor group $G \bmod H$ using the first isomorphism thm

Returns: list

Example:

```

LIB "multigrading.lib";
intmat S1[2][2] =
1,0,
0,1;
intmat L1[2][1] =
2,
0;
intmat S2[2][1] =
1,
0;
intmat L2[2][1] =
2,
0;
list G = createGroup(S1,L1);
list H = createGroup(S2,L2);
list N = factorgroup(G,H);
print(N);
↪ [1]:
↪  1,0,
↪  0,1
↪ [2]:
↪  2,1,
↪  0,0
kill G,H,N,S1,L1,S2,L2;

```

D.15.23.29 productgroup

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\], page 2082](#)).

Usage: `productgroup(G,H); list G, list H`

Purpose: Returns a representation of the group $G \times H$

Returns: list

Example:

```

LIB "multigrading.lib";
intmat S1[2][2] =
1,0,
0,1;
intmat L1[2][1] =

```

```

2,
0;
intmat S2[2][2] =
1,0,
0,2;
intmat L2[2][1] =
0,
3;
list G = createGroup(S1,L1);
list H = createGroup(S2,L2);
list N = productgroup(G,H);
print(N);
↳ [1]:
↳ 1,0,0,0,
↳ 0,1,0,0,
↳ 0,0,1,0,
↳ 0,0,0,2
↳ [2]:
↳ 2,0,
↳ 0,0,
↳ 0,0,
↳ 0,3
kill G,H,N,S1,L1,S2,L2;

```

D.15.23.30 multiDeg

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `multiDeg(A)`; polynomial/vector/ideal/module A

Purpose: compute multidegree

Example:

```

LIB "multigrading.lib";
ring r = 0,(x, y), dp;
intmat A[2][2] = 1, 0, 0, 1;

D.15.23.31 multiDegBasis

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `multiDegBasis(d)`, `multidegree: intvec d`

Assume: current ring is multigraded, monomial ordering is global

Purpose: compute all monomials of multidegree `d`

Example:

```

LIB "multigrading.lib";
ring R = 0, (x, y), dp;
intmat g1[2][2]=1,0,0,1;
intmat l[2][1]=2,0;
intmat g2[2][2]=1,1,1,1;
intvec v1=4,0;
intvec v2=4,4;
intmat g3[1][2]=1,1;
setBaseMultigrading(g3);
intvec v3=4:1;
v3;
↳ 4
multiDegBasis(v3);
↳ _[1]=x4
↳ _[2]=y4
↳ _[3]=xy3
↳ _[4]=x2y2
↳ _[5]=x3y
setBaseMultigrading(g1,l);
multiDegBasis(v1);
↳ _[1]=1
setBaseMultigrading(g2);
multiDegBasis(v2);
↳ _[1]=y4
↳ _[2]=x4
↳ _[3]=x3y
↳ _[4]=x2y2
↳ _[5]=xy3
intmat M[2][2] = 1, -1, -1, 1;
intvec d = -2, 2;
setBaseMultigrading(M);

```

```

multiDegBasis(d);
↳ _[1]=y2
attrib(_, "ZeroPart");
↳ _[1]=xy
kill R, M, d;
ring R = 0, (x, y, z), dp;
intmat M[2][3] = 1, -2, 1,      1, 1, 0;
intmat L[2][1] = 0, 2;
intvec d = 4, 1;
setBaseMultigrading(M, L);
multiDegBasis(d);
↳ _[1]=x3z
↳ _[2]=x6y
↳ _[3]=yz6
↳ _[4]=xz3
attrib(_, "ZeroPart");
↳ _[1]=xyz
↳ _[2]=x4y2
↳ _[3]=y2z4
kill R, M, d;
ring R = 0, (x, y, z), dp;
qring Q = std(ideal( y^6+ x*y^3*z-x^2*z^2 ));
intmat M[2][3] = 1, 1, 2,      2, 1, 1;
// intmat T[2][1] = 0, 2;
setBaseMultigrading(M); // BUG????
intvec d = 6, 6;
multiDegBasis(d);
↳ _[1]=x2z2
↳ _[2]=xy3z
attrib(_, "ZeroPart");
↳ _[1]=0
kill R, Q, M, d;
ring R = 0, (x, y, z), dp;
qring Q = std(ideal( x*z^3 - y *z^6, x*y*z - x^4*y^2 ));
intmat M[2][3] = 1, -2, 1,      1, 1, 0;
intmat T[2][1] = 0, 2;
intvec d = 4, 1;
setBaseMultigrading(M, T); // BUG????
multiDegBasis(d);
↳ _[1]=x3z
↳ _[2]=x6y
↳ _[3]=xz3
attrib(_, "ZeroPart");
↳ _[1]=xyz
↳ _[2]=y2z4

```

D.15.23.32 multiDegPartition

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: multiDegPartition(def p), p polynomial/vector

Returns: an ideal/module consisting of multigraded-homogeneous parts of p

Example:

```

LIB "multigrading.lib";
ring r = 0,(x,y,z),dp;
intmat g[2][3]=
1,0,1,
0,1,1;
intmat t[2][1]=
-2,
1;
setBaseMultigrading(g,t);
poly f = x10yz+x8y2z-x4z2+y5+x2y2-z2+x17z3-y6;
multiDegPartition(f);
↳ _[1]=x17z3
↳ _[2]=x10yz+x8y2z
↳ _[3]=-y6
↳ _[4]=-x4z2+y5
↳ _[5]=x2y2-z2
vector v = xy*gen(1)-x3y2*gen(2)+x4y*gen(3);
intmat B[2][3]=1,-1,-2,0,0,1;
v = setModuleGrading(v,B);
getModuleGrading(v);
↳ 1,-1,-2,
↳ 0,0,1
multiDegPartition(v, B);
↳ _[1]=x4y*gen(3)-x3y2*gen(2)
↳ _[2]=xy*gen(1)

```

D.15.23.33 isTorsionFree

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `isTorsionFree()`

Purpose: Determines whether the multigrading attached to the current ring is free.

Return: boolean, the result of the test

Example:

```

LIB "multigrading.lib";
ring R = 0,(x,y),dp;
intmat M[2][2]=
1,0,
0,1;
intmat T[2][5]=
1, 2, 3, 4, 0,
0,10,20,30, 1;
setBaseMultigrading(M,T);
// Is the resulting group free?
isTorsionFree();
↳ 1
kill R, M, T;
////////////////////////////////////
ring R=0,(x,y,z),dp;
intmat A[3][3] =
1,0,0,
0,1,0,

```

```

0,0,1;
intmat B[3][4]=
3,3,3,3,
2,1,3,0,
1,2,0,3;
setBaseMultigrading(A,B);
// Is the resulting group free?
isTorsionFree();
↳ 0
kill R, A, B;

```

D.15.23.34 isPositive

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `isPositive()`

Purpose: Computes whether the multigrading of the ring is positive. For computation theorem 8.6 of the Miller/Sturmfels book is used.

Returns: true if the multigrading is positive

Example:

```

LIB "multigrading.lib";
printlevel = 3;
ring r = 0,(x,y),dp;
intmat A[1][2]=-1,1;
setBaseMultigrading(A);
isPositive();
↳ 0
intmat B[1][2]=1,1;
setBaseMultigrading(B);
isPositive(B);
↳ 1

```

D.15.23.35 isZeroElement

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `isZeroElement(d, [T]);` intvec `d`, group `T`

Purpose: For a integer vector 'd' representing the multidegree of some polynomial or vector this method computes if the multidegree is contained in the grading group `group` (either set globally or given as an optional argument), i.e. if it is zero in the multigrading.

Example:

```

LIB "multigrading.lib";
ring r = 0,(x,y,z),dp;
intmat g[2][3]=
1,0,1,
0,1,1;
intmat t[2][1]=
-2,
1;
intmat tt[2][1]=
1,

```

```

-1;
setBaseMultigrading(g,t);
poly a = x10yz;
poly b = x8y2z;
poly c = x4z2;
poly d = y5;
poly e = x2y2;
poly f = z2;
intvec v1 = multiDeg(a) - multiDeg(b);
v1;
↳ 2,-1
isZeroElement(v1);
↳ 1
isZeroElement(v1, tt);
↳ 0
intvec v2 = multiDeg(a) - multiDeg(c);
v2;
↳ 5,0
isZeroElement(v2);
↳ 0
isZeroElement(v2, tt);
↳ 0
intvec v3 = multiDeg(e) - multiDeg(f);
v3;
↳ 0,0
isZeroElement(v3);
↳ 1
isZeroElement(v3, tt);
↳ 1
intvec v4 = multiDeg(c) - multiDeg(d);
v4;
↳ 6,-3
isZeroElement(v4);
↳ 1
isZeroElement(v4, tt);
↳ 0

```

D.15.23.36 areZeroElements

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `areZeroElements(D, [T]);` intmat D, group T

Purpose: For a integer matrix D, considered column-wise as a set of integer vecors representing the multidegree of some polynomial or vector this method checks whether all these multidegrees are contained in the grading group (either set globally or given as an optional argument), i.e. if they all are zero in the multigrading.

Example:

```

LIB "multigrading.lib";
ring r = 0,(x,y,z),dp;
intmat S[2][3]=
1,0,1,

```

```

0,1,1;
intmat L[2][1]=
2,
2;
setBaseMultigrading(S,L);
poly a = 1;
poly b = xyz;
ideal I = a, b;
print(multiDeg(I));
↪      0      2
↪      0      2
intmat m[5][2]=multiDeg(a),multiDeg(b); m=transpose(m);
print(multiDeg(a));
↪ 0,
↪ 0
print(multiDeg(b));
↪ 2,
↪ 2
print(m);
↪      0      2      0      0      0
↪      0      2      0      0      0
areZeroElements(m);
↪ 1
intmat LL[2][1]=
1,
-1;
areZeroElements(m,LL);
↪ 0

```

D.15.23.37 isHomogeneous

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `isHomogeneous(a[, f]);` a polynomial/vector/ideal/module

Return: boolean, TRUE if a is (multi)homogeneous, and FALSE otherwise

Example:

```

LIB "multigrading.lib";
ring r = 0,(x,y,z),dp;
//Grading and Torsion matrices:
intmat M[3][3] =
1,0,0,
0,1,0,
0,0,1;
intmat T[3][1] =
1,2,3;
setBaseMultigrading(M,T);
attrib(r);
↪ attr:cf_class, type int
↪ attr:global, type int
↪ attr:maxExp, type int
↪ attr:ring_cf, type int

```

D.15.23.38 equalMultiDeg

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `equalMultiDeg(exp1, exp2[, V]);` intvec exp1, exp2, intmat V

Purpose: Tests if the exponent vectors of two monomials (given by exp1 and exp2) represent the same multidegree.

Note: the integer matrix V encodes multidegrees of module components, if module component is present in exp1 and exp2

Example:

```

LIB "multigrading.lib";
printlevel=3;

```

```

ring r = 0, (x,y,z), dp;
intmat g[2][3]=
1,0,1,
0,1,1;
intmat t[2][1]=
-2,
1;
setBaseMultigrading(g,t);
poly a = x10yz;
poly b = x8y2z;

↳ 0
equalMultiDeg(leadexp(e), leadexp(f));
↳ 1

```

D.15.23.39 multiDegGroebner

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: multiDegGroebner(I); I is a poly/vector/ideal/module

Purpose: computes the multigraded standard/groebner basis of I

Note: I must be multigraded homogeneous

Returns: ideal/module, the computed basis

Example:

```
LIB "multigrading.lib";
ring r = 0, (x,y,z,w), dp;
intmat MM[2][4]=
1,1,1,1,
0,1,3,4;
setBaseMultigrading(MM);
module M = ideal( xw-yz, x2z-y3, xz2-y2w, yw2-z3);

```

D.15.23.40 multiDegSyzygy

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `multiDegSyzygy(I)`; I is a ideal or a module

Purpose: computes the multigraded syzygy module of I

Returns: module, the syzygy module of I

Note: generators of I must be multigraded homogeneous

Example:

```

LIB "multigrading.lib";
ring r = 0, (x,y,z,w), dp;
intmat MM[2][4]=
1,1,1,1,
0,1,3,4;
setBaseMultigrading(MM);
module M = ideal( xw-yz, x2z-y3, xz2-y2w, yw2-z3);
intmat v[2][nrows(M)]=
1,
0;
M = setModuleGrading(M, v);
isHomogeneous(M);
↳ 1
"Multidegrees: "; print(multiDeg(M));
↳ Multidegrees:
↳      3      4      4      4
↳      4      3      6      9
// Let's compute syzygies!
def S = multiDegSyzygy(M); S;
↳ S[1]=yw*gen(1)-x*gen(4)-z*gen(3)
↳ S[2]=z2*gen(1)-y*gen(4)-w*gen(3)
↳ S[3]=xz*gen(1)+y*gen(3)-w*gen(2)
↳ S[4]=y2*gen(1)+x*gen(3)-z*gen(2)
"Module Units Multigrading: "; print( getModuleGrading(S) );

```

```

↳ Module Units Multigrading:
↳      3      4      4      4
↳      4      3      6      9
"Multidegrees: "; print(multiDeg(S));
↳ Multidegrees:
↳      5      5      5      5
↳      9     10      7      6
isHomogeneous(S);
↳ 1

```

D.15.23.41 multiDegModulo

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `multiDegModulo(I);` I, J are ideals or modules

Purpose: computes the multigraded 'modulo' module of I and J

Returns: module, see 'modulo' command

Note: I and J should have the same multigrading, and their generators must be multigraded homogeneous

Example:

```

LIB "multigrading.lib";
ring r = 0,(x,y,z),dp;
intmat MM[2][3]=
-1,1,1,
0,1,3;
setBaseMultigrading(MM);
ideal h1 = x, y, z;
ideal h2 = x;
"Multidegrees: "; print(multiDeg(h1));
↳ Multidegrees:
↳      -1      1      1
↳      0      1      3
// Let's compute modulo(h1, h2):
def K = multiDegModulo(h1, h2); K;
↳ K[1]=gen(1)
↳ K[2]=y*gen(3)-z*gen(2)
↳ K[3]=x*gen(2)
↳ K[4]=x*gen(3)
"Module Units Multigrading: "; print( getModuleGrading(K) );
↳ Module Units Multigrading:
↳      -1      1      1
↳      0      1      3
"Multidegrees: "; print(multiDeg(K));
↳ Multidegrees:
↳      -1      2      0      0
↳      0      4      1      3
isHomogeneous(K);
↳ 1

```

D.15.23.42 multiDegResolution

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

- Usage:** `multiDegResolution(I,l,[f]);` I is poly/vector/ideal/module; l,f are integers
- Purpose:** computes the multigraded resolution of I of the length l, or the whole resolution if l is zero. Returns minimal resolution if an optional argument 1 is supplied
- Note:** input must have multigraded-homogeneous generators.
The returned list is truncated beginning with the first zero differential.
- Returns:** list, the computed resolution

Example:

```
LIB "multigrading.lib";
ring r = 0,(x,y,z,w),dp;
intmat M[2][4]=
1,1,1,1,
0,1,3,4;
setBaseMultigrading(M);
module m= ideal( xw-yz, x2z-y3, xz2-y2w, yw2-z3);
isHomogeneous(ideal( xw-yz, x2z-y3, xz2-y2w, yw2-z3), "checkGens");
↳ 1
ideal A = xw-yz, x2z-y3, xz2-y2w, yw2-z3;
int j;
for(j=1; j<=ncols(A); j++)
{
multiDegPartition(A[j]);
}

D.15.23.43 multiDegTensor

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `multiDegTensor(m, n)`, `m, n` modules or matrices.

Purpose: Computes the multigraded tensor product of two multigraded modules.

Return: A module.

Example:

```
LIB "multigrading.lib";
ring r = 0,(x),dp;
intmat g[2][1]=1,1;
setBaseMultigrading(g);
matrix m[5][3]=1,2,3,4,5,6,7,8,9,10,11,12,13,14,15;
matrix n[3][2]=x,x2,x3,x4,x5,x6;
module mm = m;
module nn = n;
intmat gm[2][5]=1,2,3,4,5,0,0,0,0,0;
intmat gn[2][3]=0,0,0,1,2,3;
mm = setModuleGrading(mm, gm);
nn = setModuleGrading(nn, gn);
module mmtnn = multiDegTensor(mm, nn);
print(mmtnn);
↳ x, x2,0, 0, 0, 0, 0, 0, 0, 0, 1, 0, 0, 2, 0, 0, 3, 0, 0,
↳ x3,x4,0, 0, 0, 0, 0, 0, 0, 0, 0, 1, 0, 0, 2, 0, 0, 3, 0,
↳ x5,x6,0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1, 0, 0, 2, 0, 0, 3,
↳ 0, 0, x, x2,0, 0, 0, 0, 0, 0, 0, 4, 0, 0, 5, 0, 0, 6, 0, 0,

D.15.23.46 pushForward

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `pushForward(f);`

Purpose: Computes the finest grading of the image ring which makes the map f a map of graded rings. The group map between the two grading groups is given by $\text{transpose}(\text{Id}, 0)$. Pay attention that the group spanned by the columns of the grading group matrix may not be a subgroup of the grading group. Still all columns are needed to find the correct image of the preimage gradings.

Example:

```

LIB "multigrading.lib";
ring r = 0,(x,y,z),dp;
// Setting degrees for preimage ring.;
intmat grad[3][3] =
1,0,0,
0,1,0,
0,0,1;
setBaseMultigrading(grad);
// grading on r:
getVariableWeights();
↳ 1,0,0,
↳ 0,1,0,
↳ 0,0,1
getLattice();
↳ 0,0,0
// only for the purpose of this example
if( voice > 1 ){ /*keeping(r);*/ export(r); }
ring R = 0,(a,b),dp;
ideal i = a2-b2+a6-b5+ab3,a7b+b15-ab6+a6b6;
// The quotient ring by this ideal will become our image ring.;
qring Q = std(i);
listvar();
↳ // Q

```

[0] *ring

```

⇒ // R [0] ring
⇒ // grad [0] intmat 3 x 3
⇒ // r [0] ring
map f = r, -a2b6+b5+a3b+a2+ab, -a2b7-3a2b5+b4+a, a6-b6-b3+a2; f;
⇒ f[1]=-a2b6+b5+a3b+a2+ab
⇒ f[2]=-a2b7-3a2b5+b4+a
⇒ f[3]=a6-b6-b3+a2
// TODO: Unfortunately this is not a very spectacular example...:
// Pushing forward f:
pushForward(f);
// due to pushForward we have got new grading on Q
getVariableWeights();
⇒ 0,0,
⇒ 0,0,
⇒ 0,0,
⇒ 1,0,
⇒ 0,1
getLattice();
⇒ 1,0,0,0,0,
⇒ 0,1,0,0,0,
⇒ 0,0,1,0,0,
⇒ 1,1,1,1,0,
⇒ 1,1,1,1,1
// only for the purpose of this example
if( voice > 1 ){ kill r; }

```

D.15.23.47 gradiator

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Purpose: coarsens the grading of the basering until the polynom or ideal `h` becomes homogeneous.

Example:

```

LIB "multigrading.lib";
ring r = 0, (x,y,z), dp;
intmat g[2][3] = 1,0,1,0,1,1;
intmat l[2][1] = 3,0;
setBaseMultigrading(g,l);
getLattice();
⇒ 3,0
ideal i = -y5+x4,
y6+xz,
x2y;
gradiator(i);
⇒ 1
getLattice();
⇒ 3,4,2,
⇒ 0,-5,-5
isHomogeneous(i);
⇒ 1

```

D.15.23.48 hermiteNormalForm

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: hermiteNormalForm(A);

Purpose: Computes the (lower triangular) Hermite Normal Form of the matrix A by column operations.

Return: intmat, the Hermite Normal Form of A

Example:

```
LIB "multigrading.lib";
intmat M[2][5] =
1, 2, 3, 4, 0,
0,10,20,30, 1;
// Hermite Normal Form of M:
print(hermiteNormalForm(M));
↪      1      0      0      0      0
↪      0      1      0      0      0
intmat T[3][4] =
3,3,3,3,
2,1,3,0,
1,2,0,3;
// Hermite Normal Form of T:
print(hermiteNormalForm(T));
↪      3      0      0      0
↪      0      1      0      0
↪      3     -1      0      0
intmat A[4][5] =
1,2,3,2,2,
1,2,3,4,0,
0,5,4,2,1,
3,2,4,0,2;
// Hermite Normal Form of A:
print(hermiteNormalForm(A));
↪      1      0      0      0      0
↪      1      2      0      0      0
↪      0      0      1      0      0
↪      0      1      0      1      0
```

D.15.23.49 smithNormalForm

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: smithNormalForm(A[,opt]); intmat A

Purpose: Computes the Smith Normal Form of A

Return: if no optional argument is given: intmat, the Smith Normal Form of A, otherwise: a list of 3 integer matrices P, D Q, such that $D == P*A*Q$.

Example:

```
LIB "multigrading.lib";
intmat A[5][7] =
1,0,1,0,-2,9,-71,
0,-24,248,-32,-96,448,-3496,
0,4,-42,4,-8,30,-260,
0,0,0,18,-90,408,-3168,
0,0,0,-32,224,-1008,7872;
```

```

print( smithNormalForm(A) );
↳      1      0      0      0      0      0      0
↳      0      2      2      6     12      0      0
↳      0      0      2      0      0      0      0
↳      0      0      0      8      0      0      0
↳      0      0      0      0     48      0      0
list l = smithNormalForm(A, 5);
l;

D.15.23.50 hilbertSeries

Procedure from library `multigrading.lib` (see [Section D.15.23 \[multigrading.lib\]](#), page 2082).

Usage: `hilbertSeries(I)`; I is poly/vector/ideal/module

Purpose: computes the multigraded Hilbert Series of I

Note: input must have multigraded-homogeneous generators.
Multigrading should be positive.

Returns: a ring in variables $t_{-}(i)$, $s_{-}(i)$, with polynomials
numerator1 and denominator1 and mutually prime numerator2 and denominator2, quotients of which give the series.

Example:

```

LIB "multigrading.lib";
ring r = 0, (x,y,z,w), dp;
intmat g[2][4]=
1,1,1,1,
0,1,3,4;
setBaseMultigrading(g);
module M = ideal(xw-yz, x2z-y3, xz2-y2w, yw2-z3);
intmat V[2][1]=
1,
0;
M = setModuleGrading(M, V);
def h = hilbertSeries(M); setring h;
⇒ -----
⇒ This proc returns a ring with polynomials called 'numerator1/2' and 'deno\
  minator1/2'!
⇒ They represent the first and the second Hilbert Series.
⇒ The s_(i)-variables are defined to be the inverse of the t_(i)-variables.
⇒ -----
factorize(numerator2);
⇒ [1]:

D.15.24 ncHilb.lib

Library: ncHilb.lib

Purpose: : A library for computing graded and multi-graded Hilbert series of non-commutative algebras. It also computes the truncated Hilbert series of the algebras whose Hilbert series are possibly not rational or unknown.

Author: Sharwan K. Tiwari shrawant@gmail.com
Roberto La Scala

References:

La Scala R.: Monomial right ideals and the Hilbert series of non-commutative modules, J. of Symb. Comp. (2016).

La Scala R., Tiwari Sharwan K.: Multigraded Hilbert Series of noncommutative modules, <https://arxiv.org/abs/1705.01083>.

Procedures:

D.15.24.1 nchilb

Procedure from library ncHilb.lib (see [Section D.15.24 \[ncHilb.lib\]](#), page 2142).

Usage: nchilb(list of relations, an integer, optional);
L is a list of modules (each module represents a free-polynomial), d is an integer for the degree bound (maximal total degree of polynomials of the generating set of the input ideal), #[]=1, computation for non-finitely generated regular ideals, #[]=2, computation of multi-graded Hilbert series, #[]=tdeg, for obtaining the truncated Hilbert series up to the total degree tdeg-1 (tdeg should be > 2), and #[]=string(p), to print the details about the orbit and system of equations. Let the orbit is $O_I = \{T_{\{w_1\}}(I), \dots, T_{\{w_r\}}(I)\}$ ($w_i \in W$), where we assume that if $T_{\{w_i\}}(I) = T_{\{w_i'\}}(I)$ for some $w_i' \in W$, then $\deg(w_i) \leq \deg(w_i')$. Then, it prints words description of orbit: w_1, \dots, w_r . It also prints the maximal degree and the cardinality of $\sum_j R(w_i, b_j)$ corresponding to each w_i , where $\{b_j\}$ is a basis of I. Moreover, it also prints the linear system (for the information about adjacency matrix) and its solving time.

Note : A Groebner basis of two-sided ideal of the input should be given in a special form. This form is a list of modules, where each generator of every module represents a monomial times a coefficient in the free associative algebra. The first entry, in each generator, represents a coefficient and every next entry is a variable.

Ex: module p1=[1,y,z],[-1,z,y], represents the poly $y*z-z*y$; module p2=[1,x,z,x],[-1,z,x,z], represents the poly $x*z*x-z*x*z$ for more details about the input, see examples.

Example:

```
LIB "ncHilb.lib";
ring r=0,(X,Y,Z),dp;
module p1 =[1,Y,Z]; //represents the poly Y*Z
module p2 =[1,Y,Z,X]; //represents the poly Y*Z*X
module p3 =[1,Y,Z,Z,X,Z];
module p4 =[1,Y,Z,Z,Z,X,Z];
module p5 =[1,Y,Z,Z,Z,Z,X,Z];
module p6 =[1,Y,Z,Z,Z,Z,Z,X,Z];
module p7 =[1,Y,Z,Z,Z,Z,Z,Z,X,Z];
module p8 =[1,Y,Z,Z,Z,Z,Z,Z,Z,X,Z];

D.15.24.2 rcolon

Procedure from library `ncHilb.lib` (see [Section D.15.24 \[ncHilb.lib\]](#), page 2142).

Usage: `rcolon(list of relations, a monomial, an integer);`
`L` is a list of modules (each module represents a monomial), `w` is a monomial
`d` is an integer for the degree bound (maximal total degree of monomials of the gener-
ating set of the input monomial ideal),

Note : A two-sided monomial ideal and a monomial w for the input should be given in a special form. This form is a list of modules, where the generator of every module represents a monomial times a coefficient in the free associative algebra. The first entry, in each generator, represents a coefficient, that is 1, and every next entry is a variable.

Ex: module $p1=[1,y,z]$, represents the monomial $y*z$;
 module $p2=[1,x,z,x]$, represents the monomial $x*z*x$
 for more details about the input, see examples.

Example:

```
LIB "ncHilb.lib";
ring r=0,(X,Y,Z),dp;
module w =[1,Y];
module p1 =[1,Y,Z];
module p2 =[1,Y,Z,X];
module p3 =[1,Y,Z,Z,X,Z];
module p4 =[1,Y,Z,Z,Z,X,Z];
module p5 =[1,Y,Z,Z,Z,Z,X,Z];
module p6 =[1,Y,Z,Z,Z,Z,Z,X,Z];
module p7 =[1,Y,Z,Z,Z,Z,Z,Z,X,Z];
module p8 =[1,Y,Z,Z,Z,Z,Z,Z,Z,X,Z];
list l1=list(p1,p2,p3,p4,p5,p6,p7,p8);
rcolon(l1,w,10);
↳ [1]:
↳ Z
↳ + generators of the given ideal;
```

D.15.25 ncfraction_lib

Library: ncfraction.lib

Purpose: object-oriented interface for olga.lib

Author: Johannes Hoffmann, email: johannes.hoffmann at math.rwth-aachen.de

Overview: This library introduces a new type: ncfraction.
 This type wraps the data defining a (non-commutative) fraction in an Ore localization of a G-algebra as in olga.lib.

An element of type ncfraction has five members:

- polys lnum, lden, rnum, rden
- ncloc loc

Operations:

```
string(ncfraction);
give a string representation of the data describing the fraction print(ncfraction);
prints the string representation of the fraction
status(ncfraction);
report on the status/validity of the fraction
test(ncfraction);
check if the fraction is valid
```

Infix operations:

```
ncfraction == ncfraction;
compare two fractions
ncfraction != ncfraction;
```

compare two fractions
`ncfrac + ncfrac;`
 add two fractions
`ncfrac - ncfrac`
 subtract two fractions
`ncfrac * ncfrac`
 multiply two fractions
`ncfrac / ncfrac`
 divide two fractions
`ncfrac = int/number/poly`
 create a fraction with:
 - left and right denominator equal to 1
 - left and right numerator determined by the input - localization data describing the trivial monoidal localization at 1
`ncfrac = vector`
 create a fraction from a vector `v` with unspecified localization such that `lden,lnum,rnum,rden = v[1],v[2],v[3],v[4]`
 (note: without specifying a localization afterwards this results is an invalid fraction)
`ncfrac = list`
 create a fraction from a list `L` as follows: - try to create a fraction from `L[1]` as above
 - if `L[2]` is of type `ncloc` set the localization of the fraction to `L[2]`

Procedures:**D.15.25.1 hasLeftDenom**

Procedure from library `ncfrac.lib` (see [Section D.15.25 \[ncfrac.lib\]](#), page 2150).

Usage: `hasLeftDenom(frac), ncfrac frac`

Purpose: checks if `frac` has a left representation

Return: `int`, 1 if `frac` has a left representation, 0 otherwise

Example:

```

LIB "ncfrac.lib";
⇒ // ** redefining testNcfrac (LIB "ncfrac.lib");
⇒ // ** redefining testNcloc ( LIB "ncloc.lib");
ring R = 0, (x,y,Dx,Dy), dp;
def S = Weyl();
setring S;
ncloc loc = ideal(x-3,y+7);
ncfrac noLeft = list([0,0,3*y*Dx,x+2], loc);
hasLeftDenom(noLeft);
⇒ 0
ncfrac left = list([1,Dx,Dx,1], loc);
hasLeftDenom(left);
⇒ 1

```

D.15.25.2 hasRightDenom

Procedure from library `ncfrac.lib` (see [Section D.15.25 \[ncfrac.lib\]](#), page 2150).

Usage: `hasRightDenom(frac), ncfrac frac`

Purpose: checks if `frac` has a right representation

Return: int, 1 if frac has a right representation, 0 otherwise

Example:

```
LIB "ncfrac.lib";
↳ // ** redefining testNcfrac (LIB "ncfrac.lib");
↳ // ** redefining testNcloc ( LIB "ncloc.lib");
ring R = 0, (x,y,Dx,Dy), dp;
def S = Weyl();
setring S;
ncloc loc = ideal(x-3,y+7);
ncfrac noRight = list([x+2,3*y*Dx,0,0], loc);
hasRightDenom(noRight);
↳ 0
ncfrac right = list([1,Dx,Dx,1], loc);
hasRightDenom(right);
↳ 1
```

D.15.25.3 isZeroNcfrac

Procedure from library `ncfrac.lib` (see [Section D.15.25 \[ncfrac.lib\]](#), page 2150).

Usage: `isZeroNcfrac(frac), ncfrac frac`

Purpose: checks if frac is zero

Return: int, 1 if frac is zero, 0 otherwise

Example:

```
LIB "ncfrac.lib";
↳ // ** redefining testNcfrac (LIB "ncfrac.lib");
↳ // ** redefining testNcloc ( LIB "ncloc.lib");
ring Q = (0,q), (x,y,Qx,Qy), dp;
matrix C[4][4] = UpOneMatrix(4);
C[1,3] = q;
C[2,4] = q;
def ncQ = nc_algebra(C,0);
setring ncQ;
ncloc loc = intvec(2);
ncfrac frac = list([y^2+7*y+1,0,0,0], loc);
isZeroNcfrac(frac);
↳ 1
frac.lnum = 42*y*Qy+7*Qx+3*x+7;
isZeroNcfrac(frac);
↳ 0
```

D.15.25.4 isOneNcfrac

Procedure from library `ncfrac.lib` (see [Section D.15.25 \[ncfrac.lib\]](#), page 2150).

Usage: `isOneNcfrac(frac), ncfrac frac`

Purpose: checks if frac is one

Return: int, 1 if frac is one, 0 otherwise

Example:

```

LIB "ncfrac.lib";
⇨ // ** redefining testNcfrac (LIB "ncfrac.lib");
⇨ // ** redefining testNcloc ( LIB "ncloc.lib");
ring Q = (0,q),(x,y,Qx,Qy),dp;
matrix C[4][4] = UpOneMatrix(4);
C[1,3] = q;
C[2,4] = q;
def ncQ = nc_algebra(C,0);
setring ncQ;
ncloc loc = intvec(2);
ncfrac frac = list([y^2+7*y+1,y^2+7*y+1,0,0], loc);
isOneNcfrac(frac);
⇨ 1
frac.lnum = 42*y*Qy+7*Qx+3*x+7;
isOneNcfrac(frac);
⇨ 0

```

D.15.25.5 zeroNcfrac

Procedure from library `ncfrac.lib` (see [Section D.15.25 \[ncfrac.lib\]](#), page 2150).

Usage: `zeroNcfrac(loc), ncloc loc`

Purpose: returns the zero fraction in the localization `loc`

Return: `ncfrac`

Example:

```

LIB "ncfrac.lib";
⇨ // ** redefining testNcfrac (LIB "ncfrac.lib");
⇨ // ** redefining testNcloc ( LIB "ncloc.lib");
ring R = 0,(x,y,Dx,Dy),dp;
def S = Weyl();
setring S;
ncloc loc = ideal(x-53,y-7);
zeroNcfrac(loc);
⇨ left repr.: (1,0)
⇨ right repr.: (0,1)
⇨

```

D.15.25.6 oneNcfrac

Procedure from library `ncfrac.lib` (see [Section D.15.25 \[ncfrac.lib\]](#), page 2150).

Usage: `oneNcfrac(loc), ncloc loc`

Purpose: returns the one fraction in the localization `loc`

Return: `ncfrac`

Example:

```

LIB "ncfrac.lib";
⇨ // ** redefining testNcfrac (LIB "ncfrac.lib");
⇨ // ** redefining testNcloc ( LIB "ncloc.lib");
ring R = 0,(x,y,Dx,Dy),dp;
def S = Weyl();
setring S;

```

```

ncloc loc = ideal(x-42,y-17);
oneNcfrac(loc);
↳ left repr.: (1,1)
↳ right repr.: (1,1)
↳

```

D.15.25.7 ensureLeftNcfrac

Procedure from library `ncfrac.lib` (see [Section D.15.25 \[ncfrac.lib\]](#), page 2150).

Usage: `ensureLeftNcfrac(frac), ncfrac frac`

Purpose: ensures that `frac` has a left representation (by computing it if not already known)

Return: `ncfrac`, a representation of `frac` which has a left representation

Example:

```

LIB "ncfrac.lib";
↳ // ** redefining testNcfrac (LIB "ncfrac.lib");
↳ // ** redefining testNcloc ( LIB "ncloc.lib");
ring R = 0, (x,y,Dx,Dy), dp;
def S = Weyl();
setring S; S;
↳ // coefficients: QQ
↳ // number of vars : 4
↳ //          block  1 : ordering dp
↳ //                   : names    x y Dx Dy
↳ //          block  2 : ordering C
↳ // noncommutative relations:
↳ //      Dxx=x*Dx+1
↳ //      Dyy=y*Dy+1
// monoidal localization
poly g1 = x+3;
poly g2 = x*y;
list L = g1,g2;
ncloc loc0 = L;
poly g = g1^2*g2;
poly f = Dx;
ncfrac frac0 = [0,0,f,g];
frac0.loc = loc0;
ncfrac rm = ensureLeftNcfrac(frac0);
print(rm);
↳ left repr.: (x^8*y^4+12*x^7*y^4+54*x^6*y^4+108*x^5*y^4+81*x^4*y^4,x^5*y^3\
  *Dx+6*x^4*y^3*Dx-3*x^4*y^3+9*x^3*y^3*Dx-12*x^3*y^3-9*x^2*y^3)
↳ right repr.: (Dx,x^3*y+6*x^2*y+9*x*y)
rm.lnum*g-rm.lden*f;
↳ 0
// geometric localization
ncloc loc1 = ideal(x-1,y-3);
f = Dx;
g = x^2+y;
ncfrac frac1 = [0,0,f,g];
frac1.loc = loc1;
ncfrac rg = ensureLeftNcfrac(frac1);
print(rg);

```

```

↳ left repr.: (x^4+2*x^2*y+y^2,x^2*Dx+y*Dx-2*x)
↳ right repr.: (Dx,x^2+y)
rg.lnum*g-rg.lden*f;
↳ 0
// rational localization
intvec rat = 1;
ncloc loc2 = rat;
f = Dx+Dy;
g = x;
ncfrac frac2 = [0,0,f,g];
frac2.loc = loc2;
ncfrac rr = ensureLeftNcfrac(frac2);
print(rr);
↳ left repr.: (x^2,x*Dx+x*Dy-1)
↳ right repr.: (Dx+Dy,x)
rr.lnum*g-rr.lden*f;
↳ 0

```

D.15.25.8 ensureRightNcfrac

Procedure from library `ncfrac.lib` (see [Section D.15.25 \[ncfrac.lib\]](#), page 2150).

Usage: `ensureLeftNcfrac(frac), ncfrac frac`

Purpose: ensures that `frac` has a right representation (by computing it if not already known)

Return: `ncfrac`, a representation of `frac` which has a right representation

Example:

```

LIB "ncfrac.lib";
↳ // ** redefining testNcfrac (LIB "ncfrac.lib");
↳ // ** redefining testNcloc ( LIB "ncloc.lib");
ring R = 0, (x,y,Dx,Dy), dp;
def S = Weyl();
setring S; S;
↳ // coefficients: QQ
↳ // number of vars : 4
↳ //          block  1 : ordering dp
↳ //          : names  x y Dx Dy
↳ //          block  2 : ordering C
↳ // noncommutative relations:
↳ //    Dxx=x*Dx+1
↳ //    Dyy=y*Dy+1
// monoidal localization
poly g = x;
poly f = Dx;
ncloc loc0 = g;
ncfrac frac0 = [g,f,0,0];
frac0.loc = loc0;
ncfrac rm = ensureRightNcfrac(frac0);
print(rm);
↳ left repr.: (x,Dx)
↳ right repr.: (x*Dx+2,x^2)
f*rm.rden-g*rm.rnum;
↳ 0

```

```

// geometric localization
g = x+y;
f = Dx+Dy;
ncloc loc1 = ideal(x-1,y-3);
ncfrac frac1 = [g,f,0,0];
frac1.loc = loc1;
ncfrac rg = ensureRightNcfrac(frac1);
print(rg);
↳ left repr.: (x+y,Dx+Dy)
↳ right repr.: (x*Dx+y*Dx+x*Dy+y*Dy+4,x^2+2*x*y+y^2)
f*rg.rden-g*rg.rnum;
↳ 0
// rational localization
intvec rat = 1;
f = Dx+Dy;
g = x;
ncloc loc2 = rat;
ncfrac frac2 = [g,f,0,0];
frac2.loc = loc2;
ncfrac rr = ensureRightNcfrac(frac2);
print(rr);
↳ left repr.: (x,Dx+Dy)
↳ right repr.: (x*Dx+x*Dy+2,x^2)
f*rr.rden-g*rr.rnum;
↳ 0

```

D.15.25.9 negateNcfrac

Procedure from library `ncfrac.lib` (see [Section D.15.25 \[ncfrac.lib\]](#), page 2150).

Usage: `negateNcfrac(frac), ncfrac frac`

Purpose: compute the negative (i.e. additive inverse) of `frac`

Return: `ncfrac`

Note: returns $(-1)*frac$

Example:

```

LIB "ncfrac.lib";
↳ // ** redefining testNcfrac (LIB "ncfrac.lib");
↳ // ** redefining testNcloc ( LIB "ncloc.lib");
ring R = 0,(x,y,Dx,Dy),dp;
def S = Weyl();
setring S;
poly g = x*y^2+4*x+7*y-98;
ncloc loc = g;
ncfrac frac = list([g, 13*x^2], loc);
frac;
↳ left repr.: (x*y^2+4*x+7*y-98,13*x^2)
↳ right repr.: (0,0)
↳
ncfrac negFrac = negateNcfrac(frac);
negFrac;
↳ left repr.: (x*y^2+4*x+7*y-98,-13*x^2)

```

```

↳ right repr.: (0,0)
↳
frac + negFrac;
↳ left repr.: (x*y^2+4*x+7*y-98,0)
↳ right repr.: (0,0)
↳

```

D.15.25.10 isInvertibleNcfrac

Procedure from library `ncfrac.lib` (see [Section D.15.25 \[ncfrac.lib\]](#), page 2150).

Usage: `isInvertibleNcfrac(frac), ncfrac frac`

Purpose: checks if `frac` is invertible

Return: `int`, 1 if `frac` is invertible, 0 otherwise

Example:

```

LIB "ncfrac.lib";
↳ // ** redefining testNcfrac (LIB "ncfrac.lib");
↳ // ** redefining testNcloc ( LIB "ncloc.lib");
ring R = 0, (x,y,Dx,Dy), dp;
def S = Weyl();
setring S;
ncloc loc = intvec(2);
ncfrac frac = list([y,y+1,0,0], loc);
isInvertibleNcfrac(frac);
↳ 1
frac = list([y,x+1,0,0], loc);
isInvertibleNcfrac(frac);
↳ 0

```

D.15.25.11 invertNcfrac

Procedure from library `ncfrac.lib` (see [Section D.15.25 \[ncfrac.lib\]](#), page 2150).

Usage: `invertNcfrac(frac), ncfrac frac`

Purpose: compute the inverse of `frac`

Return: `ncfrac`

Note: returns the zero fraction if `frac` is not invertible

Example:

```

LIB "ncfrac.lib";
↳ // ** redefining testNcfrac (LIB "ncfrac.lib");
↳ // ** redefining testNcloc ( LIB "ncloc.lib");
ring R = 0, (x,y,Dx,Dy), dp;
def S = Weyl();
setring S;
ncloc loc = intvec(2);
ncfrac frac1 = list([y,y+1,0,0], loc);
// frac1 is invertible
ncfrac inv = invertNcfrac(frac1);
inv;
↳ left repr.: (y+1,y)

```

```

↳ right repr.: (0,0)
↳
ncfrac frac2 = list([y,x+1,0,0], loc);
// frac2 is not invertible
inv = invertNcfrac(frac2);
inv;
↳ left repr.: (1,0)
↳ right repr.: (0,1)
↳

```

D.15.25.12 testNcfrac

Procedure from library `ncfrac.lib` (see [Section D.15.25 \[ncfrac.lib\]](#), page 2150).

Usage: `testNcfrac()`

Purpose: execute a series of internal testing procedures

Return: nothing

Note:

D.15.25.13 testNcfracExamples

Procedure from library `ncfrac.lib` (see [Section D.15.25 \[ncfrac.lib\]](#), page 2150).

Usage: `testNcfracExamples()`

Purpose: execute the examples of all procedures in this library

Return: nothing

Note:

D.15.26 ncloc_lib

Library: `ncloc.lib`

Purpose: Ore-localization in G-Algebras

Author: Johannes Hoffmann, email: johannes.hoffmann at math.rwth-aachen.de

Overview: This library introduces a new type: `ncloc`.
This type wraps the localization data defined as in `olga.lib`. An element of type `ncloc` has two members:

- `int locType`
- `def locData`

Operations:

```

string(ncloc);
give a string representation of the data describing the localization print(ncloc);
prints the string representation of the localization status(ncloc);
report on the status/validity of the localization test(ncloc);
check if the localization is valid

```

Infix operations:

```

ncloc == ncloc;
compare two localizations

```

```

ncloc != ncloc;
compare two localizations
ncloc = list/poly
create a monoidal localization from the given data ncloc = ideal
create a geometric localization from the given data ncloc = intvec
create a rational localization from the given data

```

Procedures:**D.15.26.1 isDenom**

Procedure from library `ncloc.lib` (see [Section D.15.26 \[ncloc.lib\]](#), page 2158).

Usage: `isDenom(p, loc)`, poly `a`, `ncloc loc`

Purpose: check if `p` is a valid denominator in the localization `loc`

Return: `int`

Note: returns 1 or 0, depending whether `p` is a valid denominator

Example:

```

LIB "ncloc.lib";
⇨ // ** redefining testNcloc (LIB "ncloc.lib");
ring R = 0,(x,y,Dx,Dy),dp;
def S = Weyl();
setring S; S;
⇨ // coefficients: QQ
⇨ // number of vars : 4
⇨ //          block  1 : ordering dp
⇨ //          : names  x y Dx Dy
⇨ //          block  2 : ordering C
⇨ // noncommutative relations:
⇨ //    Dxx=x*Dx+1
⇨ //    Dyy=y*Dy+1
// monoidal localization
ncloc loc;
poly g1 = x^2*y+x+2;
poly g2 = y^3+x*y;
list L = g1,g2;
loc = L;
poly g = g1^2*g2;
poly f = g - 1;
isDenom(g, loc);
⇨ 1
isDenom(f, loc);
⇨ 0
// geometrical localization
loc = ideal(x-1,y-3);
g = x^2+y-3;
f = (x-1)*g;
isDenom(g, loc);
⇨ 1
isDenom(f, loc);
⇨ 0
// rational localization

```

```

intvec v = 2;
loc = v;
g = y^5+17*y^2-4;
f = x*y;
isDenom(g, loc);
↳ 1
isDenom(f, loc);
↳ 0

```

D.15.26.2 testNcloc

Procedure from library `ncloc.lib` (see [Section D.15.26 \[ncloc.lib\]](#), page 2158).

Usage: `testNcloc()`

Purpose: execute a series of internal testing procedures

Return: nothing

Note:

D.15.26.3 testNclocExamples

Procedure from library `ncloc.lib` (see [Section D.15.26 \[ncloc.lib\]](#), page 2158).

Usage: `testNclocExamples()`

Purpose: execute the examples of all procedures in this library

Return: nothing

Note:

D.15.27 nets_lib

Library: `net.lib`

Purpose: Net structures for pretty printing

Authors: J. Boehm, boehm@mathematik.uni-kl.de
M. Mueller, mkmueller@mathematik.uni-kl.de
H. Rombach, rombach@mathematik.uni-kl.de
M. Stein, maxstein77@web.de

Overview: Nets are arrays of characters, which are printed in a matrix format. They can be concatenated horizontally and vertically. When concatenating horizontally, empty rows are filled with spaces. All Singular types can be converted to a Net by applying the command `net`.

Types: Net The class of all nets

Procedures:

D.15.27.1 catNets

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\]](#), page 2160).

Usage: `catNets(N,M)`; N,M Nets

Return: horizontal concatenation of N and M

Theory: The nets are concated horizontally with alignment at the top row. Can also be called with +.

Example:

```
LIB "nets.lib";
Net A = net("aaa");
Net B = net("b");
catNets(A,B);
↳ aaab
↳
A+B;
↳ aaab
↳
```

D.15.27.2 net

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\]](#), page 2160).

D.15.27.3 netBigIntMat

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\]](#), page 2160).

Usage: `netBigIntMat(M)`; M bigint Matrix

Assume: M is a bigintmatrix

Return: visual presentation of M

Theory: A Singular object is converted into a character array (a Net) for on screen printing.

Example:

```
LIB "nets.lib";
ring r1=101,(x,y,z),lp;
int a=111111;
int b=22222;
int c=3333;
int d=444;
bigintmat M[2][2]=a,b,c,d;
netBigIntMat(M);
↳ | 111111 22222 |
↳ | 3333 444 |
↳
```

D.15.27.4 netBigIntMatShort

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\]](#), page 2160).

Usage: `netBigIntMatShort(M)`; M bigint matrix

Assume: M is a bigintmatrix

Return: visual presentation of M, only the first digits of each entry

Theory: A Singular object is converted into a character array (a Net) for on screen printing.

Example:

```
LIB "nets.lib";
ring r1=101,(x,y,z),lp;
bigint a=1111111111;
bigint b=2222222222;
bigint c=3333333333;
bigint d=4444444444;
bigintmat M[2][2]=a,b,c,d;
netBigIntMatShort(M);
↪ | 1111111111 2222222222 |
↪ | 3333333333 4444444444 |
↪
```

D.15.27.5 netCoefficientRing

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\]](#), page 2160).

Usage: `netCoefficientRing(R)`; R ring

Assume: R is a ring

Return: visual presentation of the coefficient ring of R

Theory: A Singular object is converted into a character array (a Net) for on screen printing.

Example:

```
LIB "nets.lib";
ring r=0,x,lp;
netCoefficientRing(r);
↪ QQ
↪
```

D.15.27.6 netIdeal

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\]](#), page 2160).

Usage: `netIdeal(P)`; P ideal

Assume: P is a poly

Return: visual presentation of I

Theory: A Singular object is converted into a character array (a Net) for on screen printing.

Example:

```
LIB "nets.lib";
ring r;
ideal I=2x3y4,2x3y4z+x3y4z5,5x6y7z10-2x3y+4y5z8;
netIdeal(I);
↪ <2x3y4, x3y4z5+2x3y4z, 5x6y7z10+4y5z8-2x3y>
↪
```

D.15.27.7 netInt

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\], page 2160](#)).

Usage: `netInt(M)`; M integer

Assume: M is an integer

Return: visual presentation of M

Theory: A Singular object is converted into a character array (a Net) for on screen printing.

Example:

```
LIB "nets.lib";
ring r;
int M=5;
netInt(M);
↪ 5
↪
```

D.15.27.8 netBigInt

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\], page 2160](#)).

Usage: `netBigInt(M)`; M integer

Assume: M is a bigint

Return: visual presentation of M

Theory: A Singular object is converted into a character array (a Net) for on screen printing.

Example:

```
LIB "nets.lib";
ring r;
bigint M=5;
netBigInt(M);
↪ 5
↪
```

D.15.27.9 netIntMat

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\], page 2160](#)).

Usage: `netIntMat(M)`; M int matrix

Assume: M is a int matrix

Return: visual presentation of M

Theory: A Singular object is converted into a character array (a Net) for on screen printing.

Example:

```
LIB "nets.lib";
ring r1=101,(x,y,z),lp;
int a=111111;
int b=222222;
```

```

int c=333333;
int d=444444;
intmat M[2][2]=a,b,c,d;
netIntMat(M);
↳ | 111111 222222 |
↳ | 333333 444444 |
↳

```

D.15.27.10 netIntMatShort

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\]](#), page 2160).

Usage: `netIntMatShort(M)`; M int matrix

Assume: M is a int matrix

Return: visual presentation of M, only the first digits of each entry

Theory: A Singular object is converted into a character array (a Net) for on screen printing.

Example:

```

LIB "nets.lib";
ring r1=101,(x,y,z),lp;
int a=111111;
int b=222222;
int c=333333;
int d=444444;
intmat M[2][2]=a,b,c,d;
print(M);
↳ 111111 222222
↳ 333333 444444
netIntMatShort(M);
↳ | 111111 222222 |
↳ | 333333 444444 |
↳
//
print(M);
↳ 111111 222222
↳ 333333 444444
netIntMatShort(M,2);
↳ | 11... 22... |
↳ | 33... 44... |
↳
//

```

D.15.27.11 netIntVector

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\]](#), page 2160).

Usage: `netIntVector(V)`; V int vector

Assume: V is a int vector

Return: visual presentation of V

Theory: A Singular object is converted into a character array (a Net) for on screen printing.

Example:

```
LIB "nets.lib";
ring r1=101,(x,y,z),lp;
int a=111111;
int b=222222;
int c=333333;
int d=444444;
intvec V=a,b,c,d;
netIntVector(V);
⇒ | 111111 |
⇒ | 222222 |
⇒ | 333333 |
⇒ | 444444 |
⇒
```

D.15.27.12 netIntVectorShort

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\], page 2160](#)).

Usage: `netIntVectorShort(V)`; V int vector

Assume: V is a int vector

Return: visual presentation of V, only the first digits of each entry

Theory: A Singular object is converted into a character array (a Net) for on screen printing.

Example:

```
LIB "nets.lib";
ring r1=101,(x,y,z),lp;
int a=111111;
int b=222222;
int c=333333;
int d=444444;
intvec V=a,b,c,d;
netIntVectorShort(V,4);
⇒ | 1111... |
⇒ | 2222... |
⇒ | 3333... |
⇒ | 4444... |
⇒
```

D.15.27.13 netNumber

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\], page 2160](#)).

Usage: `netNumber(R)`; a number

Assume: a is a number

Return: visual presentation of a

Theory: A Singular object is converted into a character array (a Net) for on screen printing.

Example:

```
LIB "nets.lib";
ring r1=101,(x,y,z),lp;
number a = 5;
netNumber(a);
↳
↳ 5
↳
```

D.15.27.14 netList

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\]](#), page 2160).

Usage: `netList(L)`; L list

Assume: L is a list of elements

Return: visual presentation of L

Theory: A Singular object is converted into a character array (a Net) for on screen printing.

Example:

```
LIB "nets.lib";
ring r1=101,(x,y,z),lp;
list L=111, x+y, x3y-z, y+3z4;
print("list L=111, x+y, x3y-z, y+3z4");
↳ list L=111, x+y, x3y-z, y+3z4
netList(L);
↳ [111, x+y, x3y-z, y+3z4]
↳
```

D.15.27.15 netMap

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\]](#), page 2160).

Usage: `netMap(f)`; f map

Assume: f is a map from a ring to the basering

Return: visual presentation of the map f

Theory: A Singular object is converted into a character array (a Net) for on screen printing.

Example:

```
LIB "nets.lib";
ring r1=101,(x,y,z),lp;
ring r2=103,(a,b,c),lp;
map f=r1,ab,ac,bc;
netMap(f);
↳ Map: r1 --> r2 , x -> ab
↳           , y -> ac
↳           , z -> bc
↳
```

D.15.27.16 netMap2

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\], page 2160](#)).

Usage: `netMap2(f); f map`

Assume: `f` is a map from a ring to the basering

Return: visual presentation of the map `f`, alternative version

Theory: A Singular object is converted into a character array (a Net) for on screen printing.

Example:

```
LIB "nets.lib";
ring r1=101,(x,y,z),lp;
ring r2=103,(a,b,c),lp;
map f=r1,ab,ac,bc;
netMap2(f);
↳ f: r1 --> r2 , x -> ab , y -> ac , z -> bc
↳
```

D.15.27.17 netmatrix

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\], page 2160](#)).

Usage: `netmatrix(V); M matrix`

Assume: `M` is a matrix

Return: visual presentation of `M`

Theory: A Singular object is converted into a character array (a Net) for on screen printing.

Example:

```
LIB "nets.lib";
ring r1=101,(x,y,z),lp;
poly a=2x3y4+300xy-234z23;
poly b=2x3y4z;
poly c=x3y4z5;
poly d=5x6y7z10;
poly e=2x3y;
poly f=4y5z8;
matrix M[2][3]=a,b,c,d,e,f;
print(M);
↳ 2x3y4-3xy-32z23,2x3y4z,x3y4z5,
↳ 5x6y7z10,      2x3y,  4y5z8
netmatrix(M);
↳ | 2x3y4-3xy-32z23 2x3y4z x3y4z5 |
↳ | 5x6y7z10      2x3y  4y5z8 |
↳
```

D.15.27.18 netmatrixShort

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\], page 2160](#)).

Usage: `netmatrixShort(M); M matrix`

Assume: M is a matrix

Return: visual presentation of M

Theory: A Singular object is converted into a character array (a Net) for on screen printing.

Example:

```
LIB "nets.lib";
ring r1=101,(x,y,z),lp;
poly a=2x3y4+300xy-234z23;
poly b=2x3y4z;

D.15.27.19 netPoly

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\], page 2160](#)).

Usage: netPoly(P); P poly

Assume: P is a poly

Return: visual presentation of P over two rows

Theory: A Singular object is converted into a character array (a Net) for on screen printing.

Example:

```
LIB "nets.lib";
// from 3.3.1 Examples of ring declarations
//
ring R1 = 32003,(x,y,z),dp;
poly q6=1;
print(q6);
↳ 1
netPoly(q6);
↳
↳ 1
↳
poly q7=-1;
print(q7);
↳ -1
netPoly(q7);
↳
↳ -1
↳
poly q8=2;
print(q8);
↳ 2
```

```

netPoly(q8);
↳
↳ 2
↳
poly q9=-2;
print(q9);
↳ -2
netPoly(q9);
↳
↳ -2

D.15.27.20 netPrimePower

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\]](#), page 2160).

Usage: `netPrimePower(n,m)`; n,m int

Return: visual presentation of the prime power n^m

Theory: A Singular object is converted into a character array (a Net) for on screen printing.

Example:

```
LIB "nets.lib";
ring r=0,x,lp;
int n=2;
int m=5;
netPrimePower(n,m);
⇒ 2^5
⇒
```

D.15.27.21 netRing

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\]](#), page 2160).

Usage: `netRing(f); f ring`

Assume: `R` is a ring

Return: visual presentation of `R`

Theory: A Singular object is converted into a character array (a Net) for on screen printing.

Example:

```
LIB "nets.lib";
// from 3.3.1 Examples of ring declarations
ring r1 = 32003,(x,y,z),dp;
netRing(r1);
⇒ FF_32003[x,y,z]
⇒
//
ring r2 = 32003,(x(1..10)),dp;
netRing(r2);
⇒ FF_32003[x(1),x(2),x(3),x(4),x(5),x(6),x(7),x(8),x(9),x(10)]
⇒
//
ring r3 = 32003,(x(1..5)(1..8)),dp;
netRing(r3);
⇒ FF_32003[x(1)(1),x(1)(2),x(1)(3),x(1)(4),x(1)(5),x(1)(6),x(1)(7),x(1)(8),\

D.15.27.22 netString

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\], page 2160](#)).

Usage: netString(M); M string

Assume: M is a string

Return: visual presentation of M

Theory: A Singular object is converted into a character array (a Net) for on screen printing.

Example:

```

LIB "nets.lib";
string M="Hallo";
netString(M);
↳ Hallo
↳

```

D.15.27.23 netvector

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\], page 2160](#)).

Usage: netvector(V); V vector

Assume: V is a vector

Return: visual presentation of V

Theory: A Singular object is converted into a character array (a Net) for on screen printing.

Example:

```

LIB "nets.lib";
ring r1=101,(x,y,z),lp;
poly a=2x3y4;
poly b=2x3y4z;
poly c=x3y4z5;
poly d=5x6y7z10;
poly e=2x3y;
poly f=4y5z8;
vector V=[a,b,c,d,e,f];

```

```

netvector(V);
↳ | 2x3y4      |
↳ | 2x3y4z    |
↳ | x3y4z5    |
↳ | 5x6y7z10  |
↳ | 2x3y      |
↳ | 4y5z8     |
↳

```

D.15.27.24 netvectorShort

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\]](#), page 2160).

Usage: `netvectorShort(V)`; V vector

Assume: V is a vector

Return: visual presentation of V, short version

Theory: A Singular object is converted into a character array (a Net) for on screen printing.

Example:

```

LIB "nets.lib";
ring r1=101,(x,y,z),lp;
poly a=2x3y4;
poly b=2x3y4z-5x6y7z10;
poly c=x3y4z5;
poly d=5x6y7z10;
poly e=2x3y;
poly f=4y5z8+5x6y7z10;
vector V=[a,b,c,d,e,f];
netvectorShort(V);
↳ | 2x3y4      |
↳ | -5x6y7z10+2x3y4z |
↳ | x3y4z5    |
↳ | 5x6y7z10  |
↳ | 2x3y      |
↳ | 5x6y7z10+4y5z8 |
↳

```

D.15.27.25 stackNets

Procedure from library `nets.lib` (see [Section D.15.27 \[nets.lib\]](#), page 2160).

Usage: `stackNets(N,M)`; N,M Nets

Return: vertical concatenation of N and M

Theory: The nets are concated vertically with alignment at the left column.

Example:

```

LIB "nets.lib";
Net A = net("aaa");
Net B = net("b");
stackNets(A,B);

```

```

↳ aaa
↳ b
↳
A+B;
↳ aaab
↳

```

D.15.28 `nfmodstd.lib`

Library: `nfmodstd.lib`

Purpose: Groebner bases of ideals in polynomial rings over algebraic number fields

Authors: D.K. Boku boku@mathematik.uni-kl.de
W. Decker decker@mathematik.uni-kl.de
C. Fieker fiaker@mathematik.uni-kl.de

Overview: A library for computing the Groebner basis of an ideal in the polynomial ring over an algebraic number field $Q(t)$ using the modular methods, where t is algebraic over the field of rational numbers Q . For the case $Q(t) = Q$, the procedure is inspired by Arnold [1]. This idea is then extended to the case t not in Q using factorization as follows:

Let f be the minimal polynomial of t .

For I, I' ideals in $Q(t)[X], Q[X, t]/\langle f \rangle$ respectively, we map I to I' via the map sending t to $t + \langle f \rangle$. We first choose a prime p such that f has at least two factors in characteristic p and add each factor f_i to I' to obtain the ideal $J'_i = I' + \langle f_i \rangle$. We then compute a standard basis G'_i of J'_i for each i and combine the G'_i to G_p (a standard basis of I'_p) using chinese remaindering for polynomials. The procedure is repeated for many primes p , where we compute the G_p in parallel until the number of primes is sufficiently large to recover the correct standard basis G' of I' . Finally, by mapping G' back to $Q(t)[X]$, a standard basis G of I is obtained.

The procedure also works if the input is a module. For this, we consider the rings $A = Q(t)[X]$ and $A' = (Q[t]/\langle f \rangle)[X]$. For submodules I, I' in A^m, A'^m , respectively, we map I to I' via the map sending t to $t + \langle f \rangle$. As above, we first choose a prime p such that f has at least two factors in characteristic p . For each factor $f_{-i,p}$ of $f_p := (f \bmod p)$, we set $I'_{-i,p} := (I'_p \bmod f_{-i,p})$. We then compute a standard basis G'_i of $I'_{-i,p}$ over $F_p[t]/\langle f_{-i,p} \rangle$ for each i and combine the G'_i to G_p (a standard basis of I'_p) using chinese remaindering for polynomials. The procedure is repeated for many primes p as described above and we finally obtain a standard basis of I .

References:

Procedures:

D.15.28.1 `chinrempoly`

Procedure from library `nfmodstd.lib` (see [Section D.15.28 \[nfmodstd.lib\], page 2177](#)).

Usage: `chinrempoly(l, m); l list, m list`

Return: a polynomial (resp. ideal/module) which is congruent to $l[i]$ modulo $m[i]$ for all i

Note: The procedure applies chinese remaindering to the first argument w.r.t. the moduli given in the second. The elements in the first list must be of the same type which

can be polynomial, ideal, or module. The moduli must be of type polynomial. The elements in the second list must be distinct and co-prime.

Example:

```
LIB "nfmodstd.lib";
ring rr=97,x,dp;
poly f=x^7-7*x + 3;
ideal J=factorize(f,1);
J;
↳ J[1]=x+37
↳ J[2]=x3-46x2+17x-8
↳ J[3]=x3+9x2+20x-20
list m=J[1..ncols(J)];
list l= x^2+2*x+3, x^2+5, x^2+7;
ideal I=chinrempoly(l,m);
I;
↳ I[1]=24x6+19x4-20x3+43x2-16x+45
ring s=0,x,dp;
list m= x^2+2*x+3, x^3+5, x^4+x^3+7;
list l=x^3 + 2, x^4 + 7, x^5 + 11;
ideal I=chinrempoly(l,m);
I;
↳ I[1]=18113/107610x8+5826/17935x7-5257/107610x6+3975/7174x5+246151/107610x\

int p=prime(536546513);
ring r = p, (x,y,a), (dp(2),dp(1));
poly minpolynomial = a^2+1;
ideal kf=factorize(minpolynomial,1); //return factors without multiplicity
kf;
↳ kf[1]=a-222052315
↳ kf[2]=a+222052315
ideal k=(a+1)*x2+y, 3x-ay+ a+2;
option(redSB);
ideal k1=k,kf[1];
ideal k2 =k,kf[2];
k1=std(k1);
k2=std(k2);
list l=k1,k2;
list m=kf[1..ncols(kf)];
ideal I=chinrempoly(l,m);
I=simplify(I,2);
I;
↳ I[1]=x-178848838ya+178848838a-178848837
↳ I[2]=y2-268273248ya+268273250y-4a-3
l = module(k1[2..ncols(k1)]), module(k2[2..ncols(k2)]);
module M = chinrempoly(l,m);
M;
↳ M[1]=x*gen(1)-178848838ya*gen(1)+178848838a*gen(1)-178848837*gen(1)
↳ M[2]=y2*gen(1)-268273248ya*gen(1)+268273250y*gen(1)-4a*gen(1)-3*gen(1)
```

See also: [Section 5.1.8 \[chinrem\], page 160.](#)

D.15.28.2 nfmodStd

Procedure from library `nfmodstd.lib` (see [Section D.15.28 \[nfmodstd.lib\]](#), page 2177).

Usage: `nfmodStd(I, #)`; `I` ideal or module, `#` optional parameters

Return: standard basis of `I` over algebraic number field

Note: The procedure passes to [Section D.4.13.1 \[modStd\]](#), page 979 if the ground field has no parameter. In this case, the optional parameters `#` (if given) are directly passed to [Section D.4.13.1 \[modStd\]](#), page 979.

Example:

```
LIB "nfmodstd.lib";
ring r1 = (0,a),(x,y),dp;
minpoly = a^2+1;
ideal k = (a/2+1)*x^2+2/3y, 3*x-a*y+ a/7+2;
ideal I = nfmodStd(k);
I;
↳ I[1]=x+(-1/3a)*y+(1/21a+2/3)
↳ I[2]=y2+(32/5a-178/35)*y+(-4/7a-195/49)
ring rm = (0,a),(x,y),(c,dp);
minpoly = a^3+2a+7;
module M = [(a/2+1)*x^2+2/3y, 3*x-a*y+ a/7+2], [ax, y];
M = nfmodStd(M);
M;

D.15.29 nfmodesyz.lib

Library: nfmodesyz.lib

Purpose: Syzygy modules of submodules of free modules over algebraic number fields

Authors: D.K. Boku boku@mathematik.uni-kl.de
 W. Decker decker@mathematik.uni-kl.de
 C. Fieker fieker@mathematik.uni-kl.de

Overview: A library for computing the syzygy module of a given submodule I in a polynomial ring over an algebraic number field $\mathbb{Q}(t)$, where t is an algebraic number, using modular methods. For the case $\mathbb{Q}(t)=\mathbb{Q}$, that is, where t is an element of \mathbb{Q} , we compute, following [1], the syzygy module of I as follows: For a submodule I of A^m with $A = \mathbb{Q}[X]$, we first choose a sufficiently large set of primes P and compute the reduced Groebner basis of the syzygy module of I_p , for each p in P , in parallel. We then use the Chinese remainder algorithm and rational reconstruction to obtain the syzygy module of I over \mathbb{Q} . For the case where t is not in \mathbb{Q} , we compute, following [2], the syzygy module of I as follows:

Let f be the minimal polynomial of t . For a submodule I in A^m with $A = \mathbb{Q}(t)[X]$, we map I to a submodule I' in A^m with $A = (\mathbb{Q}[t]/\langle f \rangle)[X]$ via the map sending t to $t + \langle f \rangle$. We first choose a prime p such that f has at least two factors in characteristic p . For each factor $f_{i,p}$ of $f_p := (f \bmod p)$, we set $I'_{i,p} := (I'_p \bmod f_{i,p})$. We then compute the reduced Groebner bases G'_i of the syzygy modules of $I'_{i,p}$ over $F_p[t]/\langle f_{i,p} \rangle$ and combine the G'_i to G_p (the syzygy module of I'_p) using chinese remaindering for polynomials. As described in [2], the procedure is repeated for many primes p , where we compute the G_p in parallel until the number of primes is sufficiently large to recover the correct generating set for the syzygy module G' of I' which is, considered over $\mathbb{Q}(t)$, also a generating set for the syzygy module of I .

Procedures:

D.15.29.1 nfmodSyz

Procedure from library `nfmodesyz.lib` (see [Section D.15.29 \[nfmodesyz.lib\]](#), page 2180).

Usage: `nfmodSyz(I)`; I ideal or module

Return: syzygy module of I over an algebraic number field

Example:

```

LIB "nfmodsyz.lib";
ring r1 =(0,a),(x,y),(c,dp);
minpoly = (a^3+2a+7);
module M1 = [(a/2+1)*y, 3*x-a*y],
[y-x,y2],
[x2-xy, ax-y];
nfmodSyz(M1);
↪ _[1]=[x2y2-xy3+(a)*x2+(-a-1)*xy+y2,-3*x3+(a+3)*x2y+(-a)*xy2+(1/2a2+a)*xy+
(-1/2a-1)*y2,(-1/2a-1)*y3-3*x2+(a+3)*xy+(-a)*y2]
ring r2 = (0,a),(x,y,z),(dp,c);
minpoly = (a3+a+1);
module M2 = [x2z+x+(-a)*y,z2+(a+2)*x],
[y2+(a)*z+(a),(a+3)*z3+(-a)*x2],
[-xz+(a2+3)*yz,xy+(a2)*z];
nfmodSyz(M2);
↪ _[1]=x2z4*gen(3)+(3/29a2-9/29a+1/29)*x4z*gen(3)+(-1/29a2+3/29a-10/29)*x3y\

D.15.30 olga_lib

Library: olga.lib

Purpose: Ore-localization in G-Algebras

Author: Johannes Hoffmann, email: johannes.hoffmann at math.rwth-aachen.de

Overview: Let A be a G-algebra.

Current localization types:

Type 0: monoidal

- represented by a list of polys g_1, \dots, g_k that have to be contained in a commutative polynomial subring of A generated by a subset of the variables of A

Type 1: geometric

- only for algebras with an even number of variables where the first half induces a commutative polynomial subring B of A

- represented by an ideal p , which has to be a prime ideal in B

Type 2: rational

- represented by an intvec $v = [i_1, \dots, i_k]$ in the range $1..nvars(\text{basing})$

Localization data is an int specifying the type and a def with the corresponding information.

A fraction is represented as a vector with four entries: $[s, r, p, t]$ Here, $s^{-1}r$ is the left fraction representation, pt^{-1} is the right one. If s or t is zero, it means that the corresponding representation is not set. If both are zero, the fraction is not valid.

A detailed description along with further examples can be found in our paper: Johannes Hoffmann, Viktor Levandovskyy:

Constructive Arithmetics in Ore Localizations of Domains
<https://arxiv.org/abs/1712.01773>

Procedures:

D.15.30.1 locStatus

Procedure from library `olga.lib` (see [Section D.15.30 \[olga.lib\], page 2181](#)).

Usage: `locStatus(locType, locData)`, int `locType`, list/vector/intvec `locData`

Purpose: determine the status of a set of localization data

Assume:

Return: list

Note: - the first entry is 0 or 1, depending whether the input represents a valid localization
 - the second entry is a string with a status/error message

Example:

```
LIB "olga.lib";
locStatus(42, list(1));
↳ [1]:
↳ 0
↳ [2]:
↳ invalid localization: type is 42, valid types are:
↳ 0 for a monoidal localization
↳ 1 for a geometric localization
↳ 2 for a rational localization
def undef;
locStatus(0, undef);
↳ [1]:
↳ 0
↳ [2]:
↳ uninitialized or invalid localization: locData has to be defined
string s;
locStatus(0, s);
↳ [1]:
```

```

⇒ 0
⇒ [2]:
⇒ for a monoidal localization, locData has to be of type list, but is of\
  type string
list L;

locStatus(2, v);
↳ [1]:
↳ 0
↳ [2]:
↳ for a rational localization, locData has to be a non-zero intvec
locStatus(2, intvec(1,2));
↳ [1]:
↳ 1
↳ [2]:
↳ valid localization

```

D.15.30.2 testLocData

Procedure from library `olga.lib` (see [Section D.15.30 \[olga.lib\]](#), page 2181).

Usage: testLocData(locType, locData), int locType,
list/vector/intvec locData

Purpose: test if the given data specifies a denominator set wrt. the checks from locStatus

Assume:

Return: nothing

Note: throws error if checks were not successful

Example:

```
LIB "olga.lib";
ring R; setring R;
testLocData(0, list(1)); // correct localization, no error
testLocData(42, list(1)); // incorrect localization, results in error
⇒ ? invalid localization: type is 42, valid types are:
⇒ 0 for a monoidal localization
⇒ 1 for a geometric localization
⇒ 2 for a rational localization
⇒ ? leaving olga.lib::testLocData
```

D.15.30.3 isInS

Procedure from library `olga.lib` (see [Section D.15.30 \[olga.lib\]](#), page 2181).

Usage: isInS(p, locType, locData(, override)), poly p, int locType, list/vector/intvec locData(,
int override)

Purpose: determine if a polynomial is in a denominator set

Assume:

Return: int

Note: - returns 0 or 1, depending whether p is in the denominator set specified by locType
and locData
- if override is set, will not normalize locData (use with care)

Example:

```
LIB "olga.lib";
ring R = 0, (x,y,Dx,Dy), dp;
def S = Weyl();
setring S; S;
⇒ // coefficients: QQ
⇒ // number of vars : 4
⇒ //          block 1 : ordering dp
⇒ //          : names x y Dx Dy
⇒ //          block 2 : ordering C
⇒ // noncommutative relations:
⇒ //      Dxx=x*Dx+1
⇒ //      Dyy=y*Dy+1
// monoidal localization
poly g1 = x^2*y+x+2;
poly g2 = y^3+x*y;
list L = g1,g2;
poly g = g1^2*g2;
poly f = g-1;
```

```

isInS(g, 0, L); // g is in the denominator set
↳ 1
isInS(f, 0, L); // f is NOT in the denominator set
↳ 0
// geometric localization
ideal p = x-1, y-3;
g = x^2+y-3;
f = (x-1)*g;
isInS(g, 1, p); // g is in the denominator set
↳ 1
isInS(f, 1, p); // f is NOT in the denominator set
↳ 0
// rational localization
intvec v = 2;
g = y^5+17*y^2-4;
f = x*y;
isInS(g, 2, v); // g is in the denominator set
↳ 1
isInS(f, 2, v); // f is NOT in the denominator set
↳ 0

```

D.15.30.4 fracStatus

Procedure from library `olga.lib` (see [Section D.15.30 \[olga.lib\], page 2181](#)).

Usage: `fracStatus(frac, locType, locData)`, vector `frac`, int `locType`, list/intvec/vector `locData`

Purpose: determine if the given vector is a representation of a fraction in the specified localization

Assume:

Return: list

Note: - the first entry is 0 or 1, depending whether the input is valid - the second entry is a string with a status message

Example:

```

LIB "olga.lib";
ring r = QQ[x,y,Dx,Dy];
def R = Weyl();
setring R;
fracStatus([1,0,0,0], 42, list(1));
↳ [1]:
↳ 0
↳ [2]:
↳ invalid localization in fraction: gen(1)
↳ invalid localization: type is 42, valid types are:
↳ 0 for a monoidal localization
↳ 1 for a geometric localization
↳ 2 for a rational localization
list L = x;
fracStatus([0,7,x,0], 0, L);
↳ [1]:
↳ 0
↳ [2]:
↳ vector is not a valid fraction: no denominator specified in x*gen(3)+7\

```

```

    *gen(2)
fracStatus([Dx,Dy,0,0], 0, L);
↳ [1]:
↳ 0
↳ [2]:
↳ the left denominator Dx of fraction Dx*gen(1)+Dy*gen(2) is not in the \
denominator set of type 0 given by x
fracStatus([0,0,Dx,Dy], 0, L);
↳ [1]:
↳ 0
↳ [2]:
↳ the right denominator Dy of fraction Dx*gen(3)+Dy*gen(4) is not in the\
denominator set of type 0 given by x
fracStatus([x,Dx,Dy,x], 0, L);
↳ [1]:
↳ 0
↳ [2]:
↳ left and right representation are not equal in:x*gen(4)+x*gen(1)+Dx*ge\
n(2)+Dy*gen(3)
fracStatus([x,Dx,x*Dx+2,x^2], 0, L);
↳ [1]:
↳ 1
↳ [2]:
↳ valid fraction

```

D.15.30.5 testFraction

Procedure from library `olga.lib` (see [Section D.15.30 \[olga.lib\]](#), page 2181).

Usage: `testFraction(frac, locType, locData)`, vector `frac`, int `locType`, list/intvec/vector `locData`

Purpose: test if the given vector is a representation of a fraction in the specified localization wrt. the checks from `fracStatus`

Assume:

Return: nothing

Note: throws error if checks were not successful

Example:

```

LIB "olga.lib";
ring r = QQ[x,y,Dx,Dy];
def R = Weyl();
setring R;
list L = x;
vector frac = [x,Dx,x*Dx+2,x^2];
testFraction(frac, 0, L); // correct localization, no error
frac = [x,Dx,x*Dx,x^2];
testFraction(frac, 0, L); // incorrect localization, results in error
↳ ? left and right representation are not equal in:x^2*gen(4)+x*Dx*gen(3\
)+x*gen(1)+Dx*gen(2)
↳ ? leaving olga.lib::testFraction

```

D.15.30.6 leftOre

Procedure from library `olga.lib` (see [Section D.15.30 \[olga.lib\], page 2181](#)).

Usage: `leftOre(s, r, locType, locData)`, poly s, r , int `locType`, list/vector/intvec `locData`

Purpose: compute left Ore data for a given tuple (s,r)

Assume: s is in the denominator set determined via `locType` and `locData`

Return: list

Note: - the first entry of the list is a vector $[ts, tr]$ such that $ts*r=tr*s$ - the second entry of the list is a description of all choices for ts

Example:

```
LIB "olga.lib";
ring R = 0, (x,y,Dx,Dy), dp;
def S = Weyl();
setring S; S;
↳ // coefficients: QQ
↳ // number of vars : 4
↳ //          block  1 : ordering dp
↳ //          : names  x y Dx Dy
↳ //          block  2 : ordering C
↳ // noncommutative relations:
↳ //      Dxx=x*Dx+1
↳ //      Dyy=y*Dy+1
// left Ore
// monoidal localization
poly g1 = x+3;
poly g2 = x*y;
list L = g1,g2;
poly g = g1^2*g2;
poly f = Dx;
list rm = leftOre(g, f, 0, L);
print(rm[1]);
↳ [x^8*y^4+12*x^7*y^4+54*x^6*y^4+108*x^5*y^4+81*x^4*y^4,x^5*y^3*Dx+6*x^4*y^4\
    3*Dx-3*x^4*y^3+9*x^3*y^3*Dx-12*x^3*y^3-9*x^2*y^3]
rm[2];
↳ _[1]=x^8*y^4+12*x^7*y^4+54*x^6*y^4+108*x^5*y^4+81*x^4*y^4
rm[1][2]*g-rm[1][1]*f;
↳ 0
// geometric localization
ideal p = x-1, y-3;
f = Dx;
g = x^2+y;
list rg = leftOre(g, f, 1, p);
print(rg[1]);
↳ [x^4+2*x^2*y+y^2,x^2*Dx+y*Dx-2*x]
rg[2];
↳ _[1]=x^4+2*x^2*y+y^2
rg[1][2]*g-rg[1][1]*f;
↳ 0
// rational localization
intvec rat = 1;
```

```

f = Dx+Dy;
g = x;
list rr = leftOre(g, f, 2, rat);
print(rr[1]);
↳ [x^2,x*Dx+x*Dy-1]
rr[2];
↳ _[1]=x^2
rr[1][2]*g-rr[1][1]*f;
↳ 0

```

D.15.30.7 rightOre

Procedure from library `olga.lib` (see [Section D.15.30 \[olga.lib\]](#), page 2181).

Usage: `rightOre(s, r, locType, locData)`, poly s, r , int `locType`, list/vector/intvec `locData`

Purpose: compute right Ore data for a given tuple (s,r)

Assume: s is in the denominator set determined via `locType` and `locData`

Return: list

Note: - the first entry of the list is a vector $[ts,tr]$ such that $r*ts=s*tr$ - the second entry of the list is a description of all choices for ts

Example:

```

LIB "olga.lib";
ring R = 0, (x,y,Dx,Dy), dp;
def S = Weyl();
setring S; S;
↳ // coefficients: QQ
↳ // number of vars : 4
↳ //          block 1 : ordering dp
↳ //          : names  x y Dx Dy
↳ //          block 2 : ordering C
↳ // noncommutative relations:
↳ //   Dxx=x*Dx+1
↳ //   Dyy=y*Dy+1
// monoidal localization
poly g1 = x+3;
poly g2 = x*y;
list L = g1,g2;
poly g = g1^2*g2;
poly f = Dx;
list rm = rightOre(g, f, 0, L);
print(rm[1]);
↳ [x^8*y^4+12*x^7*y^4+54*x^6*y^4+108*x^5*y^4+81*x^4*y^4,x^5*y^3*Dx+6*x^4*y^3*
   3*Dx+8*x^4*y^3+9*x^3*y^3*Dx+36*x^3*y^3+36*x^2*y^3]
rm[2];
↳ _[1]=x^8*y^4+12*x^7*y^4+54*x^6*y^4+108*x^5*y^4+81*x^4*y^4

g = x;
list rr = rightOre(g, f, 2, rat);
print(rr[1]);
↳ [x^2,x*Dx+x*Dy+2]
rr[2];
↳ _[1]=x^2
g*rr[1][2]-f*rr[1][1];
↳ 0

```

D.15.30.8 convertRightToLeftFraction

Procedure from library `olga.lib` (see [Section D.15.30 \[olga.lib\]](#), page 2181).

Usage: `convertRightToLeftFraction(frac, locType, locData)`,
vector `frac`, int `locType`, list/vector/intvec `locData`

Purpose: determine a left fraction representation of a given fraction

Assume:

Return: vector

Note: - the returned vector contains a repr. of `frac` as a left fraction - if the left representation of `frac` is already specified, `frac` will be returned.

Example:

```

LIB "olga.lib";
ring R = 0, (x,y,Dx,Dy), dp;
def S = Weyl();
setring S; S;
↳ // coefficients: QQ
↳ // number of vars : 4
↳ //          block  1 : ordering dp
↳ //          : names  x y Dx Dy
↳ //          block  2 : ordering C
↳ // noncommutative relations:
↳ //    Dxx=x*Dx+1
↳ //    Dyy=y*Dy+1
// monoidal localization
poly g1 = x+3;
poly g2 = x*y;
list L = g1,g2;
poly g = g1^2*g2;
poly f = Dx;
vector fracm = [0,0,f,g];
vector rm = convertRightToLeftFraction(fracm, 0, L);

```

```

print(rm);
↳ [x^8*y^4+12*x^7*y^4+54*x^6*y^4+108*x^5*y^4+81*x^4*y^4,x^5*y^3*Dx+6*x^4*y^3\
    3*Dx-3*x^4*y^3+9*x^3*y^3*Dx-12*x^3*y^3-9*x^2*y^3,Dx,x^3*y+6*x^2*y+9*x*y]
rm[2]*g-rm[1]*f;
↳ 0
// geometric localization
ideal p = x-1, y-3;
f = Dx;
g = x^2+y;
vector fracg = [0,0,f,g];
vector rg = convertRightToLeftFraction(fracg, 1, p);
print(rg);
↳ [x^4+2*x^2*y+y^2,x^2*Dx+y*Dx-2*x,Dx,x^2+y]
rg[2]*g-rg[1]*f;
↳ 0
// rational localization
intvec rat = 1;
f = Dx+Dy;
g = x;
vector fracr = [0,0,f,g];
vector rr = convertRightToLeftFraction(fracr, 2, rat);
print(rr);
↳ [x^2,x*Dx+x*Dy-1,Dx+Dy,x]
rr[2]*g-rr[1]*f;
↳ 0

```

D.15.30.9 convertLeftToRightFraction

Procedure from library `olga.lib` (see [Section D.15.30 \[olga.lib\], page 2181](#)).

Usage: `convertLeftToRightFraction(frac, locType, locData)`, vector `frac`, int `locType`, list/vector/intvec `locData`

Purpose: determine a right fraction representation of a given fraction

Assume:

Return: vector

Note: - the returned vector contains a repr. of `frac` as a right fraction, - if the right representation of `frac` is already specified, `frac` will be returned.

Example:

```

LIB "olga.lib";
ring R = 0,(x,y,Dx,Dy),dp;
def S = Weyl();
setring S; S;
↳ // coefficients: QQ
↳ // number of vars : 4
↳ //          block 1 : ordering dp
↳ //          : names  x y Dx Dy
↳ //          block 2 : ordering C
↳ // noncommutative relations:
↳ //      Dxx=x*Dx+1
↳ //      Dyy=y*Dy+1
// monoidal localization

```

```

poly g = x;
poly f = Dx;
vector fracm = [g,f,0,0];
list L = g;
vector rm = convertLeftToRightFraction(fracm, 0, L);
print(rm);
↳ [x,Dx,x*Dx+2,x^2]
f*rm[4]-g*rm[3];
↳ 0
// geometric localization
g = x+y;
f = Dx+Dy;
vector fracg = [g,f,0,0];
ideal p = x-1, y-3;
vector rg = convertLeftToRightFraction(fracg, 1, p);
print(rg);
↳ [x+y,Dx+Dy,x*Dx+y*Dx+x*Dy+y*Dy+4,x^2+2*x*y+y^2]
f*rg[4]-g*rg[3];
↳ 0
// rational localization
intvec rat = 1;
f = Dx+Dy;
g = x;
vector fracr = [g,f,0,0];
vector rr = convertLeftToRightFraction(fracr, 2, rat);
print(rr);
↳ [x,Dx+Dy,x*Dx+x*Dy+2,x^2]
f*rr[4]-g*rr[3];
↳ 0

```

D.15.30.10 addLeftFractions

Procedure from library `olga.lib` (see [Section D.15.30 \[olga.lib\]](#), page 2181).

Usage: `addLeftFractions(a, b, locType, locData(, override)),`
vector a, b, int locType, list/vector/intvec locData(, int override)

Purpose: add two left fractions in the specified localization

Assume:

Return: vector

Note: the returned vector is the sum of a and b as fractions in the localization specified by locType and locData.

Example:

```

LIB "olga.lib";
ring R = 0, (x,y,Dx,Dy), dp;
def S = Weyl();
setring S; S;
↳ // coefficients: QQ
↳ // number of vars : 4
↳ //      block 1 : ordering dp
↳ //      : names x y Dx Dy
↳ //      block 2 : ordering C

```

```

↳ // noncommutative relations:
↳ //   Dxx=x*Dx+1
↳ //   Dyy=y*Dy+1
// monoidal localization
poly g1 = x+3;
poly g2 = x*y+y;
list L = g1,g2;
poly s1 = g1;
poly s2 = g2;
poly r1 = Dx;
poly r2 = Dy;
vector frac1 = [s1,r1,0,0];
vector frac2 = [s2,r2,0,0];
vector rm = addLeftFractions(frac1, frac2, 0, L);
print(rm);
↳ [x^2*y+4*x*y+3*y,x*y*Dx+y*Dx+x*Dy+3*Dy]
// geometric localization
ideal p = x-1, y-3;
vector rg = addLeftFractions(frac1, frac2, 1, p);
print(rg);
↳ [x^2*y+4*x*y+3*y,x*y*Dx+y*Dx+x*Dy+3*Dy]
// rational localization
intvec v = 2;
s1 = y^2+y+1;
s2 = y-2;
r1 = Dx;
r2 = Dy;
frac1 = [s1,r1,0,0];
frac2 = [s2,r2,0,0];
vector rr = addLeftFractions(frac1, frac2, 2, v);
print(rr);
↳ [y^3-y^2-y-2,y^2*Dy+y*Dx+y*Dy-2*Dx+Dy]

```

D.15.30.11 multiplyLeftFractions

Procedure from library `olga.lib` (see [Section D.15.30 \[olga.lib\]](#), page 2181).

Usage: `multiplyLeftFractions(a, b, locType, locData(, override))`, vector `a`, `b`, int `locType`, list/vector/intvec `locData`, int `override`

Purpose: multiply two left fractions in the specified localization

Assume:

Return: vector

Note: the returned vector is the product of `a` and `b` as fractions in the localization specified by `locType` and `locData`.

Example:

```

LIB "olga.lib";
ring R = 0, (x,y,Dx,Dy), dp;
def S = Weyl();
setring S; S;
↳ // coefficients: QQ
↳ // number of vars : 4

```

```

↳ //      block  1 : ordering dp
↳ //      : names  x y Dx Dy
↳ //      block  2 : ordering C
↳ // noncommutative relations:
↳ //      Dxx=x*Dx+1
↳ //      Dyy=y*Dy+1
// monoidal localization
poly g1 = x+3;
poly g2 = x*y+y;
list L = g1,g2;
poly s1 = g1;
poly s2 = g2;
poly r1 = Dx;
poly r2 = Dy;
vector frac1 = [s1,r1,0,0];
vector frac2 = [s2,r2,0,0];
vector rm = multiplyLeftFractions(frac1, frac2, 0, L);
print(rm);
↳ [x^3*y^2+5*x^2*y^2+7*x*y^2+3*y^2,x*y*Dx*Dy+y*Dx*Dy-y*Dy]
// geometric localization
ideal p = x-1, y-3;
vector rg = multiplyLeftFractions(frac1, frac2, 1, p);
print(rg);
↳ [x^3*y+5*x^2*y+7*x*y+3*y,x*Dx*Dy+Dx*Dy-Dy]
// rational localization
intvec v = 2;
s1 = y^2+y+1;
s2 = y-2;
r1 = Dx;
r2 = Dy;
frac1 = [s1,r1,0,0];
frac2 = [s2,r2,0,0];
vector rr1 = multiplyLeftFractions(frac1, frac2, 2, v);
print(rr1);
↳ [y^3-y^2-y-2,Dx*Dy]
vector rr2 = multiplyLeftFractions(frac2, frac1, 2, v);
print(rr2);
↳ [y^5-y^3-4*y^2-3*y-2,y^2*Dx*Dy+y*Dx*Dy-2*y*Dx+Dx*Dy-Dx]
areEqualLeftFractions(rr1, rr2, 2, v);
↳ 0

```

D.15.30.12 areEqualLeftFractions

Procedure from library `olga.lib` (see [Section D.15.30 \[olga.lib\]](#), page 2181).

Usage: `areEqualLeftFractions(a, b, locType, locData)`, `vector a, b, int locType`,
`list/vector/intvec locData`

Purpose: check if two given fractions are equal

Assume:

Return: `int`

Note: returns 1 or 0, depending whether $a=b$ as fractions in the localization specified by `locType` and `locData`

Example:

```

LIB "olga.lib";
ring R = 0,(x,y,Dx,Dy),dp;
def S = Weyl();
setring S; S;
↳ // coefficients: QQ
↳ // number of vars : 4
↳ //      block  1 : ordering dp
↳ //      : names  x y Dx Dy
↳ //      block  2 : ordering C
↳ // noncommutative relations:
↳ //      Dxx=x*Dx+1
↳ //      Dyy=y*Dy+1
// monoidal
poly g1 = x*y+3;
poly g2 = y^3;
list L = g1,g2;
poly s1 = g1;
poly s2 = s1*g2;
poly s3 = s2;
poly r1 = Dx;
poly r2 = g2*r1;
poly r3 = s1*r1+3;
vector fracm1 = [s1,r1,0,0];
vector fracm2 = [s2,r2,0,0];
vector fracm3 = [s3,r3,0,0];
areEqualLeftFractions(fracm1, fracm2, 0, L);
↳ 1
areEqualLeftFractions(fracm1, fracm3, 0, L);
↳ 0
areEqualLeftFractions(fracm2, fracm3, 0, L);
↳ 0

```

D.15.30.13 isInvertibleLeftFraction

Procedure from library `olga.lib` (see [Section D.15.30 \[olga.lib\], page 2181](#)).

Usage: `isInvertibleLeftFraction(frac, locType, locData), vector frac, int locType, list/vector/intvec locData`

Purpose: check if a fraction is invertible in the specified localization

Assume:

Return: int

Note: - returns 1, if the numerator of `frac` is in the denominator set, - returns 0, otherwise (NOTE: this does NOT mean that the fraction is not invertible, it just means it could not be determined by the method above).

Example:

```

LIB "olga.lib";
ring R = 0,(x,y,Dx,Dy),dp;
def S = Weyl();
setring S; S;

```

```

↳ // coefficients: QQ
↳ // number of vars : 4
↳ //          block 1 : ordering dp
↳ //          : names  x y Dx Dy
↳ //          block 2 : ordering C
↳ // noncommutative relations:
↳ //      Dxx=x*Dx+1
↳ //      Dyy=y*Dy+1
poly g1 = x+3;
poly g2 = x*y;
list L = g1,g2;
vector frac = [g1*g2, 17, 0, 0];
isInvertibleLeftFraction(frac, 0, L);
↳ 1
ideal p = x-1, y;
frac = [g1, x, 0, 0];
isInvertibleLeftFraction(frac, 1, p);
↳ 1
intvec rat = 1,2;
frac = [g1*g2, Dx, 0, 0];
isInvertibleLeftFraction(frac, 2, rat);
↳ 0

```

D.15.30.14 invertLeftFraction

Procedure from library `olga.lib` (see [Section D.15.30 \[olga.lib\], page 2181](#)).

Usage: `invertLeftFraction(frac, locType, locData)`, vector `frac`, int `locType`, list/vector/intvec `locData`

Purpose: invert a fraction in the specified localization

Assume: `frac` is invertible in the loc. specified by `locType` and `locData`

Return: vector

Note:

- returns the multiplicative inverse of `frac` in the localization specified by `locType` and `locData`,
- throws error if `frac` is not invertible (NOTE: this does NOT mean that the fraction is not invertible, it just means it could not be determined by the method listed above).

Example:

```

LIB "olga.lib";
ring R = 0,(x,y,Dx,Dy),dp;
def S = Weyl();
setring S; S;
↳ // coefficients: QQ
↳ // number of vars : 4
↳ //          block 1 : ordering dp
↳ //          : names  x y Dx Dy
↳ //          block 2 : ordering C
↳ // noncommutative relations:
↳ //      Dxx=x*Dx+1
↳ //      Dyy=y*Dy+1
poly g1 = x+3;
poly g2 = x*y;

```

```

list L = g1,g2;
vector frac = [g1*g2, 17, 0, 0];
print(invertLeftFraction(frac, 0, L));
↳ [17,x^2*y+3*x*y]
ideal p = x-1, y;
frac = [g1, x, 0, 0];
print(invertLeftFraction(frac, 1, p));
↳ [x,x+3]
intvec rat = 1,2;
frac = [g1*g2, y, 0, 0];
print(invertLeftFraction(frac, 2, rat));
↳ [y,x^2*y+3*x*y]

```

D.15.30.15 isZeroFraction

Procedure from library `olga.lib` (see [Section D.15.30 \[olga.lib\]](#), page 2181).

Usage: `isZeroFraction(frac)`, vector `frac`
Purpose: determine if the vector `frac` represents zero
Assume: `frac` is a valid fraction
Return: `int`
Note: returns 1, if `frac == 0`; 0 otherwise

Example:

```

LIB "olga.lib";
ring R = 0,(x,y,Dx,Dy),dp;
def S = Weyl();
setring S; S;
↳ // coefficients: QQ
↳ // number of vars : 4
↳ //          block  1 : ordering dp
↳ //          : names  x y Dx Dy
↳ //          block  2 : ordering C
↳ // noncommutative relations:
↳ //   Dxx=x*Dx+1
↳ //   Dyy=y*Dy+1
isZeroFraction([42,0,0,0]);
↳ 1
isZeroFraction([0,0,Dx,3]);
↳ 0
isZeroFraction([1,1,1,1]);
↳ 0

```

D.15.30.16 isOneFraction

Procedure from library `olga.lib` (see [Section D.15.30 \[olga.lib\]](#), page 2181).

Usage: `isOneFraction(frac)`, vector `frac`
Purpose: determine if the vector `frac` represents one
Assume: `frac` is a valid fraction
Return: `int`

Note: 1, if `frac == 1`; 0 otherwise

Example:

```
LIB "olga.lib";
ring R = 0, (x,y,Dx,Dy), dp;
def S = Weyl();
setring S; S;
⇨ // coefficients: QQ
⇨ // number of vars : 4
⇨ //      block 1 : ordering dp
⇨ //      : names  x y Dx Dy
⇨ //      block 2 : ordering C
⇨ // noncommutative relations:
⇨ //      Dxx=x*Dx+1
⇨ //      Dyy=y*Dy+1
isOneFraction([42,42,0,0]);
⇨ 1
isOneFraction([0,0,Dx,3]);
⇨ 0
isOneFraction([1,0,0,1]);
⇨ 0
```

D.15.30.17 normalizeMonoidal

Procedure from library `olga.lib` (see [Section D.15.30 \[olga.lib\]](#), page 2181).

Usage: `normalizeMonoidal(L)`, list L

Purpose: compute a normal form of monoidal localization data

Return: list

Note: given a list of polys, returns a list of all unique factors appearing in the given polys

Example:

```
LIB "olga.lib";
ring R = 0, (x,y,Dx,Dy), dp;
def S = Weyl(); setring S;
list L = x^2*y^3, (x+1)*(x*y-3*y^2+1);
L = normalizeMonoidal(L);
print(L);
⇨ [1]:
⇨   x*y-3*y^2+1
⇨ [2]:
⇨   x+1
⇨ [3]:
⇨   x
⇨ [4]:
⇨   y
```

D.15.30.18 normalizeRational

Procedure from library `olga.lib` (see [Section D.15.30 \[olga.lib\]](#), page 2181).

Usage: `normalizeRational(v)`, intvec v

Purpose: compute a normal form of rational localization data

Return: intvec

Note: purges double entries and sorts ascendingly

Example:

```
LIB "olga.lib";
ring R; setring R;
intvec v = 9,5,9,3,1,5;
v = normalizeRational(v);
v;
↦ 1,3,5,9
```

D.15.30.19 testOlga

Procedure from library `olga.lib` (see [Section D.15.30 \[olga.lib\]](#), page 2181).

Usage: testOlga()

Purpose: execute a series of internal testing procedures

Return: nothing

Note:

D.15.30.20 testOlgaExamples

Procedure from library `olga.lib` (see [Section D.15.30 \[olga.lib\]](#), page 2181).

Usage: testOlgaExamples()

Purpose: execute the examples of all procedures in this library

Return: nothing

Note:

D.15.31 realclassify_lib

Library: realclassify.lib

Purpose: Classification of real singularities

Author: Janko Boehm, boehm@mathematik.uni-kl.de
Magdalen Marais, magdalen@aims.ac.za
Andreas Steenpass, steenpass@mathematik.uni-kl.de

Overview: A library for classifying isolated hypersurface singularities over the reals w.r.t. right equivalence, based on the determinant of singularities by V.I. Arnold. This library is based on `classify2.lib` by the first and second author and G. Pfister, but handles the real case, while `classify2.lib` does the complex classification.

References:

Arnold, Varchenko, Gusein-Zade: Singularities of Differentiable Maps. Vol. 1: The classification of critical points caustics and wave fronts. Birkh"auser, Boston 1985
Greuel, Lossen, Shustin: Introduction to singularities and deformations. Springer, Berlin 2007

Procedures:

D.15.31.1 realclassify

Procedure from library `realclassify.lib` (see [Section D.15.31 \[realclassify.lib\]](#), page 2199).

Usage: `realclassify(f); f poly`

Return: A list of elements NF of type NormalFormEquation with the following keys:
 NF.singularityType = the type of the singularity as a string
 NF.normalFormEquation = an element F of type Poly with the normal form equation (a representative of the stable equivalence class of f, as chosen by Arnold)
 NF.modality = the modality of f
 NF.parameters = a list where each entry is a list consisting out of the parameter term in the normalform equation and an interval
 NF.corank = the corank of f (of type int)
 NF.inertiaIndex = the inertia index of f (of type int)
 NF.milnorNumber = the milnor number of f (of type int)
 NF.determinacy = an lower bound for the determinacy of f (of type int)

Note: The classification is done over the real numbers, so in contrast to `classify.lib`, the signs of coefficients of monomials where even exponents occur matter.
 The ground field must be \mathbb{Q} (the rational numbers). No field extensions of any kind nor floating point numbers are allowed.
 The monomial order must be local.
 The input polynomial must be contained in `maxideal(2)` and must be an isolated singularity of modality 0 or 1. The Milnor number is checked for being finite.
 In case of `NF.modality=1`, the parameter values are given as an element of a number field $\mathbb{Q}\mathbb{Q}[a]/(\text{minpoly})$, the coefficient ring of F in terms of the unique root of `minpoly` of the ring `F.in` in the interval specified in `NF.parameters` in conjunction with the parameter term.

Example:

```
LIB "realclassify.lib";
ring r = 0, (x,y,z), ds;
poly f = (x2+3y-2z)^2+xyz-(x-y3+x2z3)^3;
realclassify(f);
↳ [1]:
↳ Corank = 2
↳ Inertia index = 0
↳ Normalform equation of type = D[4]-
↳ Normalform equation = x2y-y3
↳ Milnor number = 4
↳ Modality = 0
↳ Determinacy <= 3
↳
map phi = r, x+2y+y^2+x*y,x+y+y^2+x^2,z;
poly f = x^2+y^2-z^2; // A[1]
f=phi(f);
realclassify(f);
↳ [1]:
↳ Corank = 0
↳ Inertia index = 1
↳ Normalform equation of type = A[1]
↳ Normalform equation = 0
↳ Milnor number = 1
```

```

↳ Modality = 0
↳ Determinacy <= 2
↳
poly f = x^3+y^2-z^2; // A[2]
f=phi(f);
realclassify(f);
↳ [1]:
↳ Corank = 1
↳ Inertia index = 1
↳ Normalform equation of type = A[2]
↳ Normalform equation = x3
↳ Milnor number = 2
↳ Modality = 0
↳ Determinacy <= 3
↳
poly f = x^2*y-y^3+z^2; // D[4]-
f=phi(f);
realclassify(f);
↳ [1]:

See also: [Section D.6.3.2 \[classify\], page 1262](#).

D.15.31.2 realmorsesplit

Procedure from library `realclassify.lib` (see [Section D.15.31 \[realclassify.lib\], page 2199](#)).

Usage: `realmorsesplit(f[, mu]);` f poly, mu int

Return: a list consisting of the corank of f, the inertia index, an upper bound for the determinacy, and the residual form of f

Note: The characteristic of the basering must be zero, the monomial order must be local, f must be contained in `maxideal(2)` and the Milnor number of f must be finite. The Milnor number of f can be provided as an optional parameter in order to avoid that it is computed again.

Example:

```

LIB "realclassify.lib";
ring r = 0, (x,y,z), ds;
poly f = (x2+3y-2z)^2+xyz-(x-y3+x2z3)^3;
realmorsesplit(f);
↳ [1]:
↳ 2
↳ [2]:
↳ 0

```

```

↳ [3] :
↳ 3
↳ [4] :
↳ -x3+2/3xy2

```

See also: [Section D.6.3.8 \[morsesplit\]](#), page 1266.

D.15.31.3 milnornumber

Procedure from library `realclassify.lib` (see [Section D.15.31 \[realclassify_lib\]](#), page 2199).

Usage: `milnornumber(f); f poly`

Return: Milnor number of f , or -1 if the Milnor number is not finite

Note: The monomial order must be local.

Example:

```

LIB "realclassify.lib";
ring r = 0, (x,y), ds;
poly f = x3+y4;
milnornumber(f);
↳ 6

```

D.15.31.4 determinacy

Procedure from library `realclassify.lib` (see [Section D.15.31 \[realclassify_lib\]](#), page 2199).

Usage: `determinacy(f[, mu]); f poly, mu int`

Return: an upper bound for the determinacy of f

Note: The characteristic of the basering must be zero, the monomial order must be local, f must be contained in `maxideal(1)` and the Milnor number of f must be finite.
The Milnor number of f can be provided as an optional parameter in order to avoid that it is computed again.

Example:

```

LIB "realclassify.lib";
ring r = 0, (x,y), ds;
poly f = x3+xy3;
determinacy(f);
↳ 5

```

See also: [Section 5.1.53 \[highcorner\]](#), page 192; [Section D.15.31.3 \[milnornumber\]](#), page 2208.

D.15.31.5 addnondegeneratevariables

Procedure from library `realclassify.lib` (see [Section D.15.31 \[realclassify_lib\]](#), page 2199).

Usage: `addnondegeneratevariables(NFR); NFR NormalFormEquation`

Return: Adds squares of the non-degenerate variables (i.e. `var(cr+1)`, ..., `var(nvars(basing))`) for corank cr) to the normalform `nf`, with signs according to the inertia index.

Example:

```

LIB "realclassify.lib";
ring r = 0, (x,y,z), ds;
poly f = (x2+3y-2z)^2+xyz-(x-y3+x2z3)^3;
list NFR = realclassify(f);
NFR[1];
↳ Corank = 2
↳ Inertia index = 0
↳ Normalform equation of type = D[4]-
↳ Normalform equation = x2y-y3
↳ Milnor number = 4
↳ Modality = 0
↳ Determinacy <= 3
↳
addnondegeneratevariables(NFR[1]);
↳ Corank = 2
↳ Inertia index = 0
↳ Normalform equation of type = D[4]-
↳ Normalform equation = z2+x2y-y3
↳ Milnor number = 4
↳ Modality = 0
↳ Determinacy <= 3
↳

```

See also: [Section D.15.31.2 \[realmorsesplit\]](#), page 2207.

D.15.32 rootisolation_lib

Library: rootisolation.lib

Purpose: implements an algorithm for real root isolation using interval arithmetic

Authors: Dominik Bendle (bendle@rhrk.uni-kl.de)
 Janko Boehm (boehm@mathematik.uni-lk.de), supervisor Fachpraktikum
 Clara Petroll (petroll@rhrk.uni-kl.de)

Overview: In this library the interval arithmetic from `interval.so` is used. The new type `ivmat`, a matrix consisting of intervals, is implemented as `newstruct`. There are various functions for computations with interval matrices implemented, such as Gaussian elimination for interval matrices.

Interval arithmetic, the interval Newton Step and exclusion methods are used to implement the procedure `rootIsolation`, an algorithm which finds boxes containing elements of the vanishing locus of an ideal. This algorithm is specialised for zero-dimensional radical ideals. The theory about the interval Newton Step is detailed in [2].

Note that interval arithmetic and the aforementioned procedures are intended for rational or real polynomial rings.

 * ivmatMultiplyGeneral matrix multiplication
```

Procedures:

D.15.32.1 bounds

Procedure from library `rootisolation.lib` (see [Section D.15.32 \[rootisolation.lib\]](#), page 2209).

Usage: `bounds(a)`; a number;
 `bounds(a, b)`; a, b number;

Return: interval: if `size(#)==0` it returns the interval `[a, a]`, else the interval `[a,#[1]]`

Example:

```
LIB "rootisolation.lib";
ring R = 0,x,dp;
interval I = bounds(1);
I;
↪ [1, 1]
interval J = bounds(2/3,3);
J;
↪ [2/3, 3]
```

D.15.32.2 length

Procedure from library `rootisolation.lib` (see [Section D.15.32 \[rootisolation.lib\]](#), page 2209).

Usage: `length(I)`; I interval

Return: number, the Euclidean length of the interval

Example:

```
LIB "rootisolation.lib";
ring R = 0,x,dp;
interval I = -1,3;
length(I);
↪ 4
I = 1/5,1/3;
length(I);
↪ 2/15
```

D.15.32.3 boxSet

Procedure from library `rootisolation.lib` (see [Section D.15.32 \[rootisolation.lib\]](#), page 2209).

Usage: `boxSet(B, i, I)`; B box, i int, I interval

Return: new box C where $C[i] == I$

Purpose: modifies a single entry of a box

Example:

```
LIB "rootisolation.lib";
ring R = 0,(x,y,z),dp;
box B; B;
↳ [0, 0] x [0, 0] x [0, 0]
B = boxSet(B, 2, bounds(-1,1)); B;
↳ [0, 0] x [-1, 1] x [0, 0]
B = boxSet(B, 1, B[2]); B;
↳ [-1, 1] x [-1, 1] x [0, 0]
```

D.15.32.4 ivmatInit

Procedure from library `rootisolation.lib` (see [Section D.15.32 \[rootisolation.lib\], page 2209](#)).

Usage: `ivmatInit(m, n); m, n int`

Return: $m \times n$ matrix of $[0,0]$ -intervals

Purpose: initialises an interval matrix with $[0,0]$ intervals to ensure the proper structure of the `ivmat` type

Example:

```
LIB "rootisolation.lib";
ring R = 0,x(1..5),dp;
ivmat A = ivmatInit(4, 5); A;
↳ [0, 0],[0, 0],[0, 0],[0, 0],[0, 0]
↳ [0, 0],[0, 0],[0, 0],[0, 0],[0, 0]
↳ [0, 0],[0, 0],[0, 0],[0, 0],[0, 0]
↳ [0, 0],[0, 0],[0, 0],[0, 0],[0, 0]
↳
```

D.15.32.5 ivmatSet

Procedure from library `rootisolation.lib` (see [Section D.15.32 \[rootisolation.lib\], page 2209](#)).

Usage: `ivmatSet(A, i, j, I); A ivmat, i, j, int, I interval`

Return: interval matrix A where $A[i][j] == I$

Purpose: modify a single entry of an `ivmat`

Example:

```
LIB "rootisolation.lib";
ring R = 0,x,dp;
ivmat A = ivmatInit(2,2); A;
↳ [0, 0],[0, 0]
↳ [0, 0],[0, 0]
↳
A = ivmatSet(A, 1, 2, bounds(1, 2)); A;
↳ [0, 0],[1, 2]
↳ [0, 0],[0, 0]
↳
```

D.15.32.6 unitMatrix

Procedure from library `rootisolation.lib` (see [Section D.15.32 \[rootisolation.lib\]](#), page 2209).

Usage: `unitMatrix(n); n int`

Return: `nxn unit interval matrix`

Example:

```
LIB "rootisolation.lib";
ring R = 0,(x,y),dp;
unitMatrix(2);
↳ [1, 1],[0, 0]
↳ [0, 0],[1, 1]
↳
unitMatrix(3);
↳ [1, 1],[0, 0],[0, 0]
↳ [0, 0],[1, 1],[0, 0]
↳ [0, 0],[0, 0],[1, 1]
↳
```

D.15.32.7 ivmatGaussian

Procedure from library `rootisolation.lib` (see [Section D.15.32 \[rootisolation.lib\]](#), page 2209).

Usage: `ivmatGaussian(A); A ivmat`

Return: `0`, if `A` not invertible, `(1, Ainv)` if `A` invertible where `Ainv` is the inverse matrix

Purpose: Inverts an interval matrix using Gaussian elimination in the setting of interval arithmetic. Pivoting is handled as a special case as `I/I != [1,1]` and `I-I != [0,0]` in general.

Example:

```
LIB "rootisolation.lib";
ring R = 0,(x,y),dp;
ideal I = 2x2-xy+2y2-2,2x2-3xy+3y2-2;
box B = list(bounds(7/8, 9/8), bounds(-1/10, 1/20));
ivmat J = evalJacobianAtBox (I, B); J;
↳ [69/20, 23/5],[-61/40, -27/40]
↳ [67/20, 24/5],[-159/40, -93/40]
↳
list result = ivmatGaussian(J);
ivmat Jinv = result[2];
Jinv;
↳ [1060/4273, 620/187],[-1220/561, -180/4273]
↳ [2680/12819, 1280/187],[-920/187, -3680/12819]
↳
Jinv * J;
↳ [-7657037/799051, 12073835/799051],[-3961862/799051, 6773506/799051]
↳ [-18293234/799051, 73172936/2397153],[-7807572/799051, 15513600/799051]
↳
```

D.15.32.8 evalPolyAtBox

Procedure from library `rootisolation.lib` (see [Section D.15.32 \[rootisolation.lib\]](#), page 2209).

Usage: `evalPolyAtBox(f, B);` f poly, B box
Return: interval, evaluation of f at B using interval arithmetic
Purpose: computes an interval extension of the polynomial

Example:

```
LIB "rootisolation.lib";
ring R = 0,(x,y),dp;
poly f = x2+y-1;
box B = list(bounds(-1,1), bounds(1,3)/2);
interval I = evalPolyAtBox(f, B); I;
↪ [-1/2, 3/2]
```

D.15.32.9 evalJacobianAtBox

Procedure from library `rootisolation.lib` (see [Section D.15.32 \[rootisolation.lib\]](#), page 2209).

Usage: `evalJacobianAtBox(I, B);` I ideal, B box
Return: Jacobian matrix of I where polynomials are evaluated at B
Purpose: evaluates each polynomial of the Jacobian matrix of I using interval arithmetic

Example:

```
LIB "rootisolation.lib";
ring R = 0,(x,y),dp;
ideal I = 2x2-xy+2y2-2, 2x2-3xy+3y2-2;
interval J = bounds(-1,1);
evalJacobianAtBox(I, list(J,J));
↪ [-5, 5], [-5, 5]
↪ [-7, 7], [-9, 9]
↪
```

D.15.32.10 rootIsolationNoPreprocessing

Procedure from library `rootisolation.lib` (see [Section D.15.32 \[rootisolation.lib\]](#), page 2209).

Usage: `rootIsolationNoPreprocessing(I, B, eps);` I ideal, B list of boxes, eps number;
Assume: I is a zero-dimensional radical ideal
Return: $(L1, L2)$, where $L1$ contains boxes smaller than eps which may contain an element of $V(I)$, i.e. a root and $L2$ contains boxes which contain exactly one element of $V(I)$
Purpose: Given input box(es) `start` we try to find all roots of I lying in `start` by computing boxes that contain exactly one root. If $eps > 0$ then boxes that become smaller than eps will be returned.
Theory: We first check for every box if it contains no roots by interval arithmetic. If this is inconclusive we apply the Newton step which, as outlined in [2] and [3], converges to a root lying in the starting box. If the result of the Newton step is already contained in the interior of the starting box, it contains a unique root.
Note: While `rootIsolation` does, `rootIsolationNoPreprocessing` does not check input ideal for necessary conditions.

Example:

```

LIB "rootisolation.lib";
ring R = 0,(x,y),dp;
ideal I = 2x2-xy+2y2-2,2x2-3xy+3y2-2; // V(I) has four elements
interval i = bounds(-3/2,3/2);
box B = list(i, i);
list result = rootIsolationNoPreprocessing(I, list(B), 1/512);
size(result[1]);
↪ 0
size(result[2]);
↪ 4

D.15.32.11 rootIsolation

Procedure from library `rootisolation.lib` (see [Section D.15.32 \[rootisolation.lib\]](#), page 2209).

Usage: `rootIsolation(I, [start, eps]);` I ideal, start box, eps number

Assume: I is a zero-dimensional radical ideal

Return: (L1, L2), where L1 contains boxes smaller than eps which may contain an element of $V(I)$, i.e. a root and L2 contains boxes which contain exactly one element of $V(I)$

Purpose: same as `rootIsolationNoPreprocessing`, but speeds up computation by preprocessing starting box

Theory: As every root of I is a root of the polynomials $I[i]$, we use Groebner elimination to find univariate polynomials for every variable which have these roots as well. Using that I is zero-dimensional these Groebner bases may be quickly computed using FGLM. Applying root isolation to these univariate polynomials then provides smaller starting boxes which speed up computations in the multivariate case.

Note: This algorithm and some procedures used therein perform Groebner basis computations in `basing`. It is thus advised to define I w.r.t. a fast monomial ordering.

The algorithm performs checks on I to prevent errors. If I does not have the right number of generators, we first try to find a suitable Groebner basis. If this fails we apply the algorithm to the triangular decomposition of I.

Example:

```

LIB "rootisolation.lib";
ring R = 0,(x,y),dp;
ideal I = 2x2-xy+2y2-2,2x2-3xy+3y2-2; // V(I) has four elements
interval i = bounds(-3/2,3/2);
box B = list(i, i);
list result = rootIsolation(I, B);

```

```

```

D.15.32.12 rootIsolationPrimdec

Procedure from library `rootisolation.lib` (see [Section D.15.32 \[rootisolation.lib\]](#), page 2209).

Usage: `rootIsolationPrimdec(I); I ideal`

Assume: `I` is a zero-dimensional radical ideal

Return: `L`, where `L` contains boxes which contain exactly one element of $V(I)$

Purpose: same as `rootIsolation`, but speeds up computation and improves output by doing a primary decomposition before doing the root isolation

Theory: For the primary decomposition we use the algorithm of Gianni-Traeger-Zarcharias.

Note: This algorithm and some procedures used therein perform Groebner basis computations in `basing`. It is thus advised to define `I` w.r.t. a fast monomial ordering.

Example:

```

LIB "rootisolation.lib";
ring R = 0,(x,y),dp;
ideal I = 2x2-xy+2y2-2,2x2-3xy+3y2-2; // V(I) has four elements
list result = rootIsolationPrimdec(I);

D.15.33 rstandard_lib

Library: `rstandard.lib`

Purpose: Computes Janet bases and border bases for ideals

Authors: Shamsa Kanwal `lotus_zone16@yahoo.com`
 Gerhard Pfister `pfister@mathematik.uni-kl.de`

Overview: Computing Janet bases and border bases for any ordering using the idea of r-standard bases (defined by V. Gerdt)

References:

- [1] A. Kehrein, M. Kreuzer, L. Robbiano: An algebrists view on border bases, in: A. Dickenstein and I. Emiris (eds.), Solving Polynomial Equations: Foundations, Algorithms and Applications, Springer, Heidelberg 2005, 169-202.

Procedures:**D.15.33.1 borderBasis**

Procedure from library `rstandard.lib` (see [Section D.15.33 \[rstandard.lib\]](#), page 2215).

Usage: `borderBasis(I)`; `I` is an ideal.

Return: ideal, a border basis for `I`.

Purpose: Computes a border basis for the ideal given by the generators in `I`.

Example:

```
LIB "rstandard.lib";
ring R=32003,(x,y,z),ds;
poly f=x3y+x5+x3y2+2x2y3+x2yz2+xy5+x12+y16+z20;
ideal i= jacob(f);
i=i,f;
ideal j=borderBasis(i); j;

See also: [Section D.15.33.2 \[modBorder\]](#), page 2225.

D.15.33.2 modBorder

Procedure from library `rstandard.lib` (see [Section D.15.33 \[rstandard.lib\]](#), page 2215).

Usage: `modBorder(I,i)`; I is an ideal, i an integer.

Return: ideal, a border basis for I using modular methods.

Purpose: Computes a border basis for the ideal given by the generators in I using modular techniques.

If second argument is 0 then the result is not verified.

Example:

```

LIB "rstandard.lib";
ring R=0,(x,y,z),ds;
poly f=x3y+x5+x3y2+2x2y3+x2yz2+xy5+x12+y16+z20;
ideal i= jacob(f);
i=i,f;
ideal j=modBorder(i,1); j;

See also: [Section D.15.33.1 \[borderBasis\]](#), page 2216.

D.15.33.3 rJanet

Procedure from library `rstandard.lib` (see [Section D.15.33 \[rstandard.lib\]](#), page 2215).

Usage: `rJanet(I)`; `I` is an ideal.

Return: ideal, a Janet basis for `I`.

Purpose: Computes a Janet basis for the ideal given by the generators in `I` for any ordering.

Example:

```

LIB "rstandard.lib";
ring R= 32003, (a,b,c,d,e,f,g), dp;
ideal i=
a+b+c+d+e+f+g,
ab+bc+cd+de+ef+fg+ga,
abc+bcd+cde+fde+efg+fga+gab,
abcd+bcde+cdef+defg+efga+fgab+gabc,

```

```

abcde+bcdef+cdefg+defga+efgab+fgabc+gabcd,
abcdef+bcdefg+cdefga+defgab+efgabc+fgabcd+gabcde,
abcdefg-1;
ideal j = rJanet(i);  j;

D.15.33.4 modJanet

Procedure from library `rstandard.lib` (see [Section D.15.33 \[rstandard.lib\]](#), page 2215).

Usage: `modJanet(I,i)`; `I` is an ideal, `i` an integer (optional).

Return: ideal, a Janet basis for `I` using modular methods.

Purpose: Computes a Janet basis for the ideal given by the generators in `I` using modular techniques.

If second argument is 0 then the result is not verified.

Example:

```
LIB "rstandard.lib";
```

```

ring R=0,(t,x,y,z),ds;

D.15.34 `rwalk.lib`

Library: `rwalk.lib`

Purpose: Groebner Walk Conversion Algorithms

Author: Stephan Oberfranz

Procedures: See also: [Section D.4.7 \[`grwalk.lib`\], page 945](#); [Section D.15.36 \[`swalk.lib`\], page 2452](#).

D.15.34.1 `prwalk`

Procedure from library `rwalk.lib` (see [Section D.15.34 \[`rwalk.lib`\], page 2428](#)).

Syntax: `rwalk(ideal i, int radius);`
 if `size(#)>0` then `rwalk(ideal i, int radius, intvec v, intvec w);`

Type: ideal

Purpose: compute the standard basis of the ideal, calculated via the Random Perturbation Walk algorithm from the ordering "`(a(v),lp)`", "`dp`", "`Dp`" or "`M`" to the ordering "`(a(w),lp)`", "`(a(1,0,...,0),lp)`" or "`M`".

Example:

```
LIB "rwalk.lib";
// compute a Groebner basis of I w.r.t. lp.
ring r = 32003,(z,y,x), lp;
ideal I = y3+xyz+y2z+xz3, 3+xy+x2y+y2z;
int radius = 1;
int o_perturb_deg = 2;
int t_perturb_deg = 2;
prwalk(I,radius,o_perturb_deg,t_perturb_deg);
↪ _[1]=y9-y7x2-y7x-y6x3-y6x2-3y6-3y5x-y3x7-3y3x6-3y3x5-y3x4-9y2x5-18y2x4-9y\

D.15.34.2 `rwalk`

Procedure from library `rwalk.lib` (see [Section D.15.34 \[`rwalk.lib`\], page 2428](#)).

Syntax: `rwalk(ideal i, int radius);`
 if `size(#)>0` then `rwalk(ideal i, int radius, intvec v, intvec w);` intermediate Groebner bases are not reduced if `reduction = 0`

Type: ideal

Purpose: compute the standard basis of the ideal, calculated via the Random walk algorithm from the ordering "`(a(v),lp)`", "`dp`", "`Dp`" or "`M`" to the ordering "`(a(w),lp)`", "`(a(1,0,...,0),lp)`" or "`M`".

Example:

```
LIB "rwalk.lib";
// compute a Groebner basis of I w.r.t. lp.
ring r = 32003,(z,y,x), lp;
ideal I = y3+xyz+y2z+xz3, 3+xy+x2y+y2z;

D.15.35 schubert.lib

Library: schubert.lib

Purpose: Procedures for Intersection Theory

Author: Hiep Dang, email: hiep@mathematik.uni-kl.de

Overview: We implement new classes (variety, sheaf, stack, graph) and methods for computing with them. An abstract variety is represented by a nonnegative integer which is its dimension and a graded ring which is its Chow ring. An abstract sheaf is represented by a variety and a polynomial which is its Chern character. In particular, we implement the concrete varieties such as projective spaces, Grassmannians, and projective bundles. An important task of this library is related to the computation of Gromov-Witten invariants. In particular, we implement new tools for the computation in equivariant intersection theory. These tools are based on the localization of moduli spaces of stable maps and Bott's formula. They are useful for the computation of Gromov-Witten invariants. In order to do this, we have to deal with moduli spaces of stable maps, which were introduced by Kontsevich, and the graphs corresponding to the fixed point components of a torus action on the moduli spaces of stable maps.

As an insightful example, the numbers of rational curves on general complete intersection Calabi-Yau threefolds in projective spaces are computed up to degree 6. The results are all in agreement with predictions made from mirror symmetry computations.

Procedures:

D.15.35.1 makeVariety

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `makeVariety(d,i)`; d int, i ideal

Assume: d is a nonnegative integer, i is an ideal

Return: variety

Theory: create an abstract variety which has dimension d , and its Chow ring should be a quotient ring

Example:

```
LIB "schubert.lib";
ring r = 0,(h,e),wp(1,1);
ideal rels = he,h2+e2;
variety V = makeVariety(2,rels);
V;
↳ A variety of dimension 2
↳
V.dimension;
↳ 2
V.relations;
↳ _[1]=he
↳ _[2]=h2+e2
```

D.15.35.2 printVariety

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `printVariety(V)`; V variety

Assume: V is an abstract variety

Theory: This is the print function used by Singular to print an abstract variety.

Example:

```
LIB "schubert.lib";
ring r = 0, (h,e), wp(1,1);
ideal rels = he, h2+e2;
variety V = makeVariety(2, rels);
V;
↳ A variety of dimension 2
↳
```

D.15.35.3 productVariety

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `productVariety(U,V)`; U variety, V variety

Input: two abstract varieties

Output: a product variety as an abstract variety

Return: variety

Example:

```
LIB "schubert.lib";
variety P = projectiveSpace(3);
variety G = Grassmannian(2,4);
variety W = productVariety(P,G);
W;
↳ A variety of dimension 7
↳
W.dimension == P.dimension + G.dimension;
↳ 1
def r = W.baseRing;
setring r;
W.relations;
↳ _[1]=h^4
↳ _[2]=q(1)^3-2*q(1)*q(2)
↳ _[3]=q(1)^4-3*q(1)^2*q(2)+q(2)^2
```

See also: [Section D.15.35.5 \[Grassmannian\]](#), page 2432; [Section D.15.35.7 \[projectiveBundle\]](#), page 2433; [Section D.15.35.6 \[projectiveSpace\]](#), page 2433.

D.15.35.4 ChowRing

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `ChowRing(V)`; V variety

Assume: V is an abstract variety

Return: qring

Example:

```
LIB "schubert.lib";
ring r = 0,(h,e),wp(1,1);
ideal rels = he,h2+e2;
int d = 2;
variety V = makeVariety(2,rels);
ChowRing(V);
↳ // coefficients: QQ
↳ // number of vars : 2
↳ //          block 1 : ordering dp
↳ //          : names   h e
↳ //          block 2 : ordering C
↳ // quotient ring from ideal ...
```

D.15.35.5 Grassmannian

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: Grassmannian(k,n); k int, n int

Return: variety

Theory: create a Grassmannian $G(k,n)$ as an abstract variety. This abstract variety has dimension $k(n-k)$ and its Chow ring is the quotient ring of a polynomial ring in $n-k$ variables $q(1), \dots, q(n-k)$, which are the Chern classes of tautological quotient bundle on $G(k,n)$, modulo some ideal generated by $n-k$ polynomials which come from the Giambelli formula. The monomial ordering of this Chow ring is 'wp' with vector $(1..k, 1..n-k)$. Moreover, we export the Chern characters of tautological subbundle and quotient bundle on $G(k,n)$ (say 'subBundle' and 'quotientBundle').

Example:

```
LIB "schubert.lib";
variety G24 = Grassmannian(2,4);
G24;
↳ A variety of dimension 4
↳
def r = G24.baseRing;
setring r;
subBundle;
↳ 1/6*q(1)*q(2)-1/2*q(1)^2+q(2)-q(1)+2
quotientBundle;
↳ -1/6*q(1)*q(2)+1/2*q(1)^2-q(2)+q(1)+2
G24.dimension;
↳ 4
G24.relations;
↳ _[1]=q(1)^3-2*q(1)*q(2)
↳ _[2]=q(1)^4-3*q(1)^2*q(2)+q(2)^2
ChowRing(G24);
↳ // coefficients: QQ
↳ // number of vars : 2
↳ //          block 1 : ordering wp
↳ //          : names   q(1) q(2)
```

```

⇒ //                : weights    1    2
⇒ //                block    2 : ordering C
⇒ // quotient ring from ideal ...

```

See also: [Section D.15.35.7 \[projectiveBundle\]](#), page 2433; [Section D.15.35.6 \[projectiveSpace\]](#), page 2433.

D.15.35.6 projectiveSpace

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `projectiveSpace(n)`; `n` int

Return: variety

Theory: create a projective space of dimension `n` as an abstract variety. Its Chow ring is a quotient ring in one variable `h` modulo the ideal generated by $h^{(n+1)}$.

Example:

```

LIB "schubert.lib";
variety P = projectiveSpace(3);
P;
⇒ A variety of dimension 3
⇒
P.dimension;
⇒ 3
def r = P.baseRing;
setring r;
P.relations;
⇒ _[1]=h4
ChowRing(P);
⇒ // coefficients: QQ
⇒ // number of vars : 1
⇒ //                block    1 : ordering lp
⇒ //                : names    h
⇒ //                block    2 : ordering C
⇒ // quotient ring from ideal ...

```

See also: [Section D.15.35.5 \[Grassmannian\]](#), page 2432; [Section D.15.35.7 \[projectiveBundle\]](#), page 2433.

D.15.35.7 projectiveBundle

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `projectiveBundle(S)`; `S` sheaf

Input: a sheaf on an abstract variety

Return: variety

Theory: create a projective bundle as an abstract variety. This is related to the enumeration of conics.

Example:

```

LIB "schubert.lib";
variety G = Grassmannian(3,5);
def r = G.baseRing;

```

```

setring r;
sheaf S = makeSheaf(G,subBundle);
sheaf B = dualSheaf(S)^2;
variety PB = projectiveBundle(B);
PB;
↳ A variety of dimension 11
↳
def R = PB.baseRing;
setring R;
QuotientBundle;
↳ 1/1995840*z^5*q(2)^3-1/120960*z^5*q(1)*q(2)^2+1/20160*z^5*q(1)^2*q(2)+1/4\
0320*z^5*q(2)^2-1/10080*z^5*q(1)^3-1/2688*z^5*q(1)*q(2)+1/840*z^5*q(1)^2+\
1/1008*z^5*q(2)-1/180*z^5*q(1)+1/120*z^5-1/36288*z^4*q(2)^3+5/12096*z^4*q\
(1)*q(2)^2-1/448*z^4*q(1)^2*q(2)+5/8064*z^4*q(2)^2+1/252*z^4*q(1)^3+1/100\
8*z^4*q(1)*q(2)-1/72*z^4*q(1)^2+1/144*z^4*q(2)+1/24*z^4+43/72576*z^3*q(2)\
^3-47/8064*z^3*q(1)*q(2)^2+11/504*z^3*q(1)^2*q(2)-1/84*z^3*q(2)^2-1/36*z^3\
q(1)^3+5/144*z^3*q(1)*q(2)+1/6*z^3-1/192*z^2*q(2)^3+1/36*z^2*q(1)*q(2)^2\
-1/24*z^2*q(1)^2*q(2)+1/36*z^2*q(2)^2+1/2*z^2+1/63*z*q(2)^3-1/36*z*q(1)*\
q(2)^2+z+1
ChowRing(PB);
↳ // coefficients: QQ
↳ // number of vars : 3
↳ //      block 1 : ordering lp
↳ //      : names      z
↳ //      block 2 : ordering wp
↳ //      : names      q(1) q(2)
↳ //      : weights    1    2
↳ //      block 3 : ordering C
↳ // quotient ring from ideal ...

```

See also: [Section D.15.35.5 \[Grassmannian\]](#), page 2432; [Section D.15.35.6 \[projectiveSpace\]](#), page 2433.

D.15.35.8 integral

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `integral(V,f)`; V variety, f poly

Input: a abstract variety and a polynomial

Return: int

Purpose: computing intersection numbers.

Example:

```

LIB "schubert.lib";
variety G = Grassmannian(2,4);
def r = G.baseRing;
setring r;
integral(G,q(1)^4);
↳ 2

```

D.15.35.9 makeSheaf

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `makeSheaf(V,ch)`; V variety, ch poly

Return: sheaf

Theory: create a sheaf on an abstract variety, and its Chern character is the polynomial ch.

Example:

```
LIB "schubert.lib";
variety X;
X.dimension = 4;
ring r = 0,(c(1..2),d(1..3)),wp(1..2,1..3);
setring r;
X.baseRing = r;
poly c = 1 + c(1) + c(2);
poly ch = 2 + logg(c,4);
sheaf S = makeSheaf(X,ch);
S;
↳ A sheaf of rank 2
↳
```

See also: [Section D.15.35.10 \[printSheaf\]](#), page 2435; [Section D.15.35.11 \[rankSheaf\]](#), page 2435.

D.15.35.10 printSheaf

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `printSheaf(S)`; S sheaf

Return: string

Input: a sheaf

Theory: This is the print function used by Singular to print a sheaf.

Example:

```
LIB "schubert.lib";
variety X;
X.dimension = 4;
ring r = 0,(c(1..2),d(1..3)),wp(1..2,1..3);
setring r;
X.baseRing = r;
poly c = 1 + c(1) + c(2);
poly ch = 2 + logg(c,4);
sheaf S = makeSheaf(X,ch);
S;
↳ A sheaf of rank 2
↳
```

See also: [Section D.15.35.9 \[makeSheaf\]](#), page 2434; [Section D.15.35.11 \[rankSheaf\]](#), page 2435.

D.15.35.11 rankSheaf

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `rankSheaf(S)`; S sheaf

Return: int

Input: S is a sheaf

Output: a positive integer which is the rank of a sheaf.

Example:

```
LIB "schubert.lib";
variety G = Grassmannian(2,4);
def R = G.baseRing;
setring R;
sheaf S = makeSheaf(G,subBundle);
rankSheaf(S);
↳ 2
```

See also: [Section D.15.35.9 \[makeSheaf\]](#), page 2434; [Section D.15.35.10 \[printSheaf\]](#), page 2435.

D.15.35.12 totalChernClass

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `totalChernClass(S)`; S sheaf

Return: poly

Input: S is a sheaf

Output: a polynomial which is the total Chern class of a sheaf

Example:

```
LIB "schubert.lib";
variety X;
X.dimension = 4;
ring r = 0, (c(1..2), d(1..3)), wp(1..2, 1..3);
setring r;
X.baseRing = r;
poly c = 1 + c(1) + c(2);
poly ch = 2 + logg(c,4);
sheaf E = makeSheaf(X, ch);
sheaf S = E^3;
totalChernClass(S);
↳ 18*c(1)^2*c(2)+9*c(2)^2+6*c(1)^3+30*c(1)*c(2)+11*c(1)^2+10*c(2)+6*c(1)+1
```

See also: [Section D.15.35.13 \[ChernClass\]](#), page 2436; [Section D.15.35.14 \[topChernClass\]](#), page 2437; [Section D.15.35.15 \[totalSegreClass\]](#), page 2437.

D.15.35.13 ChernClass

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `ChernClass(S,i)`; S sheaf, i int

Input: S is a sheaf, i is a nonnegative integer

Return: poly

Theory: This is the i-th Chern class of a sheaf

Example:

```
LIB "schubert.lib";
variety X;
X.dimension = 4;
ring r = 0, (c(1..2), d(1..3)), wp(1..2, 1..3);
```

```

setring r;
X.baseRing = r;
poly c = 1 + c(1) + c(2);
poly ch = 2 + logg(c,4);
sheaf E = makeSheaf(X, ch);
sheaf S = E^3;
ChernClass(S,1);
  ↪ 6*c(1)
ChernClass(S,2);
  ↪ 11*c(1)^2+10*c(2)
ChernClass(S,3);
  ↪ 6*c(1)^3+30*c(1)*c(2)
ChernClass(S,4);
  ↪ 18*c(1)^2*c(2)+9*c(2)^2

```

See also: [Section D.15.35.14 \[topChernClass\]](#), page 2437; [Section D.15.35.12 \[totalChernClass\]](#), page 2436.

D.15.35.14 topChernClass

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `topChernClass(S); S sheaf`

Return: `poly`

Input: `S` is a sheaf

Theory: This is the top Chern class of a sheaf

Example:

```

LIB "schubert.lib";
variety G = Grassmannian(2,4);
def R = G.baseRing;
setring R;
sheaf S = makeSheaf(G, quotientBundle);
sheaf B = S^3;
topChernClass(B);
  ↪ 27*q(2)^2

```

See also: [Section D.15.35.13 \[ChernClass\]](#), page 2436; [Section D.15.35.12 \[totalChernClass\]](#), page 2436.

D.15.35.15 totalSegreClass

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `totalSegreClass(S); S sheaf`

Return: `poly`

Input: `S` is a sheaf

Theory: This is the total Segre class of a sheaf.
SEE ALSO: `totalChernClass`

Example:

```

LIB "schubert.lib";
variety G = Grassmannian(2,4);
def R = G.baseRing;
setring R;
sheaf S = makeSheaf(G,subBundle);
totalSegreClass(S);
↪ q(2)+q(1)+1

```

D.15.35.16 dualSheaf

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `dualSheaf(S)`; S sheaf

Return: sheaf

Theory: This is the dual of a sheaf

Example:

```

LIB "schubert.lib";
variety G = Grassmannian(2,4);
def R = G.baseRing;
setring R;
sheaf S = makeSheaf(G,subBundle);
sheaf D = dualSheaf(S);
D;
↪ A sheaf of rank 2
↪

```

See also: [Section D.15.35.20 \[addSheaf\]](#), page 2440; [Section D.15.35.19 \[quotSheaf\]](#), page 2439; [Section D.15.35.18 \[symmetricPowerSheaf\]](#), page 2439; [Section D.15.35.17 \[tensorSheaf\]](#), page 2438.

D.15.35.17 tensorSheaf

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `tensorSheaf(A,B)`; A sheaf, B sheaf

Return: sheaf

Theory: This is the tensor product of two sheaves

Example:

```

LIB "schubert.lib";
variety G = Grassmannian(3,4);
def R = G.baseRing;
setring R;
sheaf S = makeSheaf(G,subBundle);
sheaf Q = makeSheaf(G,quotientBundle);
sheaf T = S*Q;
T;
↪ A sheaf of rank 3
↪

```

See also: [Section D.15.35.20 \[addSheaf\]](#), page 2440; [Section D.15.35.16 \[dualSheaf\]](#), page 2438; [Section D.15.35.19 \[quotSheaf\]](#), page 2439; [Section D.15.35.18 \[symmetricPowerSheaf\]](#), page 2439.

D.15.35.18 symmetricPowerSheaf

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `symmetricPowerSheaf(S,n)`; S sheaf, n int

Return: sheaf

Theory: This is the n-th symmetric power of a sheaf

Example:

```
LIB "schubert.lib";
variety G = Grassmannian(2,4);
def R = G.baseRing;
setring R;
sheaf S = makeSheaf(G,quotientBundle);
sheaf B = symmetricPowerSheaf(S,3);
B;
↳ A sheaf of rank 4
↳
sheaf A = S^3;
A;
↳ A sheaf of rank 4
↳
A.ChernCharacter == B.ChernCharacter;
↳ 1
```

See also: [Section D.15.35.20 \[addSheaf\]](#), page 2440; [Section D.15.35.16 \[dualSheaf\]](#), page 2438; [Section D.15.35.19 \[quotSheaf\]](#), page 2439; [Section D.15.35.17 \[tensorSheaf\]](#), page 2438.

D.15.35.19 quotSheaf

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `quotSheaf(A,B)`; A sheaf, B sheaf

Return: sheaf

Theory: This is the quotient of two sheaves

Example:

```
LIB "schubert.lib";
variety G = Grassmannian(3,5);
def r = G.baseRing;
setring r;
sheaf S = makeSheaf(G,subBundle);
sheaf B = dualSheaf(S)^2;
sheaf B3 = dualSheaf(S)^3;
sheaf B5 = dualSheaf(S)^5;
variety PB = projectiveBundle(B);
def R = PB.baseRing;
setring R;
sheaf Q = makeSheaf(PB,QuotientBundle);
sheaf V = dualSheaf(Q)*B3;
sheaf A = B5 - V;
A;
↳ A sheaf of rank 11
```

↪

See also: [Section D.15.35.20 \[addSheaf\]](#), page 2440; [Section D.15.35.16 \[dualSheaf\]](#), page 2438; [Section D.15.35.18 \[symmetricPowerSheaf\]](#), page 2439; [Section D.15.35.17 \[tensorSheaf\]](#), page 2438.

D.15.35.20 addSheaf

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `addSheaf(A,B)`; A sheaf, B sheaf

Return: sheaf

Theory: This is the direct sum of two sheaves.

Example:

```
LIB "schubert.lib";
variety G = Grassmannian(3,5);
def r = G.baseRing;
setring r;
sheaf S = makeSheaf(G,subBundle);
sheaf Q = makeSheaf(G,quotientBundle);
sheaf D = S + Q;
D;
↪ A sheaf of rank 5
↪
D.ChernCharacter == rankSheaf(D);
↪ 1
totalChernClass(D) == 1;
↪ 1
```

See also: [Section D.15.35.16 \[dualSheaf\]](#), page 2438; [Section D.15.35.19 \[quotSheaf\]](#), page 2439; [Section D.15.35.18 \[symmetricPowerSheaf\]](#), page 2439; [Section D.15.35.17 \[tensorSheaf\]](#), page 2438.

D.15.35.21 makeGraphVE

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Assume: `v` is a list of vertices, `e` is a list of edges.

Return: graph with vertices `v` and edges `e`.

Theory: Creates a graph from a list of vertices and edges.

Example:

```
LIB "schubert.lib";
ring r = 0,x,dp;
graph G = makeGraphVE(list(list(0,1,list(0,1,2)),list(1,1,list(1,0,2))),
list(list(0,1,2)));
G;
↪ A graph with 2 vertices and 1 edges
↪
```

D.15.35.22 printGraphG

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `printGraphG(G)`; G graph

Assume: G is a graph.

Theory: This is the print function used by Singular to print a graph.

Example:

```
LIB "schubert.lib";
ring r = 0,x,dp;
graph G = makeGraphVE(list(list(0,1,list(0,1,2)),list(1,1,list(1,0,2))),
list(list(0,1,2)));
G;
↳ A graph with 2 vertices and 1 edges
↳
```

D.15.35.23 moduliSpace

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\], page 2429](#)).

Usage: `moduliSpace(V,d)`; V variety, d int

Assume: V is a projective space and d is a positive integer.

Theory: This is the function used by Singular to create a moduli space of stable maps from a genus zero curve to a projective space.

Example:

```
LIB "schubert.lib";
ring r = 0,(x),dp;
variety P = projectiveSpace(4);
stack M = moduliSpace(P,2);
M;
↳ A moduli space of dimension 11
↳
```

D.15.35.24 printStack

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\], page 2429](#)).

Usage: `printStack(M)`; M stack

Assume: M is a moduli space of stable maps.

Theory: This is the print function used by Singular to print a stack.

Example:

```
LIB "schubert.lib";
ring r = 0,(x),dp;
variety P = projectiveSpace(4);
stack M = moduliSpace(P,2);
M;
↳ A moduli space of dimension 11
↳
```

D.15.35.25 dimStack

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\], page 2429](#)).

Usage: `dimStack(M)`; M stack

Return: int

Input: M is a moduli space of stable maps.

Output: the dimension of moduli space of stable maps.

Example:

```
LIB "schubert.lib";
ring r = 0,(x),dp;
variety P = projectiveSpace(4);
stack M = moduliSpace(P,2);
dimStack(M);
↳ 11
```

D.15.35.26 fixedPoints

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\], page 2429](#)).

Usage: `fixedPoints(M)`; M stack

Return: list

Input: M is a moduli space of stable maps.

Output: a list of graphs corresponding the fixed point components of a torus action on a moduli space of stable maps.

Example:

```
LIB "schubert.lib";
ring r = 0,x,dp;
variety P = projectiveSpace(4);
stack M = moduliSpace(P,2);
def F = fixedPoints(M);
size(F);
↳ 100
typeof(F[1]) == "list";
↳ 1
typeof(F[1][1]) == "graph";
↳ 1
typeof(F[1][2]) == "int";
↳ 1
```

D.15.35.27 contributionBundle

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\], page 2429](#)).

Usage: `contributionBundle(M,G,#)`; M stack, G graph, # list

Return: number

Input: M is a moduli space of stable maps, G is a graph, # is a list.

Output: a number corresponding to the contribution bundle on a moduli space of stable maps at a fixed point component (graph)

Example:

```

LIB "schubert.lib";
ring r = 0,x,dp;
variety P = projectiveSpace(4);
stack M = moduliSpace(P,2);
def F = fixedPoints(M);
graph G = F[1][1];
number f = contributionBundle(M,G);
number g = contributionBundle(M,G,5);
f == g;
↪ 1

```

See also: [Section D.15.35.28 \[normalBundle\]](#), page 2443.

D.15.35.28 normalBundle

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Return: number

Input: M is a moduli space of stable maps, G is a graph

Output: a number corresponding to the normal bundle on a moduli space of stable maps at a graph
hypersurfaces

Example:

```

LIB "schubert.lib";
ring r = 0,x,dp;
variety P = projectiveSpace(4);
stack M = moduliSpace(P,2);
def F = fixedPoints(M);
graph G = F[1][1];
number f = normalBundle(M,G);
f <> 0;
↪ 1

```

See also: [Section D.15.35.27 \[contributionBundle\]](#), page 2442.

D.15.35.29 multipleCover

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `multipleCover(d)`; d int

Return: number

Theory: This is the contribution of degree d multiple covers of a smooth rational curve as a Gromov-Witten invariant.

Example:

```

LIB "schubert.lib";
ring r = 0,x,dp;
multipleCover(1);
↪ 1
multipleCover(2);
↪ 1/8
multipleCover(3);

```

D.15.35.31 rationalCurve

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `rationalCurve(d,#)`; `d` int, `#` list

Return: number

Theory: This is the Gromov-Witten invariant corresponding the number of rational curves on a general Calabi-Yau threefold.

Example:

```
LIB "schubert.lib";
ring r = 0,x,dp;
rationalCurve(1);
↳ 2875
/*
rationalCurve(2);
rationalCurve(3);
rationalCurve(4);
rationalCurve(1,list(4,2));
rationalCurve(1,list(3,3));
rationalCurve(1,list(3,2,2));
rationalCurve(1,list(2,2,2,2));

D.15.35.32 sumofquotients

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `sumofquotient(M,F,#)`; `M` stack, `F` list, `#` list

Return: number

Theory: This is useful for the parallel computation of `rationalCurve`.

Example:

```
LIB "schubert.lib";
ring r = 0,x,dp;
variety P = projectiveSpace(4);
stack M = moduliSpace(P,2);
list F = fixedPoints(M);
```

```

sumofquotients(M,F);
↳ 4876875/8
sumofquotients(M,F,list(5));
↳ 4876875/8

```

D.15.35.33 homog_part

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `homog_part(f,n)`; f poly, n int

Return: poly

Purpose: computing the homogeneous component of a polynomial.

Example:

```

LIB "schubert.lib";
ring r = 0, (x,y,z), wp(1,2,3);
poly f = 1+x+x2+x3+x4+y+y2+y3+z+z2+xy+xz+yz+xyz;
homog_part(f,0);
↳ 1
homog_part(f,1);
↳ x
homog_part(f,2);
↳ x2+y
homog_part(f,3);
↳ x3+xy+z
homog_part(f,4);
↳ x4+y2+xz
homog_part(f,5);
↳ yz
homog_part(f,6);
↳ y3+xyz+z2

```

D.15.35.34 homog_parts

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `homog_parts(f,i,j)`; f poly, i int, j int

Return: poly

Theory: computing a polynomial which is the sum of the homogeneous components of a polynomial.

Example:

```

LIB "schubert.lib";
ring r = 0, (x,y,z), wp(1,2,3);
poly f = 1+x+x2+x3+x4+y+y2+y3+z+z2+xy+xz+yz+xyz;
homog_parts(f,2,4);
↳ x4+y2+xz+x3+xy+z+x2+y

```

D.15.35.35 logg

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\]](#), page 2429).

Usage: `logg(f,n)`; f poly, n int

Return: poly

Theory: computing Chern characters from total Chern classes.

Example:

```
LIB "schubert.lib";
ring r = 0, (x,y), wp(1,2);
poly f = 1+x+y;
logg(f,4);
↦ 1/24x4-1/6x2y+1/12y2+1/6x3-1/2xy+1/2x2-y+x
```

D.15.35.36 exp

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\], page 2429](#)).

Usage: `exp(f,n)`; `f` poly, `n` int

Return: poly

Purpose: computing total Chern classes from Chern characters.

Example:

```
LIB "schubert.lib";
ring r = 0,x,dp;
poly f = 3+x;
exp(f,3);
↦ 1/6x3+1/2x2+x+1
```

D.15.35.37 SchubertClass

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\], page 2429](#)).

Usage: `SchubertClass(p)`; `p` list

Input: a list of integers which is a partition

Return: poly

Purpose: compute the Schubert classes on a Grassmannian.

Example:

```
LIB "schubert.lib";
variety G = Grassmannian(2,4);
def r = G.baseRing;
setring r;
list p = 1,1;
SchubertClass(p);
↦ q(1)^2-q(2)
```

D.15.35.38 dualPartition

Procedure from library `schubert.lib` (see [Section D.15.35 \[schubert.lib\], page 2429](#)).

Usage: `dualPartition(k,n,p)`; `k` int, `n` int, `p` list

Input: two integers and a partition

Return: list

Purpose: compute the dual of a partition.

Example:

```
LIB "schubert.lib";
ring r = 0,(x),dp;
dualPartition(2,4,list(2,1));
↪ [1]:
↪ 1
↪ [2]:
↪ 0
```

See also: [Section D.15.35.37 \[SchubertClass\]](#), page 2451.

D.15.36 swalk_lib

Library: swalk.lib

Purpose: Sagbi Walk Conversion Algorithm

Author: Junaid Alam Khan junaidalamkhan@gmail.com

Overview: A library for computing the Sagbi basis of subalgebra through Sagbi walk algorithm.

Theory: The concept of SAGBI (Subalgebra Analog to Groebner Basis for Ideals) is defined in [L. Robbiano, M. Sweedler: Subalgebra Bases, volume 42, volume 1430 of Lectures Note in Mathematics series, Springer-Verlag (1988),61-87]. The Sagbi Walk algorithm is the subalgebra analogue to the Groebner Walk algorithm which has been proposed in [S. Collart, M. Kalkbrener and D.Mall: Converting bases with the Grobner Walk. J. Symbolic Computation 24 (1997), 465-469].

Procedures: See also: [Section D.4.7 \[grwalk_lib\]](#), page 945; [Section D.15.34 \[rwalk_lib\]](#), page 2428.

D.15.36.1 swalk

Procedure from library `swalk.lib` (see [Section D.15.36 \[swalk_lib\]](#), page 2452).

Usage: `swalk(i[,v,w]);` i ideal, v,w int vectors

Return: The sagbi basis of the subalgebra defined by the generators of i, calculated via the Sagbi walk algorithm from the ordering dp to lp if v,w are not given (resp. from the ordering (a(v),lp) to the ordering (a(w),lp) if v and w are given).

Example:

```
LIB "swalk.lib";
ring r = 0,(x,y), lp;
ideal I =x2,y2,xy+y,2xy2+y3;
swalk(I);
↪ _[1]=x2
↪ _[2]=y2
↪ _[3]=xy+y
↪ _[4]=xy2
↪ _[5]=y3
```

D.15.36.2 rswalk

Procedure from library `swalk.lib` (see [Section D.15.36 \[swalk_lib\]](#), page 2452).

Usage: `rswalk(i,weight_rad,p-deg[,v,w]);` i ideal, v,w int vectors

Return: The sagbi basis of the subalgebra defined by the generators of i , calculated via the Sagbi walk algorithm from the ordering dp to lp if v, w are not given (resp. from the ordering $(a(v), lp)$ to the ordering $(a(w), lp)$ if v and w are given).

Example:

```
LIB "swalk.lib";
ring r = 0, (x, y), lp;
ideal I = x2, y2, xy+y, 2xy2+y3;
rswalk(I, 2, 2);
↪ _[1]=x2
↪ _[2]=y2
↪ _[3]=xy+y
↪ _[4]=xy2
↪ _[5]=y3
```

D.15.37 tropicalNewton_lib

Library: tropicalNewton.lib

Purpose: Computations in Tropical Geometry using Newton Polygon methods

Authors: Tommy Hofman, email: thofmann@mathematik.uni.kl.de Yue Ren, email: reny@cs.bgu.ac.il

Overview: This libraries contains algorithms for computing

- non-trivial points on tropical varieties,
- zero-dimensional tropical varieties,
- one-codimensional links of tropical varieties

based on Newton polygon methods.

References:

Hofmann, Ren: Computing tropical points and tropical links, arXiv:1611.02878 (WARNING: this library follows the max convention instead and triangular sets follow the definition of the Singular book)

Procedures: See also: [Section D.13.4.40 \[tropicalVariety\]](#), page 1725; [Section D.13.4 \[tropical_lib\]](#), page 1679.

D.15.37.1 setUniformizingParameter

Procedure from library tropicalNewton.lib (see [Section D.15.37 \[tropicalNewton_lib\]](#), page 2453).

Usage: setUniformizingParameter(p); p number

Return: none, sets the uniformizing parameter as p

Assume: $\text{char}(K) \neq 0$ and p prime number or $\text{trdeg}(K) > 0$ and p transcendental variable or $p = 0$

Example:

```
LIB "tropicalNewton.lib";
// poor man's polynomials over Puiseux series:
ring r = (0, t), x, dp;
setUniformizingParameter(t);
val(t2+t3);
```

```

↳ 2
val(t^-2+t^-3);
↳ -3
// poor man's polynomials over p-adic numbers:
ring s = 0,x,dp;
setUniformizingParameter(2);
val(12);
↳ 2
val(1/12);
↳ -2

```

D.15.37.2 val

Procedure from library `tropicalNewton.lib` (see [Section D.15.37 \[tropicalNewton.lib\], page 2453](#)).

Usage: `val(c)`; c number

Return: int, the valuation of a element in the ground field

Assume: `uniformizingParameter` is set and $c \neq 0$

Example:

```

LIB "tropicalNewton.lib";
// poor man's polynomials over Puiseux series:
ring r = (0,t),x,dp;
setUniformizingParameter(t);
val(t2+t3);
↳ 2
val(t^-2+t^-3);
↳ -3
// poor man's polynomials over p-adic numbers:
ring s = 0,x,dp;
setUniformizingParameter(2);
val(12);
↳ 2
val(1/12);
↳ -2

```

D.15.37.3 newtonPolygonNegSlopes

Procedure from library `tropicalNewton.lib` (see [Section D.15.37 \[tropicalNewton.lib\], page 2453](#)).

Usage: `newtonPolygonNegSlopes(g,b)`; g poly, b int

Return: list, the negative slopes of the Newton Polygon of g
if $b=1$, computes root (type poly) instead if (easily) possible

Assume: `uniformizingParameter` is set and g univariate

Example:

```

LIB "tropicalNewton.lib";
ring r = (0,t),x,dp;
setUniformizingParameter(t);
poly g = tx2+x+1;
newtonPolygonNegSlopes(g);
↳ [1]:
↳ 0

```

```

↳ [2]:
↳ -1
// poor man's polynomials over p-adic numbers:
ring s = 0,x,dp;
setUniformizingParameter(3);
poly g = x2+9x+1;
newtonPolygonNegSlopes(g);
↳ [1]:
↳ 0

```

D.15.37.4 cccMatrixToPositiveIntvec

Procedure from library `tropicalNewton.lib` (see [Section D.15.37 \[tropicalNewton.lib\], page 2453](#)).

Usage: `cccMatrixToPositiveIntvec(M)`; M matrix

Return: intvec, strictly positive equivalent as weight vector to row vector in M

Assume: constant coefficient case only,
will scale weight vector and add vectors of ones to it

Example:

```

LIB "tropicalNewton.lib";
ring r = (0,t),(p01,p02,p12,p03,p13,p23,p04,p14,p24,p34),dp;
number uniformizingParameter = t;
export(uniformizingParameter);
↳ // ** 'uniformizingParameter' is already global
ideal I =
p23*p14-p13*p24+p12*p34,
p23*p04-p03*p24+p02*p34,
p13*p04-p03*p14+p01*p34,
p12*p04-p02*p14+p01*p24,
p12*p03-p02*p13+p01*p23;
system("--random",1337);
matrix p = tropicalPointNewton(I);
print(p);
↳ -59,-14,-87,57,-16,-63,41,-32,-90,-8
intvec w = cccMatrixToPositiveIntvec(p);
print(w);
↳ 32,
↳ 77,
↳ 4,
↳ 148,
↳ 75,
↳ 28,
↳ 132,
↳ 59,
↳ 1,
↳ 83
def s = switchRingsAndComputeInitialIdeal(I,w);
kill uniformizingParameter;

```

D.15.37.5 tropicalPointNewton

Procedure from library `tropicalNewton.lib` (see [Section D.15.37 \[tropicalNewton.lib\], page 2453](#)).

Usage: tropicalPointsLasVegas(I); I ideal

Return: matrix, a matrix containing a tropical point as row vector

Assume: uniformizingParameter is set and I monomial free

Note: if printlevel sufficiently high will print intermediate data and timings returns error if randomly chosen hyperplanes are not generic

Example:

```
LIB "tropicalNewton.lib";
ring r = (0,t),(p01,p02,p12,p03,p13,p23,p04,p14,p24,p34),dp;
number uniformizingParameter = t;
export(uniformizingParameter);
↳ // ** 'uniformizingParameter' is already global
ideal I =
p23*p14-p13*p24+p12*p34,
p23*p04-p03*p24+p02*p34,
p13*p04-p03*p14+p01*p34,
p12*p04-p02*p14+p01*p24,
p12*p03-p02*p13+p01*p23;
system("--random",1337);
printlevel = 3;
matrix p = tropicalPointNewton(I);

D.15.37.6 switchRingsAndComputeInitialIdeal

Procedure from library `tropicalNewton.lib` (see [Section D.15.37 \[tropicalNewton.lib\]](#), page 2453).

Usage: `switchRingsAndComputeInitialIdeal(I,w)`; I ideal, w intvec

Return: ring, a ring containing the initial ideal with respect to w

Assume: constant coefficient case and w strictly positive integer

Note: if `printlevel` sufficiently high will print timing

Example:

```

LIB "tropicalNewton.lib";
ring r = (0,t),(p01,p02,p12,p03,p13,p23,p04,p14,p24,p34),dp;

kill uniformizingParameter;

```

D.15.37.7 tropicalVarietyNewton

Procedure from library `tropicalNewton.lib` (see [Section D.15.37 \[tropicalNewton.lib\]](#), page 2453).

Usage: `tropicalVarietyNewton(I)`; I ideal

Return: matrix, a matrix containing all elements of the tropical variety

Assume: `uniformizingParameter` is set, I monomial free and zero-dimensional

Example:

```
LIB "tropicalNewton.lib";
```

```

ring r = (0,t),(z,y,x),lp;
number uniformizingParameter = t;
export(uniformizingParameter);
⇨ // ** 'uniformizingParameter' is already global
ideal I = tx2+x+1,txy2+xy+1,xyz+1;
list TI = tropicalVarietyNewton(I);
for (int i=1; i<=size(TI); i++)
{ print(TI[i]); }

kill uniformizingParameter;

```

D.15.37.8 tropicalLinkNewton

Procedure from library `tropicalNewton.lib` (see [Section D.15.37 \[tropicalNewton.lib\], page 2453](#)).

Usage: `tropicalLinkNewton(inI)`; `inI` ideal

Return: matrix, a matrix containing generators of all rays of the tropical variety

Assume: constant coefficient case, `inI` is monomial free,
its tropical variety has codimension one lineality space and is a polyhedral fan

Note: if `printlevel` sufficiently high will print intermediate results

Example:

```

LIB "tropicalNewton.lib";
// a 10 valent facet in tropical Grass(3,7)
ring r = (0,t),
(p012,p013,p023,p123,p014,p024,p124,p034,p134,p234,
p015,p025,p125,p035,p135,p235,p045,p145,p245,p345,
p016,p026,p126,p036,p136,p236,p046,p146,p246,p346,
p056,p156,p256,p356,p456),
wp(4,7,5,7,4,4,4,7,5,7,2,1,2,4,4,4,2,1,2,4,7,5,7,7,
5,7,7,5,7,4,4,4,4,4,4);
number uniformizingParameter = t;
export(uniformizingParameter);
⇨ // ** 'uniformizingParameter' is already global
ideal inI =

8 Release Notes

8.1 News and changes

NEWS in SINGULAR 4-1-1

News for version 4-1-1

New syntax:

`alias`: may be used as a prefix to a variable declaration. Can only be used in procedure headings. ([Section 3.5.1 \[General command syntax\]](#), page 41).

New command:

`fres`: improved version of `sres`: computes a (not necessarily minimal) free resolution of the input ideal/module, using Schreyer's algorithm. ([Section 5.1.46 \[fres\]](#), page 185, [Section 5.1.145 \[sres\]](#), page 264).

Extended commands:

pseudo ordering L allows setting of limits for exponents in polynomials ([Section B.2.9 \[Pseudo ordering L\]](#), page 701, [Section 5.1.2 \[attrib\]](#), page 154 for `maxExp`)

`%,mod`: also for poly operands ([Section 4.16.3 \[poly operations\]](#), page 120).

`delete`: extended to `intvec`, `ideal`, `module` ([Section 5.1.20 \[delete\]](#), page 168).

`syz` ([Section 5.1.152 \[syz\]](#), page 275), `lift` ([Section 5.1.78 \[lift\]](#), page 209), `liftstd` ([Section 5.1.79 \[liftstd\]](#), page 209), `intersect` ([Section 5.1.63 \[intersect\]](#), page 200): with a specified GB algorithm

New libraries:

`classify2.lib`: Classification of isolated singularities of corank ≤ 2 and modality \leq wrt. right equivalence over the complex numbers according to Arnold's list. ([Section D.15.5 \[classify2.lib\]](#), page 1844)

`goettsche.lib`: Goettsche's formula for the Betti numbers of the Hilbert scheme of points on a surface, Macdonald's formula for the symmetric product ([Section D.15.14 \[goettsche.lib\]](#), page 1909)

`combinat.lib`, `modules.lib`, `methods.lib`, `nets.lib`: a more mathematical view of modules ([Section D.15.8 \[combinat.lib\]](#), page 1869: combinatorics), ([Section D.15.20 \[methods.lib\]](#), page 2038: construct procedures), ([Section D.15.21 \[modules.lib\]](#), page 2038: free resolutions), ([Section D.15.27 \[nets.lib\]](#), page 2160: pretty printing)

`ncHilb.lib`: Hilbert series of non-commutative monomial algebras ([Section D.15.24 \[ncHilb.lib\]](#), page 2142)

`realclassify.lib`: Classification of real singularities ([Section D.15.31 \[realclassify.lib\]](#), page 2199)

`rootisolation.lib`: real root isolation using interval arithmetic ([Section D.15.32 \[rootisolation.lib\]](#), page 2209)

`rstandard.lib`: Janet bases and border bases for ideals ([Section D.15.33 \[rstandard.lib\]](#), page 2215)

Changed libraries:

chern.lib: new version ([Section D.15.3 \[chern.lib\]](#), page 1806)
 gitfan.lib: new (incompatible) version ([Section D.15.16 \[gitfan.lib\]](#), page 1919)
 grobcov.lib: new version ([Section D.2.4 \[grobcov.lib\]](#), page 744)

Changes in the kernel/build system:

port to polymake 3.x.x
 port to NTL 10 with threads (needs also C++11: gcc6 or -std=c++11)
 p_Invers is only a helper for p_Series: now static
 p_Divide is now p_MDivide, pDivive is a new routine

News for version 4-1-0

Syntax changes:

new (additional) form of ring definitions: (for example `ring R=QQ[x,y,z];`) ([Section 3.3.2 \[General syntax of a ring declaration\]](#), page 32)
 new (additional) form of multi-indices: (for example `i(1,2,3,4,5)`) ([Section 3.5.3 \[Names\]](#), page 44)
 changed behaviour of `charstr` ([Section 5.1.7 \[charstr\]](#), page 160)
 new data type `cring` to describe the coefficient rings, to be used for the new definitions for (polynomial) rings ([Section 3.3.2 \[General syntax of a ring declaration\]](#), page 32)
 new command `ring_list` to access the parts used to construct polynomial rings ([Section 5.1.134 \[ring_list\]](#), page 252, [Section 5.1.133 \[ringlist\]](#), page 251)
 extended polynomial ring construction: also from lists produced by `ring_list`
 new attribute `ring_cf` for `ring` ([Section 5.1.2 \[attrib\]](#), page 154)
 printing of rings changed to match `cring` names ([Section 5.1.7 \[charstr\]](#), page 160)

New libraries:

new library: `classifyMapGerms.lib`: standard basis of the tangent space at the orbit of an algebraic group action ([Section D.15.7 \[classifyMapGerms.lib\]](#), page 1850)
 new library: `ffmodstd.lib`: Groebner bases of ideals in polynomial rings over algebraic function fields ([Section D.15.12 \[ffmodstd.lib\]](#), page 1891)
 new library: `nfmodsyz.lib`: syzygy modules of submodules of free modules over algebraic number fields ([Section D.15.29 \[nfmodsyz.lib\]](#), page 2180)
 new library: `curveInv.lib`: invariants of curves ([Section D.15.9 \[curveInv.lib\]](#), page 1874)
 new library: `gfan.lib`: interface to `gfanlib` ([Section D.13.1 \[gfan.lib\]](#), page 1592)
 extended library: interface to `polymake` merged into [Section D.13.2 \[polymake.lib\]](#), page 1632
 new library: `tropicalNewton.lib`: Newton polygon methods in tropical geometry ([Section D.15.37 \[tropicalNewton.lib\]](#), page 2453)
 new library: `schubert.lib`: some procedures for intersection theory ([Section D.15.35 \[schubert.lib\]](#), page 2429)

Changed libraries:

`classify_aeq.lib`: new procedures ([Section D.15.6 \[classify_aeq.lib\]](#), page 1846)
`grobcov.lib`: new version ([Section D.2.4 \[grobcov.lib\]](#), page 744)
`ncfactor.lib`: factorization in some noncommutative algebras ([Section 7.7.14 \[ncfactor.lib\]](#), page 534) with new routine `ncfactor` ([Section 7.7.14.1 \[ncfactor\]](#), page 535)

primdec.lib: new option "subsystem" ([Section D.4.21 \[primdec.lib\]](#), page 1056)

Changes in the kernel:

improved mapping of polynomials/ideals/...

port to gcc 6

port to gfanlib 0.6 (requires C++11, i.e. gcc >=4.3)

port to NTL 10

port to polymake 3.0

port to readline 7

[Section 5.1.136 \[sba\]](#), page 254 works for global orderings, also for coefficient types Z and Z/m

[Section 5.1.147 \[std\]](#), page 266 works for all orderings, also for coefficient types Z and Z/m with local/mixed orderings

[Section 5.1.35 \[factorize\]](#), page 178 works for polynomial rings over \mathbb{Z}

Experimental stuff:

module [Section D.14.2 \[customstd.lib\]](#), page 1770: modify `std` ([Section D.14.2.2 \[satstd\]](#), page 1772)

News for version 4-0-3

New libraries:

new library: brillnoether.lib: Riemann-Roch spaces of divisors on curves ([Section D.15.2 \[brillnoether.lib\]](#), page 1805)

new library: chern.lib: Chern classes ([Section D.15.3 \[chern.lib\]](#), page 1806)

new library: fmodstd.lib: Groebner bases of ideals in polynomial rings over algebraic function fields ([Section D.15.12 \[fmodstd.lib\]](#), page 1891)

new library: GND.lib: General Neron Desingularization ([Section D.15.17 \[GND.lib\]](#), page 1957)

new library: graal.lib: localization at prime ideals ([Section D.15.15 \[graal.lib\]](#), page 1914)

new library: hess.lib: Riemann-Roch space of divisors ([Section D.15.19 \[hess.lib\]](#), page 2036)

Changed libraries:

renamed algeomodstd.lib to [Section D.15.28 \[nfmodstd.lib\]](#), page 2177, extended to module

renamed derham.lib to [Section D.15.10 \[deRham.lib\]](#), page 1878

grobcov.lib (grobcovK): Groebner Cover for parametric ideals ([Section D.2.4 \[grobcov.lib\]](#), page 744) with new routine ConsLevels ([Section D.2.4.10 \[ConsLevels\]](#), page 769), removed AddCons AddConsP.

News for version 4-0-2

New commands:

align ([Section 5.1.1 \[align\]](#), page 154)

branchTo ([Section 4.17.3 \[procs with different argument types\]](#), page 123)

-> ([Section 4.17.2 \[proc expression\]](#), page 123)

Change in ring handling:

`typeof(qring)` returns "ring"

New libraries:

- algemodstd.lib: Groebner bases of ideals in polynomial rings over algebraic number fields (renamed to [Section D.15.28 \[nfmodstd_lib\]](#), page 2177)
- arr.lib: arrangements of hyperplanes ([Section D.14.1 \[arr_lib\]](#), page 1743)
- brillnoether.lib: Riemann-Roch spaces of divisors on curve ([Section D.15.2 \[brillnoether_lib\]](#), page 1805)
- hess.lib: Riemann-Roch space of divisors on function fields and curves ([Section D.15.19 \[hess_lib\]](#), page 2036)
- gradedModules.lib: graded modules/matrices/resolutions ([Section D.15.18 \[gradedModules_lib\]](#), page 1960)

Changed libraries:

- revised polymake interface (polymake.so)
- revised gfanlib interface (gfanlib.so)
- Presolve::findvars ([Section D.8.2.6 \[findvars\]](#), page 1404, [Section 5.1.161 \[variables\]](#), page 279)
- Ring::addvarsTo ([Section D.2.11.26 \[addvarsTo\]](#), page 832)
- Ring::addNvarsTo ([Section D.2.11.27 \[addNvarsTo\]](#), page 832)
- Ring::hasAlgExtensionCoefficient ([Section D.2.11.21 \[hasAlgExtensionCoefficient\]](#), page 830)
- Schreyer::s_res ([s_res](#))
- grobcov.lib (grobcovK) ([Section D.2.4 \[grobcov_lib\]](#), page 744) with new routines AddCons AddConsP.
- normaliz.lib (for normaliz >=2.8) ([Section D.4.19 \[normaliz_lib\]](#), page 1031)
- renamed groebnerFan to groebnerFanP in polymake.lib ([Section D.13.2 \[polymake_lib\]](#), page 1632)
- renamed fVector to fVectorP in polymake.lib ([Section D.13.2 \[polymake_lib\]](#), page 1632, [polymakeInterface_lib](#))

News for version 4-0-1

Version 4-0-1 is a bug fix release.

New feature: attribute `ring_cf` for ring ([Section 5.1.2 \[attrib\]](#), page 154)

News for version 4-0-0

Version 4-0-0 is a milestone release of Singular. The new release series 4 aims for an entirely modularized architecture simplifying connectivity with other systems and paving the way for parallel computations. As a first step in modularization, the new release features an internal structural separation of coefficient rings and polynomial rings. This allows for a flexible integration of new coefficient rings.

SINGULAR 4-0-0's list of new functionality and significant improvements further extends that of the 3-1-6/7 prerelease series.

New functionality

- de Rham cohomology of complements of algebraic varieties ([Section D.15.10 \[deRham_lib\]](#), page 1878)
- Gromov-Witten numbers of elliptic curves ([Section D.4.6 \[ellipticcovers_lib\]](#), page 932)

classification of isolated complete intersection singularities in characteristic 0 ([Section D.6.5 \[classifyci_lib\]](#), page 1271)

parametrization of orbits of unipotent actions ([Section D.5.3 \[orbitparam_lib\]](#), page 1104)

F5-like Groebner basis algorithm ([Section 5.1.136 \[sba\]](#), page 254)

element-wise application of functions to data structures ([Section 5.2.1 \[apply\]](#), page 285)

support for debugging libraries ([Section 3.9.1 \[ASSUME\]](#), page 68)

Improved functionality

Groebner cover for parametric ideals ([Section D.2.4 \[grobpcov_lib\]](#), page 744)

normalization of affine rings ([Section D.4.18 \[normal_lib\]](#), page 1008)

classification of real singularities ([Section D.15.31 \[realclassify_lib\]](#), page 2199)

GIT-fans ([Section D.15.16 \[gitfan_lib\]](#), page 1919)

algebraic/transcendental field extensions

[Chapter 7 \[Non-commutative subsystem\]](#), page 312

an abstraction layer for parallel computations ([Section D.2.7 \[parallel_lib\]](#), page 797)

run-time loading of supplementary kernel code ([Section A.1.9 \[Dynamic modules\]](#), page 637)

interpreter language support for name spaces ([Section 4.15 \[package\]](#), page 118)

Availability

SINGULAR is available as source code and for Linux, Mac OS X, Windows, FreeBSD and SunOS-5.

8.2 Singular 3 and Singular 4

The purpose of this section is to describe new features and changes between Singular 3-1-7 and Singular 4.* (formerly known as Spielwiese) both for developers and Singular users. In what follows we will refer to the systems as Singular 3 and Singular 4.

8.2.1 Version schema for Singular

SINGULAR version is of the form a.b.c.d which may also be written as a-b-c-d where a,b,c and d are numbers:

a is changed with major, incompatible changes

b is changed with incompatible changes (of some commands/libraries)

c is changed with compatible changes (i.e. new commands, extended options, new algorithms, etc.)

d is changed with each release (i.e. with bug fixes, etc.)

SINGULAR does also have "unofficial" build originating from a code version between "official" version: such builds display "Development version a.b.c" in the header while "official" versions show "version a.b.c". Also the manual describes version a-b-c. To get the complete version number, use `system("version")`; or use `SINGULAR_VERSION` in C.

8.2.2 Notes for Singular users

Coefficient rings

To allow for easy integration of new coefficient rings into Singular, the way coefficient rings are being handled has been redesigned.

In general, the user syntax has not changed, however there are some changes in the behaviour of Singular:

- setting `minpoly` results in changing the current coefficient domain and clears all previously defined variables of that ring
- Minor changes in the output of coefficient ring description. Moreover the output of elements of certain rings has been improved (for example, reals).
- Algebraic and transcendental extensions of rationals and finite fields have been reimplemented. In particular, the heuristics for clearing denominators and factoring out content have been changed. In some cases this leads to a different, mathematically equivalent results of Groebner bases and related computations. For example a Groebner basis element may differ by a unit.
- Most notably, due to the redesign of the coefficient rings, if the user sets the minimal polynomial all variables dependent on the current ring are deleted.

Ring-dependent options

Formally global Singular [Section 5.1.108 \[option\], page 230](#) now belong to individual polynomial rings. This includes:

- `intStrategy`
- `redTail`
- `redThrough`

Also the following settings now belong to individual (currently active) polynomial rings:

- `short`
- `minpoly`
- `noether`

Hence setting these options only affects the current ring. Be aware of this when switching between different rings, since the options affect the result of various computations (in particular Groebner bases).

Path names

- The tree structure of the binary Singular distribution has been changed. The typical tree now looks as show at <https://github.com/Singular/Sources/wiki/Sw-tree>
- Accordingly Singular search paths (where Singular searches for libraries, dynamic modules, etc.) have been changed. You can display them by calling Singular by `Singular -v`.
- currently, multi-arch installations of Singular 4 aere not possible.

Library versioning

Due to switching from Subversion to GIT revision control system for the Singular source code, library version variables (displayed when loading a library) have changed.

New orderings for modules

The now can assign weights to module components, when defining a monomial ordering. For example

```
ring R = 0, (x,y,z), (am(1,2,3, 10,20,30,40), dp, C);
deg(x*gen(1));
↳ 11
```

will assign weights 1,2,3 to x,y,z respectively, and weights 10,20,30,40,0,0,... to components of any free module defined over R. This ordering will first sort by this weighted degree, then by dp on the ring monomials and then will give priority to the large component index.

Future benefits of Singular 4

The redesign of Singular will allow us to provide new features in the future, for example:

- Interpreter type for coefficient rings.
- User defined coefficient rings.
- Improved syntax for defining polynomial rings.

8.2.3 Notes for developers

There has been an extensive process of refactoring, redesign and modularization of Singular to facilitate easier maintenance and future development:

- Build System : automake, libfac has been integrated into Factory
- Removed MP (Multi protocol) in favor of SSI links.
- Separation/modularization into libraries and packages
- For easy integration of new coefficient rings, we defined a generic interface for coefficient rings and a supporting framework for making them accessible to the user.

In particular we have separated everything related to coefficient rings into a separate library `libcoeffs`. Dependency tree between restructured packages is show at <http://www.singular.uni-kl.de/dox/singular.png>

In order to use `libSingular` as a C++ library, see [Section 8.3 \[libSingular\], page 2470](#).

8.2.4 Building Singular

The user can build and install Singular with the following standard UNIX-like procedure:

- Download and extract the latest official source package (.tar.gz).
- Run the configure script, for instance, `./configure`.
- Build Singular by running `make`.
- Install Singular by running `make install`.

In contrast to Singular 3, there are now many more configuration options.

All possible options for configure can be seen by running the configure script with option `--help`. On a multicore compute consider running `make` with the option `-j [cores]`.

8.2.5 Side-by-side installation

Due to choosing paths according to FS standards it is no longer possible to have a side-by-side installation of different Singular versions or versions for different architectures.

8.3 libSingular

libSingular is the C++-library version of SINGULAR.

Singular/libsingular.h is the main include file, -lSingular the link parameter,

lib/pkgconfig/Singular.pc provides all parameters in the pkgconfig format.

It contains all parts of SINGULAR with two exceptions:

1. memory allocation functions for GMP (see mmInit in Singular/tesths.cc)
2. signal handlers (see init_signals in Singular/cntrlc.cc).

At least a handler for SIGCHLD must be installed for the routines from [Section D.2.7 \[parallel_lib\]](#), page 797, [Section D.4.13 \[modstd_lib\]](#), page 978, [Section D.4.12 \[modnormal_lib\]](#), page 977, [Section D.2.12 \[tasks_lib\]](#), page 833.

If the child was started by libSingular the handler has to call sig_chld_hdl from Singular/links/ssiLink.cc or implement something similar (call s1Close(1) for ssi links).

8.4 Download instructions

SINGULAR is available as source and binary program for most common hard- and software platforms.

Instructions to download and install SINGULAR can be found at

<http://www.singular.uni-kl.de/index.php/singular-download.html>.

Release versions of SINGULAR are also available from our FTP site

<ftp://www.mathematik.uni-kl.de/pub/Math/Singular/src/4-0-3/>.

8.5 Unix installation instructions

Install binaries: <http://www.singular.uni-kl.de/index.php/singular-download/install-linuxunix>.

or build it yourself:

Install the necessary packages:

```
libtool
gnu make
gcc, g++
libreadline
gmp
ntl
libcdd
```

```
Install flint 2.5: ./configure --with-gmp=/usr --prefix=$HOME/tmp --disable-shared
make && make install
```

```
Install Singular ./configure --with-flint=$HOME/tmp --enable-gfanlib --
prefix=$HOME/Singular4
```

```
make && make install
```

(\$prefix/bin/Singular is the main executable)

(optional) install 4ti2

(optional) install surf/surfer

(optional) install normaliz 2.8 (or newer)

See also <https://github.com/Singular/Sources/wiki/Step-by-Step-Installation-Instructions-for-Singular> which includes instructions adapted for debian and fedora based systems.

8.6 Windows installation instructions

Singular relies on Cygwin as its environment under Windows. There is a 32bit and a 64bit version of Cygwin.

<http://www.singular.uni-kl.de/index.php/singular-download/install-windows.html>

8.7 Macintosh installation instructions

Installation of the provided binaries <http://www.singular.uni-kl.de/index.php/singular-download/install-mac-os.html>

A.1	Programming	627
A.1.1	Basic programming	627
A.1.2	Writing procedures and libraries	628
A.1.3	Rings associated to monomial orderings	631
A.1.4	Long coefficients	633
A.1.5	Parameters	634
A.1.6	Formatting output	635
A.1.7	Cyclic roots	635
A.1.8	Parallelization with ssi links	636
A.1.9	Dynamic modules	637
A.2	Computing Groebner and Standard Bases	638
A.2.1	groebner and std	638
A.2.2	Groebner basis conversion	640
A.2.3	slim Groebner bases	642
A.3	Commutative Algebra	642
A.3.1	Saturation	643
A.3.2	Finite fields	643
A.3.3	Elimination	645

A.3.4	Free resolution	648
A.3.5	Handling graded modules	651
A.3.6	Computation of Ext	652
A.3.7	Depth	655
A.3.8	Factorization	656
A.3.9	Primary decomposition	657
A.3.10	Normalization	659
A.3.11	Kernel of module homomorphisms	660
A.3.12	Algebraic dependence	661
A.4	Singularity Theory	662
A.4.1	Milnor and Tjurina number	662
A.4.2	Critical points	664
A.4.3	Polar curves	665
A.4.4	T1 and T2	667
A.4.5	Deformations	669
A.4.6	Invariants of plane curve singularities	672
A.4.7	Branches of space curve singularities	674
A.4.8	Classification of hypersurface singularities	677
A.4.9	Resolution of singularities	679
A.5	Invariant Theory	680
A.5.1	G_a -Invariants	680
A.5.2	Invariants of a finite group	681
A.6	Geometric Invariant Theory	682
A.6.1	GIT-Fans	682
A.7	Non-commutative Algebra	684
A.7.1	Left and two-sided Groebner bases	684
A.7.2	Right Groebner bases and syzygies	686
A.8	Applications	688
A.8.1	Solving systems of polynomial equations	688
A.8.2	AG codes	692
Appendix B Polynomial data		695
B.1	Representation of mathematical objects	695
B.2	Monomial orderings	696
B.2.1	Introduction to orderings	696
B.2.2	General definitions for orderings	696
B.2.3	Global orderings	697
B.2.4	Local orderings	697
B.2.5	Module orderings	697
B.2.6	Matrix orderings	698
B.2.7	Product orderings	700
B.2.8	Extra weight vector	700
B.2.9	Pseudo ordering L	701

Appendix C Mathematical background 702

C.1	Standard bases	702
C.2	Hilbert function	702
C.3	Syzygies and resolutions	703
C.4	Characteristic sets	704
C.5	Gauss-Manin connection	705
C.6	Toric ideals and integer programming	709
C.6.1	Toric ideals	709
C.6.2	Algorithms	709
C.6.2.1	The algorithm of Conti and Traverso	709
C.6.2.2	The algorithm of Pottier	710
C.6.2.3	The algorithm of Hosten and Sturmfels	710
C.6.2.4	The algorithm of Di Biase and Urbanke	710
C.6.2.5	The algorithm of Bigatti, La Scala and Robbiano	711
C.6.3	The Buchberger algorithm for toric ideals	711
C.6.4	Integer programming	711
C.6.5	Relevant References	712
C.7	Non-commutative algebra	712
C.8	Decoding codes with Groebner bases	712
C.8.1	Codes and the decoding problem	713
C.8.2	Cooper philosophy	714
C.8.3	Generalized Newton identities	715
C.8.4	Fitzgerald-Lax method	716
C.8.5	Decoding method based on quadratic equations	717
C.8.6	References for decoding with Groebner bases	718
C.9	References	719
