### D.13.3.3 fullDimImages

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\]](#), page 2074).

**Usage:** `fullDimImages(afaces, Q)`; `afaces`: list, `Q`: intmat

**Purpose:** Determines the a-faces (represented as intvecs) from the list `afaces` which have a full-dimensional projection with respect to `Q`.

**Return:** a list of intvecs

**Example:**

```

LIB "gitfan.lib";
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =
T(5)*T(10)-T(6)*T(9)+T(7)*T(8),
T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);
intmat Q[5][10] =

### D.13.3.4 minimalAfaces

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\]](#), page 2074).

**Usage:** `minimalAfaces(listOfAfaces);` listOfAfaces: list

**Purpose:** Returns a list of all minimal a-faces. Note that listOfAfaces must only contain afaces which project to full dimension.

**Return:** a list of intvecs

**Example:**

```

LIB "gitfan.lib";
setcores(4);
↳ 4
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);

T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);
intmat Q[5][10] =

### D.13.3.5 orbitCones

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\], page 2074](#)).

**Usage:** `orbitCones(AF, Q[, d]);` AF: list of intvecs, Q: intmat, d: int

**Purpose:** Returns the list consisting of all cones  $Q(\text{gam0})$  where  $\text{gam0}$  in AF. If the optional argument  $d$  is given then the function returns only the orbit cones of dimension at least  $d$

**Return:** a list of cones

**Example:**

```
LIB "gitfan.lib";
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =
T(5)*T(10)-T(6)*T(9)+T(7)*T(8),

T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);

### D.13.3.6 GITcone

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\]](#), page 2074).

**Usage:** `GITcone(OCcones, w)`; `OCcones`: list of orbit cones, `w`: bigintmat with one row

**Purpose:** Returns the intersection of all orbit cones containing `w`.

**Return:** `cone,intvec` with the GIT cone containing `w`, and the hash of this cone (the indices of the orbit cones contributing to the intersection)

**Example:**

```
LIB "gitfan.lib";
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =
T(5)*T(10)-T(6)*T(9)+T(7)*T(8),
T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);

### D.13.3.7 GITfan

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\]](#), page 2074).

**Usage:** `GITfan(J,Q [, G]);` J:ideal, Q:intmat, G:list

**Purpose:** Computes the GIT fan associated to J and Q. Optionally a symmetry group action on the column space of Q can be specified.

**Return:** a fan, the GIT fan.

**Note:** The procedure uses parallel computation for the construction of the GIT-cones. The a-faces are not computed in parallel. This can be done by calling the `aface` procedure specifying a list of simplex faces. If used with the optional argument G, the orbit decomposition of the simplex of columns of Q is computed. Refer to the Singular documentation on how to do this more efficiently using GAP.

**Example:**

```

### D.13.3.8 GITfanFromOrbitCones

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\]](#), page 2074).

**Usage:** `GITfanFromOrbitCones(OC, Q, Qgamma [, file1, file2]);` OC:list, Q:bigintmat, Qgamma:cone, file1:string, file2:string

**Purpose:** Returns the common refinement of the cones given in the list OC which is supposed to contain the orbit cones intersected with Qgamma. The optional argument can be used to specify one or two strings with file names, where the first file will contain the hashes of the GIT-cones and the second argument the actual cones in their H-representation. To obtain the whole GIT-fan Qgamma has to be take the cone generated by the columns of Q.

**Return:** a list containing the bigint hashes of the GIT cones.

**Example:**

```

LIB "gitfan.lib";
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);

T(5)*T(10)-T(6)*T(9)+T(7)*T(8),
T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),

### D.13.3.9 GITfanParallel

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\]](#), page 2074).

**Usage:** `GITfanParallel(OC, Q, Qgamma [, file1]);` OC:list, Q:intmat, Qgamma:cone, file1:string

**Purpose:** Returns the common refinement of the cones given in the list OC which is supposed to contain the orbit cones intersected with Qgamma. The optional argument can be used to specify a name for a file which will contain the hashes of the GIT-cones. To obtain the whole GIT-fan Qgamma has to be take the cone generated by the columns of Q.

**Return:** a list containing the bigint hashes of the GIT cones.

**Note:** The proceduce uses parallel computation for the construction of the GIT-cones.

**Example:**

```

### D.13.3.10 GKZfan

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\]](#), page 2074).

### D.13.3.11 movingCone

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\]](#), page 2074).

**Usage:** `movingCone(Q); Q: intmat`

**Purpose:** Computes the moving cone from the grading matrix, with the degrees in the columns of `Q`.

**Return:** a cone

**Example:**

```

LIB "gitfan.lib";
intmat Q[5][10] =
1, 1, 1, 1, 0, 0, 0, 0, 0, 0,
1, 0, 0, 0, 1, 1, 1, 0, 0, 0,

0, 1, 0, 1, 0, -1, 0, 0, 1, 0,
0, 0, 1, 1, -1, 0, 0, 0, 0, 1;

### D.13.3.12 computeAfaceOrbits

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\]](#), page 2074).

**Usage:** `computeAfaceOrbits(AF,G)`; AF list of intvecs, G: list of permutations

**Purpose:** Computes the orbits of the afaces in the list AF under the group action in G, where G is a list of permutations. We assume that the elements of G form a group and the first entry corresponds to the neutral element.

**Return:** a list of lists of intvecs

**Example:**

### D.13.3.14 orbitConeOrbits

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\], page 2074](#)).

**Usage:** `orbitConeOrbits(F, Q)`; F: list, Q: intmat

**Purpose:** Projects a list F of a-face orbits to the orbit cones with respect to Q. The function checks whether the projections are of full dimension and returns an error otherwise.

**Return:** a list of lists of cones

**Example:**

```

LIB "gitfan.lib";

ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);

### D.13.3.15 minimalOrbitConeOrbits

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\]](#), page 2074).

**Usage:** `minimalOrbitConeOrbits(listOfOrbits)`; `listOfOrbits`: list of lists of cones

**Purpose:** Minimizes a list of orbit cone orbits.

**Return:** a list of lists of cones

**Example:**

```

LIB "gitfan.lib";
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =

### D.13.3.16 intersectOrbitsWithMovingCone

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\], page 2074](#)).

**Usage:** `intersectOrbitsWithMovingCone(OCmin, mov);` OCmin: list of lists of cones, mov: cone

**Purpose:** Intersects all cones in the orbits in OCmin with mov discarding all orbits of cones which are not of full dimension. The resulting orbits are duplicate free.

**Return:** a list of lists of cones

**Example:**

```

### D.13.3.17 groupActionOnQImage

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\]](#), page 2074).

**Usage:** `groupActionOnQImage(G,Q)`; G: list of permutations, Q: intmat

**Purpose:** Given the group  $G$  of permutations acting on the simplex on  $\text{ncols}(Q)$  objects, computes the corresponding group action on the image of  $Q$ . We assume that the basering has characteristic 0.

**Return:** list of matrices

**Example:**

### D.13.3.18 groupActionOnHashes

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\]](#), page 2074).

**Usage:** `groupActionOnHashes(Asigma,OCmov)`; `Asigma`: list, `OCmov`: list of list of cones

**Purpose:** From the list of orbits of orbitcones, and the symmetry group representation given by the matrices in `Asigma`, compute the corresponding permutation representation of the symmetry group on the orbit cones. The permutations are specified in a map representation of length the sum of the size of the orbits of `OCmov`.

**Return:** list of permutations

**Example:**

```
LIB "gitfan.lib";
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =
T(5)*T(10)-T(6)*T(9)+T(7)*T(8),
T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),
T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);
intmat Q[5][10] =
1, 1, 1, 1, 0, 0, 0, 0, 0, 0,

### D.13.3.19 storeActionOnOrbitConeIndices

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\], page 2074](#)).

**Usage:** `storeActionOnOrbitConeIndices(generatorsGperm,st)`; `generatorsGperm`: list, `fn`: string

**Purpose:** Write the action on the set of orbit cones to the file `fn` in Singular readable format.

**Return:** nothing

### D.13.3.20 permutationFromIntvec

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\], page 2074](#)).

**Usage:** `permutationFromIntvec(sigmaImage)`; `sigmaImage`: intvec

**Purpose:** Create a permutation from an intvec of images.

**Return:** permutation

### D.13.3.21 permutationToIntvec

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\], page 2074](#)).

**Usage:** `permutationToIntvec(sigma)`; `sigma`: permutation

**Purpose:** Convert a permutation to an intvec of images.

**Return:** intvec

**Example:**

```

LIB "gitfan.lib";
permutation sigma = permutationFromIntvec(intvec( 1, 2, 4, 3, 5, 7, 6, 9, 8, 10 ));
sigma;
↳ | 1 2 3 4 5 6 7 8 9 10|
↳ | 1 2 4 3 5 7 6 9 8 10|
↳
permutationToIntvec(sigma);
↳ 1,2,4,3,5,7,6,9,8,10

```

### D.13.3.22 evaluateProduct

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\], page 2074](#)).

**Usage:** `evaluateProduct(generatorsGperm,st)`; `generatorsGperm`: list, `st`: string

**Purpose:** Evaluates a formal product of variables `xi` in `st`, where `xi` corresponds to the permutation `generatorsGperm[i]`.

**Return:** permutation

**Example:**

```

LIB "gitfan.lib";
