```

### D.13.3.23 GITfanSymmetric

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\]](#), page 2074).

**Usage:** `GITfanSymmetric(OC, Q, Qgamma, actiononorbitcones [, file1, file2]);` OC:list, Q:bigintmat, Qgamma:cone, actiononorbitcones: list of intvec, file1:string, file2:string

**Purpose:** Returns the common refinement of the cones given in the list OC which is supposed to contain the orbit cones intersected with Qgamma. The list actiononorbitcones is supposed to contain the symmetry group acting as permutations of on the list of orbit cones in OC. The optional argument can be used to specify one or two strings with file names, where the first file will contain the hashes of the GIT-cones and the second argument the actual cones in their H-representation. To obtain the whole GIT-fan Qgamma has to be take the cone generated by the columns of Q.

**Return:** a list containing the bigint hashes of the GIT cones.

**Example:**

```

LIB "gitfan.lib";
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =
T(5)*T(10)-T(6)*T(9)+T(7)*T(8),

### D.13.3.24 GITfanParallelSymmetric

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\]](#), page 2074).

**Usage:** `GITfanParallelSymmetric(OC, Q, Qgamma, actiononorbitcones [, file1]);` OC:list, Q:bigintmat, Qgamma:cone, actiononorbitcones: list of intvec, file1:string

**Purpose:** Returns the common refinement of the cones given in the list OC which is supposed to contain the orbit cones intersected with Qgamma. The list actiononorbitcones is supposed to contain the symmetry group acting as permutations of on the list of orbit cones in OC. The optional argument can be used to specify a name for a file which will contain the hashes of the GIT-cones. To obtain the whole GIT-fan Qgamma has to be take the cone generated by the columns of Q.

**Return:** a list containing the bigint hashes of the GIT cones.

**Note:** The proceduce uses parallel computation for the construction of the GIT-cones.

**Example:**

```

LIB "gitfan.lib";
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =

### D.13.3.25 bigintToBinary

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\], page 2074](#)).

**Usage:** `bigintToBinary(n, r)`:  $n$  bigint,  $r$  int.

**Assume:**  $n$  is smaller than  $2^r$ .

**Return:** an intvec, with entries the positions of 1 in the binary representation of  $n$  with  $r$  bits.

**Example:**

```

LIB "gitfan.lib";
bigintToBinary(bigint(2)^90-1, 90);
↳ 1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22,23,24,25,26,27,2\
8,29,30,31,32,33,34,35,36,37,38,39,40,41,42,43,44,45,46,47,48,49,50,51,52\
,53,54,55,56,57,58,59,60,61,62,63,64,65,66,67,68,69,70,71,72,73,74,75,76,\
77,78,79,80,81,82,83,84,85,86,87,88,89,90

```

### D.13.3.26 binaryToBigint

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\], page 2074](#)).

### D.13.3.27 applyPermutationToIntvec

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\], page 2074](#)).

**Usage:** `applyPermutationToIntvec(v,g)`;  $v$ : intvec,  $g$ :permutation

**Purpose:** Apply  $g$  to the set of entries of  $v$ . The result is a sorted intvec. We assume that the entries of  $v$  are valid arguments of  $g$ . We do not require that the input is sorted.

**Return:** intvec.

**Example:**

```

LIB "gitfan.lib";
permutation g = permutationFromIntvec(intvec(10, 9, 7, 4, 8, 6, 3, 5, 2, 1));
applyPermutationToIntvec(intvec(1, 3, 4, 6, 8),g);
↳ 4,5,6,7,10

```

### D.13.3.28 hashToCone

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\]](#), page 2074).

**Usage:** `hashToCone(v, OC)`: `v` bigint, `OC` list of cones.

**Assume:** the elements of `OC` are the orbit cones used in the hash representation of the GIT cones.

**Return:** a cone, the intersection of the cones in `OC` according to the binary representation of the hash `v`.

**Example:**

```
LIB "gitfan.lib";
setcores(4);
↳ 4
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);

### D.13.3.29 hashesToFan

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\]](#), page 2074).

**Usage:** `hashesToFan(hashes, OC)`: hashes list of bigint, OC list of cones.

**Assume:** the elements of OC are the orbit cones used in the hash representation of the GIT cones.

**Return:** a fan, with maximal cones the intersections of the cones in OC according to the binary representation of the hashes.

**Example:**

```

LIB "gitfan.lib";
setcores(4);
↳ 4
ring R = 0,T(1..10),wp(1,1,1,1,1,1,1,1,1,1);
ideal J =
T(5)*T(10)-T(6)*T(9)+T(7)*T(8),
T(1)*T(9)-T(2)*T(7)+T(4)*T(5),
T(1)*T(8)-T(2)*T(6)+T(3)*T(5),

```

```

T(1)*T(10)-T(3)*T(7)+T(4)*T(6),
T(2)*T(10)-T(3)*T(9)+T(4)*T(8);

### D.13.3.30 gitCone

Procedure from library `gitfan.lib` (see [Section D.13.3 \[gitfan.lib\]](#), page 2074).

**Usage:** `gitCone(a, Q, w)`; a: ideal, Q:bigintmat, w:bigintmat

**Purpose:** Returns the GIT-cone  $\lambda(w)$ , i.e. the intersection of all orbit cones containing the vector  $w$ .

**Note:** call this only if you are interested in a single GIT-cone.

**Return:** a cone.

**Example:**

```

LIB "gitfan.lib";
intmat Q[3][4] =
  1,0,1,0,
  0,1,0,1,
  0,0,1,1;
ring R = 0,T(1..4),dp;
ideal a = 0;
bigintmat w[1][3] = 3,3,1;
cone lambda = gitCone(a, Q, w);

### D.13.4 polymake\_lib

**Library:** polymake.lib

**Purpose:** Computations with polytopes and fans, interface to TOPCOM

**Author:** Thomas Markwig, email: keilen@mathematik.uni-kl.de  
Yue Ren, email: ren@mathematik.uni-kl.de

**Warning:** Most procedures will not work unless polymake or topcom is installed and if so, they will only work with the operating system LINUX! For more detailed information see IMPORTANT NOTE respectively consult the help string of the procedures.

The conventions used in this library for polytopes and fans, e.g. the length and labeling of their vertices resp. rays, differs from the conventions used in polymake and thus from the conventions used in the polymake extension polymake.so of Singular. We recommend to use the newer polymake.so whenever possible.

**Important note:**

Even though this is a Singular library for computing polytopes and fans such as the Newton polytope or the Groebner fan of a polynomial, most of the hard computations are NOT done by Singular but by the program

- topcom by Joerg Rambau, Universitaet Bayreuth (see <http://www.rambau.wm.uni-bayreuth.de/TOPCOM/>);

this library should rather be seen as an interface which allows to use a (very limited) number of options which topcom offers to compute with polytopes and fans and to make the results available in Singular for further computations; moreover, the user familiar with Singular does not have to learn the syntax of topcom, if the options offered here are sufficient for his purposes.

Note, though, that the procedures concerned with planar polygons are independent of topcom.

**Procedures using topcom: Procedures concerned with planar polygons:**

#### D.13.4.1 triangulations

Procedure from library `polymake.lib` (see [Section D.13.4 \[polymake\\_lib\], page 7270](#)).

**Usage:** `triangulations(polygon[,#]);` list polygon, list #

**Assume:** polygon is a list of integer vectors of the same size representing the affine coordinates of the lattice points

**Purpose:** the procedure considers the marked polytope given as the convex hull of the lattice points and with these lattice points as markings; it then computes all possible triangulations of this marked polytope

**Return:** list, each entry corresponds to one triangulation and the *i*th entry is itself a list of integer vectors of size three, where each integer vector defines one triangle in the triangulation by telling which points of the input are the vertices of the triangle

**Note:** - the procedure calls for its computations the program `points2triangs` from the program `topcom` by Joerg Rambau, Universitaet Bayreuth; it therefore

is necessary that this program is installed in order to use this procedure; see <http://www.rambau.wm.uni-bayreuth.de/TOPCOM/>);

- if you only want to have the regular triangulations the procedure should be called with the string 'regular' as optional argument
- the procedure creates the files /tmp/triangulationsinput and /tmp/triangulationsoutput;

the former is used as input for points2triangs and the latter is its output containing the triangulations of corresponding to points in the format of points2triangs; if you wish to use this for further computations with topcom, you have to call the procedure with the string 'keepfiles' as optional argument

- note that an integer i in an integer vector representing a triangle refers to the ith lattice point, i.e. polygon[i]; this convention is different from TOPCOM's convention, where i would refer to the i-1st lattice point

**Example:**

**D.13.4.2 secondaryPolytope**

Procedure from library `polymake.lib` (see [Section D.13.4 \[polymake.lib\]](#), page 7270).

**Usage:** `secondaryPolytope(polygon[,#]);` list polygon, list #

**Assume:**

- polygon is a list of integer vectors of the same size representing the affine coordinates of lattice points
- if the triangulations of the corresponding polygon have already been computed with the procedure `triangulations` then these can be given as a second (optional) argument in order to avoid doing this computation again

**Purpose:** the procedure considers the marked polytope given as the convex hull of the lattice points and with these lattice points as markings; it then computes the lattice points

of the secondary polytope given by this marked polytope which correspond to the triangulations computed by the procedure triangulations

**Return:** list, say L, such that:  
 L[1] = intmat, each row gives the affine coordinates of a lattice point in the secondary polytope given by the marked polytope corresponding to polygon  
 L[2] = the list of corresponding triangulations

**Note:** if the triangulations are not handed over as optional argument the procedure calls for its computation of these triangulations the program points2triangs from the program topcom by Joerg Rambau, Universitaet Bayreuth; it therefore is necessary that this program is installed in order to use this procedure; see <http://www.rambau.wm.uni-bayreuth.de/TOPCOM/>;

```

### D.13.4.3 cycleLength

Procedure from library `polymake.lib` (see [Section D.13.4 \[polymake\\_lib\]](#), page 7270).

**Usage:** `cycleLength(boundary,interior)`; list boundary, intvec interior

**Assume:** boundary is a list of integer vectors describing a cycle in some convex lattice polygon around the lattice point interior ordered clock wise

**Return:** string, the cycle length of the corresponding cycle in the dual tropical curve

**Example:**

```

LIB "polymake.lib";
⇒ Welcome to polymake version

⇒ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
⇒ http://www.polymake.org
// the integer vectors in boundary are lattice points on the boundary
// of a convex lattice polygon in the plane
list boundary=intvec(0,0),intvec(0,1),intvec(0,2),intvec(2,2),
intvec(2,1),intvec(2,0);
// interior is a lattice point in the interior of this lattice polygon
intvec interior=1,1;
// compute the general cycle length of a cycle of the corresponding cycle
// in the dual tropical curve, note that (0,1) and (2,1) do not contribute
cycleLength(boundary,interior);
⇒ -4*u11+u00+u02+u22+u20

```

**D.13.4.4 splitPolygon**

Procedure from library `polymake.lib` (see [Section D.13.4 \[polymake\\_lib\]](#), page 7270).

**Usage:** `splitPolygon (markings);` markings list

**Assume:** markings is a list of integer vectors representing lattice points in the plane which we consider as the marked points of the convex lattice polytope spanned by them

**Purpose:** split the marked points in the vertices, the points on the facets which are not vertices, and the interior points

**Return:** list, L consisting of three lists  
`L[1]` : represents the vertices the polygon ordered clockwise  
`L[1][i][1]` = intvec, the coordinates of the *i*th vertex  
`L[1][i][2]` = int, the position of `L[1][i][1]` in markings  
`L[2][i]` : represents the lattice points on the facet of the polygon with endpoints `L[1][i]`  
and `L[1][i+1]`  
(*i* considered modulo `size(L[1])`)  
`L[2][i][j][1]` = intvec, the coordinates of the *j*th lattice point on that facet  
`L[2][i][j][2]` = int, the position of `L[2][i][j][1]` in markings  
`L[3]` : represents the interior lattice points of the polygon  
`L[3][i][1]` = intvec, coordinates of *i*th interior point  
`L[3][i][2]` = int, the position of `L[3][i][1]` in markings

**Example:**

```

### D.13.4.5 eta

Procedure from library `polymake.lib` (see [Section D.13.4 \[polymake.lib\]](#), page 7270).

**Usage:** `eta(triang,polygon);` triang, polygon list

**Assume:** polygon has the format of the output of `splitPolygon`, i.e. it is a list with three entries describing a convex lattice polygon in the following way:

`polygon[1]` : is a list of lists; for each  $i$  the entry `polygon[1][i][1]` is a lattice point which is a vertex of the lattice

polygon, and `polygon[1][i][2]` is an integer assigned to this lattice point as identifying index

`polygon[2]` : is a list of lists; for each vertex of the polygon, i.e. for each entry in `polygon[1]`, it contains a list `polygon[2][i]`, which contains the lattice points on the facet with endpoints `polygon[1][i]` and `polygon[1][i+1]` -  $i$  considered mod `size(polygon[1])`; each such lattice point contributes an entry

`polygon[2][i][j][1]` which is an integer

vector giving the coordinate of the lattice point and an entry `polygon[2][i][j][2]` which is the identifying index

`polygon[3]` : is a list of lists, where each entry corresponds to a lattice point in the interior of the polygon, with

`polygon[3][j][1]` being the coordinates of the point

and `polygon[3][j][2]` being the identifying index;

triang is a list of integer vectors all of size three describing a triangulation of the polygon described by polygon; if an entry of triang is the vector  $(i,j,k)$  then the triangle is built by the vertices with indices  $i, j$  and  $k$

**Return:** `intvec`, the integer vector eta describing that vertex of the Newton polytope discriminant of the polygon whose dual cone in the Groebner fan contains the cone of the secondary fan of the polygon corresponding to the given triangulation

**Note:** for a better description of eta see Gelfand, Kapranov, Zelevinski: *Discriminants, Resultants and multidimensional Determinants*. Chapter 10.

**Example:**

```

LIB "polymake.lib";

// compute the eta-vector of this triangulation
eta(triang,sp);
↳ 9,1,0,0,1,0,0,0,0,1

```

### D.13.4.6 findOrientedBoundary

Procedure from library `polymake.lib` (see [Section D.13.4 \[polymake\\_lib\]](#), page 7270).

**Usage:** `findOrientedBoundary(polygon);` polygon list

**Assume:** polygon is a list of integer vectors defining integer lattice points in the plane

**Return:** list l with the following interpretation

l[1] = list of integer vectors such that the polygonal path defined by these is the boundary of the convex hull of the lattice points in polygon  
l[2] = list, the redundant points in l[1] have been removed

**Example:**

```

LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
// the following lattice points in the plane define a polygon
list polygon=intvec(0,0),intvec(3,1),intvec(1,0),intvec(2,0),
intvec(1,1),intvec(3,2),intvec(1,2),intvec(2,3),
intvec(2,4);
// we compute its boundary

↳ [4]:
↳ 3,1
↳ [5]:
↳ 2,0

```

### D.13.4.7 cyclePoints

Procedure from library `polymake.lib` (see [Section D.13.4 \[polymake\\_lib\]](#), page 7270).

**Usage:** `cyclePoints(triang,points,pt)` triang,points list, pt int

**Assume:**

- points is a list of integer vectors describing the lattice points of a marked polygon;
- triang is a list of integer vectors describing a triangulation of the marked polygon in the sense that an integer vector of the form  $(i,j,k)$  describes the triangle formed by `polygon[i]`, `polygon[j]` and `polygon[k]`;
- pt is an integer between 1 and `size(points)`, singling out a lattice point among the marked points

**Purpose:** consider the convex lattice polygon, say  $P$ , spanned by all lattice points in points which in the triangulation triang are connected to the point `points[pt]`; the procedure computes all marked points in points which lie on the boundary of that polygon, ordered clockwise

**Return:** list, of integer vectors which are the coordinates of the lattice points on the boundary of the above mentioned polygon  $P$ , if this polygon is not the empty set (that would be the case if `points[pt]` is not a vertex of any triangle in the triangulation); otherwise return the empty list

**Example:**

```

↳ http://www.polymake.org
// the lattice polygon spanned by the points (0,0), (3,0) and (0,3)
// with all integer points as markings
list points=intvec(1,1),intvec(3,0),intvec(2,0),intvec(1,0),
intvec(0,0),intvec(2,1),intvec(0,1),intvec(1,2),
intvec(0,2),intvec(0,3);
// define a triangulation
list triang=intvec(1,2,5),intvec(1,5,7),intvec(1,7,9),intvec(8,9,10),
intvec(1,8,9),intvec(1,2,8);
// compute the points connected to (1,1) in triang
cyclePoints(triang,points,1);
↳ [1]:
↳ 3,0
↳ [2]:
↳ 0,0
↳ [3]:
↳ 0,1
↳ [4]:
↳ 0,2

```

```

↳ [5]:
↳ 1,2

```

#### D.13.4.8 latticeArea

Procedure from library `polymake.lib` (see [Section D.13.4 \[polymake.lib\]](#), page 7270).

**Usage:** `latticeArea(polygon)`; polygon list

**Assume:** polygon is a list of integer vectors in the plane

**Return:** int, the lattice area of the convex hull of the lattice points in polygon, i.e. twice the Euclidean area

**Example:**

```

LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
// define a polygon with lattice area 5
list polygon=intvec(1,2),intvec(1,0),intvec(2,0),intvec(1,1),
intvec(2,1),intvec(0,0);
latticeArea(polygon);
↳ 5

```

#### D.13.4.9 picksFormula

Procedure from library `polymake.lib` (see [Section D.13.4 \[polymake.lib\]](#), page 7270).

**Usage:** `picksFormula(polygon)`; polygon list

**Assume:** polygon is a list of integer vectors in the plane and consider their convex hull C

**Return:** list, L of three integers  
 L[1] : the lattice area of C, i.e. twice the Euclidean area  
 L[2] : the number of lattice points on the boundary of C  
 L[3] : the number of interior lattice points of C

**Note:** the integers in L are related by Pick's formula, namely:  $L[1]=L[2]+2*L[3]-2$

**Example:**

```

LIB "polymake.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
// define a polygon with lattice area 5
list polygon=intvec(1,2),intvec(1,0),intvec(2,0),intvec(1,1),
intvec(2,1),intvec(0,0);
list pick=picksFormula(polygon);
// the lattice area of the polygon is:
pick[1];
↳ 5
// the number of lattice points on the boundary is:
pick[2];
↳ 5

```

```

// the number of interior lattice points is:
pick[3];
↪ 1
// the number's are related by Pick's formula:
pick[1]-pick[2]-2*pick[3]+2;
↪ 0

```

#### D.13.4.10 ellipticNF

Procedure from library `polymake.lib` (see [Section D.13.4 \[polymake\\_lib\]](#), page 7270).

**Usage:** `ellipticNF(polygon)`; polygon list

**Assume:** polygon is a list of integer vectors in the plane such that their convex hull  $C$  has precisely one interior lattice point; i.e.  $C$  is the Newton polygon of an elliptic curve

**Purpose:** compute the normal form of the polygon with respect to the unimodular affine transformations  $T=A*x+v$ ; there are sixteen different normal forms (see e.g. Bjorn Poonen, Fernando Rodriguez-Villegas: Lattice Polygons and the number 12. Amer. Math. Monthly 107 (2000), no. 3, 238–250.)

**Return:** list,  $L$  such that  
 $L[1]$  : list whose entries are the vertices of the normal form of the polygon  
 $L[2]$  : the matrix  $A$  of the unimodular transformation  
 $L[3]$  : the translation vector  $v$  of the unimodular transformation  
 $L[4]$  : list such that the  $i$ th entry is the image of `polygon[i]` under the unimodular transformation  $T$

**Example:**

### D.13.5 realizationMatroids\_lib

**Library:** realizationMatroids.lib

**Purpose:** Deciding Relative Realizability for Tropical Fan Curves in 2-Dimensional Matroidal Fans

**Authors:** Anna Lena Winstel, winstel@mathematik.uni-kl.de

**Overview:** In tropical geometry, one question to ask is the following: given a one-dimensional balanced polyhedral fan  $C$  which is set theoretically contained in the tropicalization  $\text{trop}(Y)$  of an algebraic variety  $Y$ , does there exist a curve  $X$  in  $Y$  such that  $\text{trop}(X) = C$ ? This equality of  $C$  and  $\text{trop}(X)$  denotes an equality of both, the fans  $\text{trop}(X)$  and  $C$  and their weights on the maximal cones. The relative realization space of  $C$  with respect to  $Y$  is the space of all algebraic curves in  $Y$  which tropicalize to  $C$ .

This library provides procedures deciding relative realizability for tropical fan curves, i.e. one-dimensional weighted balanced polyhedral fans, contained in two-dimensional matroidal fans  $\text{trop}(Y)$  where  $Y$  is a projective plane.

**Notation:** If  $Y$  is a projective plane in  $(n-1)$ -dimensional projective space, we consider  $\text{trop}(Y)$  in  $\mathbb{R}^n/\langle 1 \rangle$ . Moreover, for the relative realization space of  $C$  with respect to  $Y$  we only consider algebraic curves of degree  $\deg(C)$  in  $Y$  which tropicalize to  $C$ .

**Procedures:**

### D.13.5.1 realizationDim

Procedure from library `realizationMatroids.lib` (see [Section D.13.5 \[realizationMatroids.lib\]](#), page 7280).

**Usage:** `realizationDim(I,C)`; where  $I$  is a homogeneous linear ideal defining the projective plane  $Y = V(I)$  and  $C$  is a list of intvectors such that each intvector represents a one-dimensional cone in the tropical fan curve whose relative realizability should be checked. This representation is done in the following way: the one-dimensional cone  $K$  is represented by a vector  $w$  whose equivalence class  $[w]$  in  $R^n/\langle 1 \rangle$  can be written as  $[w] = m*[v]$  where  $[v]$  is the primitive generator of  $K$  and  $m$  is the weight of  $K$ .

**Returns:** the dimension of the relative realization space of the tropical curve  $C$  with respect to  $Y$ , and  $-1$  if the relative realization space is empty.

**Example:**

```
LIB "realizationMatroids.lib";
ring r = 0, (x(1..4)), dp;
ideal I = x(1)+x(2)+x(3)+x(4);
list C = list(intvec(2,2,0,0), intvec(0,0,2,1), intvec(0,0,0,1));
//C represents the tropical fan curve which consists of the cones
//cone([(1,1,0,0)]) (with weight 2), cone([(0,0,2,1)]) (with weight 1)
//and cone([(0,0,0,1)]) (with weight 1)
realizationDim(I,C);
↪ -1
```

### D.13.5.2 irrRealizationDim

Procedure from library `realizationMatroids.lib` (see [Section D.13.5 \[realizationMatroids.lib\]](#), page 7280).

**Usage:** `irrRealizationDim(I,C)`; where  $I$  is a homogeneous linear ideal defining the projective plane  $Y = V(I)$  and  $C$  is a list of intvectors such that each intvector represents a one-dimensional cone in the tropical fan curve whose irreducible relative realizability should be checked. This representation is done in the following way: a one-dimensional cone  $K$  is represented by a vector  $w$  whose equivalence class  $[w]$  in  $R^n/\langle 1 \rangle$  can be written as  $[w] = m*[v]$  where  $[v]$  is the primitive generator of  $K$  and  $m$  is the weight of  $K$ .

**Returns:** the dimension of the irreducible relative realization space of  $C$  with respect to  $Y$ , and  $-1$  if the irreducible realization space is empty.

**Example:**

```
LIB "realizationMatroids.lib";
ring r = 0, (x(1..4)), dp;
ideal I = x(1)+x(2)+x(3)+x(4);
list C = list(intvec(2,2,0,0), intvec(0,0,2,2));
//C represents the tropical fan curve which consists of the cones
//cone([(1,1,0,0)]) and cone([(1,1,0,0)]), both with weight 2
realizationDim(I,C);
↪ 0
irrRealizationDim(I,C);
↪ -1
```

### D.13.5.3 realizationDimPoly

Procedure from library `realizationMatroids.lib` (see [Section D.13.5 \[realizationMatroids.lib\]](#), page 7280).

**Usage:** `realizationDimPoly(I,C)`; where  $I$  is a homogeneous linear ideal defining the projective plane  $Y = V(I)$  and  $C$  is a list of intvectors such that each intvector represents a one-dimensional cone in the tropical fan curve whose relative realizability should be checked. This representation is done in the following way: the one-dimensional cone  $K$  is represented by a vector  $w$  whose equivalence class  $[w]$  in  $R^n/\langle 1 \rangle$  can be written as  $[w] = m*[v]$  where  $[v]$  is the primitive generator of  $K$  and  $m$  is the weight of  $K$ .

**Returns:** If the relative realization space of the tropical fan curve  $C$  is non-empty, this routine returns the tuple  $(r,f)$ , where  $r$  is the dimension of the relative realization space and  $f$  is an example of a homogeneous polynomial of degree  $\deg(C)$  cutting out a curve  $X$  in  $Y$  which tropicalizes to  $C$ . In case the relative realization space is empty, the output is set to -1.

**Example:**

```
LIB "realizationMatroids.lib";
ring r = 0,(x(1..4)),dp;
ideal I = x(1)+x(2)+x(3)+x(4);
list C = list(intvec(2,2,0,0),intvec(0,0,2,2));
//C represents the tropical fan curve which consists of the cones
//cone([(1,1,0,0)]) and cone([(1,1,0,0)]), both with weight 2
realizationDimPoly(I,C);
↪ 0 x(1)^2+2*x(1)*x(2)+x(2)^2
C = list(intvec(0,0,0,4),intvec(0,1,3,0),intvec(1,0,1,0),intvec(0,2,0,0),intvec(3,1,0,0));
//C represents the tropical fan curve which consists of the cones
//cone([(0,0,0,1)]) with weight 4,
//cone([(0,1,3,0)]), cone([(1,0,1,0)]) both with weight 1,
//cone([(0,1,0,0)]) with weight 2, and
//cone([(3,1,0,0)]) with weight 1
realizationDimPoly(I,C);
↪ 7 x(1)*x(2)^3+x(1)^3*x(3)+x(2)^3*x(3)+x(1)*x(3)^3
```

### D.13.6 tropical.lib

**Library:** `tropical.lib`

**Purpose:** Computations in Tropical Geometry

**Authors:** Anders Jensen Needergerd, email: [jensen@math.tu-berlin.de](mailto:jensen@math.tu-berlin.de)  
 Hannah Markwig, email: [hannah@uni-math.gwdg.de](mailto:hannah@uni-math.gwdg.de)  
 Thomas Markwig, email: [keilen@mathematik.uni-kl.de](mailto:keilen@mathematik.uni-kl.de)  
 Yue Ren, email: [ren@mathematik.uni-kl.de](mailto:ren@mathematik.uni-kl.de)

**Warning:**

- `tropicalLifting` will only work with LINUX and if in addition `gfan` is installed.
- `drawTropicalCurve` and `drawTropicalNewtonSubdivision` will only display the tropical curve with LINUX and if in addition `latex` and `xdg-open` are installed.
- For `tropicalLifting` in the definition of the basering the parameter  $t$  from the Puiseux series field  $C\{\{t\}\}$  must be defined as a variable, while for all other procedures it must be defined as a parameter.

**Theory:** Fix some base field  $K$  and a bunch of lattice points  $v_0, \dots, v_m$  in the integer lattice  $Z^n$ , then this defines a toric variety as the closure of  $(K^*)^n$  in the projective space  $P^m$ , where the torus is embedded via the map sending a point  $x$  in  $(K^*)^n$  to the point  $(x^{v_0}, \dots, x^{v_m})$ .

The generic hyperplane sections are just the images of the hypersurfaces in  $(K^*)^n$  defined by the polynomials  $f = a_0 x^{v_0} + \dots + a_m x^{v_m} = 0$ . Some properties of these hypersurfaces can be studied via tropicalisation.

For this we suppose that  $K = C\{\{t\}\}$  is the field of Puiseux series over the field of complex numbers (or any other field with a valuation into the real numbers). One associates to the hypersurface given by  $f = a_0 x^{v_0} + \dots + a_m x^{v_m}$  the tropical hypersurface defined by the tropicalisation  $\text{trop}(f) = \min\{\text{val}(a_0) + \langle v_0, x \rangle, \dots, \text{val}(a_m) + \langle v_m, x \rangle\}$ .

Here,  $\langle v, x \rangle$  denotes the standard scalar product of the integer vector  $v$  in  $Z^n$  with the vector  $x = (x_1, \dots, x_n)$  of variables, so that  $\text{trop}(f)$  is a piecewise linear function on  $R^n$ . The corner locus of this function (i.e. the points at which the minimum is attained at least twice) is the tropical hypersurface defined by  $\text{trop}(f)$ .

The theorem of Newton-Kapranov states that this tropical hypersurface is the same as if one computes pointwise the valuation of the hypersurface given by  $f$ . The analogue holds true if one replaces one equation  $f$  by an ideal  $I$ . A constructive proof of the theorem is given by an adapted version of the Newton-Puiseux algorithm. The hard part is to find a point in the variety over  $C\{\{t\}\}$  which corresponds to a given point in the tropical variety.

It is the purpose of this library to provide basic means to deal with tropical varieties. Of course we cannot represent the field of Puiseux series over  $C$  in its full strength, however, in order to compute interesting examples it will be sufficient to replace the complex numbers  $C$  by the rational numbers  $Q$  and to replace Puiseux series in  $t$  by rational functions in  $t$ , i.e. we replace  $C\{\{t\}\}$  by  $Q(t)$ , or sometimes even by  $Q[t]$ . Note, that this in particular forbids rational exponents for the  $t$ 's.

Moreover, in Singular no negative exponents of monomials are allowed, so that the integer vectors  $v_i$  will have to have non-negative entries. Shifting all exponents by a fixed integer vector does not change the tropicalisation nor does it change the toric variety. Thus this does not cause any restriction.

If, however, for some reason you prefer to work with general  $v_i$ , then you have to pass right away to the tropicalisation of the equations, wherever this is allowed – these are linear polynomials where the constant coefficient corresponds to the valuation of the original coefficient and where the non-constant coefficient correspond to the exponents of the monomials, thus they may be rational numbers respectively negative numbers: e.g. if  $f = t^{1/2} x^{-2} y^3 + 2t x y + 4$  then  $\text{trop}(f) = \min\{1/2 - 2x + 3y, 1 + x + y, 0\}$ .

The main tools provided in this library are as follows:

- `tropicalLifting` implements the constructive proof of the Theorem of Newton-Kapranov and constructs a point in the variety over  $C\{\{t\}\}$  corresponding to a given point in the

corresponding tropical variety associated to an ideal  $I$ ; the generators of  $I$  have to be in the polynomial ring  $Q[t, x_1, \dots, x_n]$  considered as a subring of  $C\{\{t\}\}[x_1, \dots, x_n]$ ; a solution will be constructed up to given order; note that several field extensions of  $Q$  might be necessary throughout the intermediate computations; the procedures use the external program `gfan`

- `puiseuxExpansion` computes a Newton-Puiseux expansion of a plane curve singularity
- `drawTropicalCurve` visualises a tropical plane curve either given by a polynomial in  $Q(t)[x,y]$  or by a list of linear polynomials of the form  $ax+by+c$  with  $a,b$  in  $Z$  and  $c$  in  $Q$ ; latex must be installed on your computer
- `tropicalJInvariant` computes the tropical  $j$ -invariant of a tropical elliptic curve

**Procedures for tropical lifting: Procedures for drawing tropical curves: General procedures: Procedures for latex conversion: Auxiliary procedures: Procedures from binary library:**

### D.13.6.1 tropicalLifting

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\]](#), page 7282).

**Usage:** `tropicalLifting(i,w,ord[,opt]);`  $i$  ideal,  $w$  intvec,  $ord$  int,  $opt$  string

**Assume:**

- $i$  is an ideal in  $Q[t,x_1,\dots,x_n]$ ,  $w=(w_0,w_1,\dots,w_n)$  and  $(w_1/w_0,\dots,w_n/w_0)$  is in the tropical variety of  $i$ , and  $ord$  is the order up to which a point in  $V(i)$  over  $Q\{\{t\}\}$  lying over  $(w_1/w_0,\dots,w_n/w_0)$  shall be computed;
- $w_0$  may NOT be ZERO
- the basering should not have any parameters on its own and it should have a global monomial ordering,  
e.g. ring  $r=0,(t,x(1..n)),dp;$
- the first variable of the basering will be treated as the parameter  $t$  in the Puiseux series field
- the optional parameter  $opt$  should be one or more strings among the following:
  - 'isZeroDimensional' : the dimension  $i$  is zero (not to be checked);
  - 'isPrime' : the ideal is prime over  $Q(t)[x_1,\dots,x_n]$  (not to be checked);
  - 'isInTrop' :  $(w_1/w_0,\dots,w_n/w_0)$  is in the tropical variety (not to be checked);
  - 'oldGfan' : uses `gfan` version 0.2.1 or less
  - 'findAll' : find all solutions of a zero-dimensional ideal over  $(w_1/w_0,\dots,w_n/w_0)$
  - 'noAbs' : do NOT use absolute primary decomposition
  - 'puiseux' :  $n=1$  and  $i$  is generated by one equation
  - 'noResubst' : avoids the computation of the resubstitution

**Return:** IF THE OPTION 'findAll' WAS NOT SET THEN:  
list, containing one lifting of the given point  $(w_1/w_0,\dots,w_n/w_0)$  in the tropical variety of  $i$  to a point in  $V(i)$  over Puiseux series field up to the first  $ord$  terms; more precisely:  
IF THE OPTION 'noAbs' WAS NOT SET, THEN:  
 $l[1]$  = ring  $Q[a]/m[[t]]$   
 $l[2]$  = int  
 $l[3]$  = intvec  
 $l[4]$  = list  
 IF THE OPTION 'noAbs' WAS SET, THEN:  
 $l[1]$  = ring  $Q[X(1),\dots,X(k)]/m[[t]]$   
 $l[2]$  = int  
 $l[3]$  = intvec  
 $l[4]$  = list  
 $l[5]$  = string  
 IF THE OPTION 'findAll' WAS SET, THEN:  
 list, containing ALL liftings of the given point  $((w_1/w_0,\dots,w_n/w_0)$  in the tropical

variety of  $i$  to a point in  $V(i)$  over Puiseux series field up to the first ord terms, if the ideal is zero-dimensional over  $\mathbb{Q}\{\{t\}\}$ ;  
 more precisely, each entry of the list is a list  $l$  as computed if 'findAll' was NOT set  
 WE NOW DESCRIBE THE LIST ENTRIES IF 'findAll' WAS NOT SET:  
 - the ring  $l[1]$  contains an ideal LIFT, which contains a point in  $V(i)$  lying over  $w$  up to the first ord terms;  
 - and if the integer  $l[2]$  is  $N$  then  $t$  has to be replaced by  $t^{1/N}$  in the lift, or alternatively replace  $t$  by  $t^N$  in the defining ideal  
 - if the  $k+1$ st entry of  $l[3]$  is non-zero, then the  $k$ th component of LIFT has to be multiplied  $t^{-l[3][k]/l[3][1]}$  AFTER substituting  $t$  by  $t^{1/N}$   
 - unless the option 'noResubst' was set, the  $k$ th entry of list  $l[4]$  is a string which represents the  $k$ th generator of  
 the ideal  $i$  where the coordinates have been replaced by the result of the lift;  
 the  $t$ -order of the  $k$ th entry should in principle be larger than the  $t$ -degree of LIFT  
 - if the option 'noAbs' was set, then the string in  $l[5]$  defines a maximal ideal in the field  $\mathbb{Q}[X(1), \dots, X(k)]$ , where  $X(1), \dots, X(k)$  are the parameters of the ring in  $l[1]$ ;  
 the basefield of the ring in  $l[1]$  should be considered modulo this ideal

**Remark:**

- it is best to use the procedure `displayTropicalLifting` to display the result
- the option 'findAll' cannot be used if 'noAbs' is set
- if the parameter 'findAll' is set AND the ideal  $i$  is zero-dimensional in  $\mathbb{Q}\{\{t\}\}[x_1, \dots, x_n]$  then ALL points in  $V(i)$  lying over  $w$  are computed up to order ord; if the ideal is not-zero dimensional, then only the points in the ideal after cutting down to dimension zero will be computed
- the procedure requires that the program GFAN is installed on your computer; if you have GFAN version less than 0.3.0 then you must use the optional parameter 'oldGfan'
- the procedure requires the Singular procedure `absPrimdecGTZ` to be present in the package `primdec.lib`, unless the option 'noAbs' is set; but even if `absPrimdecGTZ` is present it might be necessary to set the option 'noAbs' in order to avoid the costly absolute primary decomposition; the side effect is that the field extension which is computed throughout the recursion might need more than one parameter to be described
- since  $\mathbb{Q}$  is infinite, the procedure finishes with probability one
- you can call the procedure with  $\mathbb{Z}/p\mathbb{Z}$  as base field instead of  $\mathbb{Q}$ , but there are some problems you should be aware of:
  - + the Puiseux series field over the algebraic closure of  $\mathbb{Z}/p\mathbb{Z}$  is NOT algebraically closed, and thus there may not exist a point in  $V(i)$  over the Puiseux series field with the desired valuation; so there is no chance that the procedure produced a sensible output - e.g. if  $i = tx^p - tx - 1$
  - + if the dimension of  $i$  over  $\mathbb{Z}/p\mathbb{Z}(t)$  is not zero the process of reduction to zero might not work if the characteristic is small and you are unlucky
  - + the option 'noAbs' has to be used since absolute primary decomposition in Singular only works in characteristic zero
- the basefield should either be  $\mathbb{Q}$  or  $\mathbb{Z}/p\mathbb{Z}$  for some prime  $p$ ; field extensions will be computed if necessary; if you need parameters or field extensions from the beginning they should rather be simulated as variables possibly adding their relations to the ideal; the weights for the additional variables should be zero

↳  $i[1]=0$ 
↳  $i[2]=0$ 
printlevel=oldprintlevel;

```

### D.13.6.2 displayTropicalLifting

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\]](#), page 7282).

**Usage:** `displaytropcallifting(troplift[,#]); troplift list, # list`

**Assume:** `troplift` is the output of `tropicalLifting`; the optional parameter `#` can be the string `'subst'`

**Return:** none

**Note:** - the procedure displays the output of the procedure `tropicalLifting`  
 - if the optional parameter `'subst'` is given, then the lifting is substituted into the ideal and the result is displayed

**Example:**

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=0,(t,x,y,z),dp;
ideal i=-y2t4+x2,yt3+xz+y;
intvec w=2,-4,0,4;
displayTropicalLifting(tropicalLifting(i,w,3),"subst");

```

```

↳ LP algorithm being used: "cddgmp".
↳ Groebner basis Engine being used: "gfan".
↳ 0
↳ 0
↳ 0
↳ The procedure has created a list of lists. The jth entry of this list
↳ contains a ring, an integer and an intvec.
↳ In this ring lives an ideal representing the wanted lifting,
↳ if the integer is N then in the parametrisation t has to be replaced by t\
  ^1/N,
↳ and if the ith component of the intvec is w[i] then the ith component in \
  LIFT
↳ should be multiplied by t^-w[i]/N in order to get the parametrisation.
↳
↳ Suppose your list has the name L, then you can access the 1st ring via:
↳
↳ def LIFTRing=L[1]; setring LIFTRing; LIFT;
↳
↳ The lifting of the point in the tropical variety lives in the ring
↳ Q[[t^(1/2)]]
↳
↳ The lifting has the form:
↳ x=(1)*t^(4/2)
↳ y=(1)
↳ z=(-1)*1/t^(4/2) + (-1)*t^(2/2)
↳
↳ Substituting the solution into the ideal gives:
↳ i[1]=0
↳ i[2]=0

```

### D.13.6.3 `puiseuxExpansion`

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\]](#), page 7282).

**Usage:** `puiseuxExpansion(f,n,#)`; f poly, n int, # list

**Assume:** f is a non-constant polynomial in two variables which is not divisible by the first variable and which is squarefree as a power series over the complex numbers; the base field is either the field of rational numbers or a finite extension thereof; monomial ordering is assumed to be local; the optional parameter # can be the string 'subst'

**Return:** list, where each entry of the list l describes the Newton-Puiseux parametrisations of one branch of the plane curve singularity at the origin defined by f; only the terms up to order n of each parametrisation are computed

l[i][1] = is a ring  
l[i][2] = int  
l[i][3] = string

WE NOW DESCRIBE THE LIST ENTRIES l[i] IN MORE DETAIL:

- the ring l[i][1] contains an ideal LIFT and the Newton-Puiseux parametrisation of the branch is given by  $x=t^N$  and  $y=LIFT[1]$ , where  $N=l[i][2]$
- if the base field had a parameter and a minimal polynomial, then the new base field

will have a parameter and a new minimal polynomial, and LIFT[2] describes how the old parameter can be computed from the new one

- if a field extension with minimal polynomial of degree  $k$  was necessary, then to the one extension produced actually  $k$  extensions correspond by replacing the parameter  $a$  successively by all zeros of the minimal polynomial
- if the option `subst` was set `l[i][3]` contains the polynomial where  $y$  has been substituted by  $y(t^{\{1/N\}})$  as a string

**Remark:**

- it is best to use the procedure `displayPuisseuxExpansion` to display the result
- the procedure requires the Singular procedure `absPrimdecGTZ` to be present in the package `primdec.lib`
- if  $f$  is not squarefree it will be replaced by its squarefree part

**Example:**

```

#### D.13.6.4 displayPuisseuxExpansion

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\]](#), page 7282).

**Usage:** `displayPuisseuxExpansion(puisseux[,#]);` `puisseux` list, `#` list

**Assume:** `puisseux` is the output of `puisseuxExpansion`; the optional parameter `#` can be the string `'subst'`

**Return:** none

**Note:**

- the procedure displays the output of the procedure `puisseuxExpansion`
- if the optional parameter `'subst'` is given, then the expansion is substituted into the polynomial and the result is displayed
- if the base field had a parameter and a minimal polynomial, then the new base field will have a parameter and a minimal polynomial; `var(2)` is the old parameter and it is displayed how the old parameter can be computed from the new one

**Example:**

```

LIB "tropical.lib";

  =>

```

### D.13.6.5 tropicalCurve

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\]](#), page 7282).

**Usage:** `tropicalCurve(tp[,#]);` tp list, # optional list

**Assume:** tp is list of linear polynomials of the form  $ax+by+c$  with integers a, b and a rational number c representing a tropical Laurent polynomial defining a tropical plane curve; alternatively tp can be a polynomial in  $\mathbb{Q}(t)[x,y]$  defining a tropical plane curve via the valuation map; the basering must have a global monomial ordering, two variables and up to one parameter!

**Return:** list, each entry  $i=1,\dots,\text{size}(l)-1$  corresponds to a vertex in the tropical plane curve defined by tp  
 $l[i][1]$  = x-coordinate of the ith vertex  
 $l[i][2]$  = y-coordinate of the ith vertex  
 $l[i][3]$  = intmat, if j is an entry in the first row

of intmat then the  $i$ th vertex of the tropical curve is connected to the  $j$ th vertex with multiplicity given by the corresponding entry in the second row  
 $l[i][4]$  = list of lists, the first entry of a list is a primitive integer vector defining the direction of an unbounded edge emerging from the  $i$ th vertex of the graph, the corresponding second entry in the list is the multiplicity of the unbounded edge  
 $l[i][5]$  = a polynomial whose monomials mark the vertices in the Newton polygon corresponding to the entries in  $tp$  which take the common minimum at the  $i$ th vertex – if some coefficient  $a$  or  $b$  of the linear polynomials in the input was negative, then each monomial has to be shifted by the values in  $l[size(l)][3]$   
 $l[size(l)][1]$  = list, the entries describe the boundary points of the Newton subdivision  
 $l[size(l)][2]$  = list, the entries are pairs of integer vectors defining an interior edge of the Newton subdivision  
 $l[size(l)][3]$  = intvec, the monomials occurring in  $l[i][5]$  have to be shifted by this vector in order to represent marked vertices in the Newton polygon

**Note:** here the tropical polynomial is supposed to be the MINIMUM of the linear forms in  $tp$ , unless the optional input  $\#[1]$  is the string 'max'

**Example:**

```
LIB "tropical.lib";
⇒ Welcome to polymake version
⇒ Copyright (c) 1997-2015
⇒ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
⇒ http://www.polymake.org
ring r=(0,t),(x,y),dp;
poly f=t*(x7+y7+1)+1/t*(x4+y4+x2+y2+x3y+xy3)+1/t7*x2y2;
list graph=tropicalCurve(f);
// the tropical curve has size(graph)-1 vertices
size(graph)-1;
⇒ 7
// the coordinates of the first vertex are graph[1][1],graph[1][2];
graph[1][1],graph[1][2];
⇒ -8/3 -8/3
// the first vertex is connected to the vertices
// graph[1][3][1,1..ncols(graph[1][3])]
intmat M=graph[1][3];
M[1,1..ncols(graph[1][3])];
⇒ 2 3
// the weights of the edges to these vertices are
// graph[1][3][2,1..ncols(graph[1][3])]
M[2,1..ncols(graph[1][3])];
⇒ 1 1
// from the first vertex emerge size(graph[1][4]) unbounded edges
size(graph[1][4]);
⇒ 1
```

```

// the primitive integral direction vector of the first unbounded edge
//   of the first vertex
graph[1][4][1][1];
↳ -1,-1
// the weight of the first unbounded edge of the first vertex
graph[1][4][1][2];
↳ 7
// the monomials which are part of the Newton subdivision of the first vertex
graph[1][5];
↳ x7+y7+x2y2
// connecting the points in graph[size(graph)][1] we get
//   the boundary of the Newton polytope
graph[size(graph)][1];
↳ [1]:
↳ 0,7
↳ [2]:
↳ 7,0
↳ [3]:
↳ 0,0
// an entry in graph[size(graph)][2] is a pair of points
//   in the Newton polytope bounding an inner edge
graph[size(graph)][2][1];

↳ 7,0
↳ [2]:
↳ 2,2

```

### D.13.6.6 drawTropicalCurve

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\]](#), page 7282).

**Usage:** `drawTropicalCurve(f,#)`; `f` poly or list, `#` optional list

**Assume:** `f` is list of linear polynomials of the form  $ax+by+c$  with integers  $a$ ,  $b$  and a rational number  $c$  representing a tropical Laurent polynomial defining a tropical plane curve; alternatively `f` can be a polynomial in  $\mathbb{Q}(t)[x,y]$  defining a tropical plane curve via the valuation map;  
the basering must have a global monomial ordering, two variables and up to one parameter!

**Return:** NONE

**Note:**

- the procedure creates the files `/tmp/tropicalcurveNUMBER.tex` and `/tmp/tropicalcurveNUMBER.ps`, where `NUMBER` is a random four digit integer; moreover it displays the tropical curve via `xdg-open`;
- if you wish to remove all these files from `/tmp`, call the procedure `cleanTmp`
- edges with multiplicity greater than one carry this multiplicity
- if `#` is empty, then the tropical curve is computed w.r.t. minimum, if `#[1]` is the string 'max', then it is computed w.r.t. maximum
- if the last optional argument is 'onlytexfile' then only the latex file is produced; this option should be used if `xdg-utils` is not installed on your system
- note that lattice points in the Newton subdivision which are black correspond to markings of the marked subdivision, while lattice points in grey are not marked

**Example:**

```

LIB "tropical.lib";
⇒ Welcome to polymake version
⇒ Copyright (c) 1997-2015
⇒ Ewgenij Gawrilow, Michael Joswig (TU Darmstadt)
⇒ http://www.polymake.org

### D.13.6.7 drawNewtonSubdivision

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\], page 7282](#)).

**Usage:** `drawTropicalCurve(f,#)`; `f` poly, `#` optional list

**Assume:** `f` is list of linear polynomials of the form  $ax+by+c$  with integers `a`, `b` and a rational number `c` representing a tropical Laurent polynomial defining a tropical plane curve; alternatively `f` can be a polynomial in  $\mathbb{Q}(t)[x,y]$  defining a tropical plane curve via the valuation map; the basering must have a global monomial ordering, two variables and up to one parameter!

**Return:** NONE

**Note:** - the procedure creates the files `/tmp/newtonsubdivisionNUMBER.tex`, and `/tmp/newtonsubdivisionNUMBER.ps`, where `NUMBER` is a random four digit integer; moreover it displays the tropical curve defined by `f` via `xdg-open`; if you wish to remove all these files from `/tmp`, call the procedure `cleanTmp`; if `#` is empty, then the tropical curve is computed w.r.t. minimum, if `#[1]` is the string 'max', then it is computed w.r.t. maximum - note that lattice points in the Newton subdivision which are black correspond to markings of the marked subdivision, while lattice points in grey are not marked

**Example:**

```

### D.13.6.8 tropicalJInvariant

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\]](#), page 7282).

**Usage:** `tropicalJInvariant(f[,#]);` `f` poly or list, `#` optional list

**Assume:** `f` is list of linear polynomials of the form  $ax+by+c$  with integers `a`, `b` and a rational number `c` representing a tropical Laurent polynomial defining a tropical plane curve; alternatively `f` can be a polynomial in  $\mathbb{Q}(t)[x,y]$  defining a tropical plane curve via the valuation map; the basering must have a global monomial ordering, two variables and up to one parameter!

**Return:** number, if the graph underlying the tropical curve has precisely one loop then its weighted lattice length is returned, otherwise the result will be -1

**Note:**

- if the tropical curve is elliptic and its embedded graph has precisely one loop, then the weighted lattice length of the loop is its tropical j-invariant
- the procedure checks if the embedded graph of the tropical curve has genus one, but it does NOT check if the loop can be resolved, so that the curve is not a proper tropical elliptic curve
- if the embedded graph of a tropical elliptic curve has more than one loop, then all but one can be resolved, but this is not observed by this procedure, so it will not compute the j-invariant
- if `#` is empty, then the tropical curve is computed w.r.t. minimum, if `#[1]` is the string 'max', then it is computed w.r.t. maximum
- the tropicalJInvariant of a plane tropical cubic is the 'cycle length' of the cubic as introduced in the paper: Eric Katz, Hannah Markwig, Thomas Markwig: The j-invariant of a cubic tropical plane curve.

**Example:**

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),(x,y),dp;
// tropicalJInvariant computes the tropical j-invariant of an elliptic curve
tropicalJInvariant(t*(x3+y3+1)+1/t*(x2+y2+x+y+x2y+xy2)+1/t2*xy);
↳ // ** int division with '/': use 'div' instead in line >> genus=-genus/2\
; // we have counted each bounded edge twice<<
↳ 6
// the Newton polygon need not be the standard simplex
tropicalJInvariant(x+y+x2y+xy2+1/t*xy);

```

```

⇒ // ** int division with '/': use 'div' instead in line >> genus=-genus/2\
    ; // we have counted each bounded edge twice<<
⇒ 8
// the curve can have arbitrary degree
tropicalJInvariant(t*(x7+y7+1)+1/t*(x4+y4+x2+y2+x3y+xy3)+1/t7*x2y2);
⇒ // ** int division with '/': use 'div' instead in line >> genus=-genus/2\
    ; // we have counted each bounded edge twice<<
⇒ 14/3
// the procedure does not realise, if the embedded graph of the tropical
// curve has a loop that can be resolved
tropicalJInvariant(1+x+y+xy+tx2y+txy2);
⇒ // ** int division with '/': use 'div' instead in line >> genus=-genus/2\
    ; // we have counted each bounded edge twice<<
⇒ 4
// but it does realise, if the curve has no loop at all ...
tropicalJInvariant(x+y+1);
⇒ // ** int division with '/': use 'div' instead in line >> genus=-genus/2\
    ; // we have counted each bounded edge twice<<
⇒ The embedded graph of the curve has not genus one.
⇒ -1
// or if the embedded graph has more than one loop - even if only one
// cannot be resolved
tropicalJInvariant(1+x+y+xy+tx2y+txy2+t3x5+t3y5+tx2y2+t2xy4+t2yx4);
⇒ // ** int division with '/': use 'div' instead in line >> genus=-genus/2\
    ; // we have counted each bounded edge twice<<
⇒ The embedded graph of the curve has not genus one.
⇒ -1

```

### D.13.6.9 weierstrassForm

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\], page 7282](#)).

### D.13.6.10 conicWithTangents

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\], page 7282](#)).

**Usage:** `conicWithTangents(points[,#]);` points list, # optional list

**Assume:** points is a list of five points in the plane over  $K(t)$

**Return:** list,  $l[1]$  = the list points of the five given points  
 $l[2]$  = the conic  $f$  passing through the five points  
 $l[3]$  = list of equations of tangents to  $f$  in the given points  
 $l[4]$  = ideal, tropicalisation of  $f$  (i.e. list of linear forms)  
 $l[5]$  = a list of the tropicalisation of the tangents  
 $l[6]$  = a list containing the vertices of the tropical conic  $f$   
 $l[7]$  = a list containing lists with vertices of the tangents  
 $l[8]$  = a string which contains the latex-code to draw the tropical conic and its tropicalised tangents  
 $l[9]$  = if # is non-empty, this is the same data for the dual conic and the points dual to the computed tangents

**Note:** the points must be generic, i.e. no three on a line

**Example:**

```

### D.13.6.11 tropicalise

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\]](#), page 7282).

**Usage:** `tropicalise(f,#)`;  $f$  polynomial,  $\#$  optional list

**Assume:**  $f$  is a polynomial in  $\mathbb{Q}(t)[x_1, \dots, x_n]$

**Return:** list, the linear forms of the tropicalisation of  $f$

**Note:** if  $\#$  is empty, then the valuation of  $t$  will be 1,  
if  $\#$  is the string 'max' it will be -1;  
the latter supposes that we consider the maximum of the computed linear forms, the former that we consider their minimum

**Example:**

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org

↳ [6]:
↳ 0

```

### D.13.6.12 tropicaliseSet

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\]](#), page 7282).

**Usage:** `tropicaliseSet(i)`;  $i$  ideal

**Assume:**  $i$  is an ideal in  $\mathbb{Q}(t)[x_1, \dots, x_n]$

**Return:** list, the  $j$ th entry is the tropicalisation of the  $j$ th generator of  $i$

**Example:**

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),(x,y),dp;
ideal i=txy-y2+1,2t3x2+1/t*y-t6;
tropicaliseSet(i);

```

### D.13.6.13 tInitialForm

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\], page 7282](#)).

**Usage:** `tInitialForm(f,w)`;  $f$  a polynomial,  $w$  an integer vector

**Assume:**  $f$  is a polynomial in  $\mathbb{Q}[t,x_1,\dots,x_n]$  and  $w=(w_0,w_1,\dots,w_n)$

**Return:** `poly`, the  $t$ -initialform of  $f(t,x)$  w.r.t.  $w$  evaluated at  $t=1$

**Note:** the  $t$ -initialform is the sum of the terms with MAXIMAL weighted order w.r.t.  $w$

**Example:**

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=0,(t,x,y),dp;
poly f=t4x2+y2-t2xy+t4x-t9;
intvec w=-1,-2,-3;
tInitialForm(f,w);
↳ y2+x

```

### D.13.6.14 tInitialIdeal

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\], page 7282](#)).

**Usage:** `tInitialIdeal(i,w)`;  $i$  ideal,  $w$  intvec

**Assume:**  $i$  is an ideal in  $\mathbb{Q}[t,x_1,\dots,x_n]$  and  $w=(w_0,\dots,w_n)$

**Return:** `ideal ini`, the  $t$ -initial ideal of  $i$  with respect to  $w$

**Example:**

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=0,(t,x,y),dp;
ideal i=t2x-y+t3,t2x-y-2t3x;
intvec w=-1,2,0;
// the t-initial forms of the generators are
tInitialForm(i[1],w),tInitialForm(i[2],w);
↳ x-y x-y
// and they do not generate the t-initial ideal of i
tInitialIdeal(i,w);
↳ _[1]=-x+y
↳ _[2]=2xy
↳ _[3]=2x
↳ _[4]=2xy2

```

**D.13.6.15 initialForm**

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\], page 7282](#)).

**Usage:** `initialForm(f,w)`;  $f$  a polynomial,  $w$  an integer vector

**Assume:**  $f$  is a polynomial in  $\mathbb{Q}[x_1, \dots, x_n]$  and  $w=(w_1, \dots, w_n)$

**Return:** `poly`, the initial form of  $f(x)$  w.r.t.  $w$

**Note:** the `initialForm` consists of the terms with MAXIMAL weighted order w.r.t.  $w$

**Example:**

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=0,(x,y),dp;
poly f=x3+y2-xy+x-1;
intvec w=2,3;
initialForm(f,w);
↳ x3+y2

```

**D.13.6.16 initialIdeal**

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\], page 7282](#)).

**Usage:** `initialIdeal(i,w)`;  $i$  ideal,  $w$  intvec

**Assume:**  $i$  is an ideal in  $\mathbb{Q}[x_1, \dots, x_n]$  and  $w=(w_1, \dots, w_n)$

**Return:** ideal, the `initialIdeal` of  $i$  w.r.t.  $w$

**Note:** the `initialIdeal` consists of the terms with MAXIMAL weighted order w.r.t.  $w$

**Example:**

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=0,(x,y),dp;
poly f=x3+y2-xy+x-1;
intvec w=2,3;
initialIdeal(f,w);
↳ _[1]=x3+y2

```

### D.13.6.17 texNumber

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\], page 7282](#)).

**Usage:** `texNumber(f)`;  $f$  poly

**Return:** string, tex command representing leading coefficient of  $f$  using `\frac`

**Example:**

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),x,dp;
texNumber((3t2-1)/t3);
↳ \tfrac{-1+3\cdot t^2}{t^3}

```

### D.13.6.18 texPolynomial

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\], page 7282](#)).

**Usage:** `texPolynomial(f)`;  $f$  poly

**Return:** string, the tex command representing  $f$

**Example:**

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),x,dp;
texPolynomial(1/t*x2-t2x+1/t);
↳ \tfrac{1}{t}\cdot x^2-t^2\cdot x+\tfrac{1}{t}

```

### D.13.6.19 texMatrix

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\], page 7282](#)).

**Usage:** `texMatrix(M)`;  $M$  matrix

**Return:** string, the tex command representing  $M$

**Example:**

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),x,dp;
matrix M[2][2]=3/2,1/t*x2-t2x+1/t,5,-2x;
texMatrix(M);
↳ \left(\begin{array}{cc}
↳   \tfrac{3}{2} & \tfrac{1}{t}\cdot x^2-t^2\cdot x+\tfrac{1}{t} \\
↳   5 & -2\cdot x \\
↳   \end{array}\right)

```

### D.13.6.20 texDrawBasic

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\], page 7282](#)).

**Usage:** `texDrawBasic(texdraw); list texdraw`

**Assume:** `texdraw` is a list of strings representing `texdraw` commands (as produced by `texDrawTropical`) which should be embedded into a `texdraw` environment

**Return:** string, a `texdraw` environment enclosing the input

**Note:** is called from `conicWithTangents`

**Example:**

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),(x,y),dp;
poly f=x+y+1;
string texf=texDrawTropical(tropicalCurve(f),list("",1));
texDrawBasic(texf);
↳
↳   \begin{texdraw}
↳     \drawdim cm \relunitscale 0.7 \arrowheadtype t:V
↳     %\linewidth 0.05 \lpatt (0.1 0.4)
↳     %\move (-4 0) \avec (9 0) \move (0 -4) \avec (0 9)
↳     \linewidth 0.1 \lpatt (1 0)
↳
↳
↳     \setgray 0.6

↳     \move (0 0) \fcir f:0 r:0.016
↳     \move (0 0) \rlvec (0 0.25)
↳     \move (0 0) \rlvec (0.25 0)
↳     \move (0 0) \rlvec (-0.25 -0.25)
↳
↳
↳     %% HERE STARTS THE CODE FOR THE LATTICE
↳     \move (0 0) \fcir f:0.8 r:0.008

```

```

↳      %% HERE ENDS THE CODE FOR THE LATTICE
↳
↳      \end{texdraw}

```

### D.13.6.21 texDrawTropical

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\]](#), page 7282).

**Usage:** `texDrawTropical(graph[,#]);` graph list, # optional list

**Assume:** graph is the output of `tropicalCurve`

**Return:** string, the texdraw code of the tropical plane curve encoded by graph

**Note:**

- if the list # is non-empty, the first entry should be a string; if this string is 'max', then the tropical curve is considered with respect to the maximum
- the procedure computes a scalefactor for the texdraw command which should help to display the curve in the right way; this may, however, be a bad idea if several `texDrawTropical` outputs are put together to form one image; the scalefactor can be prescribed by the further optional entry of type poly
- one can add a string as last optional argument to the list #; it can be used to insert further texdraw commands (e.g. to have a lighter image as when called from inside `conicWithTangents`);
- the list # is optional and may as well be empty

**Example:**

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org

### D.13.6.22 texDrawNewtonSubdivision

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\]](#), page 7282).

**Usage:** `texDrawNewtonSubdivision(graph[,#]);` graph list, # optional list

**Assume:** graph is the output of `tropicalCurve`

**Return:** string, the texdraw code of the Newton subdivision of the tropical plane curve encoded by graph

**Note:** - the list # may contain optional arguments, of which only one will be considered, namely the first entry of type 'poly'; this entry should be a rational number which specifies the scaling factor to be used; if it is missing, the factor will be computed; the list # may as well be empty  
 - note that lattice points in the Newton subdivision which are black correspond to markings of the marked subdivision, while lattice points in grey are not marked

**Example:**

```
LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org

↳

```

### D.13.6.23 texDrawTriangulation

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\]](#), page 7282).

**Usage:** `texDrawTriangulation(triang,polygon)`; `triang,polygon` list

**Assume:** `polygon` is a list of integer vectors describing the lattice points of a marked polygon;  
`triang` is a list of integer vectors describing a triangulation of the marked polygon in the sense that an integer vector of the form  $(i,j,k)$  describes the triangle formed by `polygon[i]`, `polygon[j]` and `polygon[k]`

**Return:** string, a `texdraw` code for the triangulation described by `triang` without the `texdraw` environment

**Example:**

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
// the lattice polygon spanned by the points (0,0), (3,0) and (0,3)
// with all integer points as markings
list polygon=intvec(1,1),intvec(3,0),intvec(2,0),intvec(1,0),intvec(0,0),
intvec(2,1),intvec(0,1),intvec(1,2),intvec(0,2),intvec(0,3);
// define a triangulation by connecting the only interior point
// with the vertices
list triang=intvec(1,2,5),intvec(1,5,10),intvec(1,2,10);
// produce the texdraw output of the triangulation triang
texDrawTriangulation(triang,polygon);
↳
↳      \drawdim cm \relunitscale 1.2 \arrowheadtype t:V

↳      \fcir f:0.7 r:0.04

```

### D.13.6.24 radicalMemberShip

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\]](#), page 7282).

**Usage:**     `radicalMemberShip (f,i);` f poly, i ideal

**Return:**    int, 1 if f is in the radical of i, 0 else

**Example:**

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=0,(x,y),dp;
ideal i=(x+1)*y2;
// y is NOT in the radical of i
radicalMemberShip(y,i);
↳ 0
ring rr=0,(x,y),ds;
ideal i=(x+1)*y2;
// since this time the ordering is local, y is in the radical of i

```

```
radicalMemberShip(y,i);
↳ 1
```

### D.13.6.25 tInitialFormPar

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\], page 7282](#)).

**Usage:** `tInitialFormPar(f,w)`;  $f$  a polynomial,  $w$  an integer vector

**Assume:**  $f$  is a polynomial in  $\mathbb{Q}(t)[x_1, \dots, x_n]$  and  $w=(w_1, \dots, w_2)$

**Return:** poly, the  $t$ -initialform of  $f(t,x)$  w.r.t.  $(1,w)$  evaluated at  $t=1$

**Note:** the  $t$ -initialform are the terms with MINIMAL weighted order w.r.t.  $(1,w)$

**Example:**

```
LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),(x,y),dp;
poly f=t4x2+y2-t2xy+t4x-t9;
intvec w=2,3;
tInitialFormPar(f,w);
↳ y2+x
```

### D.13.6.26 tInitialFormParMax

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\], page 7282](#)).

**Usage:** `tInitialFormParMax(f,w)`;  $f$  a polynomial,  $w$  an integer vector

**Assume:**  $f$  is a polynomial in  $\mathbb{Q}(t)[x_1, \dots, x_n]$  and  $w=(w_1, \dots, w_2)$

**Return:** poly, the  $t$ -initialform of  $f(t,x)$  w.r.t.  $(-1,w)$  evaluated at  $t=1$

**Note:** the  $t$ -initialform are the terms with MAXIMAL weighted order w.r.t.  $(1,w)$

**Example:**

```
LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),(x,y),dp;
poly f=t4x2+y2-t2xy+t4x-1/t6;
intvec w=2,3;
tInitialFormParMax(f,w);
↳ y2-1
```

### D.13.6.27 solveTInitialFormPar

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\], page 7282](#)).

**Usage:** `solveTInitialFormPar(i)`;  $i$  ideal

**Assume:**  $i$  is a zero-dimensional ideal in  $\mathbb{Q}(t)[x_1, \dots, x_n]$  generated by the  $(1,w)$ -homogeneous elements for some integer vector  $w$  - i.e. by the  $(1,w)$ -initialforms of polynomials

**Return:** none

**Note:** the procedure just displays complex approximations of the solution set of  $i$

**Example:**

```
LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),(x,y),dp;
ideal i=t2x2+y2,x-t2;
solveTInitialFormPar(i);
↳ [1]:
↳ [1]:
↳ 1
↳ [2]:
↳ -i
↳ [2]:
↳ [1]:
↳ 1
↳ [2]:
↳ i
↳ [1]:
↳ // coefficients: real[i](complex:8 digits, additional 8 digits)/(i^2+1\
)
↳ // number of vars : 2
↳ //      block  1 : ordering lp
↳ //      : names  x y
↳ //      block  2 : ordering C
```

### D.13.6.28 detropicalise

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\]](#), page 7282).

**Usage:** `detropicalise(f)`;  $f$  poly or  $f$  list

**Assume:** if  $f$  is of type `poly` then  $t$  is a linear polynomial with an arbitrary constant term and positive integer coefficients as further coefficients;  
if  $f$  is of type `list` then  $f$  is a list of polynomials of the type just described in before

**Return:** `poly`, the detropicalisation of  $f$  ignoring the constant parts

**Note:** the output will be a monomial and the constant coefficient has been ignored

**Example:**

```
LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),(x,y),dp;
detropicalise(3x+4y-1);
↳ x3y4
```

### D.13.6.29 tDetropicalise

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\], page 7282](#)).

**Usage:** `tDetropicalise(f)`;  $f$  poly or  $f$  list

**Assume:** if  $f$  is of type `poly` then  $f$  is a linear polynomial with an integer constant term and positive integer coefficients as further coefficients;  
if  $f$  is of type `list` then it is a list of polynomials of the type just described in before

**Return:** `poly`, the detropicalisation of  $f$  over the field  $\mathbb{Q}(t)$

**Note:** the output will be a term where the coefficient is a Laurent monomial in the variable  $t$

**Example:**

```
LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),(x,y),dp;
tDetropicalise(3x+4y-1);
↳ 1/(t)*x3y4
```

### D.13.6.30 dualConic

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\], page 7282](#)).

**Usage:** `dualConic(f)`;  $f$  poly

**Assume:**  $f$  is an affine conic in two variables  $x$  and  $y$

**Return:** `poly`, the equation of the dual conic

**Example:**

```
LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=0,(x,y),dp;
poly conic=2x2+1/2y2-1;
dualConic(conic);
↳ 1/2x2+2y2-1
```

### D.13.6.31 parameterSubstitute

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\], page 7282](#)).

**Usage:** `parameterSubstitute(f,N)`;  $f$  poly,  $N$  int

**Assume:**  $f$  is a polynomial in  $\mathbb{Q}(t)[x_1, \dots, x_n]$  describing a plane curve over  $\mathbb{Q}(t)$

**Return:** `poly`  $f$  with  $t$  replaced by  $t^N$

**Example:**

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),(x,y),dp;
poly f=t2xy+1/t*y+t3;

↳ 1/(t2)*xy+(t)*y+1/(t3)

```

### D.13.6.32 tropicalSubst

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\]](#), page 7282).

**Usage:** `parameterSubstitute(f,N,L)`;  $f$  poly,  $N$  int,  $L$  list

**Assume:**  $f$  is a polynomial in  $\mathbb{Q}(t)[x_1, \dots, x_k]$   
and  $L$  is a list of the form `var(i_1),poly_1,...,v(i_k),poly_k`

**Return:** list, the list is the tropical polynomial which we get from  $f$  by replacing the  $i$ -th variable be the  $i$ -th polynomial but in the  $i$ -th polynomial the parameter  $t$  is replaced by  $t^{1/N}$

**Example:**

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),(x,y),dp;
poly f=t2x+1/t*y-1;
tropicalSubst(f,2,x,x+t,y,tx+y+t2);
↳ [1]:
↳ x-1/2
↳ [2]:
↳ y-1
↳ [3]:
↳ 5/2
// The procedure can be used to study the effect of a transformation of
// the form  $x \rightarrow x+t^b$ , with  $b$  a rational number, on the tropicalisation and
// the  $j$ -invariant of a cubic over the Puiseux series.
f=t7*y3+t3*y2+t*(x3+xy2+y+1)+xy;
// - b=3/2, then the cycle length of the tropical cubic equals -val(j-inv)
list g32=tropicalSubst(f,2,x,x+t3,y,y);
tropicalJInvariant(g32);
↳ // ** int division with '/': use 'div' instead in line >> genus=-genus/2\
; // we have counted each bounded edge twice<<
↳ 5
// - b=1, then it is still true, but only just ...
list g1=tropicalSubst(f,1,x,x+t,y,y);
tropicalJInvariant(g1);
↳ // ** int division with '/': use 'div' instead in line >> genus=-genus/2\
; // we have counted each bounded edge twice<<
↳ 5

```

```
// - b=2/3, as soon as b<1, the cycle length is strictly less than -val(j-inv)
list g23=tropicalSubst(f,3,x,x+t2,y,y);
tropicalJInvariant(g23);
↳ // ** int division with '/': use 'div' instead in line >> genus=-genus/2\
    ; // we have counted each bounded edge twice<<
↳ 14/3
```

### D.13.6.33 randomPolyInT

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\], page 7282](#)).

**Usage:** `randomPolyInT(d,ug,og[,#]);` d, ug, og int, # list

**Assume:** the basering has a parameter t

**Return:** poly, a polynomial of degree d where the coefficients are of the form  $t^j$  with j a random integer between ug and og

**Note:** if an optional argument # is given, then the coefficients are instead either of the form  $t^j$  as above or they are zero, and this is chosen randomly

**Example:**

```
LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r=(0,t),(x,y),dp;
randomPolyInT(3,-2,5);
↳ (t5)*x3+1/(t2)*x2y+(t3)*xy2+(t4)*y3+1/(t)*x2+(t5)*xy+y2+1/(t2)*x+1/(t)*y+\
    1
randomPolyInT(3,-2,5,1);
↳ (t4)*y3+1/(t)*x2+(t2)*xy+(t2)*y2+(t3)*x
```

### D.13.6.34 cleanTmp

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\], page 7282](#)).

**Usage:** `cleanTmp()`

**Purpose:** some procedures create latex and ps-files in the directory /tmp; in order to remove them simply call `cleanTmp()`;

**Return:** none

### D.13.6.35 groebnerCone

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\], page 7282](#)).

**Usage:** `groebnerCone(I,w);` I ideal or poly, w intvec or bigintmat

**Assume:** I a reduced standard basis and w contained in the maximal Groebner cone

**Return:** cone, the Groebner cone of I with respect to w

**Example:**

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r = 0,(x,y,z),dp;
ideal I = cyclic(3);
option(redSB);
ideal stdI = std(I);
// w lies in the interior of a maximal Groebner cone
intvec w = 3,2,1;
cone CwI = groebnerCone(stdI,w);
print(rays(CwI));
↳ 1,1,0,
↳ 1,0,0,
↳ 1,1,1
// v lies on a facet of a maximal Groebner cone
intvec v = 2,1,0;
cone CvI = groebnerCone(stdI,v);
print(rays(CvI));
↳ 1,0,0,
↳ 1,1,0
// v lies on a ray of a maximal Groebner cone
intvec u = 1,1,1;
cone CuI = groebnerCone(stdI,u);
print(rays(CuI));
↳ 1,1,1

```

### D.13.6.36 maximalGroebnerCone

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\], page 7282](#)).

**Usage:** `maximalGroebnerCone(I)`; I ideal or poly

**Assume:** I a reduced standard basis

**Return:** cone, the maximal Groebner cone of I with respect to the current ordering

**Example:**

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r = 0,(x,y,z),dp;
ideal I = cyclic(3);
option(redSB);
ideal stdI = std(I);
cone CI = maximalGroebnerCone(stdI);
print(rays(CI));
↳ 1,1,0,
↳ 1,0,0,
↳ 1,1,1
ring s = 0,(x,y,z,u),dp;
ideal Ih = homog(cyclic(3),u);

```

```

ideal stdI = std(Ih);
cone CIh = maximalGroebnerCone(stdI);
print(rays(CIh));
↳ 1, 1,-1,-1,
↳ 3,-1,-1,-1,
↳ 1, 1, 1,-3
print(generatorsOfLinealitySpace(CIh));
↳ -1,-1,-1,-1
ring rw = 0,(x,y,z),(a(1,0,1),lp);
ideal I = cyclic(3);
ideal stdI = std(I);
CI = maximalGroebnerCone(stdI);
print(rays(CI));
↳ 1,0,0,
↳ 1,0,1,
↳ 1,1,1

```

### D.13.6.37 homogeneitySpace

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\], page 7282](#)).

**Usage:** `homogeneitySpace(I)`; I ideal or poly

**Assume:** I a reduced standard basis

**Return:** cone, the set of all weight vectors with respect to whom I is weighted homogeneous

**Example:**

```

LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r = 0,(x,y,z),dp;
ideal I = cyclic(3);
option(redSB);
ideal stdI = std(I);
cone COI = homogeneitySpace(stdI);
print(generatorsOfLinealitySpace(COI));
↳
ring s = 0,(x,y,z,u),dp;
ideal Ih = homog(cyclic(3),u);
ideal stdI = std(Ih);
cone COIh = homogeneitySpace(stdI);
print(generatorsOfLinealitySpace(COIh));
↳ -1,-1,-1,-1

```

### D.13.6.38 initial

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\], page 7282](#)).

**Usage:** `initial(f,w)`; f poly, w intvec or bigintmat  
`initial(I,w)`; I ideal, w intvec or bigintmat

**Assume:** I reduced Groebner basis,  
w in the maximal Groebner cone of I with respect to the current ordering

**Return:** poly or ideal, the initial form of  $f$  or the initial ideal of  $I$  with respect to  $w$

**Example:**

```
LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org
ring r = 0,(x,y,z),dp;
ideal I = cyclic(3);
intvec w = 1,1,1;
option(redSB);
ideal stdI = std(I);
stdI;
↳ stdI[1]=x+y+z
↳ stdI[2]=y2+yz+z2
↳ stdI[3]=z3-1
ideal inI = initial(stdI,w);
inI;
↳ inI[1]=x+y+z
↳ inI[2]=y2+yz+z2
↳ inI[3]=z3
```

### D.13.6.39 tropicalVariety

Procedure from library `tropical.lib` (see [Section D.13.6 \[tropical.lib\], page 7282](#)).

**Usage:** `tropicalVariety(f,[p]);`  $f$  poly,  $p$  optional number  
`tropicalVariety(I,[p]);`  $I$  ideal,  $p$  optional number

**Assume:**  $I$  homogeneous,  $p$  prime number

**Return:** fan, the tropical variety of  $f$  resp.  $I$  with respect to the trivial valuation or the  $p$ -adic valuation

**Note:** set `printlevel=1` for output during traversal

**Example:**

```
LIB "tropical.lib";
↳ Welcome to polymake version
↳ Copyright (c) 1997-2015
↳ Evgenij Gawrilow, Michael Joswig (TU Darmstadt)
↳ http://www.polymake.org

### D.13.7 tropicalNewton\_lib

**Library:** tropicalNewton.lib

**Purpose:** Computations in Tropical Geometry using Newton Polygon methods

**Authors:** Tommy Hofman, email: thofmann@mathematik.uni.kl.de Yue Ren, email: reny@cs.bgu.ac.il

**Overview:** This libraries contains algorithms for computing

- non-trivial points on tropical varieties,
- zero-dimensional tropical varieties,
- one-codimensional links of tropical varieties

based on Newton polygon methods.

**References:**

Hofmann, Ren: Computing tropical points and tropical links, arXiv:1611.02878 (WARNING: this library follows the max convention instead and triangular sets follow the definition of the Singular book)

**Procedures:** See also: [Section D.13.6.39 \[tropicalVariety\]](#), page 7324; [Section D.13.6 \[tropical\\_lib\]](#), page 7282.

### D.13.7.1 setUniformizingParameter

Procedure from library `tropicalNewton.lib` (see [Section D.13.7 \[tropicalNewton.lib\], page 7341](#)).

**Usage:** `setUniformizingParameter(p)`;  $p$  number

**Return:** none, sets the uniformizing parameter as  $p$

**Assume:**  $\text{char}(K) \neq 0$  and  $p$  prime number or  
 $\text{trdeg}(K) > 0$  and  $p$  transcendental variable or  
 $p = 0$

**Example:**

```
LIB "tropicalNewton.lib";
// poor man's polynomials over Puiseux series:
ring r = (0,t),x,dp;
setUniformizingParameter(t);
val(t2+t3);
  ↪ 2
val(t^-2+t^-3);
  ↪ -3
// poor man's polynomials over p-adic numbers:
ring s = 0,x,dp;
setUniformizingParameter(2);
val(12);
  ↪ 2
val(1/12);
  ↪ -2
```

### D.13.7.2 val

Procedure from library `tropicalNewton.lib` (see [Section D.13.7 \[tropicalNewton.lib\], page 7341](#)).

**Usage:** `val(c)`;  $c$  number

**Return:** int, the valuation of a element in the ground field

**Assume:** uniformizingParameter is set and  $c \neq 0$

**Example:**

```
LIB "tropicalNewton.lib";
// poor man's polynomials over Puiseux series:
ring r = (0,t),x,dp;
setUniformizingParameter(t);
val(t2+t3);
  ↪ 2
val(t^-2+t^-3);
  ↪ -3
// poor man's polynomials over p-adic numbers:
ring s = 0,x,dp;
setUniformizingParameter(2);
val(12);
  ↪ 2
val(1/12);
  ↪ -2
```

### D.13.7.3 newtonPolygonNegSlopes

Procedure from library `tropicalNewton.lib` (see [Section D.13.7 \[tropicalNewton.lib\], page 7341](#)).

**Usage:** `newtonPolygonNegSlopes(g,b);`  $g$  poly,  $b$  int

**Return:** list, the negative slopes of the Newton Polygon of  $g$   
if  $b=1$ , computes root (type poly) instead if (easily) possible

**Assume:** `uniformizingParameter` is set and  $g$  univariate

**Example:**

```
LIB "tropicalNewton.lib";
ring r = (0,t),x,dp;
setUniformizingParameter(t);
poly g = tx2+x+1;
newtonPolygonNegSlopes(g);
↳ [1]:
↳ 0
↳ [2]:
↳ -1
// poor man's polynomials over p-adic numbers:
ring s = 0,x,dp;
setUniformizingParameter(3);
poly g = x2+9x+1;
newtonPolygonNegSlopes(g);
↳ [1]:
↳ 0
```

### D.13.7.4 cccMatrixToPositiveIntvec

Procedure from library `tropicalNewton.lib` (see [Section D.13.7 \[tropicalNewton.lib\], page 7341](#)).

**Usage:** `cccMatrixToPositiveIntvec(M);`  $M$  matrix

**Return:** intvec, strictly positive equivalent as weight vector to row vector in  $M$

**Assume:** constant coefficient case only,  
will scale weight vector and add vectors of ones to it

**Example:**

```
LIB "tropicalNewton.lib";
ring r = (0,t),(p01,p02,p12,p03,p13,p23,p04,p14,p24,p34),dp;
number uniformizingParameter = t;
export(uniformizingParameter);
ideal I =
p23*p14-p13*p24+p12*p34,
p23*p04-p03*p24+p02*p34,
p13*p04-p03*p14+p01*p34,
p12*p04-p02*p14+p01*p24,
p12*p03-p02*p13+p01*p23;
system("--random",1337);
matrix p = tropicalPointNewton(I);
print(p);
↳ -59,-14,-87,57,-16,-63,41,-32,-90,-8
intvec w = cccMatrixToPositiveIntvec(p);
print(w);
```

```

↳ 32,
↳ 77,
↳ 4,
↳ 148,
↳ 75,
↳ 28,
↳ 132,
↳ 59,
↳ 1,
↳ 83
def s = switchRingsAndComputeInitialIdeal(I,w);
kill uniformizingParameter;

```

### D.13.7.5 tropicalPointNewton

Procedure from library `tropicalNewton.lib` (see [Section D.13.7 \[tropicalNewton.lib\], page 7341](#)).

**Usage:** `tropicalPointsLasVegas(I);` I ideal

**Return:** matrix, a matrix containing a tropical point as row vector

**Assume:** `uniformizingParameter` is set and I monomial free

**Note:** if `printlevel` sufficiently high will print intermediate data and timings returns error if randomly chosen hyperplanes are not generic

**Example:**

```

LIB "tropicalNewton.lib";
ring r = (0,t),(p01,p02,p12,p03,p13,p23,p04,p14,p24,p34),dp;
number uniformizingParameter = t;
export(uniformizingParameter);
ideal I =
p23*p14-p13*p24+p12*p34,
p23*p04-p03*p24+p02*p34,
p13*p04-p03*p14+p01*p34,
p12*p04-p02*p14+p01*p24,
p12*p03-p02*p13+p01*p23;
system("--random",1337);
printlevel = 3;
matrix p = tropicalPointNewton(I);

### D.13.7.6 switchRingsAndComputeInitialIdeal

Procedure from library `tropicalNewton.lib` (see [Section D.13.7 \[tropicalNewton.lib\]](#), page 7341).

**Usage:** `switchRingsAndComputeInitialIdeal(I,w)`; I ideal, w intvec

**Return:** ring, a ring containing the initial ideal with respect to w

**Assume:** constant coefficient case and w strictly positive integer

**Note:** if printlevel sufficiently high will print timing

**Example:**

```

LIB "tropicalNewton.lib";
ring r = (0,t),(p01,p02,p12,p03,p13,p23,p04,p14,p24,p34),dp;
number uniformizingParameter = t;
export(uniformizingParameter);
ideal I =
p23*p14-p13*p24+p12*p34,

```

```

p23*p04-p03*p24+p02*p34,
p13*p04-p03*p14+p01*p34,
p12*p04-p02*p14+p01*p24,
p12*p03-p02*p13+p01*p23;
system("--random",1337);
printlevel = 3;
matrix p = tropicalPointNewton(I);
↳ maximal independent set: 1,1,1,0,1,1,0,0,1,1
↳ substituting p01 with number of valuation 59
↳ substituting p02 with number of valuation 14
↳ substituting p12 with number of valuation 87
↳ substituting p13 with number of valuation 16
↳ substituting p23 with number of valuation 63
↳ substituting p24 with number of valuation 90

### D.13.7.7 tropicalVarietyNewton

Procedure from library `tropicalNewton.lib` (see [Section D.13.7 \[tropicalNewton.lib\], page 7341](#)).

**Usage:** `tropicalVarietyNewton(I);` I ideal

**Return:** matrix, a matrix containing all elements of the tropical variety

**Assume:** `uniformizingParameter` is set, I monomial free and zero-dimensional

**Example:**

```

LIB "tropicalNewton.lib";
ring r = (0,t),(z,y,x),lp;
number uniformizingParameter = t;
export(uniformizingParameter);
ideal I = tx2+x+1,txy2+xy+1,xyz+1;
list TI = tropicalVarietyNewton(I);
for (int i=1; i<=size(TI); i++)
{ print(TI[i]); }
↳ 0,0,0
↳ 0,-1,1
↳ -1,1,0
↳ -2,1,1
kill uniformizingParameter;

```

### D.13.7.8 tropicalLinkNewton

Procedure from library `tropicalNewton.lib` (see [Section D.13.7 \[tropicalNewton.lib\], page 7341](#)).

**Usage:** `tropicalLinkNewton(inI);` inI ideal

**Return:** matrix, a matrix containing generators of all rays of the tropical variety

**Assume:** constant coefficient case, inI is monomial free, its tropical variety has codimension one lineality space and is a polyhedral fan

**Note:** if `printlevel` sufficiently high will print intermediate results

**Example:**

```

LIB "tropicalNewton.lib";
// a 10 valent facet in tropical Grass(3,7)
ring r = (0,t),
(p012,p013,p023,p123,p014,p024,p124,p034,p134,p234,

## D.14 Miscellaneous libraries

### D.14.1 arr\_lib

**Library:** arr.lib

**Purpose:** a library of algorithms for arrangements of hyperplanes

**Authors:** Randolph Scholz (rscholz@rhrk.uni-kl.de),  
 Patrick Serwene (serwene@mathematik.uni-kl.de),  
 Lukas Kuehne (lf.kuehne@gmail.com)

**Overloads:**

```
// OPERATORS
= arrAdd assignment
+ arrAdd union of two arrs
[ arrGet access to a single/multiple hyperplane(s) - arrMinus deletes given hyperplanes
from the arr <= arrLEQ comparison
>= arrGEQ comparison
== arrEQ comparison
!= arrNEQ comparison
< arrLNEQ comparison
> arrGNEQ comparison
// TYPECASTING
matrix arr2mat coeff matrix
poly arr2poly defining polynomial
// OTHER
variables arrVariables ideal generated by the variables the arr depends on nvars arrN-
vars number of variables the arr depends on delete arrDelete deletes hyperplanes by
indices print arrPrint prints the arr on the screen
// IDEAL INHERITED FUNCTIONS
homog arrHomog checks if arrangement is homogeneous simplify arrSimplify simplifies
arrangement size arrSize number of planes
subst arrSubst substitute variables
// MULTI-ARRANGEMENTS
= multarrAdd assignment of multarr
+ multarrAdd union of multarr
poly multarr2poly defining polynomial
size multarrSize number of hyperplanes with mult. print multarrPrint displays multiarr
delete multarrDelete deletes hyperplane
```

**Procedures:****D.14.1.1 arrSet**

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrSet(A, k, p);` arr A, int k, poly p;

**Return:** [arr] Arrangement where the k-th hyperplane is replaced by p.

**Note:** p must be linear

**Example:**

```
LIB "arr.lib";
ring R = 0, (x,y,z), dp;
arr A = ideal(x,y,z);
arrSet(A,1,x+1);
↳ _[1]=x+1
↳ _[2]=y
↳ _[3]=z
↳
```

### D.14.1.2 type2arr

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `type2arr(#); # def`

**Return:** `[arr]` Arrangement defined by the input

**Note:** The procedure tries to cast the input to `[arr]` using `arrAdd`

**Example:**

```
LIB "arr.lib";
ring R = 0, (x,y,z), dp;
ideal I = x,y,z;
typeof(type2arr(I));
↳ arr
```

### D.14.1.3 mat2arr

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `mat2arr(M); matrix (M|b)`

**Return:** `[arr]` interprets the rows of the matrix as the defining polynomial equations of the arrangement where the last column will be considered as the constant terms, i.e. if  $M$  is an  $m \times (n+1)$  matrix we have  $H_i = \text{Ker}(M_{i1}x_1 + \dots + M_{in}x_n + M_{i(n+1)})$  for  $i=1\dots m$  and  $A = \{H_1, \dots, H_m\}$  the resulting arrangement.

**Example:**

```
LIB "arr.lib";
ring R = 0, (x,y,z), dp;
matrix M[4][4] = 1,0,1,1,1,1,0,2,0,1,1,3,2,1,1,4;
print(M);
↳ 1,0,1,1,
↳ 1,1,0,2,
↳ 0,1,1,3,
↳ 2,1,1,4
mat2arr(M);
↳ _[1]=x+z+1
↳ _[2]=x+y+2
↳ _[3]=y+z+3
↳ _[4]=2x+y+z+4
↳
```

See also: [Section D.14.1.4 \[mat2carr\]](#), page 7352.

### D.14.1.4 mat2carr

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `mat2carr(M); matrix M`

**Return:** `[arr]` interprets the rows of the matrix as the defining polynomial equations of the arrangement. I.e. if  $M$  is an  $m \times n$  matrix we have  $H_i = \text{Ker}(M_{i1}x_1 + \dots + M_{in}x_n)$  for  $i=1\dots m$  and  $A = \{H_1, \dots, H_m\}$  the resulting arrangement.

**Example:**

```

LIB "arr.lib";
ring R = 0, (x,y,z), dp;
matrix M[4][3] = 1,0,1,1,1,0,0,1,1,2,1,1;
print(M);
↳ 1,0,1,
↳ 1,1,0,
↳ 0,1,1,
↳ 2,1,1
mat2carr(M);
↳ _[1]=x+z
↳ _[2]=x+y
↳ _[3]=y+z
↳ _[4]=2x+y+z
↳

```

See also: [Section D.14.1.3 \[mat2arr\]](#), page 7352.

**D.14.1.5 arrPrintMatrix**

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrPrintMatrix(arr A)`

**Return:** `[]` prints `arr` in matrix form

**Note:** differs `print(matrix(arr A))` since variables included

**Example:**

```

LIB "arr.lib";
ring R = 0, (x,y,z), dp;
arr A = mat2arr(random(20,5,4));
A;
↳ _[1]=10x+y-2z-12
↳ _[2]=2x-16z-14
↳ _[3]=11y+16z-5
↳ _[4]=-16x-18y-5z+11
↳ _[5]=3x+8y+6
↳
arrPrintMatrix(A);
↳ 10x, y, -2z, -12,
↳ 2x, 0, -16z, -14,
↳ 0, 11y, 16z, -5,
↳ -16x, -18y, -5z, 11,
↳ 3x, 8y, 0, 6

```

**D.14.1.6 varMat**

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `varMat(v); v intvec`

**Return:** `[matrix] M` containing the corresponding ring\_variables

**Example:**

```
LIB "arr.lib";
ring R = 0, (x(1..6)), dp;
intvec v = 2,4,6;
varMat(v);
↳ _[1,1]=x(2)
↳ _[2,1]=x(4)
↳ _[3,1]=x(6)
```

See also: [Section D.14.1.9 \[arrLastVar\]](#), page 7355; [Section D.14.1.8 \[arrSwapVar\]](#), page 7354; [Section D.14.1.6 \[varMat\]](#), page 7353; [Section D.14.1.7 \[varNum\]](#), page 7354.

### D.14.1.7 varNum

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:**     varnum(string s);  
              varnum(ring\_variable);

**Return:**    [int] number of given ring variable, or 0 if it does not appear

**Note:**     This procedure has the same functionality as `varNum` from the `dmod.lib` package, but also accepts polys as input.

**Example:**

```
LIB "arr.lib";
ring R = 0, (x,y,z), dp;
varNum(y);
↳ 2
ring S = 0, (x(1..5),y(1..5)), dp;
varNum("y(3)");
↳ 8
```

See also: [Section D.14.1.9 \[arrLastVar\]](#), page 7355; [Section D.14.1.8 \[arrSwapVar\]](#), page 7354; [Section D.14.1.6 \[varMat\]](#), page 7353; [Section D.14.1.7 \[varNum\]](#), page 7354.

### D.14.1.8 arrSwapVar

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:**     arrSwapVar(A, i, j); arr A, ring\_variables/integers i,j

**Return:**    [arr] A where variables i and j are swapped.

**Note:**     if i and/or j are integers the algorithm considers the variables `variables(A)[i]` and/or `variables(A)[j]`

**Example:**

```
LIB "arr.lib";
ring R = 0, (x,y,z), lp;
arr A = ideal(x+1,x+y,z);
arrSwapVar(A,x,z);
↳ _[1]=z+1
↳ _[2]=y+z
↳ _[3]=x
↳
```

See also: [Section D.14.1.9 \[arrLastVar\]](#), page 7355; [Section D.14.1.8 \[arrSwapVar\]](#), page 7354; [Section D.14.1.6 \[varMat\]](#), page 7353; [Section D.14.1.7 \[varNum\]](#), page 7354.

### D.14.1.9 arrLastVar

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrLastVar(A); arr A`

**Return:** `[int]` number of the last variable A uses

**Note:** useful if you want a list containing all variables  $x_1 \dots x_k$  used in A, but you do not want to skip any like variables(A) does.

**Example:**

```
LIB "arr.lib";
ring R = 0,x(1..10),dp;
arr A = ideal(x(1), x(2), x(3), x(6));
int n = arrLastVar(A);
varMat(1..n);
  ↳ _[1,1]=x(1)
  ↳ _[2,1]=x(2)
  ↳ _[3,1]=x(3)
  ↳ _[4,1]=x(4)
  ↳ _[5,1]=x(5)
  ↳ _[6,1]=x(6)
variables(A);
  ↳ _[1]=x(1)
  ↳ _[2]=x(2)
  ↳ _[3]=x(3)
  ↳ _[4]=x(6)
```

See also: [Section D.14.1.9 \[arrLastVar\]](#), page 7355; [Section D.14.1.8 \[arrSwapVar\]](#), page 7354; [Section D.14.1.6 \[varMat\]](#), page 7353; [Section D.14.1.7 \[varNum\]](#), page 7354.

### D.14.1.10 arrCenter

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrCenter(A); arr A`

**Return:** `[list]` L entry 0 if A not centered or entries 1, x, H, where x is any particular point of the center and H is a matrix consisting of vectors which spanning linear intersection space.

If there is exactly one solution, then  $H = 0$ .

**Note:** The intersection of all hyperplanes can be expressed in forms of a linear system  $Ax=b$ , where  $(A|b)$  is the coeff. matrix of the arrangement, which is then solved using L-U decomposition

**Example:**

```
LIB "arr.lib";
ring R = 0,(x,y,z),dp;
arr A= ideal(x,y,x-y+1); // centerless
arrCenter(A);
  ↳ [1]:
  ↳ 0
arr B= ideal(x,y,z); // center is a single point
arrCenter(B);
  ↳ [1]:
```

```

↳ 1
↳ [2]:
↳ _[1,1]=0
↳ _[2,1]=0
↳ _[3,1]=0
↳ [3]:
↳ _[1,1]=0
arr C= ideal(x,z,x+z); // center is a line
// here we get a wrong result because the matrix is simplified since A doesn't
// contain any "y" the matrix (A|b) will be 3x3 only.
arrCenter(C);
↳ [1]:
↳ 1
↳ [2]:
↳ _[1,1]=0
↳ _[2,1]=0
↳ _[3,1]=0
↳ [3]:
↳ _[1,1]=0
↳ _[2,1]=-1
↳ _[3,1]=0

```

See also: [Section D.14.1.10 \[arrCenter\]](#), page 7355; [Section D.14.1.12 \[arrCentered\]](#), page 7356; [Section D.14.1.11 \[arrCentral\]](#), page 7356; [Section D.14.1.13 \[arrCentralize\]](#), page 7357.

### D.14.1.11 arrCentral

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrCentral(A)`; `arr A`

**Return:** `[0,1]` true if `arr` is central (i.e. all planes intersect in 0)

**Note:** This is the same as `homog(A)`

**Example:**

```

LIB "arr.lib";
ring R = 0, (x,y,z), dp;
// centered and central
arr A = ideal(x,y,z);
arrCentered(A);
↳ 1
arrCentral(A);
↳ 1
// centered but not central (center: (-1,-1/2, 1))
arr B = ideal(x+1,2y+1,-z+1);
arrCentered(B);
↳ 1
arrCentral(B);
↳ 0

```

See also: [Section D.14.1.10 \[arrCenter\]](#), page 7355; [Section D.14.1.12 \[arrCentered\]](#), page 7356; [Section D.14.1.11 \[arrCentral\]](#), page 7356; [Section D.14.1.13 \[arrCentralize\]](#), page 7357.

### D.14.1.12 arrCentered

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrCentered(A); arr A`

**Return:** `[0,1]` true if A is centered(i.e. intersection of all planes not empty)

**Note:** The algorithm uses the rank of matrix:  $Ax=b$  has a solution iff  $\text{rank}(A) = \text{rank}(A|b)$

**Example:**

```
LIB "arr.lib";
ring R = 0, (x,y,z), dp;
arr A= ideal(x,y,x-y+1);      // centerless
arrCentral(A);
↳ 0
arr B= ideal(x,y,z);         // central with center being the origin
arrCentral(B);
↳ 1
arr C= ideal(x+1,2y+1,-z+1); // central with center (-1,-1/2, 1)
arrCentral(C);
↳ 0
```

See also: [Section D.14.1.10 \[arrCenter\], page 7355](#); [Section D.14.1.12 \[arrCentered\], page 7356](#); [Section D.14.1.11 \[arrCentral\], page 7356](#); [Section D.14.1.13 \[arrCentralize\], page 7357](#).

### D.14.1.13 arrCentralize

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\], page 7350](#)).

**Usage:** `arrCentralize(A); arr A`

**Return:** `[arr]` A after centralization via coordinate change

**Note:** The coordinate change only does translation, vector of translation is the second output of `arrCenter`

**Example:**

```
LIB "arr.lib";
ring R = 0, (x,y,z), dp;
arr A = ideal(x-1,y,x-z-1,x-z-1);
arrCentralize(A);
↳ _[1]=x-2
↳ _[2]=y
↳ _[3]=x-z-2
↳
```

See also: [Section D.14.1.10 \[arrCenter\], page 7355](#); [Section D.14.1.12 \[arrCentered\], page 7356](#); [Section D.14.1.11 \[arrCentral\], page 7356](#); [Section D.14.1.13 \[arrCentralize\], page 7357](#).

### D.14.1.14 arrCoordChange

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\], page 7350](#)).

**Usage:** `arrCoordChange(A, T); arr A, (m*n mat) n*n or n*n+1 matrix T arrCoordChange(A, T, c); arr A, n*n matrix T, n*1 matrix/vector`

**Return:** `[arr]`: Arrangement A  $[A|b]$  after a coordinate change  $f: x \rightarrow Tx + c$  with T invertible i.e.  $[A|b] \Rightarrow [AT^{-1}|b+AT^{-1}c]$  since we have  
 $f(H) = f(\ker(a_1x_1 + \dots + a_nx_n - b)) = \{f(x) : a'x - b = 0\} = \{y : a'f^{-1}(y) - b = 0\}$   
 $= \{y : a'(T^{-1}(y-c)) - b = 0\}$   
 $= \{y : a'T^{-1}y - (b + a'T^{-1}c) = 0\}$

**Note:** There are 3 options how you can give the input (in each case  $n \leq \text{nvars}(\text{basing})$ )

1. Just a  $n \times n$  matrix with
  - => Will automatically complete T by a unit matrix and perform  $x \rightarrow Tx$
2. A  $n \times n$  matrix T and a  $n \times 1$  vector/matrix c with
  - => Will automatically complete T and c and perform  $x \rightarrow Tx + c$
3. A  $n \times n + 1$  matrix T with
  - => will use last column as translation vector c

**Example:**

```
LIB "arr.lib";
ring r = 0, (x,y,z), lp;
arr A = x,y,z;
arrCoordChange(A,1,[0,0,1]); //lifts z-hyperplane by 1 unit
↳ _[1]=x
↳ _[2]=y
↳ _[3]=z-1
↳
matrix T[2][2] = [0,1,1,0]; // swaps x and y
arrCoordChange(A,T);
↳ _[1]=y
↳ _[2]=x
↳ _[3]=z
↳
matrix c[2][1] = [1,0];
T = concat(T,c); // now swap x and y and add 1 to x afterwards
arrCoordChange(A,T);
↳ _[1]=y
↳ _[2]=x-1
↳ _[3]=z
↳
// Note how T doesn't even need to be a full 3x3 base change matrix.
```

See also: [Section D.14.1.14 \[arrCoordChange\], page 7357](#); [Section D.14.1.15 \[arrCoordNormalize\], page 7358](#).

**D.14.1.15 arrCoordNormalize**

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\], page 7350](#)).

**Usage:** `arrCoordChange(A, v);`

**Return:** `[arr]`: Arrangement after a coordinate change that transforms the arrangement such that after a transformation  $x \rightarrow Tx + c$  we have the arrangement has the matrix representation  $[AT^{-1} | b + AT^{-1}c]$  such that  $[AT^{-1}]_{-v} = I$  and  $[b + AT^{-1}c]_{-v} = 0$ ;

**Note:** algorithm performs a base change if  $H_k$  is homogeneous (i.e. has no) constant term and an affine transformation otherwise  
 $Ax + b = 0$ , Transformation  $x = Ty + c$ :  $AT^{-1}y + AT^{-1}c + b = 0$  Now we want to have  $(AT^{-1})_{-v} = I$  and  $(AT^{-1}c + b)_{-v} = AT^{-1}_{-v} * c + b_{-v} = 0$

**Example:**

```
LIB "arr.lib";
ring r = 0, (x,y,z), lp;
arr A = ideal(x,y,z,x+z+4);
intvec v = 1,2,4;
```

```

arrCoordNormalize(A,v);
↳ _[1]=x
↳ _[2]=y
↳ _[3]=-x+z-4
↳ _[4]=z
↳

```

See also: [Section D.14.1.14 \[arrCoordChange\]](#), page 7357; [Section D.14.1.15 \[arrCoordNormalize\]](#), page 7358.

### D.14.1.16 arrCone

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrCone(A);`  
`arrCone(A, ring_variable);` arr A arrangement in variables `x_1...x_n`;

**Return:** arr, the coned hyperplane Arrangement cA with respect to the given ring\_variable, or the last ring\_variable if none was given.

**Note:** The hyperplanes are homogenized w.r.t. v and a new hyperplane  $H = \ker(x_{n+1})$  is added.

**Example:**

```

LIB "arr.lib";
ring R = 0, (x,y,z), dp;
arr A = ideal(x+1, x,x-2,x-1);
arrCone(A, y);
↳ _[1]=x+y
↳ _[2]=x
↳ _[3]=x-2y
↳ _[4]=x-y
↳ _[5]=y
↳
arr B= ideal(x,y,x+y-1);
arrCone(B);
↳ _[1]=x
↳ _[2]=y
↳ _[3]=x+y-z
↳ _[4]=z
↳

```

See also: [Section D.14.1.16 \[arrCone\]](#), page 7359; [Section D.14.1.17 \[arrDecone\]](#), page 7359; [Section D.14.1.21 \[arrEssentialize\]](#), page 7362; [Section D.14.1.20 \[arrIsEssential\]](#), page 7361; [Section D.14.1.19 \[arrRestrict\]](#), page 7360.

### D.14.1.17 arrDecone

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrDecone(A, k);` arrangement A, integer k;

**Return:** arr: the deconed hyperplane Arrangement dA

**Note:** A has to be non-empty and central. `arrDecone` is an inverse operation to `arrCone` since  $A == \text{arrDecone}(\text{arrCone}(A), \text{size}(A)+1)$  for any A. One can also decone a central arrangement with respect to any hyper- plane k, but than a coordinate change is

necessary to make  $H_k = \ker(x_k)$ . Since such a coordinate change is not unique, use `arrCoordchange` to do so.

**Example:**

```
LIB "arr.lib";
ring R = 0, (x,y,z), dp;
arr A= ideal(x,y,z,x+y-z);
arrDecone(A,3);
  ↪ _[1]=x
  ↪ _[2]=y
  ↪ _[3]=x+y-1
  ↪
```

See also: [Section D.14.1.16 \[arrCone\]](#), page 7359; [Section D.14.1.17 \[arrDecone\]](#), page 7359; [Section D.14.1.21 \[arrEssentialize\]](#), page 7362; [Section D.14.1.20 \[arrIsEssential\]](#), page 7361; [Section D.14.1.19 \[arrRestrict\]](#), page 7360.

**D.14.1.18 arrLocalize**

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrLocalize(A, v)`; arrangement  $A$ , intvec  $v$ ;

**Return:** `arr`: the localized arrangement  $A_X$ , i.e.  $A_X$  only contains the hyperplanes which contain the flat  $X$ , which is defined by the equations  $A[v]$

**Example:**

```
LIB "arr.lib";
ring R = 0, (x,y,z), dp;
arr A=arrTypeB(3);
intvec v=5,8;
arr B=arrLocalize(A,v);
B;
  ↪ _[1]=x-y
  ↪ _[2]=x+y
  ↪ _[3]=x
  ↪ _[4]=y
  ↪
```

See also: [Section D.14.1.16 \[arrCone\]](#), page 7359; [Section D.14.1.17 \[arrDecone\]](#), page 7359; [Section D.14.1.21 \[arrEssentialize\]](#), page 7362; [Section D.14.1.20 \[arrIsEssential\]](#), page 7361; [Section D.14.1.19 \[arrRestrict\]](#), page 7360.

**D.14.1.19 arrRestrict**

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Return:** `arr`: the restricted hyperplane Arrangement ( $A^X$ )

**Note:**  $A$  has to be non-empty.

**Remarks:** We restrict  $A$  to the flat  $X$ , defined by the equations in  $A[v]$ . The restriction will only be performed, if the ideal defining the flat  $X$  is monomial (i.e.  $X$  is an intersection of coordinate planes). If the optional argument  $CC$  is given, the arrangement is transformed in such a way that  $X$  has the above form.

**Example:**

```

LIB "arr.lib";
ring S = 0, (x,y,z), dp;
arr A = arrTypeB(3);
A;
↳ _[1]=x-y
↳ _[2]=x+y
↳ _[3]=x-z
↳ _[4]=x+z
↳ _[5]=x
↳ _[6]=y-z
↳ _[7]=y+z
↳ _[8]=y
↳ _[9]=z
↳
arrRestrict(A,9);
↳ _[1]=x-y
↳ _[2]=x+y
↳ _[3]=x
↳ _[4]=y
↳
arrRestrict(A,4,"CC");
↳ _[1]=1/2y-z
↳ _[2]=1/2y+z
↳ _[3]=y
↳ _[4]=z
↳
intvec v=5,8;
arrRestrict(A,v);
↳ _[1]=-z
↳

```

### D.14.1.20 arrIsEssential

Procedure from library `arr.lib` (see [Section D.14.1 \[arr\\_lib\]](#), page 7350).

**Usage:** `arrIsEssential(A)`; arrangement A;

**Return:** boolean: 1 if arr is essential, i.e. rank of maximal element of poset is dimension

**Note:** A has to be non-empty.

**Example:**

```

LIB "arr.lib";
ring S = 0, (x,y,z), lp;
arr A = ideal(x,y,z);
arr B = ideal(x+y+z,x,y+z);
arrIsEssential(A);
↳ 1
arrIsEssential(B);
↳ 0

```

See also: [Section D.14.1.16 \[arrCone\]](#), page 7359; [Section D.14.1.17 \[arrDecone\]](#), page 7359; [Section D.14.1.21 \[arrEssentialize\]](#), page 7362; [Section D.14.1.20 \[arrIsEssential\]](#), page 7361; [Section D.14.1.19 \[arrRestrict\]](#), page 7360.

### D.14.1.21 arrEssentialize

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrEssentialize(A)`; arrangement A;

**Return:** essential arrangement by transformation

**Note:** A has to be non-empty.

**Example:**

```
LIB "arr.lib";
ring S = 0,(x,y,z),dp;
arr A=arrBraid(3);
arrEssentialize(A);
↳ _[1]=x-y
↳ _[2]=x
↳ _[3]=y
↳
arr B = ideal(x+y+z,x,y+z);
arrEssentialize(B);
↳ _[1]=x+y
↳ _[2]=x
↳ _[3]=y
↳
```

See also: [Section D.14.1.16 \[arrCone\]](#), page 7359; [Section D.14.1.17 \[arrDecone\]](#), page 7359; [Section D.14.1.21 \[arrEssentialize\]](#), page 7362; [Section D.14.1.20 \[arrIsEssential\]](#), page 7361; [Section D.14.1.19 \[arrRestrict\]](#), page 7360.

### D.14.1.22 arrBoolean

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrBoolean(v)`; int v

**Return:** arr, which uses the first v variables of ring for boolean arrangement

**Example:**

```
LIB "arr.lib";
ring R = 0,x(1..10),dp;
arrBoolean(7);
↳ _[1]=x(1)
↳ _[2]=x(2)
↳ _[3]=x(3)
↳ _[4]=x(4)
↳ _[5]=x(5)
↳ _[6]=x(6)
↳ _[7]=x(7)
↳
```

See also: [Section D.14.1.22 \[arrBoolean\]](#), page 7362; [Section D.14.1.23 \[arrBraid\]](#), page 7363; [Section D.14.1.28 \[arrEdelmanReiner\]](#), page 7366; [Section D.14.1.26 \[arrRandom\]](#), page 7365; [Section D.14.1.24 \[arrTypeB\]](#), page 7363; [Section D.14.1.25 \[arrTypeD\]](#), page 7364.

### D.14.1.23 arrBraid

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrBraid(v); int v`

**Return:** Type A (braid) arrangement of dimension  $v$

**Example:**

```
LIB "arr.lib";
ring R = 0,x(1..10),dp;
arrBraid(7);
↳ _[1]=x(1)-x(2)
↳ _[2]=x(1)-x(3)
↳ _[3]=x(1)-x(4)
↳ _[4]=x(1)-x(5)
↳ _[5]=x(1)-x(6)
↳ _[6]=x(1)-x(7)
↳ _[7]=x(2)-x(3)
↳ _[8]=x(2)-x(4)
↳ _[9]=x(2)-x(5)
↳ _[10]=x(2)-x(6)
↳ _[11]=x(2)-x(7)
↳ _[12]=x(3)-x(4)
↳ _[13]=x(3)-x(5)
↳ _[14]=x(3)-x(6)
↳ _[15]=x(3)-x(7)
↳ _[16]=x(4)-x(5)
↳ _[17]=x(4)-x(6)
↳ _[18]=x(4)-x(7)
↳ _[19]=x(5)-x(6)
↳ _[20]=x(5)-x(7)
↳ _[21]=x(6)-x(7)
↳
```

See also: [Section D.14.1.22 \[arrBoolean\]](#), page 7362; [Section D.14.1.23 \[arrBraid\]](#), page 7363; [Section D.14.1.28 \[arrEdelmanReiner\]](#), page 7366; [Section D.14.1.26 \[arrRandom\]](#), page 7365; [Section D.14.1.24 \[arrTypeB\]](#), page 7363; [Section D.14.1.25 \[arrTypeD\]](#), page 7364.

### D.14.1.24 arrTypeB

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrTypeB(v); int v`

**Return:** arrangement, which uses first  $v$  variables of ring for reflection arrangement of type B

**Example:**

```
LIB "arr.lib";
ring R = 0,x(1..10),dp;
arrTypeB(5);
↳ _[1]=x(1)-x(2)
↳ _[2]=x(1)+x(2)
↳ _[3]=x(1)-x(3)
↳ _[4]=x(1)+x(3)
↳ _[5]=x(1)-x(4)
```

```

↳  $\_ [6] = x(1) + x(4)$ 
↳  $\_ [7] = x(1) - x(5)$ 
↳  $\_ [8] = x(1) + x(5)$ 
↳  $\_ [9] = x(1)$ 
↳  $\_ [10] = x(2) - x(3)$ 
↳  $\_ [11] = x(2) + x(3)$ 
↳  $\_ [12] = x(2) - x(4)$ 
↳  $\_ [13] = x(2) + x(4)$ 
↳  $\_ [14] = x(2) - x(5)$ 
↳  $\_ [15] = x(2) + x(5)$ 
↳  $\_ [16] = x(2)$ 
↳  $\_ [17] = x(3) - x(4)$ 
↳  $\_ [18] = x(3) + x(4)$ 
↳  $\_ [19] = x(3) - x(5)$ 
↳  $\_ [20] = x(3) + x(5)$ 
↳  $\_ [21] = x(3)$ 
↳  $\_ [22] = x(4) - x(5)$ 
↳  $\_ [23] = x(4) + x(5)$ 
↳  $\_ [24] = x(4)$ 
↳  $\_ [25] = x(5)$ 
↳

```

See also: [Section D.14.1.22 \[arrBoolean\]](#), page 7362; [Section D.14.1.23 \[arrBraid\]](#), page 7363; [Section D.14.1.28 \[arrEdelmanReiner\]](#), page 7366; [Section D.14.1.26 \[arrRandom\]](#), page 7365; [Section D.14.1.24 \[arrTypeB\]](#), page 7363; [Section D.14.1.25 \[arrTypeD\]](#), page 7364.

### D.14.1.25 arrTypeD

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrTypeD(v); int v`

**Return:** arrangement, which uses first  $v$  variables of ring for reflection arrangement of type D

**Example:**

```

LIB "arr.lib";
ring R = 0,x(1..10),dp;
arrTypeD(5);
↳  $\_ [1] = x(1) - x(2)$ 
↳  $\_ [2] = x(1) + x(2)$ 
↳  $\_ [3] = x(1) - x(3)$ 
↳  $\_ [4] = x(1) + x(3)$ 
↳  $\_ [5] = x(1) - x(4)$ 
↳  $\_ [6] = x(1) + x(4)$ 
↳  $\_ [7] = x(1) - x(5)$ 
↳  $\_ [8] = x(1) + x(5)$ 
↳  $\_ [9] = x(2) - x(3)$ 
↳  $\_ [10] = x(2) + x(3)$ 
↳  $\_ [11] = x(2) - x(4)$ 
↳  $\_ [12] = x(2) + x(4)$ 
↳  $\_ [13] = x(2) - x(5)$ 
↳  $\_ [14] = x(2) + x(5)$ 
↳  $\_ [15] = x(3) - x(4)$ 
↳  $\_ [16] = x(3) + x(4)$ 
↳  $\_ [17] = x(3) - x(5)$ 

```

```

↳  $_{[18]} = x(3) + x(5)$ 
↳  $_{[19]} = x(4) - x(5)$ 
↳  $_{[20]} = x(4) + x(5)$ 
↳

```

See also: [Section D.14.1.22 \[arrBoolean\]](#), page 7362; [Section D.14.1.23 \[arrBraid\]](#), page 7363; [Section D.14.1.28 \[arrEdelmanReiner\]](#), page 7366; [Section D.14.1.26 \[arrRandom\]](#), page 7365; [Section D.14.1.24 \[arrTypeB\]](#), page 7363; [Section D.14.1.25 \[arrTypeD\]](#), page 7364.

### D.14.1.26 arrRandom

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrRandom(n,v,N); int n,v,N`

**Return:** Random arrangement, where  $m$  is the number of hyperplanes,  $n$  the dimension,  $d$  the upper bound for absolute value of coefficients.

**Note:** You can also write `arr = random(d,m,n)` to create random arrangements

**Example:**

```

LIB "arr.lib";
ring R = 0,x(1..20),dp;
arrRandom(7,3,15);
↳  $_{[1]} = 2x(1) - 6x(2) - 3x(3) + 4x(5) + x(6) - 4x(7) - 3x(8) - x(9) + x(10) - 3x(11) - 6x(12) - x(13) + 2x(14) - 6x(15) - 4$ 
↳  $_{[2]} = x(1) - 3x(2) - 4x(3) - 7x(5) - 3x(6) + x(8) - 3x(9) - 4x(10) - x(11) - 7x(12) - 2x(13) - 3x(14) - 1$ 
↳  $_{[3]} = 4x(1) + 2x(2) + 5x(3) - x(4) + 6x(5) + 5x(6) - 6x(7) + 5x(8) + x(10) + 3x(11) - 5x(12) + 2x(13) + 6x(14) + x(15) + 3$ 
↳

```

See also: [Section D.14.1.22 \[arrBoolean\]](#), page 7362; [Section D.14.1.23 \[arrBraid\]](#), page 7363; [Section D.14.1.28 \[arrEdelmanReiner\]](#), page 7366; [Section D.14.1.26 \[arrRandom\]](#), page 7365; [Section D.14.1.24 \[arrTypeB\]](#), page 7363; [Section D.14.1.25 \[arrTypeD\]](#), page 7364.

### D.14.1.27 arrRandomCentral

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrRandomCentral(d,m,n); int d,m,n`

**Return:** Random central arrangement, where  $m$  is the number of hyperplanes,  $n$  the dimension,  $d$  the upper bound for absolute value of coefficients.

**Example:**

```

LIB "arr.lib";
ring R = 0,x(1..20),dp;
arrRandomCentral(7,3,15);
↳  $_{[1]} = 2x(1) - 6x(2) - 3x(3) + 4x(5) + x(6) - 4x(7) - 3x(8) - x(9) + x(10) - 3x(11) - 6x(12) - x(13) + 2x(14) - 6x(15)$ 
↳  $_{[2]} = -4x(1) + x(2) - 3x(3) - 4x(4) - 7x(6) - 3x(7) + x(9) - 3x(10) - 4x(11) - x(12) - 7x(13) - 2x(14) - 3x(15)$ 
↳  $_{[3]} = -x(2) + 4x(3) + 2x(4) + 5x(5) - x(6) + 6x(7) + 5x(8) - 6x(9) + 5x(10) + x(12) + 3x(13) - 5x(14) + 2x(15)$ 
↳

```

See also: [Section D.14.1.22 \[arrBoolean\]](#), page 7362; [Section D.14.1.23 \[arrBraid\]](#), page 7363; [Section D.14.1.28 \[arrEdelmanReiner\]](#), page 7366; [Section D.14.1.26 \[arrRandom\]](#), page 7365; [Section D.14.1.24 \[arrTypeB\]](#), page 7363; [Section D.14.1.25 \[arrTypeD\]](#), page 7364.

### D.14.1.28 arrEdelmanReiner

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrEdelmanReiner();`

**Return:** the Edelman-Reiner arrangement, which is a free arrangement but the restriction to the 6-th hyperplane is nonfree.  
(i.e. counterexample for Orlik-Conjecture)

**Note:** the active ring must have at least five variables

**Example:**

```
LIB "arr.lib";
ring r=0,x(1..5),dp;
arrEdelmanReiner();
↳ _[1]=x(1)
↳ _[2]=x(2)
↳ _[3]=x(3)
↳ _[4]=x(4)
↳ _[5]=x(5)
↳ _[6]=x(1)-x(2)-x(3)-x(4)-x(5)
↳ _[7]=x(1)-x(2)-x(3)-x(4)+x(5)
↳ _[8]=x(1)-x(2)-x(3)+x(4)-x(5)
↳ _[9]=x(1)-x(2)-x(3)+x(4)+x(5)
↳ _[10]=x(1)-x(2)+x(3)-x(4)-x(5)
↳ _[11]=x(1)-x(2)+x(3)-x(4)+x(5)
↳ _[12]=x(1)-x(2)+x(3)+x(4)-x(5)
↳ _[13]=x(1)-x(2)+x(3)+x(4)+x(5)
↳ _[14]=x(1)+x(2)-x(3)-x(4)-x(5)
↳ _[15]=x(1)+x(2)-x(3)-x(4)+x(5)
↳ _[16]=x(1)+x(2)-x(3)+x(4)-x(5)
↳ _[17]=x(1)+x(2)-x(3)+x(4)+x(5)
↳ _[18]=x(1)+x(2)+x(3)-x(4)-x(5)
↳ _[19]=x(1)+x(2)+x(3)-x(4)+x(5)
↳ _[20]=x(1)+x(2)+x(3)+x(4)-x(5)
↳ _[21]=x(1)+x(2)+x(3)+x(4)+x(5)
↳
```

See also: [Section D.14.1.22 \[arrBoolean\]](#), page 7362; [Section D.14.1.23 \[arrBraid\]](#), page 7363; [Section D.14.1.28 \[arrEdelmanReiner\]](#), page 7366; [Section D.14.1.26 \[arrRandom\]](#), page 7365; [Section D.14.1.24 \[arrTypeB\]](#), page 7363; [Section D.14.1.25 \[arrTypeD\]](#), page 7364.

### D.14.1.29 arrOrlikSolomon

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrOrlikSolomon(A); arr A`

**Return:** [ring] exterior Algebra E as ring with Orlik-Solomon ideal as attribute I. The Orlik-Solomon ideal is generated by the differentials of dependent tuples of hyperplanes. For a complex arrangement the quotient  $E/I$  is isomorphic to the cohomology ring of the complement of the arrangement.

**Note:** In order to access this ideal I activate this exterior algebra with setring.

**Example:**

```
LIB "arr.lib";
ring R = 0, (x,y,z), dp;
arr A = arrTypeB(3);
def E = arrOrlikSolomon(A);
setring E;
//The generators of the Orlik-Solomon-Ideal are:
I;
↳ I[1]=e(7)*e(8)-e(7)*e(9)+e(8)*e(9)
↳ I[2]=e(6)*e(8)-e(6)*e(9)+e(8)*e(9)
↳ I[3]=e(6)*e(7)-e(6)*e(9)+e(7)*e(9)
↳ I[4]=e(4)*e(5)-e(4)*e(9)+e(5)*e(9)
↳ I[5]=e(3)*e(5)-e(3)*e(9)+e(5)*e(9)
↳ I[6]=e(3)*e(4)-e(3)*e(9)+e(4)*e(9)
↳ I[7]=e(6)*e(7)-e(6)*e(8)+e(7)*e(8)
↳ I[8]=e(2)*e(5)-e(2)*e(8)+e(5)*e(8)
↳ I[9]=e(1)*e(5)-e(1)*e(8)+e(5)*e(8)
↳ I[10]=e(1)*e(2)-e(1)*e(8)+e(2)*e(8)
↳ I[11]=e(1)*e(4)-e(1)*e(7)+e(4)*e(7)
↳ I[12]=e(2)*e(3)-e(2)*e(7)+e(3)*e(7)
↳ I[13]=e(2)*e(4)-e(2)*e(6)+e(4)*e(6)
↳ I[14]=e(1)*e(3)-e(1)*e(6)+e(3)*e(6)
↳ I[15]=e(3)*e(4)-e(3)*e(5)+e(4)*e(5)
↳ I[16]=e(1)*e(2)-e(1)*e(5)+e(2)*e(5)
↳ I[17]=-e(2)*e(4)*e(8)+e(2)*e(4)*e(9)-e(2)*e(8)*e(9)+e(4)*e(8)*e(9)
↳ I[18]=-e(1)*e(4)*e(8)+e(1)*e(4)*e(9)-e(1)*e(8)*e(9)+e(4)*e(8)*e(9)
↳ I[19]=-e(2)*e(3)*e(8)+e(2)*e(3)*e(9)-e(2)*e(8)*e(9)+e(3)*e(8)*e(9)
↳ I[20]=-e(1)*e(3)*e(8)+e(1)*e(3)*e(9)-e(1)*e(8)*e(9)+e(3)*e(8)*e(9)
↳ I[21]=-e(2)*e(5)*e(7)+e(2)*e(5)*e(9)-e(2)*e(7)*e(9)+e(5)*e(7)*e(9)
↳ I[22]=-e(1)*e(5)*e(7)+e(1)*e(5)*e(9)-e(1)*e(7)*e(9)+e(5)*e(7)*e(9)
↳ I[23]=-e(2)*e(4)*e(7)+e(2)*e(4)*e(9)-e(2)*e(7)*e(9)+e(4)*e(7)*e(9)
↳ I[24]=-e(1)*e(3)*e(7)+e(1)*e(3)*e(9)-e(1)*e(7)*e(9)+e(3)*e(7)*e(9)
↳ I[25]=-e(1)*e(2)*e(7)+e(1)*e(2)*e(9)-e(1)*e(7)*e(9)+e(2)*e(7)*e(9)
↳ I[26]=-e(2)*e(5)*e(6)+e(2)*e(5)*e(9)-e(2)*e(6)*e(9)+e(5)*e(6)*e(9)
↳ I[27]=-e(1)*e(5)*e(6)+e(1)*e(5)*e(9)-e(1)*e(6)*e(9)+e(5)*e(6)*e(9)
↳ I[28]=-e(1)*e(4)*e(6)+e(1)*e(4)*e(9)-e(1)*e(6)*e(9)+e(4)*e(6)*e(9)
↳ I[29]=-e(2)*e(3)*e(6)+e(2)*e(3)*e(9)-e(2)*e(6)*e(9)+e(3)*e(6)*e(9)
↳ I[30]=-e(1)*e(2)*e(6)+e(1)*e(2)*e(9)-e(1)*e(6)*e(9)+e(2)*e(6)*e(9)
↳ I[31]=-e(1)*e(2)*e(4)+e(1)*e(2)*e(9)-e(1)*e(4)*e(9)+e(2)*e(4)*e(9)

↳ I[54]=-e(2)*e(3)*e(5)+e(2)*e(3)*e(6)-e(2)*e(5)*e(6)+e(3)*e(5)*e(6)
↳ I[55]=-e(1)*e(2)*e(3)+e(1)*e(2)*e(4)-e(1)*e(3)*e(4)+e(2)*e(3)*e(4)

```

See also: [Section D.14.1.29 \[arrOrlikSolomon\]](#), page 7366.

### D.14.1.30 arrDer

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrDer(A); arr A , multarr A`

**Return:** [module] The module `Der(A)` of derivations of the (multi-)arrangement `A`, i.e. the derivations tangent to each hyperplane of `A` (resp. with multiplicities)

**Note:** This is only defined for central (multi-)arrangements

**Example:**

```

LIB "arr.lib";
ring R = 0, (x,y,z), dp;
arr A3 = arrBoolean(3);
arr B3 = arrTypeB(3);
arr G = ideal(x,y,z,x+y+z);
//The derivation module of the Boolean 3-arrangement:
arrDer(A3);
↳ _[1]=z*gen(3)
↳ _[2]=y*gen(2)
↳ _[3]=x*gen(1)
//The derivation module of the Braid 3-arrangement:
arrDer(B3);
↳ _[1]=x*gen(1)+y*gen(2)+z*gen(3)
↳ _[2]=x2y*gen(2)-y3*gen(2)+x2z*gen(3)-z3*gen(3)
↳ _[3]=x2y2z*gen(3)-x2z3*gen(3)-y2z3*gen(3)+z5*gen(3)
//The derivation module of the generic arrangement:
arrDer(G);
↳ _[1]=x*gen(1)+y*gen(2)+z*gen(3)
↳ _[2]=yz*gen(3)-yz*gen(2)
↳ _[3]=xz*gen(3)+yz*gen(2)+z2*gen(3)
↳ _[4]=xy*gen(2)+y2*gen(2)+yz*gen(2)

```

See also: [Section D.14.1.30 \[arrDer\]](#), page 7368; [Section D.14.1.32 \[arrExponents\]](#), page 7369; [Section D.14.1.31 \[arrIsFree\]](#), page 7368.

### D.14.1.31 arrIsFree

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrIsFree(A); arr A, multarr A`

**Return:** [0,1] 1 if the (multi-)arrangement is free, i.e.  $\text{Der}(A)$  is a free module

**Note:** only defined for central arrangements

**Example:**

```
LIB "arr.lib";
ring R = 0, (x,y,z), dp;
arr A3 = arrBoolean(3);
arr B3 = arrTypeB(3);
arr G = ideal(x,y,z,x+y+z);
arrIsFree(A3);
↳ 1
arrIsFree(B3);
↳ 1
arrIsFree(G);
↳ 0
```

See also: [Section D.14.1.30 \[arrDer\]](#), page 7368; [Section D.14.1.32 \[arrExponents\]](#), page 7369; [Section D.14.1.31 \[arrIsFree\]](#), page 7368.

### D.14.1.32 arrExponents

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrExponents(A)`; `arr A`, `multarr A`

**Return:** [intvec] The exponents of a free (multi-) arrangement, i.e. the degrees of a basis of  $D(A)$  the derivation module.

**Note:** only defined for central arrangements

**Example:**

```
LIB "arr.lib";
ring R = 0, (x,y,z), dp;
arr A3 = arrBoolean(3);
arr B3 = arrTypeB(3);
arr G = ideal(x,y,z,x+y+z);
arrExponents(A3);
↳ 1,1,1
arrExponents(B3);
↳ 1,3,5
```

See also: [Section D.14.1.30 \[arrDer\]](#), page 7368; [Section D.14.1.32 \[arrExponents\]](#), page 7369; [Section D.14.1.31 \[arrIsFree\]](#), page 7368.

### D.14.1.33 arr2multarr

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `multArrFromIntvec(arr A, intvec v)`;

**Return:** [multarr] multiarrangement  $MA$ , which is the arrangement  $A$  with multiplicities  $v$

**Note:** the size of  $v$  must match the number of hyperplanes of the arrangement  $A$

**Example:**

```

LIB "arr.lib";
ring R = 0, (x,y,z), dp;
arr A = arrTypeB(3);           A;
↳ _[1]=x-y
↳ _[2]=x+y
↳ _[3]=x-z
↳ _[4]=x+z
↳ _[5]=x
↳ _[6]=y-z
↳ _[7]=y+z
↳ _[8]=y
↳ _[9]=z
↳
intvec v=2:9;                 v;
↳ 2,2,2,2,2,2,2,2,2
multarr MA=arr2multarr(A,v);
MA;
↳ _[1]=(x-y)^2
↳ _[2]=(x+y)^2
↳ _[3]=(x-z)^2
↳ _[4]=(x+z)^2
↳ _[5]=(x)^2
↳ _[6]=(y-z)^2
↳ _[7]=(y+z)^2
↳ _[8]=(y)^2
↳ _[9]=(z)^2
↳

```

See also: [Section D.14.1.33 \[arr2multarr\]](#), page 7369; [Section D.14.1.34 \[multarr2arr\]](#), page 7370.

### D.14.1.34 multarr2arr

Procedure from library `arr.lib` (see [Section D.14.1 \[arr\\_lib\]](#), page 7350).

**Usage:** `multarr2arr(multarr A, intvec v);`

**Return:** `[arr]` arrangement A, with all multiplicities removed

**Example:**

```

LIB "arr.lib";
ring r = 0, (x,y,z), dp;
multarr A=x2y3z5;   A;
↳ _[1]=(x)^2
↳ _[2]=(y)^3
↳ _[3]=(z)^5
↳
arr AS = multarr2arr(A); AS;
↳ _[1]=x
↳ _[2]=y
↳ _[3]=z
↳

```

See also: [Section D.14.1.33 \[arr2multarr\]](#), page 7369; [Section D.14.1.34 \[multarr2arr\]](#), page 7370.

### D.14.1.35 multarrRestrict

Procedure from library `arr.lib` (see [Section D.14.1 \[arr\\_lib\]](#), page 7350).

**Return:** [multarr] the restricted hyperplane Multi-Arrangement ( $A^X$ ) with multiplicities i.e. counting how often one element of the restricted arrangement occurs as intersection of hyperplane of the first arrangement. This definition is due to Guenter M. Ziegler.

**Note:** A has to be non-empty.

**Remarks:** We restrict A to the flat X, defined by the equations in  $A[v]$ . The restriction will only be performed, if the ideal defining the flat X is monomial (i.e. X is an intersection of coordinate planes). If the optional argument CC is given, the arrangement is transformed in such a way that X has the above form.

**Example:**

```
LIB "arr.lib";
ring R = 0,x(1..5),dp;
arr A = arrEdelmanReiner();  A;
↳ _[1]=x(1)
↳ _[2]=x(2)
↳ _[3]=x(3)
↳ _[4]=x(4)
↳ _[5]=x(5)
↳ _[6]=x(1)-x(2)-x(3)-x(4)-x(5)
↳ _[7]=x(1)-x(2)-x(3)-x(4)+x(5)
↳ _[8]=x(1)-x(2)-x(3)+x(4)-x(5)
↳ _[9]=x(1)-x(2)-x(3)+x(4)+x(5)
↳ _[10]=x(1)-x(2)+x(3)-x(4)-x(5)
↳ _[11]=x(1)-x(2)+x(3)-x(4)+x(5)
↳ _[12]=x(1)-x(2)+x(3)+x(4)-x(5)
↳ _[13]=x(1)-x(2)+x(3)+x(4)+x(5)
↳ _[14]=x(1)+x(2)-x(3)-x(4)-x(5)
↳ _[15]=x(1)+x(2)-x(3)-x(4)+x(5)
↳ _[16]=x(1)+x(2)-x(3)+x(4)-x(5)
↳ _[17]=x(1)+x(2)-x(3)+x(4)+x(5)
↳ _[18]=x(1)+x(2)+x(3)-x(4)-x(5)
↳ _[19]=x(1)+x(2)+x(3)-x(4)+x(5)
↳ _[20]=x(1)+x(2)+x(3)+x(4)-x(5)
↳ _[21]=x(1)+x(2)+x(3)+x(4)+x(5)
↳
multarr AR = multarrRestrict(A,6,"CC");  AR;
↳ _[1]=(x(2)+1/4*x(3)+1/4*x(4)+1/4*x(5))^2
↳ _[2]=(x(2)+4*x(3)-x(4)-x(5))^2
↳ _[3]=(x(2)-x(3)+4*x(4)-x(5))^2
↳ _[4]=(x(2)-x(3)-x(4)+4*x(5))^2
↳ _[5]=(x(2)-x(3)-x(4)-x(5))^2
↳ _[6]=(x(2)-x(3)-x(4)+3/2*x(5))^1
↳ _[7]=(x(2)-x(3)+3/2*x(4)-x(5))^1
↳ _[8]=(x(2)-x(3)+3/2*x(4)+3/2*x(5))^1
↳ _[9]=(x(2)-x(3)+2/3*x(4)+2/3*x(5))^1
↳ _[10]=(x(2)+3/2*x(3)-x(4)-x(5))^1
↳ _[11]=(x(2)+3/2*x(3)-x(4)+3/2*x(5))^1
↳ _[12]=(x(2)+2/3*x(3)-x(4)+2/3*x(5))^1
↳ _[13]=(x(2)+3/2*x(3)+3/2*x(4)-x(5))^1
↳ _[14]=(x(2)+2/3*x(3)+2/3*x(4)-x(5))^1
↳ _[15]=(x(2)+2/3*x(3)+2/3*x(4)+2/3*x(5))^1
↳
```

See also: [Section D.14.1.19 \[arrRestrict\]](#), page 7360; [Section D.14.1.36 \[multarrMultRestrict\]](#), page 7372; [Section D.14.1.35 \[multarrRestrict\]](#), page 7370.

### D.14.1.36 multarrMultRestrict

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `multarrMultRestrict(A, k)`; multiarrangement A, integer k;

**Return:** `[multarr]` the restricted hyperplane Multi-Arrangement ( $A^{\wedge}H_k$ ) with multiplicities, i.e. counting with multiplicities how often one element of the restricted arrangement occurs as intersection of hyperplane of the first multiarrangement. This definition is due to Guenter M. Ziegler.

**Note:** A has to be non-empty.

**Remarks:** The restriction will only be performed, if  $H_k = \ker(x_i)$  for some i. One can also restrict an arrangement with respect to any hyperplane k, but then a coordinate change is necessary first to make  $H_k = \ker(x_k)$ . Since such a coordinate change is not unique, please use `arrCoordchange` to do so.

**Example:**

```
LIB "arr.lib";
ring R = 0, (x,y,z), dp;
multarr A = ideal(x2,y2,z2, (x-y)^3, (x-z)^2, (y-z));    A;
↳ _[1]=(x)^2
↳ _[2]=(y)^2
↳ _[3]=(z)^2
↳ _[4]=(x-y)^3
↳ _[5]=(x-z)^2
↳ _[6]=(y-z)^1
↳
//The restriction of the multiarrangement is:
multarr AR = multarrMultRestrict(A,1);    AR;
↳ _[1]=(y)^5
↳ _[2]=(z)^4
↳ _[3]=(y-z)^1
↳
```

See also: [Section D.14.1.19 \[arrRestrict\]](#), page 7360; [Section D.14.1.36 \[multarrMultRestrict\]](#), page 7372; [Section D.14.1.35 \[multarrRestrict\]](#), page 7370.

### D.14.1.37 arrFlats

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `size(A)`; A arr

**Return:** `[arrposet]` Intersection lattice

**Example:**

```
LIB "arr.lib";
ring R = 0, (x(1..5)), dp;
arrFlats(arrBraid(5));
↳
↳
↳ === Computing poset ===

### D.14.1.38 arrLattice

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:**     `arrLattice(arr ARR)`

**Return:** [arrposet] intersection poset of the arrangement

**Note:** The algorithm works by a bottom up approach, i.e. it calculates the

**Example:**

```
LIB "arr.lib";
ring r;
arrLattice(arrTypeB(3));
↳
↳
↳ === Computing poset ===
↳

,5,9), (3,8), (4,8), (5,6), (5,7), (6,7,8,9),
↳ ===== rank 3: 1 flats =====
↳ (1,2,3,4,5,6,7,8,9),
↳
```

See also: [Section D.14.1.37 \[arrFlats\], page 7372](#); [Section D.14.1.38 \[arrLattice\], page 7373](#).

### D.14.1.39 moebius

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\], page 7350](#)).

**Usage:** moebius(arrposet P)

**Return:** [arrposet] fills in the moebius values of the flats in the poset

**Example:**

```
LIB "arr.lib";
ring R = 0,(x,y,z,t),dp;
arr A = arrBraid(4);
arrposet P = arrLattice(A);
↳
↳
```

```

↳ === Computing poset ===
↳
↳

↳ ===== rank 2: 7 flats =====
↳ (2), (2), (1), (2), (1), (1), (2),
↳ ===== rank 3: 1 flats =====
↳ (-6),
↳ ===== rank 4: 0 flats =====
↳

```

See also: [Section D.14.1.39 \[moebius\]](#), page 7374.

### D.14.1.40 arrCharPoly

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrCharPoly(arr A)`

**Return:** `[intvec]` coefficients of the characteristic polynomial of  $A$  in increasing order

**Remarks:** The algorithm only returns the coefficients of the characteristic polynomial since they are whole numbers but the basering could be something different.

**Example:**

```
LIB "arr.lib";
ring R = 0, (x,y,z,u,v), dp;
arr A = arrBraid(5);
intvec v = arrCharPoly(A);
x*(x-1)*(x-2)*(x-3)*(x-4);
↪ x5-10x4+35x3-50x2+24x
v;
↪ 24, -50, 35, -10, 1
```

See also: [Section D.14.1.40 \[arrCharPoly\]](#), page 7376; [Section D.14.1.41 \[arrPoincare\]](#), page 7376.

### D.14.1.41 arrPoincare

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrPoincare(A); arr A`

**Return:** `[intvec]` The Poincare polynomial as integer vector of the arrangement, which is equal to the second kind Poincare-Series of the Orlik-Solomon Algebra.

**Example:**

```
LIB "arr.lib";
ring R = 0, (x,y,z,u,v), dp;
arr A = arrBraid(5);
intvec v = arrPoincare(A);
(1+x)*(1+2x)*(1+3x)*(1+4x);
↪ 24x4+50x3+35x2+10x+1
v;
↪ 1, 10, 35, 50, 24
```

See also: [Section D.14.1.43 \[arrBoundedChambers\]](#), page 7377; [Section D.14.1.42 \[arrChambers\]](#), page 7376; [Section D.14.1.41 \[arrPoincare\]](#), page 7376.

### D.14.1.42 arrChambers

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrChambers(A); arr A`

**Return:** `[int]` The number of chambers of an arrangement, which is equal to the evaluation of the Poincare polynomial at 1.

**Example:**

```
LIB "arr.lib";
ring R = 0, (x,y), dp;
arr A = ideal(x,y,x+y-1);
arrChambers(A);
```

↪ 7

See also: [Section D.14.1.43 \[arrBoundedChambers\]](#), page 7377; [Section D.14.1.42 \[arrChambers\]](#), page 7376; [Section D.14.1.41 \[arrPoincare\]](#), page 7376.

### D.14.1.43 arrBoundedChambers

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `arrBoundedChambers(A); arr A`

**Return:** `[int]` The number of bounded chambers of an arrangement, which is equal to the evaluation of the Poincare polynomial at -1.

**Example:**

```
LIB "arr.lib";
ring R = 0, (x,y), dp;
arr A = ideal(x,y,x+y-1);
arrBoundedChambers(A);
↪ 1
```

See also: [Section D.14.1.43 \[arrBoundedChambers\]](#), page 7377; [Section D.14.1.42 \[arrChambers\]](#), page 7376; [Section D.14.1.41 \[arrPoincare\]](#), page 7376.

### D.14.1.44 printMoebius

Procedure from library `arr.lib` (see [Section D.14.1 \[arr.lib\]](#), page 7350).

**Usage:** `printMoebius(A); arr A`

**Return:** `[]` displays the moebius values of all the flats in the poset

**Remarks:** Mainly used for debugging.

**Example:**

```
LIB "arr.lib";
ring R = 0, (x,y,z,t), dp;
arr A = arrBraid(4);
arrposet P = arrLattice(A);
↪
↪

## D.14.2 `combinat_lib`

**Library:** `combinat.lib`

**Purpose:** Some useful functions

**Authors:** J. Boehm, boehm @ mathematik.uni-kl.de

**Overview:** Some useful basic functions from combinatorics.

**Procedures:**

### D.14.2.1 `intersectLists`

Procedure from library `combinat.lib` (see [Section D.14.2 \[`combinat\_lib`\], page 7378](#)).

**Usage:** `intersectLists(L,M)`; L list, M list

**Return:** list, containing all elements of L which are elements of M

**Theory:** we require the elements of the lists to have a compare operator ==.

**Example:**

```
LIB "combinat.lib";
intersectLists(list(1,1,2,2,3),list(2,3,3,4));
↳ [1]:
↳ 2
↳ [2]:
↳ 3
intersectLists(list(1,1,2,2,3),list(1,1,2,2,3));
↳ [1]:
↳ 1
↳ [2]:
↳ 2
↳ [3]:
↳ 3
```

### D.14.2.2 sublists

Procedure from library `combinat.lib` (see [Section D.14.2 \[combinat.lib\]](#), page 7378).

**Usage:** `sublists(L)`; L list

**Assume:** L is a list

**Return:** list of all sublists of L.

**Example:**

```
LIB "combinat.lib";
list L = 1,2,3,4,5;
sublists(L);
↳ [1]:
↳ empty list
↳ [2]:
↳ [1]:
↳ 1
↳ [3]:
↳ [1]:
↳ 2

```

### D.14.2.3 member

Procedure from library `combinat.lib` (see [Section D.14.2 \[combinat.lib\]](#), page 7378).

**Usage:** `member(e,L)`; e def, L list

**Return:** 1 if e is an element of L, 0 otherwise

**Theory:** we require the elements involved to have a compare operator `==`.

**Example:**

```

LIB "combinat.lib";
member(1,list(1,4,5));
↳ 1

```

### D.14.3 customstd\_lib

**Library:** `customstd.lib`

**Purpose:** Load `customstd.so`

**Authors:** Hans Schoenemann, hannes at mathematik.uni-kl.de  
Yue Ren, ren at mathematik.uni-kl.de

**Overview:** This library offers customly modified standard bases algorithms in order to increase the performance of other algorithms. If you require a customly modified standard bases algorithm, please contact the authors.

**Procedures:**

#### D.14.3.1 monomialabortstd

Procedure from library `customstd.lib` (see [Section D.14.3 \[customstd.lib\]](#), page 7383).

**Usage:** `monomialabortstd(I)`; I ideal

**Purpose:** computes a standard basis and aborts if a monomial generator is found. Returns all standard basis elements that have been computed.

**Note:** Due to sequencing of the standard basis computation:  
- If aborted, there is no guarantee that the monomial is the final standard bases element  
- If ideal has a monomial generator, there is no guarantee that the computation aborts because of it

**Example:**

```

LIB "customstd.lib";
LIB "polylib.lib";
ring r = 0, (x,y,z,u,v), dp;
// yields normal standard basis since no monomial is found
ideal I = homog(cyclic(4),v);
monomialabortstd(I);
↳ _[1]=x+y+z+u
↳ _[2]=y2+2yu+u2
↳ _[3]=yz2+z2u-yu2-u3
↳ _[4]=yzu2+z2u2-yu3+zu3-u4-v4
↳ _[5]=yu4+u5-yv4-uv4
↳ _[6]=z3u2+z2u3-zv4-uv4
↳ _[7]=z2u4+yzv4-yuv4+zuv4-2u2v4
// will not start standard basis computation in the first place,
// as one of the generators is a monomial
I = v, homog(cyclic(4),v);
monomialabortstd(I);
↳ _[1]=v
// aborts standard basis computation when it encounters monomial u
// note that u is not the final element in the standard basis!!!
I = x+y+z, homog(cyclic(4),v);
monomialabortstd(I);
↳ _[1]=u
↳ _[2]=x+y+z+u
// aborts standard basis computation when it encounters monomial z2
// note that it is not the monomial generator x which lead to the abortion!!!
I = x, homog(cyclic(4),v);
monomialabortstd(I);
↳ _[1]=y+z+u
↳ _[2]=x+y+z+u
↳ _[3]=z2

```

**D.14.3.2 satstd**

Procedure from library `customstd.lib` (see [Section D.14.3 \[customstd.lib\]](#), page 7383).

**Usage:** `satstd(I[,J]);` I ideal, J optional ideal

**Assume:** J generated by variables

**Purpose:** computes a standard basis of I and, if possible, divides each polynomial during the computation by the variables in J. By default, J is assumed to be the ideal generated by all variables.

**Note:** Even if I contains a monomial generated by the variables in J, there is no guarantee that it is found during the computation. If it is found, however, 1 is immediately returned.

**Note:** The result is a standard basis of a partially saturated ideal wrt. the the variables in J. If the I is homogeneous and the ordering dp, the result is completely saturated wrt. to the last variable (wrt. to the first for Dp).

**Example:**

```
LIB "customstd.lib";
```

```

ring r = 0, (x,y,z,u,v), dp;
ideal I = x2+x,y2+y,z2+z;
// returns normal standard basis, no changes during (trivial) computation
satstd(I,ideal(u,v));
↳ _[1]=z2+z
↳ _[2]=y2+y
↳ _[3]=x2+x
// returns x+1 instead of x2+x
satstd(I,ideal(x));
↳ _[1]=x+1
↳ _[2]=z2+z
↳ _[3]=y2+y
// returns standard basis with elements of degree up to 8 (instead of 16)
deg(satstd(I^8));
↳ 8

```

#### D.14.4 methods\_lib

**Library:** methods.lib

**Purpose:** installing methods in Singular

**Authors:** J. Boehm, boehm @ mathematik.uni-kl.de

**Overview:** Methods select the function to execute by the types of the input tuple. The central function is installMethod, which takes a hashtable associating a tuple of input types to function names and creates a corresponding procedure.

HashTables are lists with arbitrary index sets. They can be created by the command hashTable. Their size can be determined by the command size. Values can be extracted by selectKey or the \* operator. HashTables can also be added using addHashTables or the + operator.

Methods can be added with the + operator.

**Types:** Method the class of all methods  
 HashTable the class of all hash tables

**Procedures:**

#### D.14.5 nets\_lib

**Library:** net.lib

**Purpose:** Net structures for pretty printing

**Authors:** J. Boehm, boehm@mathematik.uni-kl.de  
 M. Mueller, mkmuelle@mathematik.uni-kl.de  
 H. Rombach, rombach@mathematik.uni-kl.de  
 M. Stein, maxstein77@web.de

**Overview:** Nets are arrays of characters, which are printed in a matrix format. They can be concatenated horizontally and vertically. When concatenating horizontally, empty rows are filled with spaces. All Singular types can be converted to a Net by applying the command net.

**Types:** Net The class of all nets

**Procedures:**

### D.14.5.1 catNets

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\]](#), page 7385).

**Usage:** `catNets(N,M)`; N,M Nets

**Return:** horizontal concatenation of N and M

**Theory:** The nets are concated horizontally with alignment at the top row. Can also be called with `+`.

**Example:**

```
LIB "nets.lib";
Net A = net("aaa");
Net B = net("b");
catNets(A,B);
↳ aaab
↳
A+B;
↳ aaab
↳
```

### D.14.5.2 net

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\]](#), page 7385).

### D.14.5.3 netBigIntMat

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\]](#), page 7385).

**Usage:** `netBigIntMat(M)`; M bigint Matrix

**Assume:** M is a bigintmatrix

**Return:** visual presentation of M

**Theory:** A Singular object is converted into a character array (a Net) for on screen printing.

**Example:**

```
LIB "nets.lib";
ring r1=101,(x,y,z),lp;
int a=111111;
int b=22222;
int c=3333;
int d=444;
bigintmat M[2][2]=a,b,c,d;
netBigIntMat(M);
↳ | 111111 22222 |
↳ | 3333   444   |
↳
```

#### D.14.5.4 netBigIntMatShort

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\], page 7385](#)).

**Usage:** `netBigIntMatShort(M)`; M bigint matrix

**Assume:** M is a bigintmatrix

**Return:** visual presentation of M, only the first digits of each entry

**Theory:** A Singular object is converted into a character array (a Net) for on screen printing.

**Example:**

```
LIB "nets.lib";
ring r1=101,(x,y,z),lp;
bigint a=1111111111;
bigint b=2222222222;
bigint c=3333333333;
bigint d=4444444444;
bigintmat M[2][2]=a,b,c,d;
netBigIntMatShort(M);
⇒ | 1111111111 2222222222 |
⇒ | 3333333333 4444444444 |
⇒
```

#### D.14.5.5 netCoefficientRing

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\], page 7385](#)).

**Usage:** `netCoefficientRing(R)`; R ring

**Assume:** R is a ring

**Return:** visual presentation of the coefficient ring of R

**Theory:** A Singular object is converted into a character array (a Net) for on screen printing.

**Example:**

```
LIB "nets.lib";
ring r=0,x,lp;
netCoefficientRing(r);
⇒ QQ
⇒
```

#### D.14.5.6 netIdeal

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\], page 7385](#)).

**Usage:** `netIdeal(P)`; P ideal

**Assume:** P is a poly

**Return:** visual presentation of I

**Theory:** A Singular object is converted into a character array (a Net) for on screen printing.

**Example:**

```
LIB "nets.lib";
ring r;
ideal I=2x3y4,2x3y4z+x3y4z5,5x6y7z10-2x3y+4y5z8;
netIdeal(I);
↪ <2x3y4, x3y4z5+2x3y4z, 5x6y7z10+4y5z8-2x3y>
↪
```

### D.14.5.7 netInt

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\]](#), page 7385).

**Usage:** `netInt(M)`; M integer

**Assume:** M is an integer

**Return:** visual presentation of M

**Theory:** A Singular object is converted into a character array (a Net) for on screen printing.

**Example:**

```
LIB "nets.lib";
ring r;
int M=5;
netInt(M);
↪ 5
↪
```

### D.14.5.8 netBigInt

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\]](#), page 7385).

**Usage:** `netBigInt(M)`; M integer

**Assume:** M is a bigint

**Return:** visual presentation of M

**Theory:** A Singular object is converted into a character array (a Net) for on screen printing.

**Example:**

```
LIB "nets.lib";
ring r;
bigint M=5;
netBigInt(M);
↪ 5
↪
```

### D.14.5.9 netIntMat

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\]](#), page 7385).

**Usage:** `netIntMat(M)`; M int matrix

**Assume:** M is a int matrix

**Return:** visual presentation of M

**Theory:** A Singular object is converted into a character array (a Net) for on screen printing.

**Example:**

```
LIB "nets.lib";
ring r1=101,(x,y,z),lp;
int a=111111;
int b=222222;
int c=333333;
int d=444444;
intmat M[2][2]=a,b,c,d;
netIntMat(M);
↳ | 111111 222222 |
↳ | 333333 444444 |
↳
```

#### D.14.5.10 netIntMatShort

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\], page 7385](#)).

**Usage:** `netIntMatShort(M)`; M int matrix

**Assume:** M is a int matrix

**Return:** visual presentation of M, only the first digits of each entry

**Theory:** A Singular object is converted into a character array (a Net) for on screen printing.

**Example:**

```
LIB "nets.lib";
ring r1=101,(x,y,z),lp;
int a=111111;
int b=222222;
int c=333333;
int d=444444;
intmat M[2][2]=a,b,c,d;
print(M);
↳ 111111 222222
↳ 333333 444444
netIntMatShort(M);
↳ | 111111 222222 |
↳ | 333333 444444 |
↳
//
print(M);
↳ 111111 222222
↳ 333333 444444
netIntMatShort(M,2);
↳ | 11... 22... |
↳ | 33... 44... |
↳
//
```

#### D.14.5.11 netIntVector

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\], page 7385](#)).

**Usage:** `netIntVector(V); V int vector`

**Assume:** `V` is a int vector

**Return:** visual presentation of `V`

**Theory:** A Singular object is converted into a character array (a Net) for on screen printing.

**Example:**

```
LIB "nets.lib";
ring r1=101,(x,y,z),lp;
int a=111111;
int b=222222;
int c=333333;
int d=444444;
intvec V=a,b,c,d;
netIntVector(V);
⇒ | 111111 |
⇒ | 222222 |
⇒ | 333333 |
⇒ | 444444 |
⇒
```

#### D.14.5.12 netIntVectorShort

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\], page 7385](#)).

**Usage:** `netIntVectorShort(V); V int vector`

**Assume:** `V` is a int vector

**Return:** visual presentation of `V`, only the first digits of each entry

**Theory:** A Singular object is converted into a character array (a Net) for on screen printing.

**Example:**

```
LIB "nets.lib";
ring r1=101,(x,y,z),lp;
int a=111111;
int b=222222;
int c=333333;
int d=444444;
intvec V=a,b,c,d;
netIntVectorShort(V,4);
⇒ | 1111... |
⇒ | 2222... |
⇒ | 3333... |
⇒ | 4444... |
⇒
```

#### D.14.5.13 netNumber

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\], page 7385](#)).

**Usage:** `netNumber(R); a number`

**Assume:** a is a number

**Return:** visual presentation of a

**Theory:** A Singular object is converted into a character array (a Net) for on screen printing.

**Example:**

```
LIB "nets.lib";
ring r1=101,(x,y,z),lp;
number a = 5;
netNumber(a);
↪
↪ 5
↪
```

#### D.14.5.14 netList

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\], page 7385](#)).

**Usage:** netList(L); L list

**Assume:** L is a list of elements

**Return:** visual presentation of L

**Theory:** A Singular object is converted into a character array (a Net) for on screen printing.

**Example:**

```
LIB "nets.lib";
ring r1=101,(x,y,z),lp;
list L=111, x+y, x3y-z, y+3z4;
print("list L=111, x+y, x3y-z, y+3z4");
↪ list L=111, x+y, x3y-z, y+3z4
netList(L);
↪ [111, x+y, x3y-z, y+3z4]
↪
```

#### D.14.5.15 netMap

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\], page 7385](#)).

**Usage:** netMap(f); f map

**Assume:** f is a map from a ring to the basering

**Return:** visual presentation of the map f

**Theory:** A Singular object is converted into a character array (a Net) for on screen printing.

**Example:**

```
LIB "nets.lib";
ring r1=101,(x,y,z),lp;
ring r2=103,(a,b,c),lp;
map f=r1,ab,ac,bc;
netMap(f);
↪ Map: r1 --> r2 , x -> ab
↪           , y -> ac
↪           , z -> bc
↪
```

### D.14.5.16 netMap2

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\], page 7385](#)).

**Usage:** `netMap2(f); f map`

**Assume:** `f` is a map from a ring to the basering

**Return:** visual presentation of the map `f`, alternative version

**Theory:** A Singular object is converted into a character array (a Net) for on screen printing.

**Example:**

```
LIB "nets.lib";
ring r1=101,(x,y,z),lp;
ring r2=103,(a,b,c),lp;
map f=r1,ab,ac,bc;
netMap2(f);
↳ f: r1 --> r2 , x -> ab , y -> ac , z -> bc
↳
```

### D.14.5.17 netmatrix

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\], page 7385](#)).

**Usage:** `netmatrix(V); M matrix`

**Assume:** `M` is a matrix

**Return:** visual presentation of `M`

**Theory:** A Singular object is converted into a character array (a Net) for on screen printing.

**Example:**

```
LIB "nets.lib";
ring r1=101,(x,y,z),lp;
poly a=2x3y4+300xy-234z23;
poly b=2x3y4z;
poly c=x3y4z5;
poly d=5x6y7z10;
poly e=2x3y;
poly f=4y5z8;
matrix M[2][3]=a,b,c,d,e,f;
print(M);
↳ 2x3y4-3xy-32z23,2x3y4z,x3y4z5,
↳ 5x6y7z10,      2x3y,  4y5z8
netmatrix(M);
↳ | 2x3y4-3xy-32z23 2x3y4z x3y4z5 |
↳ | 5x6y7z10      2x3y  4y5z8 |
↳
```

### D.14.5.18 netmatrixShort

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\], page 7385](#)).

**Usage:** `netmatrixShort(M); M matrix`

**Assume:** M is a matrix

**Return:** visual presentation of M

**Theory:** A Singular object is converted into a character array (a Net) for on screen printing.

**Example:**

```
LIB "nets.lib";
ring r1=101,(x,y,z),lp;
poly a=2x3y4+300xy-234z23;
poly b=2x3y4z;
poly c=x3y4z5;
poly d=5x6y7z10;
poly e=2x3y-2x3y4+300xy-234z23;
poly f=4y5z8;
matrix M[2][3]=a,b,c,d,e,f;
netmatrixShort(M, 10);
↳ | 2x3y4-3xy-32z23 2x3y4z          x3y4z5 |
↳ | 5x6y7z10      -2x3y4+2x3y-3xy-32z23 4y5z8 |
↳
```

#### D.14.5.19 netPoly

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\], page 7385](#)).

**Usage:** netPoly(P); P poly

**Assume:** P is a poly

**Return:** visual presentation of P over two rows

**Theory:** A Singular object is converted into a character array (a Net) for on screen printing.

**Example:**

```
LIB "nets.lib";
// from 3.3.1 Examples of ring declarations
//
ring R1 = 32003,(x,y,z),dp;
poly q6=1;
print(q6);
↳ 1
netPoly(q6);

#### D.14.5.20 netPrimePower

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\]](#), page 7385).

**Usage:** `netPrimePower(n,m);` n,m int

**Return:** visual presentation of the prime power  $n^m$

**Theory:** A Singular object is converted into a character array (a Net) for on screen printing.

**Example:**

```
LIB "nets.lib";
ring r=0,x,lp;
int n=2;
int m=5;
netPrimePower(n,m);
⇒ 2^5
⇒
```

**D.14.5.21 netRing**

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\]](#), page 7385).

**Usage:** `netRing(f); f ring`

**Assume:** `R` is a ring

**Return:** visual presentation of `R`

**Theory:** A Singular object is converted into a character array (a Net) for on screen printing.

**Example:**

```
LIB "nets.lib";
// from 3.3.1 Examples of ring declarations
ring r1 = 32003,(x,y,z),dp;
netRing(r1);
⇒ FF_32003[x,y,z]
⇒
//
ring r2 = 32003,(x(1..10)),dp;
netRing(r2);
⇒ FF_32003[x(1),x(2),x(3),x(4),x(5),x(6),x(7),x(8),x(9),x(10)]
⇒
//
ring r3 = 32003,(x(1..5)(1..8)),dp;
netRing(r3);
⇒ FF_32003[x(1)(1),x(1)(2),x(1)(3),x(1)(4),x(1)(5),x(1)(6),x(1)(7),x(1)(8),\

```

### D.14.5.22 netString

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\], page 7385](#)).

**Usage:** netString(M); M string

**Assume:** M is a string

**Return:** visual presentation of M

**Theory:** A Singular object is converted into a character array (a Net) for on screen printing.

**Example:**

```

LIB "nets.lib";
string M="Hallo";
netString(M);
↳ Hallo
↳

```

### D.14.5.23 netvector

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\], page 7385](#)).

**Usage:** netvector(V); V vector

**Assume:** V is a vector

**Return:** visual presentation of V

**Theory:** A Singular object is converted into a character array (a Net) for on screen printing.

**Example:**

```

LIB "nets.lib";
ring r1=101,(x,y,z),lp;
poly a=2x3y4;
poly b=2x3y4z;
poly c=x3y4z5;
poly d=5x6y7z10;
poly e=2x3y;
poly f=4y5z8;
vector V=[a,b,c,d,e,f];

```

```

netvector(V);
↳ | 2x3y4      |
↳ | 2x3y4z    |
↳ | x3y4z5    |
↳ | 5x6y7z10  |
↳ | 2x3y      |
↳ | 4y5z8     |
↳

```

#### D.14.5.24 netvectorShort

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\], page 7385](#)).

**Usage:** `netvectorShort(V); V` vector

**Assume:** `V` is a vector

**Return:** visual presentation of `V`, short version

**Theory:** A Singular object is converted into a character array (a Net) for on screen printing.

**Example:**

```

LIB "nets.lib";
ring r1=101,(x,y,z),lp;
poly a=2x3y4;
poly b=2x3y4z-5x6y7z10;
poly c=x3y4z5;
poly d=5x6y7z10;
poly e=2x3y;
poly f=4y5z8+5x6y7z10;
vector V=[a,b,c,d,e,f];
netvectorShort(V);
↳ | 2x3y4      |
↳ | -5x6y7z10+2x3y4z |
↳ | x3y4z5    |
↳ | 5x6y7z10  |
↳ | 2x3y      |
↳ | 5x6y7z10+4y5z8 |
↳

```

#### D.14.5.25 stackNets

Procedure from library `nets.lib` (see [Section D.14.5 \[nets.lib\], page 7385](#)).

**Usage:** `stackNets(N,M); N,M` Nets

**Return:** vertical concatenation of `N` and `M`

**Theory:** The nets are concated vertically with alignment at the left column.

**Example:**

```

LIB "nets.lib";
Net A = net("aaa");
Net B = net("b");
stackNets(A,B);

```

```

↳ aaa
↳ b
↳
A+B;
↳ aaab
↳

```

### D.14.6 phindex\_lib

**Library :** phindex.lib

**Purpose:** Procedures to compute the index of real analytic vector fields

**Author:** Victor Castellanos

**Note:** To compute the Poincare-Hopf index of a real analytic vector field with an algebraically isolated singularity at 0 (w. an a. i. s), we use the algebraic formula for the degree of the real analytic map germ found by Eisenbud-Levine in 1997. This result was also proved by Khimshiashvili. If the isolated singularity is non algebraically isolated and the vector field has similar reduced complex zeroes of codimension 1, we use a formula as the Eisenbud-Levine found by Victor Castellanos, in both cases is necessary to use a local order (ds,...). To compute the signature of a quadratic form (or symmetric matrix) we use the method of Lagrange.

**Procedures:**

#### D.14.6.1 signatureL

Procedure from library `phindex.lib` (see [Section D.14.6 \[phindex.lib\]](#), page 7402).

**Usage:** signatureL(M[,r]); M symmetric matrix, r int (optional).

**Return:** the signature of M of type int or if r is given and !=0 then intvec with (signature, nr. of +, nr. of -) is returned.

**Theory:** Given the matrix M, we construct the quadratic form associated. Afterwards we use the method of Lagrange to compute the signature. The law of inertia for a real quadratic form  $A(x,x)$  says that in a representation of  $A(x,x)$  as a sum of independent squares  $A(x,x)=\sum_{i=1}^r a_i X_i^2$ .

The number of positive and the number of negative squares are independent of the choice of representation. The signature -s- of  $A(x,x)$  is the difference between the number -pi- of positive squares and the number -nu- of negative squares in the representation of  $A(x,x)$ . The rank -r- of M (or  $A(x,x)$ ) and the signature -s- determine the numbers -pi- and -nu- uniquely, since  $r=\pi+\nu$ ,  $s=\pi-\nu$ .

The method of Lagrange is a procedure to reduce any real quadratic form to a sum of squares.

Ref. Gantmacher, The theory of matrices, Vol. I, Chelsea Publishing Company, NY 1960, page 299.

**Example:**

```

LIB "phindex.lib";
ring r=0,(x),ds;
matrix M[5][5]=0,0,0,1,0,0,1,0,0,-1,0,0,1,0,0,1,0,0,3,0,0,-1,0,0,1;
signatureL(M,1); //The rank of M is 3+1=4

```

```

↳ 2,3,1
matrix H[5][5]=0,-7,0,1,0,-7,1,0,0,-1,0,0,1,0,0,-3,5,0,-1,0,5,1;
signatureL(H);
↳ 1

```

### D.14.6.2 signatureLqf

Procedure from library `phindex.lib` (see [Section D.14.6 \[phindex.lib\]](#), page 7402).

**Usage:** `signatureLqf(h)`; `h` quadratic form (poly type).

**Return:** the signature of `h` of type `int` or if `r` is given and `!=0` then `intvec` with (signature, nr. of +, nr. of -) is returned.

**Theory:** To compute the signature we use the method of Lagrange. The law of inertia for a real quadratic form  $h(x,x)$  says that in a representation of  $h(x,x)$  as a sum of independent squares  $h(x,x)=\sum_{i=1}^r a_i X_i^2$  the number of positive and the number of negative squares are independent of the choice of representation. The signature  $-s-$  of  $h(x,x)$  is the difference between the number  $-pi-$  of positive squares and the number  $-nu-$  of negative squares in the representation of  $h(x,x)$ . The rank  $-r-$  of  $h(x,x)$  and the signature  $-s-$  determine the numbers  $-pi-$  and  $-nu-$  uniquely, since  $r=pi+nu$ ,  $s=pi-nu$ .

The method of Lagrange is a procedure to reduce any real quadratic form to a sum of squares.

Ref. Gantmacher, The theory of matrices, Vol. I, Chelsea Publishing Company, NY 1960, page 299.

**Example:**

```

LIB "phindex.lib";
ring r=0,(x(1..4)),ds;
poly Ax=4*x(1)^2+x(2)^2+x(3)^2+x(4)^2-4*x(1)*x(2)-4*x(1)*x(3)+4*x(1)*x(4)+4*x(2)*x(3);
signatureLqf(Ax,1); //The rank of Ax is 3+1=4
↳ 2,3,1
poly Bx=2*x(1)*x(4)+x(2)^2+x(3)^2;
signatureLqf(Bx);
↳ 2

```

### D.14.6.3 PH\_ais

Procedure from library `phindex.lib` (see [Section D.14.6 \[phindex.lib\]](#), page 7402).

**Usage:** `PH_ais(I)`; `I` ideal of coordinates of the vector field.

**Return:** the Poincare-Hopf index of type `int`.

**Note:** the isolated singularity must be algebraically isolated.

**Theory:** The Poincare-Hopf index of a real vector field  $X$  at the isolated singularity  $0$  is the degree of the map  $(X/|X|) : S_{\epsilon} \rightarrow S$ , where  $S$  is the unit sphere, and the spheres are oriented as  $(n-1)$ -spheres in  $\mathbb{R}^n$ . The degree depends only on the germ,  $X$ , of  $X$  at  $0$ . If the vector field  $X$  is real analytic, then an invariant of the germ is its local ring

$$Q_x = \mathbb{R}[[x_1..x_n]]/I_x$$

where  $\mathbb{R}[[x_1,..,x_n]]$  is the ring of germs at  $0$  of real-valued analytic functions on  $\mathbb{R}^n$ , and  $I_x$  is the ideal generated by the components of  $X$ . The isolated singularity of  $X$  is algebraically isolated if the algebra  $Q_x$  is finite dimensional as real vector space,

geometrically this mean that 0 is also an isolated singularity for the complexified vector field. In this case the Poincare-Hopf index is the signature of the non degenerate bilinear form  $\langle, \rangle$  obtained by composition of the product in the algebra  $Q_x$  with a linear functional map

$$\langle, \rangle : (Q_x)_x(Q_x) \xrightarrow{(\cdot)} Q_x \xrightarrow{(L)} R$$

with  $L(J_0) > 0$ , where  $J_0$  is the residue class of the Jacobian determinant in  $Q_x$ . Here, we use a natural linear functional defined as follows. Suppose that  $E = \{E_1, \dots, E_r\}$  is a basis of  $Q_x$ , then  $J_0$  can be written as

$$J_0 = a_1 E_{\{j_1\}} + \dots + a_k E_{\{j_k\}}, \quad j_s \in \{1 \dots r\}, \quad s = 1..k, \quad k \leq r, \quad \text{where } a_s \text{ are constant.}$$

The linear functional  $L: Q_x \rightarrow R$  is defined as  $L(E_{\{j_1\}}) = (a_1) / |a_1| = \text{sign of } a_1$ ,

the other elements of the base are sent to 0.

Refs. -Eisenbud & Levine, An algebraic formula for the degree of a  $C^\infty$  map germ, Ann. Math., 106, (1977), 19-38.

-Khimshiashvili, On a local degree of a smooth map, trudi Tbilisi Math. Inst., (1980), 105-124.

**Example:**

```
LIB "phindex.lib";
ring r=0,(x,y,z),ds;
ideal I=x3-3xy2,-y3+3yx2,z3;
PH_nais(I);
↪ 3
```

#### D.14.6.4 PH\_nais

Procedure from library `phindex.lib` (see [Section D.14.6 \[phindex.lib\]](#), page 7402).

**Usage:** PH\_nais(I); I ideal of coordinates of the vector field.

**Return:** the Poincare-Hopf index of type int.

**Note:** the vector field must be a non algebraically isolated singularity at 0, with reduced complex zeros of codimension 1.

**Theory:** Suppose that 0 is an algebraically isolated singularity of the real analytic vector field  $X$ , geometrically this corresponds to the fact that the complexified vector field has positive dimension singular locus, algebraically this mean that the local ring  $Q_x = R[[x_1 \dots x_n]] / I_x$  where  $R[[x_1, \dots, x_n]]$  is the ring of germs at 0 of real-valued analytic functions on  $R^n$ , and  $I_x$  is the ideal generated by the components of  $X$  is infinite dimensional as real vector space. In the case that  $X$  has a reduced hypersurface as complex zeros we have the next. There exist a real analytic function  $f: R^n \rightarrow R$ , and a real analytic vector field  $Y$  s. t.  $X = fY$ . The function  $f$  does not change of sign out of 0 and

$$M_x = R[[x_1 \dots x_n]] / (I_x : \text{radical}(I_x))$$

is a finite dimensional sub-algebra of  $Q_x$ . The Poincare-Hopf index of  $X$  at 0 is the sign of  $f$  times the signature of the non degenerate bilinear form  $\langle, \rangle$  obtained by composition of the product in the algebra  $M_x$  with a linear functional map

$$\langle, \rangle : (M_x)_x(M_x) \xrightarrow{(\cdot)} M_x \xrightarrow{(L)} R$$

with  $L(J_p) > 0$ , where  $J_p$  is the residue class of the Jacobian determinant of  $X$ ,  $JX$ , over  $f^n$ ,  $JX / (f^n)$  in  $M_x$ . Here, we use a natural linear functional defined as follows. Suppose that  $E = \{E_1, \dots, E_r\}$  is a basis of  $M_x$ , then  $J_p$  is writing as

$$J_p = a_1 E_{\{j_1\}} + \dots + a_k E_{\{j_k\}}, \quad j_s \in \{1 \dots r\}, \quad s = 1..k, \quad k \leq r, \quad \text{where } a_s \text{ are constant.}$$

The linear functional  $L: M_x \rightarrow R$  is defined as  $L(E_{\{j_1\}}) = (a_1) / |a_1| = \text{sign of } a_1$ ,

the other elements of the base are sent to 0.

-Castellanos -Vargas, V. The index of non algebraically isolated singularity, Bol. Soc. Mat. Mexicana, (3)  
Vol. 8, 2002, 141-147.

**Example:**

```
LIB "phindex.lib";
ring r=0,(x,y,z),ds;
ideal I=x5-2x3y2-3xy4+x3z2-3xy2z2,-3x4y-2x2y3+y5-3x2yz2+y3z2,x2z3+y2z3+z5;
PH_nais(I);
↳ -3
```

### D.14.7 polybori.lib

**Library:** polybori.lib

**Purpose:** A Singular Library Interface for PolyBoRi

**Authors:** Maximilian Kammermeier: Max0791@gmx.de  
Susanne Scherer: sscherer90@yahoo.de

**Overview:** A library for using PolyBoRi in the SINGULAR interface, with procedures that convert structures (polynomials, rings, ideals) in both directions. Therefore, it is possible to compute boolean groebner basis via [Section D.14.7.1 \[boolean\\_std\]](#), [page 7406](#). Polynomials can be converted to zero-supressed decision diagrams (zdd) and vice versa.

For usability it defines the PolyBoRi types `bideal`, `bpoly`, and `bring` which are equivalent to Singular's `ideal`, `poly`, and `ring`, as well as `bset` which corresponds to the type `zdd` introduced here. In addition `bvar(i)` constructs the Boolean variable corresponding to `var(i)` from current `ring`;

For convenience, the corresponding types can be converted explicitly or implicitly while assigning. Also several SINGULAR operators were overloaded: `bring` comes with `nvars`, `bpoly` implements `lead`, `leadmonom` and `leadcoef`. Objects of this type may be added and multiplied, too. Finally, `bideal` yields `std` and `size` as well as addition and element access.

Hence, by using these types PolyBoRi functionality can be carried out seamlessly in SINGULAR:

```
> LIB "polybori.lib";
> ring r0=2,x(1..4),lp;
> def x=bvar; // enforce Boolean variables

> bpoly f1=x(1)+x(4);
> bpoly f2=x(1)+x(3)*x(1);
> bideal bI=list(f1,f2);

> std(bI);
_ [1] = x(1) + x(4)
_ [2] = x(3)*x(4) + x(4)
```

**Note:** For using this library SINGULAR's python interface must be available on your system. Please `./configure --with-python` when building SINGULAR for this purpose.

There are prebuilt binary packages for PolyBoRi available from <http://polybori.sf.net/>.

For building your own PolyBoRi please ensure that you have `scons` and a development version of the boost libraries installed on you system. Then you may execute the following commands in a `bash`-style shell to build PolyBoRi available to `python`:

```
PBDIR=/path/to/custom/polybori
wget http://downloads.sf.net/project/polybori/polybori/\
0.8.2/polybori-0.8.2.tar.gz
tar -xvzf polybori-0.8.2.tar.gz
cd polybori-0.8.2
scons install PREFIX=$PBDIR PYINSTALLPREFIX=$PBDIR/python
export PYTHONPATH=$PBDIR/python:$PYTHONPATH
```

#### References:

See <http://polybori.sf.net> for details about PolyBoRi.

**Procedures:** See also: [Section 3.8 \[Libraries\]](#), page 54; [Section 4.23 \[User defined types\]](#), page 133; [Section 4.27 \[pyobject\]](#), page 137.

### D.14.7.1 boolean\_std

Procedure from library `polybori.lib` (see [Section D.14.7 \[polybori.lib\]](#), page 7405).

**Usage:** `boolean_std(Is)`; Is ideal

**Return:** Singular ideal of the boolean groebner basis of Is

#### Example:

```
LIB "polybori.lib";
ring r0=2,x(1..4),lp;
poly f1=x(1)^2+2*x(2)*(x(3))-x(4)^3;
poly f2=x(1)^2-x(3)*x(1);
poly f3=x(2)+5-2*x(1);
poly f4=x(1)*x(2)-x(3);
ideal I=f1,f2,f3,f4;
boolean_std(I);          // implicitly add x(i)^2-x(i)
bideal bI=I;            // alternative syntax
bideal re = std(bI);    // Continue PolyBoRi computations
std(re[1..2]);
ring r1=0,x,Dp;
poly f1=x3+2*x+1;
poly f2=x10-x5+2x;
poly f3=19;
ideal I=f1,f2,f3;
boolean_std(I);
ring r2=32003,(x,y,z),Dp;
poly f1=xz+y+20*x^2*y;
poly f2=32002*xy+xz2+y;
ideal I=f1,f2;
boolean_std(I);
ring r2=32003,(x,y,z),Dp;
```

```

poly f1=xyz+20*x^2*y-3*xz+15;
poly f2=32002*xy+z2;
poly f3=19*x5y;
ideal I=f1,f2,f3;
boolean_std(I);

```

See also: [Section D.14.7.7 \[boolean\\_ideal\]](#), page 7409; [Section D.14.7.4 \[boolean\\_poly\]](#), page 7407; [Section D.14.7.2 \[boolean\\_poly\\_ring\]](#), page 7407; [Section D.14.7.13 \[from\\_boolean\\_ideal\]](#), page 7411; [Section D.14.7.10 \[from\\_boolean\\_poly\]](#), page 7410.

### D.14.7.2 boolean\_poly\_ring

Procedure from library `polybori.lib` (see [Section D.14.7 \[polybori.lib\]](#), page 7405).

### D.14.7.3 boolean\_constant

Procedure from library `polybori.lib` (see [Section D.14.7 \[polybori.lib\]](#), page 7405).

**Usage:** `boolean_constant(const[, rb]);` const constant and rb boolean ring

**Return:** default: constant const in the representation of the boolean ring  
rb==boolean\_poly\_ring(basering); optional input: rb=boolean ring rb

**Example:**

```

LIB "polybori.lib";
ring r=7,(x,y),Dp;
pyobject rb=boolean_poly_ring(r);
boolean_constant(int(3));
typeof(boolean_constant(int(3)));
boolean_constant(int(0));
typeof(boolean_constant(int(0)));

```

See also: [Section D.14.7.7 \[boolean\\_ideal\]](#), page 7409; [Section D.14.7.1 \[boolean\\_std\]](#), page 7406.

### D.14.7.4 boolean\_poly

Procedure from library `polybori.lib` (see [Section D.14.7 \[polybori.lib\]](#), page 7405).

**Usage:** `boolean_poly(ps[, dir, rb]);` ps polynomial, dir integer zero or one, rb boolean ring

**Return:** default: polynomial ps in the representation of the boolean ring  
rb==boolean\_poly\_ring(basering); optional input: boolean ring rb

**Note:** via the optional input dir, one can choose the computation method (either direct[dir==0] or recursive[dir==1]). default: recursive

**Example:**

```

LIB "polybori.lib";
ring r=0,x(1..5),Dp;
poly f=x(2)*(x(3)-x(1))+x(4)*x(5);
bring rb=r;
boolean_poly(f);
boolean_poly(f,0);
boolean_poly(f,0,boolean_poly_ring(r));
boolean_poly(f,0,rb);
poly g=0;
boolean_poly(g);

```

```
poly g=1;
boolean_poly(g);
```

See also: [Section D.14.7.7 \[boolean\\_ideal\]](#), page 7409; [Section D.14.7.1 \[boolean\\_std\]](#), page 7406.

### D.14.7.5 direct\_boolean\_poly

Procedure from library `polybori.lib` (see [Section D.14.7 \[polybori\\_lib\]](#), page 7405).

**Usage:** `boolean_poly(ps[, rb]);` ps polynomial, rb boolean ring

**Return:** default: polynomial ps in the representation of the boolean ring  
`rb==boolean_poly_ring(basering);` optional input: boolean ring rb

**Example:**

```
LIB "polybori.lib";
ring r0=2,x(1..4),lp;
bring rb=r0;
poly f=x(1)^2+2*x(2)*(x(3))-x(4)^3;
direct_boolean_poly(f);
direct_boolean_poly(f,rb);
ring r1=0,x,Dp;
poly f=x3+2x+1;
direct_boolean_poly(f);
ring r2=32003,(x,y,z),Dp;
poly f=xyz+20*x^2*y-3*xz+15;
direct_boolean_poly(f);
```

See also: [Section D.14.7.7 \[boolean\\_ideal\]](#), page 7409; [Section D.14.7.1 \[boolean\\_std\]](#), page 7406.

### D.14.7.6 recursive\_boolean\_poly

Procedure from library `polybori.lib` (see [Section D.14.7 \[polybori\\_lib\]](#), page 7405).

**Usage:** `boolean_poly(ps[, rb]);` ps polynomial, rb boolean ring

**Return:** default: polynomial ps in the representation of the boolean ring  
`rb==boolean_poly_ring(basering);` optional input: rb boolean ring

**Example:**

```
LIB "polybori.lib";
ring r0=2,x(1..4),lp;
poly f=x(1)^2+2*x(2)*(x(3))-x(4)^3;
recursive_boolean_poly(f);
ring r1=0,x,Dp;
poly f=x3+2x+1;
recursive_boolean_poly(f);
ring r2=32003,(x,y,z),Dp;
def br2=boolean_poly_ring(r2);
bring bbr2=r2;
poly f=xyz+20*x^2*y-3*xz+15;
recursive_boolean_poly(f,br2);
recursive_boolean_poly(f,bbr2);
```

See also: [Section D.14.7.7 \[boolean\\_ideal\]](#), page 7409; [Section D.14.7.1 \[boolean\\_std\]](#), page 7406.

### D.14.7.7 boolean\_ideal

Procedure from library `polybori.lib` (see [Section D.14.7 \[polybori.lib\], page 7405](#)).

**Usage:** `boolean_ideal(Is[, rb]);` Is Ideal, rb boolean ring

**Return:** default: ideal Is in the representation of the boolean ring  
`rb==boolean_poly_ring(basering);` optional input: rb boolean ring

**Example:**

```
LIB "polybori.lib";
ring r0=2,x(1..4),lp;
poly f1=x(1)^2+2*x(2)*(x(3))-x(4)^3;
poly f2=x(1)^2-x(3)*x(1);
poly f3=x(2)+5-2*x(1);
poly f4=x(1)*x(2)-x(3);
ideal I=f1,f2,f3,f4;
boolean_ideal(I);
ring r1=0,x,Dp;
poly f1=x3+2*x+1;
poly f2=x10-x5+2x;
poly f3=19;
ideal I=f1,f2,f3;
boolean_ideal(I);
ring r2=32003,(x,y,z),Dp;
bring bbr2=r2;
poly f1=xyz+20*x^2*y-3*xz+15;
poly f2=32002*xy+z2;
poly f3=19;
ideal I=f1,f2,f3;
boolean_ideal(I);
boolean_ideal(I,bbr2);
```

See also: [Section D.14.7.1 \[boolean\\_std\], page 7406](#).

### D.14.7.8 boolean\_set

Procedure from library `polybori.lib` (see [Section D.14.7 \[polybori.lib\], page 7405](#)).

**Usage:** `boolean_set(ss[, rb]);` ss zdd, rb boolean ring

**Return:** default: boolean set ss in the representation of a Polybori boolean set in the ring  
`rb==boolean_poly_ring(basering);` optional input: boolean ring rb

**Example:**

```
LIB "polybori.lib";
ring rs=0,(x,y,z),Dp;
poly ps=(x+1)*(y+1)*(z+1);
zdd fz=ps;
boolean_set(fz);
poly g=x*y*z+1;
zdd gz=g;
boolean_set(gz);
ring R=0,(x(1..4)),Dp;
def Rb=boolean_poly_ring(R);
poly h=(x(1)+1)*(x(2)+1)*(x(3)+1)*(x(4)+1);
```

```
zdd hz=h;
boolean_set(hz);
```

See also: [Section D.14.7.7 \[boolean\\_ideal\]](#), page 7409; [Section D.14.7.1 \[boolean\\_std\]](#), page 7406.

### D.14.7.9 from\_boolean\_constant

Procedure from library `polybori.lib` (see [Section D.14.7 \[polybori\\_lib\]](#), page 7405).

**Usage:** `from_boolean_constant(pb);` pb pyobject

**Return:** constant polynomial

**Example:**

```
LIB "polybori.lib";
ring rs=0,(x,y,z),Dp;
def rsb=boolean_poly_ring(rs);
poly f=(x+y)*x+z;
bpoly pp=f;
from_boolean_constant(0);
from_boolean_constant(1);
from_boolean_constant(pp);
```

See also: [Section D.14.7.7 \[boolean\\_ideal\]](#), page 7409; [Section D.14.7.1 \[boolean\\_std\]](#), page 7406.

### D.14.7.10 from\_boolean\_poly

Procedure from library `polybori.lib` (see [Section D.14.7 \[polybori\\_lib\]](#), page 7405).

**Usage:** `from_boolean_poly(ps[, dir]);` ps polynomial, dir integer zero or one

**Return:** default: polynomial ps in the representation of the boolean ring

**Note:** via the optional input dir, one can choose the computation method (either `direct[dir==0]` or `recursive[dir==1]`). default: `direct`

**Example:**

```
LIB "polybori.lib";
ring r=0,(x,y,z),Dp;
def rb=boolean_poly_ring(r);
poly f=x^2+2*y+5*z^4;
bpoly pp=f;
from_boolean_poly(pp);
from_boolean_poly(pp,1);
ring r2=5,(x,y,z),Dp;
def rb2=boolean_poly_ring(r2);
poly f2=x+y+z;
bpoly pp2=f2;
from_boolean_poly(pp);
from_boolean_poly(pp,1);
```

See also: [Section D.14.7.7 \[boolean\\_ideal\]](#), page 7409; [Section D.14.7.1 \[boolean\\_std\]](#), page 7406.

### D.14.7.11 direct\_from\_boolean\_poly

Procedure from library `polybori.lib` (see [Section D.14.7 \[polybori\\_lib\]](#), page 7405).

**Usage:** `from_boolean_poly(pb);` pb boolean polynomial

**Return:** polynomial in Singular

**Example:**

```
LIB "polybori.lib";
ring r=0,(x,y,z),Dp;
pobject rb=boolean_poly_ring(r);
poly f=x^2+2*y^3+3*z^3;
bpoly pp=f;
direct_from_boolean_poly(pp);
poly g=0;
bpoly pp=g;
direct_from_boolean_poly(pp);
```

See also: [Section D.14.7.7 \[boolean\\_ideal\]](#), page 7409; [Section D.14.7.4 \[boolean\\_poly\]](#), page 7407; [Section D.14.7.2 \[boolean\\_poly\\_ring\]](#), page 7407; [Section D.14.7.1 \[boolean\\_std\]](#), page 7406; [Section D.14.7.13 \[from\\_boolean\\_ideal\]](#), page 7411.

### D.14.7.12 recursive\_from\_boolean\_poly

Procedure from library `polybori.lib` (see [Section D.14.7 \[polybori.lib\]](#), page 7405).

**Usage:** recursive\_from\_boolean\_poly(pb); pb boolean polynomial

**Return:** polynomial in Singular

**Example:**

```
LIB "polybori.lib";
ring rs=0,(x,y,z),Dp;
def rsb=boolean_poly_ring(rs);
poly f=(x+y)*x+z;
bpoly pp=f;
recursive_from_boolean_poly(pp);
ring rs2=2,(x,y,z),Dp;
def rsb2=boolean_poly_ring(rs2);
poly f2=(x+y)*x+x;
bpoly pp2=f2;
recursive_from_boolean_poly(pp);
```

See also: [Section D.14.7.7 \[boolean\\_ideal\]](#), page 7409; [Section D.14.7.4 \[boolean\\_poly\]](#), page 7407; [Section D.14.7.2 \[boolean\\_poly\\_ring\]](#), page 7407; [Section D.14.7.13 \[from\\_boolean\\_ideal\]](#), page 7411; [Section D.14.7.10 \[from\\_boolean\\_poly\]](#), page 7410.

### D.14.7.13 from\_boolean\_ideal

Procedure from library `polybori.lib` (see [Section D.14.7 \[polybori.lib\]](#), page 7405).

**Usage:** from\_boolean\_ideal(I); I boolean ideal

**Return:** ideal in Singular

**Example:**

```
LIB "polybori.lib";
ring rs=0,(x,y,z),Dp;
def rb3=boolean_poly_ring(rs);
poly f1=x+y;
poly f2=x+z;
bpoly pp =f1;
```

```

bpoly p = f2;
bideal Ib;
list K=(p,pp);
Ib=K;
from_boolean_ideal(Ib);
ring rs2=5,(x,y,z),Dp;
def rb4=boolean_poly_ring(rs2);
poly p1=x+y;
poly p2=x+z;
poly p3=y+z;
bpoly p = p1;
bpoly pp = p2;
bpoly ppp = p3;
bideal Ib;
list K=(p,pp,ppp);
Ib=K;
from_boolean_ideal(Ib);

```

See also: [Section D.14.7.7 \[boolean\\_ideal\]](#), page 7409; [Section D.14.7.4 \[boolean\\_poly\]](#), page 7407; [Section D.14.7.2 \[boolean\\_poly\\_ring\]](#), page 7407; [Section D.14.7.1 \[boolean\\_std\]](#), page 7406; [Section D.14.7.10 \[from\\_boolean\\_poly\]](#), page 7410.

#### D.14.7.14 from\_boolean\_set

Procedure from library `polybori.lib` (see [Section D.14.7 \[polybori.lib\]](#), page 7405).

**Usage:** `from_boolean_set(sb)`; sb boolean set

**Return:** Boolean set sb in the representation of a zdd

**Example:**

```

LIB "polybori.lib";
ring r=0,(x,y,z),Dp;
poly f=(x+1)*(y+1)*(z+1);
bpoly fb=f;
bset fs=fb;
from_boolean_set(fs);
poly g=x*y*z+1;
bpoly gb=g;
bset gs=gb;
from_boolean_set(gs);
ring R=0,(x(1..4)),Dp;
poly h=(x(1)+1)*(x(2)+1)*(x(3)+1)*(x(4)+1);
pyobject hb=boolean_poly(h);
def hs=hb.set();
from_boolean_set(hs);

```

See also: [Section D.14.7.7 \[boolean\\_ideal\]](#), page 7409; [Section D.14.7.1 \[boolean\\_std\]](#), page 7406.

#### D.14.7.15 bvar

Procedure from library `polybori.lib` (see [Section D.14.7 \[polybori.lib\]](#), page 7405).

**Usage:** `bvar(i)`; int i

**Return:** i-th variable of Boolean ring corresponding to current basering

**Example:**

```
LIB "polybori.lib";
ring r = 2, (x,y,z), Dp;
bvar(1); // -> x
```

See also: [Section D.14.7.2 \[boolean\\_poly\\_ring\]](#), page 7407; [Section 5.1.163 \[var\]](#), page 278.

**D.14.7.16 poly2zdd**

Procedure from library `polybori.lib` (see [Section D.14.7 \[polybori\\_lib\]](#), page 7405).

**Usage:** `poly2zdd(poly ps)`; polynomial `ps`

**Return:** polynomial `ps` in zdd representation

**Example:**

```
LIB "polybori.lib";
ring r=0,x(1..5),Dp;
poly f=(x(1)+1)*(x(2)+1)*(x(3)+1)*x(4)*x(5);
poly2zdd(f);
poly g=x(3);
poly2zdd(g);
```

See also: [Section D.14.7.4 \[boolean\\_poly\]](#), page 7407; [Section D.14.7.14 \[from\\_boolean\\_set\]](#), page 7412.

**D.14.7.17 zdd2poly**

Procedure from library `polybori.lib` (see [Section D.14.7 \[polybori\\_lib\]](#), page 7405).

**Usage:** `zdd2poly(ss)`; zero-suppressed decision diagram `ss`

**Return:** zdd `ss` in polynomial representation

**Example:**

```
LIB "polybori.lib";
ring r=0,x(1..5),Dp;
poly f=(x(1)+1)*(x(2)+1)*(x(3)+1)*x(4)*x(5);
zdd2poly(poly2zdd(f));
poly g=x(3);
zdd2poly(poly2zdd(g));
poly g=0;
zdd2poly(poly2zdd(0));
poly g=1;
zdd2poly(poly2zdd(01));
```

See also: [Section D.14.7.8 \[boolean\\_set\]](#), page 7409; [Section D.14.7.10 \[from\\_boolean\\_poly\]](#), page 7410.

**D.14.7.18 disp\_zdd**

Procedure from library `polybori.lib` (see [Section D.14.7 \[polybori\\_lib\]](#), page 7405).

**Usage:** `disp_zdd(ss)`; zero-suppressed decision diagram `ss`

**Return:** string containing visualization of `ss`

**Note:** the resulting string is the visualization of the polynomial that corresponds to `ss`, but with a additional structure that comes from the zdd. Every reached else- Branch induces a new line in the string.

**Example:**

```

LIB "polybori.lib";
ring r1=0,(x,y,z),Dp;
poly f1=xyz+xy+xz+yz+y+z+x+1;
zdd s1=f1;

**D.14.8 sets\_lib**

**Library:** sets.lib

**Purpose:** Sets in Singular

**Authors:** J. Boehm, boehm @ mathematik.uni-kl.de  
 D. Wienholz, wienholz @ mathematik.uni-kl.de  
 S. Zillien, zillien @ rhrk.uni-kl.de

**Overview:** We implement the new class set and all basic methods needed to work with sets. A set is generated from a list. After the generating of a set, the adding of an element or the union of two sets, automatically every double element is removed to secure that no element occurs in a set more than once.

There is a comparison operator, we access the operator via the function isEqual. This function isEqual can be used to compare two elements of the same type (Set, list, int, bigint, string, intmat, bigintmat, intvec, ring, map, poly, matrix, ideal, module, vector, resolution) and also works for comparing of int, bigint and number with each other, similarly for matrix, bigintmat and intmat.

The function size can be used to determine the number of elements.

The + operator is used for the union, the \* operator for the intersection.

The operators < and > can be used for inclusion tests.

The print function can be used for printing sets.

Note that the implementation of the underlying data structure and algorithms is very trivial and will at some point be replaced with something more efficient.

**Types:** Set The class of all sets

**Procedures:**

### D.14.8.1 set

Procedure from library `sets.lib` (see [Section D.14.8 \[sets.lib\], page 7414](#)).

**Usage:** `set(l)` or `*=l` (short form of `* = set(l)`); `l` list

**Return:** Set, the set created from the entered list

**Example:**

```
LIB "sets.lib";
//example for set
Set S0a = list(list(1,2,3),list(list(1,2)),list(10,11));
Set S0b = list(list(10,11),list(list(1,2)));
S0b<S0a;
  ↳ 1
S0a<S0b;
  ↳ 0
S0a==S0a;
  ↳ 1
S0a==S0b;
  ↳ 0
list L = 1,1,2,3;
Set S1 = L;
S1;
  ↳ {3; 2; 1}
  ↳ Set with 3 elements
  ↳
ring R1;
ring R2 = 0,(x,y),dp;
Set S2 = list(R1,R1,R2);
S2;
  ↳ {(QQ),(x,y),(dp(2),C); (ZZ/32003),(x,y,z),(dp(3),C)}
  ↳ Set with 2 elements
  ↳
ideal I1 = x+y;
ideal I2 = y^2;
ideal I3 = x+y, (x+y)^3;
Set S3 = list(I1,I2,I3);
S3;
  ↳ {y2; x+y}
  ↳ Set with 2 elements
  ↳
isEqual(I1,I3);
  ↳ 1
isEqual(I1,I2);
  ↳ 0
module M1 = x*gen(1), y*gen(1);
module M2 = y^2*gen(2);
module M3 = (x+y)*gen(1), (x-y)*gen(1);
Set S4 = list(M1,M2,M3);
S4;
```

```

↳ {y2*gen(2); x*gen(1),y*gen(1)}
↳ Set with 2 elements
↳
intmat m1[2][3]= 1,2,3,4,5,6;
intmat m2[2][3]= 1,2,3,4,5,7;
Set S5 = list(m1,m2,m1);
S5;
↳ {1,2,3,4,5,7 ; 1,2,3,4,5,6 }
↳ Set with 2 elements
↳
bigintmat b1[2][3]= 1,2,3,4,5,6;
bigintmat b2[2][3]= 1,2,3,4,5,7;
Set S6 = list(b1,b2,b1);
S6;
↳ {[ [ 1, 2, 3 ], [ 4, 5, 7 ] ] ; [ [ 1, 2, 3 ], [ 4, 5, 6 ] ] }
↳ Set with 2 elements
↳
resolution r1 = res(maxideal(3),0);
resolution r2 = res(maxideal(4),0);
Set S7 = list(r1,r1,r2);
size(S7);
↳ 2

```

### D.14.8.2 union

Procedure from library `sets.lib` (see [Section D.14.8 \[sets.lib\], page 7414](#)).

**Usage:**     `union(N,M)` or `N+M`; `N,M` sets

**Return:**    Set, the union of the sets `N` and `M`

**Example:**

```

LIB "sets.lib";
list l =1,2,3;
list j =2,3,4;
Set N=l;
Set M=j;
N;
↳ {3; 2; 1}
↳ Set with 3 elements
↳
M;
↳ {4; 3; 2}
↳ Set with 3 elements
↳
N+M;
↳ {1; 4; 3; 2}
↳ Set with 4 elements
↳

```

### D.14.8.3 intersectionSet

Procedure from library `sets.lib` (see [Section D.14.8 \[sets.lib\], page 7414](#)).

**Usage:**     `intersectionSet(N,M)` or `N*M`; `N,M` sets

**Return:** Set, the intersection of the sets N and M

**Example:**

```
LIB "sets.lib";
list l =1,2,3;
list j =2,3,4;
Set N=l;
Set M=j;
N;
↳ {3; 2; 1}
↳ Set with 3 elements
↳
M;
↳ {4; 3; 2}
↳ Set with 3 elements
↳
N*M;
↳ {3; 2}
↳ Set with 2 elements
↳
```

#### D.14.8.4 complement

Procedure from library `sets.lib` (see [Section D.14.8 \[sets.lib\], page 7414](#)).

**Usage:** `complement(N,M)`; N,M sets

**Return:** Set, the complement of the set N in M

**Example:**

```
LIB "sets.lib";
list l =1,2;
list j =1,2,3,4;
Set N=l;
Set M=j;
N;
↳ {2; 1}
↳ Set with 2 elements
↳
M;
↳ {4; 3; 2; 1}
↳ Set with 4 elements
↳
complement(N,M);
↳ {3; 4}
↳ Set with 2 elements
↳
```

#### D.14.8.5 isElement

Procedure from library `sets.lib` (see [Section D.14.8 \[sets.lib\], page 7414](#)).

**Usage:** `isElement(a,M)`; M set a def

**Return:** bool, 1 if a is an element of M, 0 if not

**Example:**

```

LIB "sets.lib";
int i=1;
int j=5;
list k =1,2,3,4;
Set M=k;
i;
↳ 1
j;
↳ 5
M;
↳ {4; 3; 2; 1}
↳ Set with 4 elements
↳
isElement(i,M);
↳ 1
isElement(j,M);
↳ 0

```

**D.14.8.6 isSubset**

Procedure from library `sets.lib` (see [Section D.14.8 \[sets.lib\], page 7414](#)).

**Usage:** `isSubset(N,M)` or `N<M` ; N,M sets

**Return:** bool, 1 if N is a Subset of M or 0 if not

**Example:**

```

LIB "sets.lib";
list l =1,2;
list j =1,2,3,4;
Set N=l;
Set M=j;
N;
↳ {2; 1}
↳ Set with 2 elements
↳
M;
↳ {4; 3; 2; 1}
↳ Set with 4 elements
↳
N<M;
↳ 1
M<N;
↳ 0

```

**D.14.8.7 isSuperset**

Procedure from library `sets.lib` (see [Section D.14.8 \[sets.lib\], page 7414](#)).

**Return:** bool, 1 if N is a Superset of M or 0 if not

**Example:**

```

LIB "sets.lib";
list l =1,2;

```

```

list j =1,2,3,4;
Set N=1;
Set M=j;
N;
↳ {2; 1}
↳ Set with 2 elements
↳
M;
↳ {4; 3; 2; 1}
↳ Set with 4 elements
↳
N>M;
↳ 0
M>N;
↳ 1

```

### D.14.8.8 addElement

Procedure from library `sets.lib` (see [Section D.14.8 \[sets.lib\]](#), page 7414).

**Usage:**     `addElement(M,a)` ; M Set, a freely chosen element

**Return:**    adds the Element a to the Set M

**Example:**

```

LIB "sets.lib";
//example for addElement
int a=4;
list L = 1,2,3;
Set S = L;
S;
↳ {3; 2; 1}
↳ Set with 3 elements
↳
a;
↳ 4
addElement(S,a);
↳ {1; 2; 3; 4}
↳ Set with 4 elements
↳

```

## D.15 Experimental libraries

This sections collect libraries in the beta test phase. Everything in these libraries may change.

For the minimal requirements and guidelines see [Section 3.8 \[Libraries\]](#), page 54.

Comments should be send to the author of the library directly.

### D.15.1 autgradalg\_lib

**Library:**    `autgradalg.lib`

**Purpose:**     Compute automorphism groups of pointedly graded algebras and of Mori dream spaces.

**Authors:**   Simon Keicher

**Overview:** This library provides a framework for computing automorphisms of integral, finitely generated algebras that are graded by a finitely generated abelian group. This library also contains functions to compute automorphism groups of Mori dream spaces. The results are ideals  $I$  such that the respective automorphism group is isomorphic to the subgroup  $V(I)$  in some  $GL(n)$ .

**Assumptions:**

\* the algebra  $R$  is given as factor algebra  $S/I$  with a graded polynomial ring  $S = KK[T_1, \dots, T_r]$ . We will always assume that the basering is  $S$  and it is given over the rationals  $QQ$  or a number field  $QQ(a)$ . \*  $R$  must be minimally presented, i.e.,  $I$  is contained in  $\langle T_1, \dots, T_r \rangle^2$ . \*  $S$  (and hence  $R$ ) are graded via 'setBaseMultigrading(Q)' from 'multigrading.lib'. The last rows of the matrix  $Q$  are interpreted over  $\mathbb{Z}\mathbb{Z}/a_i\mathbb{Z}\mathbb{Z}$  if the respective entry of the list  $TOR$  is  $a_i$  and has been provided as parameter to the respective function. (See the functions for more details.) \* For all  $1 \leq i \leq r$ :  $L_{w_i} = 0$  where  $w_i := \deg(T_i)$ . \* the grading is pointed, i.e., no generator has degree 0 and the cone over all generator degrees is pointed. \* For Mori dream spaces  $X$ , we assume them to be given as  $X = X(R, w)$  with the Cox ring  $R$  of  $X$  (given as the algebra  $R$  before) and an ample class  $w$  in the grading group  $K$  with the torsion entries removed.

**Note:** we require the user to execute 'LIB'gfanlib.so" before using this library.

**Procedures:**

**Note:** the following functions were taken from 'quotsingcox.lib' by M.Donten-Bury and S.Keicher: 'hilbertBas'.

**Note:** This library comes without any warranty whatsoever. Use it at your own risk.

### D.15.1.1 autKS

Procedure from library `autgradalg.lib` (see [Section D.15.1 \[autgradalg.lib\], page 7419](#)).

**Usage:** `autKS(TOR)`;  $TOR$ : optional list of elementary divisors in case of torsion.

**Assume:** the basering is multigraded having used the command `setBaseMultigrading(Q)` from 'multigrading.lib'.

**Purpose:** Compute the subgroup  $\text{Aut}_K(S)$  of  $GL(n)$  of graded automorphisms of the polynomial ring  $S$  (the basering).

**Return:** returns a ring  $S$  and exports an ideal `ideal` in the coordinate ring  $S = K[Y_{ij}]$  of  $GL(n)$  such that  $\text{Aut}_K(S) = V(I)$ .

**Example:**

```
LIB "autgradalg.lib";
////////////////////////////////////
// example: fano 15:
intmat Q[1][5] = 3,3,2,2,1;
ring R = 0,T(1..5),dp;
// attach degree matrix Q to R:
setBaseMultigrading(Q);
//ideal I = T(1)*T(2) + T(3)^2*T(4) + T(5)^6;
def S = autKS();
⇒ // coefficients: QQ
⇒ // number of vars : 50
⇒ //          block 1 : ordering dp

### D.15.1.2 autGradAlg

Procedure from library `autgradalg.lib` (see [Section D.15.1 \[autgradalg\\_lib\]](#), page 7419).

**Usage:** `autGradAlg(I, TOR)`; `I` is an ideal, `TOR` is an optional list of integers representing the torsion part of the grading group.

**Assume:** minimally presented, degrees of the generators of `I` are the minimal degrees, basering multigraded pointedly,  $I_w = 0$  for all  $w = \deg(\text{var}(i))$

**Return:** a ring. Also exports an ideal `Jexported` and a list `stabExported`.

**Example:**

```

LIB "autgradalg.lib";
intmat Q[1][3] =
1,1,1;
ring R = 0,T(1..3), dp;
setBaseMultigrading(Q);
ideal I = 0; //T(1)*T(2) + T(3)*T(4);
def RR = autGradAlg(I);
↳ // coefficients: QQ
↳ // number of vars : 12
↳ //      block 1 : ordering dp
↳ //      : names T(1) T(2) T(3) Y(1) Y(2) Y(3) Y(4) Y(5) Y(\

```

### D.15.1.3 autGenWeights

Procedure from library `autgradalg.lib` (see [Section D.15.1 \[autgradalg.lib\]](#), page 7419).

**Usage:** `autGenWeights(Q)`:  $Q$  is an `intmat` (columns must contain a lattice basis).

**Assume:** the cone over  $Q$  must be pointed and the columns of  $Q$  contain a lattice basis; there must be no 0-columns in  $Q$ . We assume that, in the torsion case, the torsion rows of  $Q$  are reduced (for example, a row of  $Q$  standing for entries in  $\mathbb{Z}\mathbb{Z}/5\mathbb{Z}\mathbb{Z}$  must not contain elements  $> 5$  or  $< 0$ ).

**Purpose:** computes generators for the subgroup `aut(Omega_S)` of  $GL(n, \mathbb{Z}\mathbb{Z})$  that consists of all invertible integer `kxk` matrices which fix the set `Omega_S` of degrees of the variables of the basering  $S$ . The set of columns of  $Q$  equals `Omega_S`.

**Reference:**  
Remark 3.1.

**Return:** a list of integral matrices  $A$  with  $|\det A| = 1$  such that  $A^*\{\text{columns of } Q\} = \{\text{columns of } Q\}$ .

**Example:**

```

LIB "autgradalg.lib";
// torsion example
// ZZ + ZZ/5ZZ:
intmat Q[2][5] =
1,1,1,1,1,
2,3,1,4,0;
list TOR = 5;

```

#### D.15.1.4 stabilizer

Procedure from library `autgradalg.lib` (see [Section D.15.1 \[autgradalg.lib\], page 7419](#)).

**Usage:** `stabilizer(RL, A, BB, AMON, n0)`: RL is an ideal, A a matrix (standing for a subgroup of  $GL(n)$ ), BB is an intmat (standing for an automorphism of the grading group), AMON a list of monomials corresponding to the rows/columns of A, n0 an integer such that the first n0 variables of the basering are the  $T(i)$ , optional: a list of elementary divisors if there is torsion.

**Assume:** the basering must be graded (see `setBaseMultigrading()`) and the cone over the degrees of the variables must be pointed; there mustn't be 0-degrees. The vector w must be an element of the cone over the degrees of the variables. Moreover, B must be such that it permutes the degrees of the variables and the degrees of the generators of RL.

**Purpose:** returns relations such that  $A \cdot I = I$ .

**Return:** a ring. Also exports an ideal `Jexported` and a list `stabExported`.

**Example:**

```

LIB "autgradalg.lib";
////////////////////////////////////
// example: fano 15:
intmat Q[1][5] = 3,3,2,2,1;
ring R = 0,T(1..5),dp;
// attach degree matrix Q to R:
setBaseMultigrading(Q);
ideal I = T(1)*T(2) + T(3)^2*T(4) + T(5)^6;

### D.15.1.5 autXhat

Procedure from library `autgradalg.lib` (see [Section D.15.1 \[autgradalg.lib\], page 7419](#)).

**Usage:** `autXhat(RL, w0, TOR)`: RL is an ideal, w an intvec, TOR a list of integers

**Assume:** the basering is multigraded, the elements of TOR stand for the torsion rows of the matrix `getVariableWeights()`, w is an ample class or the free part of such a class.

**Purpose:** compute an ideal J such that  $V(J)$  in some  $GL(n)$  is isomorphic to the H-equivariant automorphisms  $\widehat{X} \rightarrow \widehat{X}$ .

**Example:**

```

LIB "autgradalg.lib";
intmat Q[3][5] =
1,1,1,1,1,
1,-1,0,0,1,

```

```

1,1,1,0,0;
list TOR = 2;
ring R = 0,T(1..5),dp;
setBaseMultigrading(Q);
ideal I = T(1)*T(2) + T(3)^2 + T(4)^2;
intvec w0 = 2,1,0;
def RR = autXhat(I, w0, TOR);

### D.15.1.6 autX

Procedure from library `autgradalg.lib` (see [Section D.15.1 \[autgradalg.lib\], page 7419](#)).

**Usage:** `autX(RL, w, TOR)`; RL: ideal, w: intvec, TOR: optional list of integers.

**Purpose:** compute generators for the hopf algebra  $O(\text{Aut}(X))$  of the Mori dream space  $X$  given by  $\text{Cox}(X) := \text{basing}/\text{RL}$  and the ample class  $w$ .

**Assume:** there is no torsion.

**Return:** a ring. Also exports an ideal `Iexported`.

**Example:**

```
LIB "autgradalg.lib";
//////////
//// CAREFUL: the following examples seems to be unfeasible at the moment, see remark
//echo=2;
//////////
//// PP2
//intmat Q[1][4] =
// 1,1,1,1;
//ring R = 0,T(1..ncols(Q)),dp;
//// attach degree matrix Q to R:
//setBaseMultigrading(Q);
//ideal I = 0;
//intvec w0 = 1;
//def RR = autX(I, w0);
//setring RR;
//Iexported;
//basing;
//dim(std(Iexported));
//kill RR, Q, R;
//////////
//// example 3.14 from the paper
//intmat Q[3][5] =
// 1,1,1,1,1,
// 1,-1,0,0,1,
// 1,1,1,0,0;
//list TOR = 2;
//ring R = 0,T(1..5),dp;
//// attach degree matrix Q to R:
//setBaseMultigrading(Q);
//ideal I = T(1)*T(2) + T(3)^2 + T(4)^2;
//list TOR = 2;
//intvec w0 = 2,1,0;
//def RR = autX(I, w0, TOR);
//setring RR;
//kill RR, Q, R;
```

### D.15.2 difform\_lib

**Library:** `difform.lib`

**Purpose:** Procedures for differential forms

**Author:** Peter Chini, chini@rhrk.uni-kl.de

**Overview:** A library for computing with elements of the differential algebra over a (quotient) ring. To compute in this algebra, a non-commutative ring with additional variables  $dx_1, \dots, dx_n$  and 'exterior' relations between these variables is used. In the case of a quotient ring, the defining ideal and its image under the universal derivation are added as relations. The differential forms themselves are defined via an additional type 'difform'. Objects of this type carry as an attribute a polynomial in the differential algebra and make it available over the basering.

Additionally, the universal derivation is available as a procedure and the differentials between the graded parts of the differential algebra can be applied to differential forms. The library also supports derivations: maps from the first graded part of the differential algebra to the basering. These are defined via the type 'derivation' and there are procedures for basic arithmetic operations, evaluation and Lie-derivative.

**Procedures:**

### D.15.2.1 diffAlgebra

Procedure from library `difform.lib` (see [Section D.15.2 \[difform.lib\]](#), page 7470).

**Side effects:**

If  $R$  is the basering, the differential algebra is constructed with name `Omega_R` and the differential forms  $dx_1, \dots, dx_n$  are available. The name of the differential algebra is stored in the attribute `attrib(R, "diffAlgebra")`.

**Note:**

- computations with differential forms need the structure of the differential algebra, so this procedure should be executed first.
- the variable names 'd' or 'D' should be avoided.
- the procedure also works for quotient rings

**Example:**

```
LIB "difform.lib";
/////////////////////////////////////////////////////////////////
// Example for a differential algebra over a polynomial ring //
/////////////////////////////////////////////////////////////////
ring R = 0, (a,b,c), ds;
diffAlgebra();
⇒ // The differential algebra Omega_R was constructed and the differential \
   forms dDa, dDb, dDc, da, db, dc are available.
setring Omega_R;
// The differential algebra is given by:
basing;
⇒ // coefficients: QQ
⇒ // number of vars : 6
⇒ //      block  1 : ordering dp
⇒ //                : names    Da Db Dc
⇒ //      block  2 : ordering ds
⇒ //                : names    a b c
⇒ //      block  3 : ordering C
⇒ // noncommutative relations:
⇒ //      DbDa=-Da*Db
⇒ //      DcDa=-Da*Dc
⇒ //      DcDb=-Db*Dc
```

```

↳ // quotient ring from ideal
↳ _[1]=Da^2
↳ _[2]=Db^2
↳ _[3]=Dc^2
kill R, Omega_R, da, db, dc;
////////////////////////////////////
// Example for a differential algebra over a quotient ring //
////////////////////////////////////
ring R = 0, (x, y, z), lp;
ideal I = x+y+z, xyz;
qring S = std(I);
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
    forms dDx, dDy, dDz, dx, dy, dz are available.
setring Omega_R;
// The differential algebra is given by:
basing;
↳ // coefficients: QQ
↳ // number of vars : 6
↳ //      block 1 : ordering dp
↳ //      : names  Dx Dy Dz
↳ //      block 2 : ordering lp
↳ //      : names  x y z
↳ //      block 3 : ordering C
↳ // noncommutative relations:
↳ //      DyDx=-Dx*Dy
↳ //      DzDx=-Dx*Dz
↳ //      DzDy=-Dy*Dz
↳ // quotient ring from ideal
↳ _[1]=y^2*z+y*z^2
↳ _[2]=x+y+z
↳ _[3]=Dz*y^4+3*Dz*y^3*z+2*Dz*y^2*z^2
↳ _[4]=Dy*z^3+2*Dz*y^3+5*Dz*y^2*z+2*Dz*y*z^2
↳ _[5]=2*Dy*y*z+Dy*z^2+Dz*y^2+2*Dz*y*z
↳ _[6]=Dx+Dy+Dz
↳ _[7]=Dy*Dz*y^2+2*Dy*Dz*y*z
↳ _[8]=Dz^2
↳ _[9]=Dy^2
↳ _[10]=Dx^2
kill Omega_R, dx, dy, dz;

```

See also: [Section D.15.2.3 \[diffAlgebraGens\]](#), page 7473; [Section D.15.2.2 \[diffAlgebraStructure\]](#), page 7472; [Section D.15.2.4 \[diffAlgebraUnivDerIdeal\]](#), page 7473.

### D.15.2.2 diffAlgebraStructure

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\]](#), page 7470).

**Usage:** `diffAlgebraStructure();`

**Return:** the structure of the differential algebra

**Remarks:** The differential algebra is constructed as non-commutative ring with additional variables  $Dx_1, \dots, Dx_n$  and 'exterior' relations between them. In the case, that the basering is a quotient ring, the defining ideal and its image under the universal derivation are added as relations.

**Note:** the monomial ordering of the basering is preserved in the differential algebra

See also: [Section D.15.2.1 \[diffAlgebra\]](#), page 7471; [Section D.15.2.3 \[diffAlgebraGens\]](#), page 7473; [Section D.15.2.4 \[diffAlgebraUnivDerIdeal\]](#), page 7473.

### D.15.2.3 diffAlgebraGens

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\]](#), page 7470).

**Usage:** `diffAlgebraGens();`

**Side effects:**

The differential forms  $dx_1, \dots, dx_n$  are constructed.

See also: [Section D.15.2.1 \[diffAlgebra\]](#), page 7471; [Section D.15.2.2 \[diffAlgebraStructure\]](#), page 7472; [Section D.15.2.4 \[diffAlgebraUnivDerIdeal\]](#), page 7473.

### D.15.2.4 diffAlgebraUnivDerIdeal

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\]](#), page 7470).

**Usage:** `diffAlgebraUnivDerIdeal(I);` I ideal

**Assume:** current basering is the differential algebra of a polynomial ring and I is lifted from the polynomial ring

**Return:** the image of I under the universal derivation

**Remark:** The procedure computes the universal derivation of every generator of the ideal.

**Note:** for differential forms use the procedure `diffformUnivDer` or `diffformDiff`

See also: [Section D.15.2.1 \[diffAlgebra\]](#), page 7471; [Section D.15.2.3 \[diffAlgebraGens\]](#), page 7473; [Section D.15.2.2 \[diffAlgebraStructure\]](#), page 7472.

### D.15.2.5 diffAlgebraChangeOrd

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\]](#), page 7470).

**Usage:** `diffAlgebraChangeOrd(#);` # list

**Assume:** the current basering is the differential algebra

**Return:** the differential algebra with changed monomial ordering

**Note:**

- an ordering is defined via the following pattern:
- `#[i] = 'gen'` defines the ordering on the generators  $dx_i$  - `#[i+1]` must then be a valid monomial ordering as string - `#[i+2]` an optional weight vector
- `#[i] = 'ringvar'` defines the ordering on the ringvariables - `#[i+1]` must then be a valid monomial ordering as string - `#[i+2]` an optional weight vector
- only use for interior computations
- differential forms are polynomials in the differential algebra - not in the returned ring - do not define differential forms as polynomials in the returned ring since this is another data-ring - an error occurs if:
  - no valid monomial ordering is given
  - no weight vector is given but a weighted monomial ordering
  - a given weight vector has wrong dimension
- weight vectors are ignored if the given ordering is not weighted

See also: [Section D.15.2.21 \[diffformIsBigger\]](#), page 7485; [Section D.15.2.22 \[diffformIsSmaller\]](#), page 7485; [Section D.15.2.27 \[diffformListSort\]](#), page 7489.

### D.15.2.6 diffAlgebraListGen

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\]](#), page 7470).

**Usage:** `diffAlgebraListGen(#); # list`

**Return:** - a list of generators of the differential algebra as module over the basering - a list of generators of a graded part of the differential algebra

**Remarks:** In order to find all generators, they are counted 'binary': The generators are in 1:1 - correspondence to the dual number representations of 1 up to  $(2^n - 1)$

**Note:**

- if all generators of the differential algebra are needed, apply the procedure without input
- if the generator(s) of a graded part are needed, apply the procedure with an integer which specifies the wanted degree
- the list of generators is sorted with respect to the monomial ordering on the differential algebra

**Example:**

```
LIB "diffform.lib";
ring R = 11, (x,y,z), dp;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
    forms dDx, dDy, dDz, dx, dy, dz are available.
////////////////////////////////////
// Generators of the differential algebra //
////////////////////////////////////
diffAlgebraListGen();
↳ [1]:
↳ 1
↳
↳ [2]:
↳ dz
↳
↳ [3]:
↳ dy
↳
↳ [4]:
↳ dx
↳
↳ [5]:
↳ dy*dz
↳
↳ [6]:
↳ dx*dz
↳
↳ [7]:
↳ dx*dy
↳
↳ [8]:
↳ dx*dy*dz
↳
////////////////////////////////////
// Generators of the second graded part //
```

```

////////////////////////////////////
diffAlgebraListGen(2);
↳ [1]:
↳   dy*dz
↳
↳ [2]:
↳   dx*dz
↳
↳ [3]:
↳   dx*dy
↳
kill Omega_R,dx,dy,dz;

```

### D.15.2.7 diffFromPoly

Procedure from library `diffFrom.lib` (see [Section D.15.2 \[diffFrom.lib\], page 7470](#)).

**Usage:** `diffFrom df = f; f poly`

**Return:** the differential form of degree 0 defined by `f`

**Remark:** The given polynomial gets lifted to the differential algebra and the differential form is defined there.

**Example:**

```

LIB "diffFrom.lib";
ring R = 0,(x,y,z),ds;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
   forms dDx, dDy, dDz, dx, dy, dz are available.
////////////////////////////////////
// Construction of differential forms //
////////////////////////////////////
poly f = 3x3z*(y4-y5) + 2;
diffFrom df = f;
df;
↳ 2+3x3y4z-3x3y5z
↳
// For the construction of more general differential forms,
// the constructor diffFromFromPoly is used implicitly:
diffFrom dg = 3*x*dx - y*dy + dx*dy*dz + 1;
dg;
↳ 1+3x*dx+(-y)*dy+dx*dy*dz
↳
kill Omega_R,df,dg,dx,dy,dz;

```

### D.15.2.8 diffFromCoef

Procedure from library `diffFrom.lib` (see [Section D.15.2 \[diffFrom.lib\], page 7470](#)).

**Usage:** `diffFromCoef(df); df diffFrom`

**Return:** list of lists of differential forms and polynomials:  
- the first entry is a generator of the differential algebra which appears in `df` - the second entry is the corresponding coefficient

**Remarks:** Via the procedure `coef`, the coefficients are found - therefore the ring has to be changed to the differential algebra. After that, the coefficients have to be mapped back to the original ring.

**Note:** the returned list can be sorted with the procedure `diffFormListSort` and the optional string `'Llist'`

**Example:**

```
LIB "diffForm.lib";
ring R = 0,(x,y,z),lp;
diffAlgebra();
⇨ // The differential algebra Omega_R was constructed and the differential \
    forms dDx, dDy, dDz, dx, dy, dz are available.

### D.15.2.9 difformGenToString

Procedure from library `difform.lib` (see [Section D.15.2 \[difform.lib\], page 7470](#)).

**Usage:** `difformGenToString(df); df difform`

**Return:** the differential form `df` as a string - but with unsorted coefficients

**Note:** - this is only used to print generators  
 - the procedure replaces the 'D' from the variables of the differential algebra by an 'd'

See also: [Section D.15.2.11 \[difformToString\], page 7479](#).

### D.15.2.10 difformHomogDecomp

Procedure from library `difform.lib` (see [Section D.15.2 \[difform.lib\], page 7470](#)).

**Usage:** `difformHomogDecomp(df); df difform`

**Return:** list of differential forms: homogeneous decomposition

**Note:** the output list always has as length the maximal possible degree plus one and the degree-0 part is the last element in the list

**Example:**

```

LIB "difform.lib";
ring R = 0,(x,y,z),ds;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
    forms dDx, dDy, dDz, dx, dy, dz are available.
difform df = 3*dx*dz - x8*dx*dy + 12 + dy*dz + dz*dx - (y4-y5)*x12*dx*dy*dz - dx - dy
////////////////////////////////////
// Homogeneous decomposition //
////////////////////////////////////
list L = difformHomogDecomp(df);
L;
↳ [1]:
↳ (-1)*dx+(-1)*dy+dz
↳
↳ [2]:
↳ (x2-x8)*dx*dy+2*dx*dz+dy*dz
↳
↳ [3]:
↳ (-x12y4+x12y5)*dx*dy*dz
↳
↳ [4]:
↳ 12
↳
kill Omega_R,df,L,dx,dy,dz;

```

See also: [Section D.15.2.8 \[difformCoef\], page 7475](#); [Section D.15.2.23 \[difformDeg\], page 7486](#).

### D.15.2.11 difformToString

Procedure from library `difform.lib` (see [Section D.15.2 \[difform.lib\], page 7470](#)).

**Usage:** `difformToString(df,#);` `df` difform, `#` list

**Return:** `df` as a string, sorted by a given ordering on the generators (standard: the ordering chosen for the differential algebra)

**Remarks:** The differential form is decomposed via `difformCoef`, the coefficient list is sorted and then the string is built as concatenation of coefficients and generators

**Note:** to get a string, respecting a certain monomial ordering on the generators, use: `- #[1] = 'gen'`  
`- #[2]:` a monomial ordering as string  
`- #[3]:` an optional weight vector

**Example:**

```
LIB "difform.lib";
ring R = 0,(x,y,z,a,b),ds;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
    forms dDx, dDy, dDz, dDa, dDb, dx, dy, dz, da, db are available.
difform df = 3*x*dx -2*db + 24*a*dy - y*dx*dy*db + 12*dx*dy*dz - dz*dy*da*db + 3 + 12
////////////////////////////////////
// String sorted with respect to the monomial order on the differential algebra //
////////////////////////////////////
string df_str = difformToString(df);
print(df_str);
↳ dy*dz*da*db+12*dx*dy*dz+(-y)*dx*dy*db+1/77*dx*da+15x*dx+24a*dy+(-2)*db+3
////////////////////////////////////
// String sorted with respect to the weighted order wp //
////////////////////////////////////
df_str = difformToString(df,"gen","wp",intvec(-1,-1,-1,1,1));
print(df_str);
↳ (-2)*db+dy*dz*da*db+1/77*dx*da+3+(-y)*dx*dy*db+15x*dx+24a*dy+12*dx*dy*dz
kill Omega_R,df,df_str,dx,dy,dz,da,db;
```

See also: [Section D.15.2.9 \[difformGenToString\], page 7478](#); [Section D.15.2.12 \[difformPrint\], page 7479](#).

### D.15.2.12 difformPrint

Procedure from library `difform.lib` (see [Section D.15.2 \[difform.lib\], page 7470](#)).

**Usage:** `df;` `df` difform

**Side effects:** prints the differential form

**Remarks:** Uses the procedure `difformToString` with a `ds`-ordering on the generators

**Example:**

```
LIB "difform.lib";
ring R = 0,(x,y,z),ds;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
```

```

    forms dDx, dDy, dDz, dx, dy, dz are available.
    //////////////////////////////////////
    // Application of Print //
    //////////////////////////////////////
    diffform df = 3*x*dx - y*dx*dy + 12*dx*dy*dz - dz*dy + 3 + 12*x*dx;
    df;
    ↪ 3+15x*dx+(-y)*dx*dy+dy*dz+12*dx*dy*dz
    ↪
    kill Omega_R,df,dx,dy,dz;

```

See also: [Section D.15.2.9 \[diffformGenToString\], page 7478](#); [Section D.15.2.11 \[diffformToString\], page 7479](#).

### D.15.2.13 diffformIsGen

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\], page 7470](#)).

**Usage:** `diffformIsGen(df); df diffform`

**Return:** 1, if `df` is a generator of the differential algebra - 0, otherwise

**Remarks:** Uses the procedure `diffformCoef` and tests for a single coefficient which is one

**Example:**

```

LIB "diffform.lib";
ring R = 0,(x,y,z,a,b,c),lp;
diffAlgebra();
↪ // The differential algebra Omega_R was constructed and the differential \
    forms dDx, dDy, dDz, dDa, dDb, dDc, dx, dy, dz, da, db, dc are available.
    //////////////////////////////////////
    // Generators //
    //////////////////////////////////////
    diffformIsGen(1);
    ↪ 1
    diffformIsGen(dx);
    ↪ 1
    diffformIsGen(da*dc);
    ↪ 1
    diffformIsGen(dy*da*db);
    ↪ 1
    diffformIsGen(-da*dz);
    ↪ 1
    //////////////////////////////////////
    // No generators //
    //////////////////////////////////////
    diffformIsGen(-1);
    ↪ 0
    diffformIsGen(-dx);
    ↪ 0
    diffformIsGen(dc*da);
    ↪ 0
    diffformIsGen(dy*db*da);
    ↪ 0
    diffformIsGen(dx*dz*dy);
    ↪ 0
    kill Omega_R,dx,dy,dz,da,db,dc;

```

See also: [Section D.15.2.8 \[diffformCoef\]](#), page 7475.

### D.15.2.14 diffformAdd

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform\\_lib\]](#), page 7470).

**Usage:** `df+dg; df,dg diffform`

**Return:** the sum of the differential forms as differential form

**Example:**

```
LIB "diffform.lib";
ring R = 0,(x,y,z),ds;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
    forms dDx, dDy, dDz, dx, dy, dz are available.
////////////////////////////////////
// Addition of differential forms //
////////////////////////////////////
diffform df = dx + 4*dy - dz*dx + 4 + 3*dx*dy + 4*dz;
diffform dg = dx + dy + 27*dz*dy;
df+dg;
↳ 4+2*dx+5*dy+4*dz+3*dx*dy+dx*dz+(-27)*dy*dz
↳
////////////////////////////////////
// Addition of polynomials and differential forms //
////////////////////////////////////
df + x2y2z2;
↳ 4+x2y2z2+dx+4*dy+4*dz+3*dx*dy+dx*dz
↳
12 + dg;
↳ 12+dx+dy+(-27)*dy*dz
↳
kill Omega_R,df,dg,dx,dy,dz;
```

See also: [Section D.15.2.15 \[diffformSub\]](#), page 7481.

### D.15.2.15 diffformSub

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform\\_lib\]](#), page 7470).

**Usage:** `df-dg; df,dg diffform`

**Return:** the difference of the differential forms as differential form

**Example:**

```
LIB "diffform.lib";
ring R = 0,(x,y,z),ds;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
    forms dDx, dDy, dDz, dx, dy, dz are available.
////////////////////////////////////
// Subtraction of differential forms //
////////////////////////////////////
diffform df = 5*dx*x2 - 7*dy*z - 2x2*dz - 3;
diffform dg = dx - 8x*dz*dy;
```

```

df-dg;
↳ -3+(-1+5x2)*dx+(-7z)*dy+(-2x2)*dz+(-8x)*dy*dz
↳
////////////////////////////////////
// Subtraction of polynomials and differential forms //
////////////////////////////////////
df - 2x3;
↳ -3-2x3+5x2*dx+(-7z)*dy+(-2x2)*dz
↳
1 - dg;
↳ 1+(-1)*dx+(-8x)*dy*dz
↳
kill Omega_R,df,dg,dx,dy,dz;

```

See also: [Section D.15.2.14 \[diffformAdd\]](#), page 7481; [Section D.15.2.16 \[diffformNeg\]](#), page 7482.

### D.15.2.16 diffformNeg

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\]](#), page 7470).

**Usage:** `-df; df diffform`

**Return:** the negation of the differential form

**Example:**

```

LIB "diffform.lib";
ring R = 0,(x,y,z),ds;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
   forms dDx, dDy, dDz, dx, dy, dz are available.
////////////////////////////////////
// Negation of a differential form //
////////////////////////////////////
diffform df = 13*dx*dy + 2*dy*dz - 6*dx*dy*dz - 3;
-df;
↳ 3+(-13)*dx*dy+(-2)*dy*dz+6*dx*dy*dz
↳
kill Omega_R,df,dx,dy,dz;

```

See also: [Section D.15.2.15 \[diffformSub\]](#), page 7481.

### D.15.2.17 diffformMul

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\]](#), page 7470).

**Usage:** `df*dg; df,dg diffform`

**Return:** the product of the differential forms as differential form

**Example:**

```

LIB "diffform.lib";
ring R = 0,(x,y,z),ds;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
   forms dDx, dDy, dDz, dx, dy, dz are available.
////////////////////////////////////
// Multiplication of differential forms //

```

```

////////////////////////////////////
diffform df = 13*dx*dy - 7*dy*dz - 6*dx*dy*dz;
diffform dg = dx - 8x;
df*dg;
↳ (-104x)*dx*dy+56x*dy*dz+(-7+48x)*dx*dy*dz
↳
////////////////////////////////////
// Multiplication of polynomials and differential forms //
////////////////////////////////////
df*(y2-x);
↳ (-13x+13y2)*dx*dy+(7x-7y2)*dy*dz+(6x-6y2)*dx*dy*dz
↳
12*dg;
↳ -96x+12*dx
↳
kill Omega_R,df,dg,dx,dy,dz;

```

See also: [Section D.15.2.18 \[diffformDiv\]](#), page 7483.

### D.15.2.18 diffformDiv

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\]](#), page 7470).

**Usage:** `df/dg; df,dg diffform`

**Return:** the quotient `df/dg` as differential form

**Example:**

```

LIB "diffform.lib";
ring R = 0,(x,y,z),lp;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
   forms dDx, dDy, dDz, dx, dy, dz are available.
////////////////////////////////////
// Divisions without remainder //
////////////////////////////////////
dx / dx;
↳ 1
↳
dx*dy*dz / dz;
↳ dx*dy
↳
(dx*x2 - yx2) / x2;
↳ -y+dx
↳
////////////////////////////////////
// Divisions with reaminder //
////////////////////////////////////
(dx + dx*dy + 1) / dx;
↳ 1+(-1)*dy
↳
(x2*dx - x*dy) / (dx-dy);
↳ x2
↳
kill Omega_R,dx,dy,dz;

```

See also: [Section D.15.2.17 \[diffformMul\]](#), page 7482.

### D.15.2.19 diffformEqu

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform\\_lib\]](#), page 7470).

**Usage:** `df == dg; df,dg diffform`

**Return:** 1, if `df` and `dg` are euqal - 0, otherwise

**Example:**

```
LIB "diffform.lib";
ring R = 0,(x,y,z),ds;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
    forms dDx, dDy, dDz, dx, dy, dz are available.
////////////////////////////////////
// Applications of comparison operator //
////////////////////////////////////
diffform df = 3*dx - x8*dx*dy;
diffform dg = 3 + x8*dy;
df == dg;
↳ 0
dg = dg*dx;
df == dg;
↳ 1
kill Omega_R,df,dg,dx,dy,dz;
```

See also: [Section D.15.2.20 \[diffformNeq\]](#), page 7484.

### D.15.2.20 diffformNeq

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform\\_lib\]](#), page 7470).

**Usage:** `df != dg; df,dg diffform`

**Return:** 0, if `df` and `dg` are euqal - 1, otherwise

**Example:**

```
LIB "diffform.lib";
ring R = 0,(x,y,z),ds;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
    forms dDx, dDy, dDz, dx, dy, dz are available.
////////////////////////////////////
// Applications of negated comparison operator //
////////////////////////////////////
diffform df = 3*dx - x8*dx*dy;
diffform dg = 3 + x8*dy;
df != dg;
↳ 1
dg = dg*dx;
df != dg;
↳ 0
kill Omega_R,df,dg,dx,dy,dz;
```

See also: [Section D.15.2.19 \[diffformEqu\]](#), page 7484.

### D.15.2.21 difformIsBigger

Procedure from library `difform.lib` (see [Section D.15.2 \[difform.lib\]](#), page 7470).

**Usage:** `df > dg` OR `difformIsBigger(df,dg,#)`; `df,dg` difform, `#` list

**Return:** - 1, if `df` is bigger than `dg` with respect to the monomial ordering in the differential algebra - 0, otherwise - 1, if `df` is bigger than `dg` with respect to a given monomial ordering on the generators/ringvariables - 0, otherwise

**Note:** the procedure uses `diffAlgebraChangeOrd` to change the order on the differential algebra, therefore an ordering is defined via the following pattern:  
 - `#[i] = 'gen'` defines the ordering on the generators `dx.i` - `#[i+1]` must then be a valid monomial ordering as string - `#[i+2]` an optional weight vector  
 - `#[i] = 'ringvar'` defines the ordering on the ringvariables - `#[i+1]` must then be a valid monomial ordering as string - `#[i+2]` an optional weight vector

**Example:**

```
LIB "difform.lib";
ring R = 0,(x,y,z),dp;
diffAlgebra();
⇒ // The differential algebra Omega_R was constructed and the differential \
    forms dDx, dDy, dDz, dx, dy, dz are available.
////////////////////////////////////
// With standard ordering //
////////////////////////////////////
dx > dy;
⇒ 1
x37*dy > dz;
⇒ 1
x*dz > y*x*dy;
⇒ 0
x3*dx - y*dx*dz > dx*dy*dz;
⇒ 0
////////////////////////////////////
// With changed ordering //
////////////////////////////////////
difformIsBigger(dx,dy,"gen","ls");
⇒ 0
difformIsBigger(x37*dy,dz,"gen","wp",intvec(1,-1,1));
⇒ 0
difformIsBigger(x*dz,y*x*dy,"gen","wp",intvec(1,-1,1),"ringvar","wp",intvec(1,-1,1))
⇒ 1
difformIsBigger(x3*dx - y*dx*dz,dx*dy*dz,"gen","wp",intvec(-1,-1,1));
⇒ 1
kill Omega_R,dx,dy,dz;
```

See also: [Section D.15.2.5 \[diffAlgebraChangeOrd\]](#), page 7473; [Section D.15.2.22 \[difformIsSmaller\]](#), page 7485.

### D.15.2.22 difformIsSmaller

Procedure from library `difform.lib` (see [Section D.15.2 \[difform.lib\]](#), page 7470).

**Usage:** `df < dg` OR `difformIsSmaller(df,dg,#)`; `df,dg` difform, `#` list

**Return:** - 1, if df is smaller than dg with respect to the monomial ordering in the differential algebra - 0, otherwise - 1, if df is smaller than dg with respect to a given monomial ordering on the generators/ringvariables - 0, otherwise

**Note:** the procedure uses `diffAlgebraChangeOrd` to change the order on the differential algebra, therefore an ordering is defined via the following pattern:  
 - `#[i] = 'gen'` defines the ordering on the generators `dx.i - #[i+1]` must then be a valid monomial ordering as string - `#[i+2]` an optional weight vector  
 - `#[i] = 'ringvar'` defines the ordering on the ringvariables - `#[i+1]` must then be a valid monomial ordering as string - `#[i+2]` an optional weight vector

**Example:**

```
LIB "diffform.lib";
ring R = 0,(x,y,z),lp;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
    forms dDx, dDy, dDz, dx, dy, dz are available.
////////////////////////////////////
// With standard ordering //
////////////////////////////////////
dz < dy;
↳ 1
x*dz < y*dz;
↳ 0
y2*z2*dy < x;
↳ 0
dx*dz < dy;
↳ 0
////////////////////////////////////
// With changed ordering //
////////////////////////////////////
diffformIsSmaller(dz,dy,"gen","ls");
↳ 0
diffformIsSmaller(x*dz,y*dz,"ringvar","ls");
↳ 1
diffformIsSmaller(y2*z2*dy,x,"gen","wp",intvec(1,-1,1));
↳ 1
diffformIsSmaller(dx*dz,dy,"gen","ws",intvec(1,-1,-1));
↳ 1
kill Omega_R,dx,dy,dz;
```

See also: [Section D.15.2.5 \[diffAlgebraChangeOrd\], page 7473](#); [Section D.15.2.21 \[diffformIsBigger\], page 7485](#).

### D.15.2.23 diffformDeg

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\], page 7470](#)).

**Usage:** `deg(df); df diffform`

**Return:** degree of df - degree of the highest generator, -1 if df = 0

**Note:** - the procedure does not check if df is homogeneous  
 - be careful: `diffformDeg` does not cast polynomials to differential forms. So before applying to a polynomial, a type cast should be done

```

homog(x*dx+dy*dx);
↳ 0
// When applying homog to a polynomial which is considered
// as a differential form, a type cast has to be done first
homog(3x-y2);
↳ 0
diffform df = 3x-y2;
homog(df);
↳ 1
kill Omega_R,dx,dy,dz,df;

```

See also: [Section D.15.2.23 \[diffformDeg\]](#), page 7486; [Section D.15.2.25 \[diffformIsHomogDeg\]](#), page 7488.

### D.15.2.25 diffformIsHomogDeg

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\]](#), page 7470).

**Usage:** `diffformIsHomogDeg(df,p)`; `df` diffform, `p` int

**Return:** 1, if `df` is homogeneous of degree `p - 0`, otherwise

**Note:** - 0 is homogeneous of degree -1

**Example:**

```

LIB "diffform.lib";
ring R = 0,(x,y,z),ds;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
   forms dDx, dDy, dDz, dx, dy, dz are available.
diffform df = 3*dx*dz - x8*dx*dy;
diffform dg = 3 + x8*dy;
diffform dh = 2;
diffform dt = 0;
////////////////////////////////////
// Homogeneous of given degree //
////////////////////////////////////
diffformIsHomogDeg(df,2);
↳ 1
diffformIsHomogDeg(dh,0);
↳ 1
diffformIsHomogDeg(dt,-1);
↳ 1
////////////////////////////////////
// Not homogeneous of given degree //
////////////////////////////////////
diffformIsHomogDeg(df,1);
↳ 0
diffformIsHomogDeg(dg,1);
↳ 0
diffformIsHomogDeg(dh,1);
↳ 0
kill Omega_R,df,dg,dh,dt,dx,dy,dz;

```

See also: [Section D.15.2.23 \[diffformDeg\]](#), page 7486; [Section D.15.2.24 \[diffformIsHomog\]](#), page 7487.

### D.15.2.26 difformListCont

Procedure from library `difform.lib` (see [Section D.15.2 \[difform.lib\], page 7470](#)).

**Usage:** `difformListCont(L,df)`; L list, df difform

**Return:** 1, if df is in the list L - 0, otherwise

**Note:** lists with arbitrary input are allowed

**Example:**

```
LIB "difform.lib";
ring R = 17,(a,b,c),lp;
diffAlgebra();
↪ // The differential algebra Omega_R was constructed and the differential \
    forms dDa, dDb, dDc, da, db, dc are available.
list L = "",3,12*a,da-db,16 + dc, 23*da - 4*db*dc*da, db - 4, "entry", dc - db*da, a
//////////
// Elements in the list //
//////////
difformListCont(L,da - db);
↪ 1
difformListCont(L,16 + dc);
↪ 1
difformListCont(L,dc - db*da);
↪ 1
//////////
// Elements not in the list //
//////////

kill Omega_R,L,da,db,dc;
```

See also: [Section D.15.2.19 \[difformEqu\], page 7484](#).

### D.15.2.27 difformListSort

Procedure from library `difform.lib` (see [Section D.15.2 \[difform.lib\], page 7470](#)).

**Return:** the sorted list L in ascending order, depending on the optional monomial ordering given

**Remarks:** Classical insertion sort is used to sort the list

**Note:**

- the procedure uses `difformIsBigger` to compare list elements, therefore an optional ordering is defined via the pattern in `difformIsBigger` - the standard ordering is the ordering on the differential algebra - the procedure can also handle special lists of lists by using the optional input "Dlist" or "Llist":
  - "Dlist" is used for lists with structure:
    - L[1] is a list of differential forms
    - L[2] is a list of polynomials of same size,
 The list gets sorted by the elements in L[1]. This is mainly used for the structure of derivations.
  - "Llist" allows the structure: L[i] is a list with two entries: L[i][1] is a differential form

$L[i][2]$  is a polynomial

The list gets sorted by the elements  $L[i][1]$ . This is used to sort coefficient lists.

**Example:**

```
LIB "diffform.lib";
ring R = 0,(x,y,z,t),dp;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
    forms dDx, dDy, dDz, dDt, dx, dy, dz, dt are available.
////////////////////////////////////
// Sortation of a list //
////////////////////////////////////
list L = dx*x, x2 - y*t, 12, dt*dy*dx*dz;
// Sort list with standard ordering
diffformListSort(L);
↳ [1]:
↳ 12
↳
↳ [2]:
↳ x2-yt
↳
↳ [3]:
↳ x*dx
↳
↳ [4]:
↳ dx*dy*dz*dt
↳
// Sort list with changed ordering
diffformListSort(L,"gen","ls","ringvar","wp",intvec(-1,1,1,1));
↳ [1]:
↳ dx*dy*dz*dt
↳

↳      x
kill Omega_R,dx,dy,dz,dt,L,DL,LL;

```

See also: [Section D.15.2.21 \[difformIsBigger\]](#), page 7485; [Section D.15.2.22 \[difformIsSmaller\]](#), page 7485.

### D.15.2.28 difformUnivDer

Procedure from library `difform.lib` (see [Section D.15.2 \[difform.lib\]](#), page 7470).

**Usage:** `difformUnivDer(f); f poly`

**Return:** a differential form: the image of the universal derivation applied to `f`

**Example:**

```

LIB "diffform.lib";
ring R = 0,(x,y,z),lp;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
    forms dDx, dDy, dDz, dx, dy, dz are available.
////////////////////////////////////
// Universal derivation applied to polynomials //
////////////////////////////////////
diffformUnivDer(3x);
↳ 3*dx
↳
diffformUnivDer(xyz+x2y2z2);
↳ (2xy2z2+yz)*dx+(2x2yz2+xz)*dy+(2x2y2z+xy)*dz
↳
diffformUnivDer(x+y+z);
↳ dx+dy+dz
↳
kill Omega_R,dx,dy,dz;

```

See also: [Section D.15.2.29 \[diffformDiff\]](#), page 7492.

### D.15.2.29 diffformDiff

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\]](#), page 7470).

**Usage:** `diffformDiff(df); df diffform`

**Return:** the image of `df` under the differential

**Remark:** To compute the image, the universal derivation is applied to each coefficient and multiplied with the corresponding generator

**Note:**

- the differential is a map  $\Omega_R^p \rightarrow \Omega_R^{p+1}$  and this procedure applies the differential to all homogeneous parts of `df`
- this procedure can also be applied to polynomials - in this case it is just the universal derivation

**Example:**

```

LIB "diffform.lib";
ring R = 0,(x,y,z,a,b,c),lp;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
    forms dDx, dDy, dDz, dDa, dDb, dDc, dx, dy, dz, da, db, dc are available.
////////////////////////////////////
// Construction of differential forms //
////////////////////////////////////
diffform df_1 = y*dx + z*dy + x*dz + a*db + b*dc + c*da;
diffform df_2 = -5*c4*dc*dz*dy + 3*dx*dz - 13*a4*da*db + 12*a4*da*db + x8*dx*dy + 12
poly f = 3x2y2 - z3*c;
////////////////////////////////////
// Differential applied to the forms //
////////////////////////////////////
diffformDiff(df_1);
↳ (-1)*dx*dy+dx*dz+(-1)*dy*dz+da*db+(-1)*da*dc+db*dc
↳
diffformDiff(df_2);

```

```

↳ (-2x)*dx*dy*db+(5x12y4-4x12y3)*dx*dy*dz*db
↳
diffformDiff(f);
↳ 6xy2*dx+6x2y*dy+(-3z2c)*dz+(-z3)*dc
↳
// The composition of differentials is the zero-map:
diffformDiff(diffformDiff(df_1));
↳ 0
↳
kill Omega_R,df_1,df_2,f,dx,dy,dz,da,db,dc;

```

See also: [Section D.15.2.28 \[diffformUnivDer\]](#), page 7491.

### D.15.2.30 derivationFromList

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\]](#), page 7470).

**Usage:** derivation phi = derivationFromList(L); L list

**Return:** the derivation defined by the list L

**Remarks:** The structure of L is checked and L is sorted, then it is set as structure list of phi

**Note:** the structure of L must follow the rules:  
- L[1] is a list of all degree-1 generators: all  $dx_i$  must occur once and no other differential forms are allowed. The order of the list is not important - L[2] is the list of images of the  $dx_i$ : these must be polynomials Since the map is linear, it is enough to store the images of the  $dx_i$

**Example:**

```

LIB "diffform.lib";
ring R = 11,(u,v,w,x),lp;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
    forms dDu, dDv, dDw, dDx, du, dv, dw, dx are available.
////////////////////////////////////
// Construction of structure lists //
////////////////////////////////////
list L_1;
L_1[1] = list(du,dv,dw,dx);
L_1[2] = list(u,v,w,x);
list L_2;
L_2[1] = list(dx,dw,du,dv);
L_2[2] = list(x2,w2,u2,v-wu);
////////////////////////////////////
// Construction of derivations //
////////////////////////////////////
derivation phi = derivationFromList(L_1); phi;
↳ Omega_R^1 --> R
↳      du |--> u
↳      dv |--> v
↳      dw |--> w
↳      dx |--> x
↳
↳

```

```

derivation psi = derivationFromList(L_2); psi;
↳ Omega_R^1 --> R
↳ du |--> u2
↳ dv |--> -uw+v
↳ dw |--> w2
↳ dx |--> x2
↳
↳
kill Omega_R,du,dv,dw,dx,phi,psi,L_1,L_2;

```

See also: [Section D.15.2.31 \[derivationCheckList\]](#), page 7494; [Section D.15.2.33 \[derivationConstructor\]](#), page 7495; [Section D.15.2.32 \[derivationFromPoly\]](#), page 7494.

### D.15.2.31 derivationCheckList

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\]](#), page 7470).

**Usage:** `derivationCheckList(L); L list`

**Remarks:** The procedure checks if a given list has the right form for a derivation and throws an error if this is not the case. In particular: - Only degree-1 generators are allowed in `L[1]` - this is checked via `diffformIsGen` - Any degree-1 generator must occur once - this is checked via `diffformListCont`

**Note:** like in `derivationFromList`, the structure of `L` must follow the rules: - `L[1]` is a list of all degree-1 generators: all `dxi` must occur once and no other differential forms are allowed. The order of the list is not important - `L[2]` is the list of images of the `dxi`: these must be polynomials

See also: [Section D.15.2.30 \[derivationFromList\]](#), page 7493; [Section D.15.2.13 \[diffformIsGen\]](#), page 7480; [Section D.15.2.26 \[diffformListCont\]](#), page 7489.

### D.15.2.32 derivationFromPoly

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\]](#), page 7470).

**Usage:** `derivation phi = derivationFromPoly(f); f poly`

**Return:** a derivation which maps any degree-1 generator to `f`

**Remarks:** The degree-1 generators are returned by `diffAlgebraListGen`

**Note:** the procedure allows to interpret polynomials as derivations

**Example:**

```

LIB "diffform.lib";
ring R = 0,(x,y,z),lp;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
  forms dDx, dDy, dDz, dx, dy, dz are available.
////////////////////////////////////
// Construction of derivations from polynomials //
////////////////////////////////////
derivation phi = derivationFromPoly(3x*y - 12*y4-z2); phi;
↳ Omega_R^1 --> R
↳ dx |--> 3xy-12y4-z2
↳ dy |--> 3xy-12y4-z2

```

```

↳          dz |--> 3xy-12y4-z2
↳
↳
derivation psi = derivationFromPoly(0); psi;
↳ Omega_R^1 --> R
↳          dx |--> 0
↳          dy |--> 0
↳          dz |--> 0
↳
↳
kill Omega_R,dx,dy,dz,phi,psi;

```

See also: [Section D.15.2.33 \[derivationConstructor\], page 7495](#); [Section D.15.2.30 \[derivationFromList\], page 7493](#).

### D.15.2.33 derivationConstructor

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\], page 7470](#)).

**Usage:** `derivation phi = inp;` `inp` of any type

**Return:** the derivation defined by `inp`:

**Remarks:** the output depends on the type of `inp`:  
- if `inp` is of type list, the constructor `derivationFromList` is used - if `inp` is of type poly, number, int or bigint, `derivationFromPoly` is used

**Note:** for other than the mentioned types, there is no output

**Example:**

```

LIB "diffform.lib";
ring R = 31,(x,y,z),dp;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
    forms dDx, dDy, dDz, dx, dy, dz are available.
////////////////////////////////////
// Construction of derivations from lists and polynomials //
////////////////////////////////////
list L; L[1] = list(dx,dz,dy); L[2] = list(x2,y-x,z);
derivation phi = L; phi;
↳ Omega_R^1 --> R
↳          dx |--> x2
↳          dy |--> z
↳          dz |--> -x+y
↳
↳
derivation psi = 3x2-12z; psi;
↳ Omega_R^1 --> R
↳          dx |--> 3x2-12z
↳          dy |--> 3x2-12z
↳          dz |--> 3x2-12z
↳
↳
kill Omega_R,dx,dy,dz,phi,psi;

```

See also: [Section D.15.2.30 \[derivationFromList\], page 7493](#); [Section D.15.2.32 \[derivationFromPoly\], page 7494](#).

### D.15.2.34 derivationToString

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\]](#), page 7470).

**Usage:** `derivationToString(phi,#)`; `phi` derivation, `#` list

**Return:** the derivation as a string, describing the image of the degree-1 generators, optionally ordered by a given monomial ordering on the generators

**Remarks:** To sort the images of the generators in the output string, `diffformListSort` is used.

**Note:** to define an ordering for the generators, one can use:

- `#[1]` = 'gen'
  - `#[2]`: a monomial ordering as string
  - `#[3]`: an optional weight vector
- the standard ordering is the ordering of the differential algebra

**Example:**

```
LIB "diffform.lib";
ring R = 0,(x,y,z),dp;
diffAlgebra();
⇨ // The differential algebra Omega_R was constructed and the differential \
    forms dDx, dDy, dDz, dx, dy, dz are available.
list L; L[1] = list(dx,dy,dz); L[2] = list(x2,y-23xz,xz4);
derivation phi = L;
////////////////////////////////////
// String with standard ordering //
////////////////////////////////////
print(derivationToString(phi));
⇨ Omega_R^1 --> R
⇨      dz |--> xz4
⇨      dy |--> -23xz+y
⇨      dx |--> x2
⇨
////////////////////////////////////
// String with changed ordering //
////////////////////////////////////
print(derivationToString(phi,"gen","wp",intvec(-1,-1,1)));
⇨ Omega_R^1 --> R
⇨      dy |--> -23xz+y
⇨      dx |--> x2
⇨      dz |--> xz4
⇨
kill Omega_R,dx,dy,dz,L,phi;
```

See also: [Section D.15.2.35 \[derivationPrint\]](#), page 7496; [Section D.15.2.9 \[diffformGenToString\]](#), page 7478; [Section D.15.2.27 \[diffformListSort\]](#), page 7489.

### D.15.2.35 derivationPrint

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\]](#), page 7470).

**Usage:** `derivationPrint(phi)`; `phi` derivation

**Side effects:**  
prints the given derivation

**Remarks:** Prints the string returned by `derivationToString` with a ls-ordering on the generators

**Example:**

```
LIB "diffform.lib";
ring R = 0,(a,b,c,x,y,z),lp;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
    forms dDa, dDb, dDc, dDx, dDy, dDz, da, db, dc, dx, dy, dz are available.
//////////
// Derivations //
//////////
list L; L[1] = list(dx,dy,dz,da,db,dc); L[2] = list(1,12x-y,z4aby, 2*b5x,0,xyz-abc);
derivation phi = L;
derivation phi_poly = 3ab - c2*x + z;
//////////
// Applications of Print //
//////////
phi;
↳ Omega_R^1 --> R
↳      da |--> 2b5x
↳      db |--> 0
↳      dc |--> -abc+xyz
↳      dx |--> 1
↳      dy |--> 12x-y
↳      dz |--> abyz4
↳
↳
phi_poly;
↳ Omega_R^1 --> R
↳      da |--> 3ab-c2x+z
↳      db |--> 3ab-c2x+z
↳      dc |--> 3ab-c2x+z
↳      dx |--> 3ab-c2x+z
↳      dy |--> 3ab-c2x+z
↳      dz |--> 3ab-c2x+z
↳
↳
kill Omega_R,da,db,dc,dx,dy,dz,L,phi,phi_poly;
```

See also: [Section D.15.2.34 \[derivationToString\]](#), page 7496.

### D.15.2.36 derivationAdd

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\]](#), page 7470).

**Usage:** `phi+psi; phi,psi derivation`

**Return:** the sum of the given derivations

**Remark:** The sum is computed componentwise - this works since the structure lists of derivations are sorted the same way.

**Note:** once can also add polynomials and derivations

**Example:**

```

LIB "diffform.lib";
ring R = 0,(x,y,z),ds;
diffAlgebra();
⇨ // The differential algebra Omega_R was constructed and the differential \
    forms dDx, dDy, dDz, dx, dy, dz are available.
list L_1; L_1[1] = list(dx,dy,dz); L_1[2] = list(2x,2y,2z);
list L_2; L_2[1] = list(dx,dy,dz); L_2[2] = list(y2-x,z4+x+y,y2);
//////////
// Derivations //
//////////
derivation phi_1 = L_1; phi_1;
⇨ Omega_R^1 --> R
⇨      dx |--> 2x
⇨      dy |--> 2y
⇨      dz |--> 2z
⇨
⇨
derivation phi_2 = L_2; phi_2;
⇨ Omega_R^1 --> R
⇨      dx |--> -x+y2
⇨      dy |--> x+y+z4
⇨      dz |--> y2
⇨
⇨
//////////
// Sum of derivations //
//////////
phi_1 + phi_2;
⇨ Omega_R^1 --> R
⇨      dx |--> x+y2
⇨      dy |--> x+3y+z4
⇨      dz |--> 2z+y2
⇨
⇨
phi_1 + phi_2 + phi_2;
⇨ Omega_R^1 --> R
⇨      dx |--> 2y2
⇨      dy |--> 2x+4y+2z4
⇨      dz |--> 2z+2y2
⇨
⇨
phi_1 + phi_2 + 3x2;
⇨ Omega_R^1 --> R
⇨      dx |--> x+3x2+y2
⇨      dy |--> x+3y+3x2+z4
⇨      dz |--> 2z+3x2+y2
⇨
⇨
kill Omega_R,dx,dy,dz,L_1,L_2,phi_1,phi_2;

```

See also: [Section D.15.2.37 \[derivationSub\]](#), page 7499.

### D.15.2.37 derivationSub

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\]](#), page 7470).

**Usage:** `phi-psi; phi,psi derivation`

**Return:** the difference of the given derivations

**Remarks:** The difference is computed componentwise - this works since the structure lists of derivations are sorted the same way.

**Note:** one can also subtract polynomials from derivations

**Example:**

```
LIB "diffform.lib";
ring R = 0,(x,y),lp;
diffAlgebra();
⇨ // The differential algebra Omega_R was constructed and the differential \
    forms dDx, dDy, dx, dy are available.
list L_1; L_1[1] = list(dx,dy); L_1[2] = list(x+y,1);
list L_2; L_2[1] = list(dy,dx); L_2[2] = list(x,y2);
//////////
// Derivations //
//////////
derivation phi_1 = L_1; phi_1;
⇨ Omega_R^1 --> R
⇨      dx |--> x+y
⇨      dy |--> 1
⇨
⇨
derivation phi_2 = L_2; phi_2;
⇨ Omega_R^1 --> R
⇨      dx |--> y2
⇨      dy |--> x
⇨
⇨
//////////
// Difference of derivations //
//////////
phi_1-phi_2;
⇨ Omega_R^1 --> R
⇨      dx |--> x-y2+y
⇨      dy |--> -x+1
⇨
⇨
phi_1-phi_2-phi_1;
⇨ Omega_R^1 --> R
⇨      dx |--> -y2
⇨      dy |--> -x
⇨
⇨
phi_1 - (x+y);
⇨ Omega_R^1 --> R
⇨      dx |--> 0
⇨      dy |--> -x-y+1
```

```

↳
↳
kill Omega_R,dx,dy,L_1,L_2,phi_1,phi_2;

```

See also: [Section D.15.2.36 \[derivationAdd\]](#), page 7497; [Section D.15.2.38 \[derivationNeg\]](#), page 7500.

### D.15.2.38 derivationNeg

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\]](#), page 7470).

**Usage:**     `-phi; phi` derivation

**Return:**    the negation of a given derivation

**Example:**

```

LIB "diffform.lib";
ring R = 0,(x,y,z,t),dp;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
   forms dDx, dDy, dDz, dDt, dx, dy, dz, dt are available.
list L_1; L_1[1] = list(dy,dx,dt,dz); L_1[2] = list(x2-y,23y+t,tz4,z-y);
////////////////////////////////////
// Derivations //
////////////////////////////////////
derivation phi_1 = L_1; phi_1;
↳ Omega_R^1 --> R
↳      dx |--> 23y+t
↳      dy |--> x2-y
↳      dz |--> -y+z
↳      dt |--> z4t
↳
↳
derivation phi_poly = 3xyz; phi_poly;
↳ Omega_R^1 --> R
↳      dx |--> 3xyz
↳      dy |--> 3xyz
↳      dz |--> 3xyz
↳      dt |--> 3xyz
↳
↳
////////////////////////////////////
// Negation of derivations //
////////////////////////////////////
-phi_1;
↳ Omega_R^1 --> R
↳      dx |--> -23y-t
↳      dy |--> -x2+y
↳      dz |--> y-z
↳      dt |--> -z4t
↳
↳
-(-phi_1);
↳ Omega_R^1 --> R
↳      dx |--> 23y+t

```

```

↳          dy |--> x2-y
↳          dz |--> -y+z
↳          dt |--> z4t
↳
↳
-(phi_poly);
↳  Omega_R^1 --> R
↳          dx |--> -3xyz
↳          dy |--> -3xyz
↳          dz |--> -3xyz
↳          dt |--> -3xyz
↳
↳
kill Omega_R,dx,dy,dz,dt,L_1,phi_1,phi_poly;

```

See also: [Section D.15.2.37 \[derivationSub\]](#), page 7499.

### D.15.2.39 derivationMul

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\]](#), page 7470).

**Usage:** `phi*psi; phi,psi derivation`

**Return:** the componentwise product of `phi` and `psi`

**Remarks:** The product is computed componentwise - this works since the structure lists of derivations are sorted the same way.

**Note:** one can also multiply polynomials and derivations

**Example:**

```

LIB "diffform.lib";
ring R = 0,(a,b,t),ls;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \

### D.15.2.40 derivationEqu

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\]](#), page 7470).

**Usage:** `phi == psi; phi,psi derivation`

**Return:** 1, if phi and psi are equal - 0, otherwise

**Remarks:** The images of the generators are compared componentwise - this works since the structure lists of derivations are sorted the same way.

**Note:** derivations can also be compared to polynomials

**Example:**

```

LIB "diffform.lib";
ring R = 0,(u,v),lp;
diffAlgebra();
  => // The differential algebra Omega_R was constructed and the differential \
      forms dDu, dDv, du, dv are available.
list L_1; L_1[1] = list(dv,du); L_1[2] = list(u,-v);
////////////////////////////////////
// Derivations //
////////////////////////////////////
derivation phi_1 = L_1; phi_1;
  => Omega_R^1 --> R
  =>      du |--> -v
  =>      dv |--> u
  =>
  =>
derivation phi_poly = u*v; phi_poly;

```

```

↳ Omega_R^1 --> R
↳      du |--> uv
↳      dv |--> uv
↳
↳
////////////////////////////////////
// Comparison of derivations //
////////////////////////////////////
phi_1 == phi_1;
↳ 1
phi_1 == phi_poly;
↳ 0
phi_poly == u*v;
↳ 1
kill Omega_R,du,dv,phi_1,phi_poly;

```

See also: [Section D.15.2.41 \[derivationNeq\]](#), page 7503.

### D.15.2.41 derivationNeq

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\]](#), page 7470).

**Usage:** `phi != psi; phi,psi derivation`

**Return:** 0, if phi and psi are equal - 1, otherwise

**Remarks:** The comparison is done by `diffformEqu`

**Note:** derivations can also be compared to polynomials

**Example:**

```

LIB "diffform.lib";
ring R = 0,(u,v),lp;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
    forms dDu, dDv, du, dv are available.
list L_1; L_1[1] = list(dv,du); L_1[2] = list(u,-v);
////////////////////////////////////
// Derivations //
////////////////////////////////////
derivation phi_1 = L_1; phi_1;
↳ Omega_R^1 --> R
↳      du |--> -v
↳      dv |--> u
↳
↳
derivation phi_poly = u*v; phi_poly;
↳ Omega_R^1 --> R
↳      du |--> uv
↳      dv |--> uv
↳
↳
////////////////////////////////////
// Comparison of derivations //
////////////////////////////////////
phi_1 != phi_1;

```

```

↳ 0
phi_1 != phi_poly;
↳ 1
phi_poly != u*v;
↳ 0
kill Omega_R,du,dv,phi_1,phi_poly;

```

See also: [Section D.15.2.40 \[derivationEqu\]](#), page 7502.

### D.15.2.42 derivationEval

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform-lib\]](#), page 7470).

**Usage:** `phi(df); phi` derivation, `df` diffform

**Return:** the polynomial `phi(df)`, the derivation `phi` evaluated at `df`

**Remarks:**

- By linearity it is enough to compute the sum of all differential forms: (coefficient of `dx_i`)\*(image of `dx_i`)
- The coefficient list of `df` is computed via `diffformCoef` - To avoid searching generators in lists, the coefficient list of `df` and the structure list of `phi` are sorted the same way

**Note:**

- the differential form 0 is allowed as input
- an error will occur if the given differential form is not of degree 1 or -1

**Example:**

```

LIB "diffform.lib";
ring R = 13,(x,y,z,t),dp;
diffAlgebra();
↳ // The differential algebra Omega_R was constructed and the differential \
   forms dDx, dDy, dDz, dDt, dx, dy, dz, dt are available.
////////////////////////////////////
// Construction of derivations //
////////////////////////////////////
list L_1; L_1[1] = list(dx,dt,dz,dy); L_1[2] = list(x,y,z,t);
derivation phi_1 = L_1; phi_1;
↳ Omega_R^1 --> R
↳      dx |--> x
↳      dy |--> t
↳      dz |--> z
↳      dt |--> y
↳
↳
list L_2; L_2[1] = list(dx,dy,dz,dt); L_2[2] = list(y2x-zt,zt + y, t3-x, y4-y5);
derivation phi_2 = L_2; phi_2;
↳ Omega_R^1 --> R
↳      dx |--> xy2-zt
↳      dy |--> zt+y
↳      dz |--> t3-x
↳      dt |--> -y5+y4
↳
↳
list L_3; L_3[1] = list(dx,dy,dz,dt); L_3[2] = list(0,0,0,0);
derivation phi_3 = L_3; phi_3;
↳ Omega_R^1 --> R
↳      dx |--> 0

```

```

↳          dy |--> 0
↳          dz |--> 0
↳          dt |--> 0
↳
↳
////////////////////////////////////
// Evaluation of derivations //
////////////////////////////////////
phi_1(0);
↳ 0
phi_1(dx+dy+dz+dt);
↳ x+y+z+t
phi_1(3*dx - dt);
↳ 3x-y
phi_2(dt);
↳ -y5+y4
phi_2(dx+dt);
↳ -y5+y4+xy2-zt
phi_2(dx - dy + (x3-y2)*dz + 12*dt);
↳ x3t3+y5-y2t3-x4-y4+2xy2-2zt-y
phi_3(dx);
↳ 0
phi_3(dy);
↳ 0
phi_3(dx - 24*(dx + dz) - x4*dy);
↳ 0
kill Omega_R,dx,dy,dz,dt,L_1,L_2,L_3,phi_1,phi_2,phi_3;

```

See also: [Section D.15.2.8 \[difformCoef\]](#), page 7475; [Section D.15.2.27 \[difformListSort\]](#), page 7489.

### D.15.2.43 derivationContractionGen

Procedure from library `difform.lib` (see [Section D.15.2 \[difform.lib\]](#), page 7470).

**Usage:** `derivationContractionGen(phi,d_gen);` phi derivation, d\_gen difform

**Assume:** d\_gen is a generator of the differential algebra

**Return:** the image of d\_gen under the contraction map `i_phi`

**Remarks:** The formula for the contraction map applied to a generator of degree l is given by:  
 $i_{\text{phi}}^{(l)}(dx.k*...*dx.j) = \sum_{(i=1,..l)} (-1)^{(i+1)} * \text{phi}(dx.i) * (dx.k*...*dx.j / dx.i)$

**Note:** this procedure should only be applied to generators

See also: [Section D.15.2.44 \[derivationContraction\]](#), page 7505.

### D.15.2.44 derivationContraction

Procedure from library `difform.lib` (see [Section D.15.2 \[difform.lib\]](#), page 7470).

**Usage:** `derivationContraction(phi,df);` phi derivation, df difform

**Return:** the image of the contraction map `i_phi` applied to df

**Remarks:** Since the contraction map is linear, it is only applied to the generators: So the image of df under `i_phi` is a sum, where the coefficients are multiplied by the image of the generators.

**Note:** over the basering, the contraction map is the 0-map

**Example:**

```
LIB "diffform.lib";
ring R = 0,(x,y,z),lp;
diffAlgebra();
⇨ // The differential algebra Omega_R was constructed and the differential \
    forms dDx, dDy, dDz, dx, dy, dz are available.
////////////////////////////////////
// Construction of derivations //
////////////////////////////////////
list L_1; L_1[1] = list(dx,dy,dz); L_1[2] = list(x,y,z);
derivation phi_1 = L_1; phi_1;
⇨ Omega_R^1 --> R
⇨      dx |--> x
⇨      dy |--> y
⇨      dz |--> z
⇨
⇨
list L_2; L_2[1] = list(dx,dy,dz); L_2[2] = list(y-x,z-y,x-z);
derivation phi_2 = L_2; phi_2;
⇨ Omega_R^1 --> R
⇨      dx |--> -x+y
⇨      dy |--> -y+z
⇨      dz |--> x-z
⇨
⇨
////////////////////////////////////
// Contractions of derivations //
////////////////////////////////////
derivationContraction(phi_1,dx+dy+dz);
⇨ x+y+z
⇨
derivationContraction(phi_1,x2*y4-z);
⇨ 0
⇨
derivationContraction(phi_1,x2*dx*dy + dx*dy*dz);
⇨ (-x2y)*dx+(-x3)*dy+z*dx*dy+y*dx*dz+x*dy*dz
⇨
derivationContraction(phi_2,dx+dy+dz);
⇨ 0
⇨
derivationContraction(phi_2,dx*dy*dz - dx*dy + dx*dz);
⇨ (-x-y+2z)*dx+(-x+y)*dy+(x-y)*dz+(x-z)*dx*dy+(-y+z)*dx*dz+(-x+y)*dy*dz
⇨
kill Omega_R,dx,dy,dz,L_1,L_2,phi_1,phi_2;
```

See also: [Section D.15.2.44 \[derivationContraction\]](#), page 7505; [Section D.15.2.45 \[derivationLie\]](#), page 7506.

### D.15.2.45 derivationLie

Procedure from library `diffform.lib` (see [Section D.15.2 \[diffform.lib\]](#), page 7470).

**Usage:** `diff(phi,df)`; phi derivation, df diffform

**Return:** the image of  $df$  under the Lie-derivative  $L_{\phi}$

**Remarks:** The map  $L_{\phi}$  is the anticommutator of the contraction map  $i_{\phi}$  and the differential  $d$ :  
 $(i_{\phi} \circ d) + (d \circ i_{\phi})$

**Example:**

```
LIB "diffform.lib";
ring R = 0,(x,y,z),lp;
diffAlgebra();
⇨ // The differential algebra Omega_R was constructed and the differential \
    forms dDx, dDy, dDz, dx, dy, dz are available.
////////////////////////////////////
// Construction of derivations //
////////////////////////////////////
list L; L[1] = list(dx,dy,dz); L[2] = list(x2,y2,z2);
derivation phi = L; phi;
⇨ Omega_R^1 --> R
⇨      dx |--> x2
⇨      dy |--> y2
⇨      dz |--> z2
⇨
⇨
derivation phi_poly = x-y;
////////////////////////////////////
// Lie-derivative of derivations //
////////////////////////////////////
diff(phi,dx);
⇨ 2x*dx
⇨
diff(phi,dx*dy);
⇨ (-2x+2y)*dx*dy
⇨
diff(phi,dx*dy*dz);
⇨ (2x-2y+2z)*dx*dy*dz
⇨
diff(phi,dx*dy + dy*dx);
⇨ 0
⇨
diff(phi,dx*dy - dy*dx);
⇨ (-4x+4y)*dx*dy
⇨
diff(phi_poly,dx);
⇨ dx+(-1)*dy
⇨
diff(phi_poly,dx-dy);
⇨ 0
⇨
diff(phi_poly,dx+dy);
⇨ 2*dx+(-2)*dy
⇨
diff(phi_poly,dx*(x2-y4) + 1);
⇨ (3x2-4xy3-2xy+3y4)*dx+(-x2-8xy3+9y4)*dy
⇨
```

```
kill Omega_R,dx,dy,dz,L,phi,phi_poly;
```

See also: [Section D.15.2.44 \[derivationContraction\]](#), page 7505; [Section D.15.2.29 \[diffformDiff\]](#), page 7492.

### D.15.3 finitediff\_lib

Issues:

- installation of qepcadfilter.pl needs to be solved
- tests for (nearly) all procedures are missing
- global variables needs to be cleaned
- temporary files needs to be cleaned
- temporary file names need to be unique (think about multiple instances)
- pollution of global Top namespace must be solved
- u is not a good name for a procedure

**Library:** finitediff.lib

**Purpose:** procedures to compute finite difference schemes for linear differential equations

**Author:** Christian Dingler

**Overview:** Using `qepcad/qepcadsystem` from this library requires the program `qepcad` to be installed. You can download `qepcad` from <http://www.usna.edu/CS/qepcadweb/B/QEPCAD.html>

**Procedures:**

#### D.15.3.1 visualize

Procedure from library `finitediff.lib` (see [Section D.15.3 \[finitediff\\_lib\]](#), page 7508).

**Usage:** `visualize(f)`; `f` of type `poly`.

**Return:** type `string`; translates the polynomial form of a finite difference scheme into an indexed one as often seen in literature

**Example:**

```
LIB "finitediff.lib";
list D="Ux","Ut","U";
list P="a";
list V="t","x";
setinitials(V,D,P);
scheme(u(Ut)+a*u(Ux),trapezoid(Ux,U,x),backward(Ut,U,t));
⇒ (dx)*x+(dx)
visualize(_);
⇒ (dx)*U(0,1)+(dx)*U(0,0)
```

#### D.15.3.2 u

Procedure from library `finitediff.lib` (see [Section D.15.3 \[finitediff\\_lib\]](#), page 7508).

**Usage:** `u(D[,#])`; `D` a string that occurs in the list of `@derivatives`, `#` an optional list of integers.

**Return:** type `vector`; gives the vector, that corresponds with `gen(n)*m`, where `m` is the monomial defined by `#`

**Example:**

```

LIB "finitediff.lib";
list D="Ux","Uy","Ut","U";
list P="a","b";
list V="t","x","y";
setinitials(V,D,P);
u(Ux);
↳ [1]
u(Ux,2,3,7);
↳ [t^2*x^3*y^7]
u(Uy)+u(Ut)-u(Ux);
↳ [-1,1,1]
u(U)*234-dx*dt*dy*3*u(Uy);
↳ [0,(-3*dt*dx*dy),0,234]

```

**D.15.3.3 scheme**

Procedure from library `finitediff.lib` (see [Section D.15.3 \[finitediff.lib\], page 7508](#)).

**Usage:** `scheme([v1,...,vn]);`  $v_1, \dots, v_n$  of type vector

**Return:** poly

**Purpose:** performs substitutions by the means of Groebner basis computation of the submodule, generated by the input vectors, then intersects the intermediate result with the suitable component in order to get a finite difference scheme

**Note:** works only for a single PDE, for the case of a system use `matrixsystem`

**Example:**

```

LIB "finitediff.lib";
list D="Ux","Ut","U";
list P="a";
list V="t","x";
setinitials(V,D,P);
def s1=scheme(u(Ut)+a*u(Ux),backward(Ux,U,x),forward(Ut,U,t));
s1;
↳ (-a*dt+dx)/(dx)*x+(a*dt)/(dx)

```

**D.15.3.4 laxfrT**

Procedure from library `finitediff.lib` (see [Section D.15.3 \[finitediff.lib\], page 7508](#)).

**Usage:** `laxfrT(U1,U2,var);`  $U_1, U_2$  are the names of occurring derivatives, `var` is a variable in the basering;

**Return:** type vector; gives a predefined approximation of the Lax-Friedrich-approximation for the derivation in the timevariable as often used in literature;

**Note:** see also `laxfrX`, `setinitials`, `scheme`; Warning: `laxfrT` is not to be interchanged with `laxfrX`

**Example:**

```

LIB "finitediff.lib";
list D="Ux","Ut","U";
list P="a";

```

```
list V="t","x";
setinitials(V,D,P);
laxfrT(Ux,U,x);
↳ [(dt)*x,0,-t*x+1/2*x^2+1/2]
```

### D.15.3.5 laxfrX

Procedure from library `finitediff.lib` (see [Section D.15.3 \[finitediff.lib\], page 7508](#)).

**Usage:** `laxfrX(U1,U2,var)`; U1, U2 are the names of occurring derivatives, var is a variable in the basering;

**Return:** type vector; gives a predefined approximation of the Lax-Friedrich-approximation for the derivation in one of the spatial variables as often used in literature;

**Note:** see also `laxfrT`, `setinitials`, `scheme`; Warning: `laxfrX` is not to be interchanged with `laxfrT`

**Example:**

```
LIB "finitediff.lib";
list D="Ux","Ut","U";
list P="a";
list V="t","x";
setinitials(V,D,P);
laxfrX(Ux,U,x);
↳ [(2*dx)*x,0,-x^2+1]
```

### D.15.3.6 forward

Procedure from library `finitediff.lib` (see [Section D.15.3 \[finitediff.lib\], page 7508](#)).

**Usage:** `forward(U1,U2,var)`; U1, U2 are the names of occurring derivatives, var is a variable in the basering;

**Return:** type vector; gives a predefined approximation of the forward approximation as often used in literature;

**Note:** see also `laxfrT`, `setinitials`, `scheme`;

**Example:**

```
LIB "finitediff.lib";
list D="Ut","Ux","Uy","U";
list V="t","x","y";
list P="a","b";
setinitials(V,D,P);
forward(Ux,U,x);
↳ [0,(dx),0,-x+1]
forward(Uy,U,y);
↳ [0,0,(dy),-y+1]
forward(Ut,U,t);
↳ [(dt),0,0,-t+1]
```

### D.15.3.7 backward

Procedure from library `finitediff.lib` (see [Section D.15.3 \[finitediff.lib\], page 7508](#)).

**Usage:** backward(U1,U2,var); U1, U2 are the names of occurring derivatives, var is a variable in the basering;

**Return:** type vector; gives a predefined approximation of the backward approximation as often used in literature;

**Note:** see also forward,laxfrT,setinitials,scheme;

**Example:**

```
LIB "finitediff.lib";
list D="Ut","Ux","Uy","U";
list V="t","x","y";
list P="a","b";
setinitials(V,D,P);
backward(Ux,U,x);
↪ [0,(dx)*x,0,-x+1]
backward(Uy,U,y);
↪ [0,0,(dy)*y,-y+1]
backward(Ut,U,t);
↪ [(dt)*t,0,0,-t+1]
```

### D.15.3.8 central1st

Procedure from library `finitediff.lib` (see [Section D.15.3 \[finitediff.lib\], page 7508](#)).

**Usage:** central1st(U1,U2,var); U1, U2 are the names of occurring derivatives, var is a variable in the basering;

**Return:** type vector; gives a predefined approximation of the first-order-central-approximation as often used in literature;

**Note:** see also forward,laxfrT,setinitials,scheme;

**Example:**

```
LIB "finitediff.lib";
list D="Ut","Ux","Uy","U";
list V="t","x","y";
list P="a","b";
setinitials(V,D,P);
central1st(Ux,U,x);
↪ [0,(2*dx)*x,0,-x^2+1]
central1st(Uy,U,y);
↪ [0,0,(2*dy)*y,-y^2+1]
```

### D.15.3.9 central2nd

Procedure from library `finitediff.lib` (see [Section D.15.3 \[finitediff.lib\], page 7508](#)).

**Usage:** central2nd(U1,U2,var); U1, U2 are the names of occurring derivatives, var is a variable in the basering;

**Return:** type vector; gives a predefined approximation of the second-order-central-approximation as often used in literature;

**Note:** see also forward,laxfrT,setinitials,scheme;

**Example:**

```

LIB "finitediff.lib";
list D="Uxx","Ux","Utt","Ut","U";
list P="lambda";
list V="t","x";
setinitials(V,D,P);
central2nd(Uxx,U,x);
↪ [(dx^2)*x,0,0,0,-x^2+2*x-1]
central2nd(Utt,U,t);
↪ [0,0,(dt^2)*t,0,-t^2+2*t-1]

```

### D.15.3.10 trapezoid

Procedure from library `finitediff.lib` (see [Section D.15.3 \[finitediff.lib\]](#), page 7508).

**Usage:** `trapezoid(U1,U2,var)`; U1, U2 are the names of occurring derivatives, var is a variable in the basering;

**Return:** type vector; gives a predefined approximation of the trapezoid-approximation as often used in literature;

**Note:** see also `forward,laxfrT,setinitials,scheme`;

**Example:**

```

LIB "finitediff.lib";
list D="Uxx","Ux","Utt","Ut","U";
list P="lambda";
list V="t","x";
setinitials(V,D,P);
trapezoid(Uxx,Ux,x);
↪ [(dx)/2*x+(dx)/2,-x+1]
trapezoid(Ux,U,x);
↪ [0,(dx)/2*x+(dx)/2,0,0,-x+1]

```

### D.15.3.11 midpoint

Procedure from library `finitediff.lib` (see [Section D.15.3 \[finitediff.lib\]](#), page 7508).

**Usage:** `midpoint(U1,U2,var)`; U1, U2 are the names of occurring derivatives, var is a variable in the basering;

**Return:** type vector; gives a predefined approximation of the midpoint-approximation as often used in literature;

**Note:** see also `forward,laxfrT,setinitials,scheme`;

**Example:**

```

LIB "finitediff.lib";
list D="Uxx","Ux","Utt","Ut","U";
list P="lambda";
list V="t","x";
setinitials(V,D,P);
midpoint(Ux,U,x);
↪ [0,(2*dx)*x,0,0,-x^2+1]

```

### D.15.3.12 pyramid

Procedure from library `finitediff.lib` (see [Section D.15.3 \[finitediff.lib\]](#), page 7508).

**Usage:** `pyramid(U1,U2,var)`; U1, U2 are the names of occurring derivatives, var is a variable in the basering;

**Return:** type vector; gives a predefined approximation of the pyramid-approximation as often used in literature;

**Note:** see also `forward,laxfrT,setinitials,scheme`;

**Example:**

```
LIB "finitediff.lib";
list D="Uxx","Ux","Utt","Ut","U";
list P="lambda";
list V="t","x";
setinitials(V,D,P);
pyramid(Ux,U,x);
⇒ [0,(dx)/3*x^2+(dx)/3*x+(dx)/3,0,0,-x^3+x]
```

### D.15.3.13 setinitials

Procedure from library `finitediff.lib` (see [Section D.15.3 \[finitediff.lib\]](#), page 7508).

**Usage:** `setinitials(V,D[,P])`; V,D,P are lists with strings as elements

**Return:** no return value: sets the dependence order of the occurring derivatives, constructs the suitable ring to compute in containing user chosen parameters, sets new basering

**Note:** P is optional, used to introduce some additional parameters into the ring. The Sine and Cosine values needed for the fourier transformation are symbolically introduced under the names `string(c)+nameof(variable)`, i.e. if x is any spatial variable then `cx:=cosine(dx*ksi)`, when regarding the fourier transform after ksi (for sine respectively). Artificial parameters I,T,Px,Py are introduced for the later eigenvalue analysis. Variables can be transformed into parameters of similar name

**Example:**

```
LIB "finitediff.lib";
list D="Ut","Ux","Uy","U";
list V="t","x","y";
list P="alpha","beta","gamma";
setinitials(V,D,P);////does not show the ring, since there is no output
basing;////does show the ring
⇒ // coefficients: QQ(I, T, Px, Py, Cx, Cy, Sx, Sy, alpha, beta, gamma, dt,\
    dx, dy)

```

### D.15.3.14 errormap

Procedure from library `finitediff.lib` (see [Section D.15.3 \[finitediff.lib\], page 7508](#)).

**Usage:** `errormap(f)`;  $f$  of type `poly`

**Return:** type `poly`; performs the fouriertransformation of a single polynomial

**Example:**

```
LIB "finitediff.lib";
list D="Ux","Ut","U";
list P="a";
list V="t","x";
setinitials(V,D,P);
scheme(u(Ut)+a*u(Ux),central1st(Ux,U,x),backward(Ut,U,t));
↪ (2*dx)*x
errormap(_);
↪ (2*dx)*i*sx+(2*dx)*cx
```

### D.15.3.15 matrixsystem

Procedure from library `finitediff.lib` (see [Section D.15.3 \[finitediff.lib\], page 7508](#)).

**Usage:** `matrixsystem(M,A)`; where the  $M=M_t, M_1, \dots, M_n$  is a list with square matrices of the same dimension as entries, and  $A=A_t, A_1, \dots, A_n$  gives the corresponding approximations for the several variables  $(t, x_1, \dots, x_n)$  as vector. Intended to solve  $M_t \cdot U_t + M_1 \cdot U_{x_1} + \dots + M_n \cdot U_{x_n} = 0$  as a linear system of partial differential equations numerically by a finite difference scheme;

**Return:** type `matrix`; gives back the matrices  $B_1, B_2$  that represent the finite difference scheme, partitioned into different time levels in the form:  $B_1 \cdot U(t=N) = B_2 \cdot U(t < N)$ , where  $N$  is the maximal occurring degree (timelevel) of  $t$ .

**Example:**

```
LIB "finitediff.lib";
list D="Ut","Ux","Uy","U";
list V="t","x","y";
list P="a","b";
setinitials(V,D,P);
list Mat=unitmat(2),unitmat(2);
list Appr=forward(Ut,U,t),forward(Ux,U,x);
matrixsystem(Mat,Appr);
↪ _[1,1]=-1/(dt)*t-1/(dx)*x+(dt+dx)/(dt*dx)
↪ _[1,2]=0
↪ _[2,1]=0
↪ _[2,2]=-1/(dt)*t-1/(dx)*x+(dt+dx)/(dt*dx)
```

### D.15.3.16 timestep

Procedure from library `finitediff.lib` (see [Section D.15.3 \[finitediff.lib\], page 7508](#)).

**Usage:** `timestep(M)`;  $M$  a square matrix with polynomials over the basering as entries;

**Return:** type `list`; gives two matrices  $M_1, M_2$  that are the splitting of  $M$  with respect to the degree of the variable  $t$  in the entries, where the first list-entry  $M_1$  consists of the polynomials of the highest timelevel and  $M_2$  of the lower levels in the form:  $M=0 \Rightarrow M_1=M_2$ , i.e.  $M_1-M_2=M$

**Note:** intended to be used for the finite-difference-scheme-construction and partition into the several time steps

**Example:**

```
LIB "finitediff.lib";
list D="Ut","Ux","Uy","U";
list V="t","x","y";
list P="a","b";
setinitials(V,D,P);
list Mat=unitmat(2),unitmat(2);
list Apr=forward(Ut,U,t),forward(Ux,U,x);
matrixsystem(Mat,Apr);
⇒ _[1,1]=-1/(dt)*t-1/(dx)*x+(dt+dx)/(dt*dx)
⇒ _[1,2]=0
⇒ _[2,1]=0
⇒ _[2,2]=-1/(dt)*t-1/(dx)*x+(dt+dx)/(dt*dx)
timestep(_);
⇒ [1]:
⇒ _[1,1]=t
⇒ _[1,2]=0
⇒ _[2,1]=0
⇒ _[2,2]=t
⇒ [2]:
⇒ _[1,1]=(-dt)/(dx)*x+(dt+dx)/(dx)
⇒ _[1,2]=0
⇒ _[2,1]=0
⇒ _[2,2]=(-dt)/(dx)*x+(dt+dx)/(dx)
```

### D.15.3.17 fouriersystem

Procedure from library `finitediff.lib` (see [Section D.15.3 \[finitediff.lib\]](#), page 7508).

**Usage:** `fouriersystem(M,A)`; M a list of matrices, A a list of approximations;

**Return:** type list; each entry is some matrix obtained by performing the substitution of the single approximations into the system of pde's, partitioning the equation into the several timesteps and fouriertransforming these parts

**Example:**

```
LIB "finitediff.lib";
list D="Ut","Ux","Uy","U";
list V="t","x","y";
list P="a","b";
setinitials(V,D,P);
matrix M[2][2]=0,-a,-a,0;
list Mat=unitmat(2),M;
list Apr=forward(Ut,U,t),trapezoid(Ux,U,x);
def s=fouriersystem(Mat,Apr);s;
⇒ [1]:
⇒ [1]:
⇒ [1,1]=(I*T*Sx+T*Cx)
⇒ [1,2]=0
⇒ [2,1]=0
```

```

↳      _[2,2]=(I*T*Sx+T*Cx)
↳      [2]:
↳      _[1,1]=(I*Sx+Cx)
↳      _[1,2]=(2*I*Sx*a*dt+2*Cx*a*dt-2*a*dt)/(dx)
↳      _[2,1]=(2*I*Sx*a*dt+2*Cx*a*dt-2*a*dt)/(dx)
↳      _[2,2]=(I*Sx+Cx)
↳      [2]:
↳      [1]:
↳      _[1]=(I*T*Sx+T*Cx)
↳      [2]:
↳      _[1]=(-2*I*Sx*a*dt+I*Sx*dx-2*Cx*a*dt+Cx*dx+2*a*dt)/(dx)
↳      _[2]=(2*I*Sx*a*dt+I*Sx*dx+2*Cx*a*dt+Cx*dx-2*a*dt)/(dx)
↳ [2]:
↳ [1]:
↳ [1]:
↳ (T^2)
↳ [2]:
↳ [1]:
↳ (-8*Cx*a^2*dt^2+4*Cx*a*dt*dx+8*a^2*dt^2-4*a*dt*dx+dx^2)/(dx^2)
↳ [2]:
↳ (-8*Cx*a^2*dt^2-4*Cx*a*dt*dx+8*a^2*dt^2+4*a*dt*dx+dx^2)/(dx^2)

```

### D.15.3.18 PartitionVar

Procedure from library `finitediff.lib` (see [Section D.15.3 \[finitediff.lib\]](#), page 7508).

**Usage:** PartitionVar(f); f a poly in the basering;

**Return:** type poly; gives back a list L=f1,f2 obtained by the partition of f into two parts f1,f2 with  $\text{deg\_var}_n(f1) > 0$   $\text{deg\_var}_n(f2)=0$

**Example:**

```

LIB "finitediff.lib";
list D="Ut","Ux","Uy","U";
list V="t","x","y";
list P="a","b";
setinitials(V,D,P);////does not show the ring, since there is no output
basing;////does show the ring
↳ // coefficients: QQ(I, T, Px, Py, Cx, Cy, Sx, Sy, a, b, dt, dx, dy)
↳ // number of vars : 8
↳ //      block  1 : ordering c
↳ //      block  2 : ordering lp
↳ //      : names      i t x y cx cy sx sy
↳ // quotient ring from ideal
↳ _[1]=cy^2+sy^2-1
↳ _[2]=cx^2+sx^2-1
↳ _[3]=i^2+1
poly f=t**3*cx**2-cy**2*dt+i**3*sx;
PartitionVar(f,1); ////i is the first variable
↳ [1]:
↳ i^3*sx
↳ [2]:
↳ t^3*cx^2+(-dt)*cy^2

```

### D.15.3.19 ComplexValue

Procedure from library `finitediff.lib` (see [Section D.15.3 \[finitediff.lib\], page 7508](#)).

**Usage:** `ComplexValue(f)`;  $f$  a poly in the basering;

**Return:** type poly; gives back the formal complex-value of  $f$ , where `var(1)` is regarded as the imaginary unit. Does only make sense, if the proc `<setinitials>` is executed before `-> nvars <= npars`

**Example:**

```
LIB "finitediff.lib";
list D="Ut","Ux","Uy","U";
list V="t","x","y";
list P="a","b";
setinitials(V,D,P);////does not show the ring, as there is no output
basing;////does show the ring
↳ // coefficients: QQ(I, T, Px, Py, Cx, Cy, Sx, Sy, a, b, dt, dx, dy)
↳ // number of vars : 8
↳ //          block 1 : ordering c
↳ //          block 2 : ordering lp
↳ //          : names    i t x y cx cy sx sy
↳ // quotient ring from ideal
↳ _[1]=cy^2+sy^2-1
↳ _[2]=cx^2+sx^2-1
↳ _[3]=i^2+1
poly f=t**3*cx**2-cy**2*dt+i**3*sx;
f;
↳ i^3*sx+t^3*cx^2+(-dt)*cy^2
ComplexValue(f);
↳ t^6*sx^4-2*t^6*sx^2+t^6+(-2*dt)*t^3*sx^2*sy^2+(2*dt)*t^3*sx^2+(2*dt)*t^3*\
sy^2+(-2*dt)*t^3+sx^2+(dt^2)*sy^4+(-2*dt^2)*sy^2+(dt^2)
```

### D.15.3.20 VarToPar

Procedure from library `finitediff.lib` (see [Section D.15.3 \[finitediff.lib\], page 7508](#)).

**Usage:** `VarToPar(f)`;  $f$  a poly in the basering;

**Return:** type poly; gives back the poly obtained by substituting `var(i)` by `par(i)`, for all variables. Does only make sense, if the proc `<setinitials>` is executed before `-> nvars <= npars`;

**Example:**

```
LIB "finitediff.lib";
list D="Ut","Ux","Uy","U";
list V="t","x","y";
list P="a","b";
setinitials(V,D,P);////does not show the ring, as there is no output
basing;////does show the ring
↳ // coefficients: QQ(I, T, Px, Py, Cx, Cy, Sx, Sy, a, b, dt, dx, dy)
↳ // number of vars : 8
↳ //          block 1 : ordering c
↳ //          block 2 : ordering lp
↳ //          : names    i t x y cx cy sx sy
↳ // quotient ring from ideal
↳ _[1]=cy^2+sy^2-1
```

```

↳ _[2]=cx^2+sx^2-1
↳ _[3]=i^2+1
poly f=t**3*cx**2-cy**2*dt+i**3*sx;
f;
↳ i^3*sx+t^3*cx^2+(-dt)*cy^2
VarToPar(f);
↳ (I^3*Sx+T^3*Cx^2-Cy^2*dt)

```

### D.15.3.21 ParToVar

Procedure from library `finitediff.lib` (see [Section D.15.3 \[finitediff.lib\], page 7508](#)).

**Usage:** `ParToVar(f)`;  $f$  a poly in the basering;

**Return:** type poly; gives back the poly obtained by substituting `par(i)` by `var(i)`, for the first `nvars(basering)` parameters. Does only make sense, if `setinitials` is executed before  $\rightarrow$  `nvars <= npars`. Is the opposite action to `VarToPar`, see example `ParToVar`;

**Example:**

```

LIB "finitediff.lib";
list D="Ut","Ux","Uy","U";
list V="t","x","y";
list P="a","b";
setinitials(V,D,P);////does not show the ring, as there is no output
basing;////does show the ring
↳ // coefficients: QQ(I, T, Px, Py, Cx, Cy, Sx, Sy, a, b, dt, dx, dy)
↳ // number of vars : 8
↳ //          block  1 : ordering c
↳ //          block  2 : ordering lp
↳ //          : names    i t x y cx cy sx sy
↳ // quotient ring from ideal
↳ _[1]=cy^2+sy^2-1
↳ _[2]=cx^2+sx^2-1
↳ _[3]=i^2+1
poly f=t**3*cx**2-cy**2*dt+i**3*sx/dt*dx;
f;
↳ (dx)/(dt)*i^3*sx+t^3*cx^2+(-dt)*cy^2
def g=VarToPar(f);
g;
↳ (I^3*Sx*dx+T^3*Cx^2*dt-Cy^2*dt^2)/(dt)
def h=ParToVar(g);
h==f;
↳ 1

```

### D.15.3.22 qepcad

Procedure from library `finitediff.lib` (see [Section D.15.3 \[finitediff.lib\], page 7508](#)).

**Usage:** `qepcad(f)`;  $f$  a poly in the basering;

**Return:** type list; gives back some constraints that are equivalent to  $f < 1$  (computed by QEP-CAD);

**Example:**

```

LIB "finitediff.lib";
list D="Ux","Ut","U";
list P="a";
list V="t","x";
setinitials(V,D,P);
def s1=scheme(u(Ut)+a*u(Ux),laxfrX(Ux,U,x),laxfrT(Ut,U,x));
s1;
↳ (-a*dt+dx)/(2*dx)*x^2+(a*dt+dx)/(2*dx)
def s2=errormap(s1);
s2;
↳ (-a*dt+dx)/(dx)*i*cx*sx+(a*dt-dx)/(dx)*sx^2+1
def s3=ComplexValue(s2);s3;
↳ (a^2*dt^2-dx^2)/(dx^2)*sx^2+1
qepcad(s3);
↳ 0
↳ 0
↳ 0
↳ sh: qepcad: Kommando nicht gefunden.
↳ sh: qepcadfilter.pl: Kommando nicht gefunden.
↳ 32512

↳ Try manually

```

### D.15.3.23 qepcadsystem

Procedure from library `finitediff.lib` (see [Section D.15.3 \[finitediff\\_lib\]](#), page 7508).

**Usage:** `qepcadsystem(f); l` a list;

**Return:** list

**Purpose:** gives back some constraints that are equivalent to the eigenvalues of the matrices in the list `l` being  $< 1$  (computed by QEPCAD)

**Example:**

```

LIB "finitediff.lib";
list D="Ut","Ux","Uy","U";
list V="t","x","y";
list P="a","b";
setinitials(V,D,P);
matrix M[2][2]=0,-a,-a,0;
list Mat=unitmat(2),M;
list Appr=forward(Ut,U,t),forward(Ux,U,x);
//matrixsystem(Mat,Appr);
//timestep(_);
fourierysystem(Mat,Appr);
↳ [1]:
↳ [1]:
↳ [1,1]=(T)
↳ [1,2]=0
↳ [2,1]=0
↳ [2,2]=(T)
↳ [2]:
↳ [1,1]=1

```

```

↳      _[1,2]=(I*Sx*a*dt+Cx*a*dt-a*dt)/(dx)
↳      _[2,1]=(I*Sx*a*dt+Cx*a*dt-a*dt)/(dx)
↳      _[2,2]=1
↳      [2]:
↳      [1]:
↳      _[1]=(T)
↳      [2]:
↳      _[1]=(-I*Sx*a*dt-Cx*a*dt+a*dt+dx)/(dx)
↳      _[2]=(I*Sx*a*dt+Cx*a*dt-a*dt+dx)/(dx)
↳ [2]:
↳ [1]:
↳ [1]:
↳ (T^2)
↳ [2]:
↳ [1]:
↳ (-2*Cx*a^2*dt^2-2*Cx*a*dt*dx+2*a^2*dt^2+2*a*dt*dx+dx^2)/(dx^2)
↳ [2]:
↳ (-2*Cx*a^2*dt^2+2*Cx*a*dt*dx+2*a^2*dt^2-2*a*dt*dx+dx^2)/(dx^2)
qepcadsystem(_[2]);
↳ 0
↳ 0

```

#### D.15.4 GND\_lib

**Library :** GND.lib

**Author :** Adrian Popescu, popescu@mathematik.uni-kl.de

**Overview :**

A method to compute the General Neron Desingularization in the frame of one dimensional local domains

**References:**

[1] A. Popescu, D. Popescu, "A method to compute the General Neron Desingularization in the frame of one dimensional local domains", [arxiv.org/abs/1508.05511](http://arxiv.org/abs/1508.05511)

**Procedures:**

##### D.15.4.1 desingularization

Procedure from library GND.lib (see [Section D.15.4 \[GND\\_lib\]](#), page 7520).

**Usage :** Returns as output a General Neron Desingularization as in the Paper <http://arxiv.org/abs/1508.05511>

**Example:**

```

LIB "GND.lib";
//Example 1
ring All = 0, (a1,a2,a3,x1,x2,x3,Y1,Y2,Y3), dp;
int nra = 3;
int nrx = 3;
int nry = 3;
ideal xid = x2^3-x3^2,x1^3-x3^2;
ideal yid = Y1^3-Y2^3;
ideal aid = a3^2-a1*a2;
poly y;
int i;
for(i=0;i<=30;i++)
{
y = y + a1*x3^i/factorial(i);
}
for(i=31;i<=50;i++)
{
y = y + a2*x3^i/factorial(i);
}
ideal f = a3*x1,a3*x2,y;
desingularization(All, nra,nrx,nry,xid,yid,aid,f);
↳ h =
↳ h[1]=Y1+(x1^3*x3^6)*T3+(-a3*x1)
↳ h[2]=Y2+(-x1^2*x3^6)*T1+(x1^2*x2*x3^6)*T3+(-a3*x2)
↳ h[3]=Y3+(x1^3*x3^6)*T2+(-a1*x3^7-7*a1*x3^6-42*a1*x3^5-210*a1*x3^4-840*a1*\
x3^3-2520*a1*x3^2-5040*a1*x3-5040*a1)/5040
↳ h[4]=Y4+(-x1^2*x3^4)*T4+1
// With debug output

```

### D.15.5 gradedModules.lib

**Library:** gradedModules.lib

**Purpose:** Operations with graded modules/matrices/resolutions

**Authors:** Oleksandr Motsak <U@D>, where U=motsak, D=mathematik.uni-kl.de  
 Hanieh Keneshlou <hkeneshlou@yahoo.com>

**Overview:** The library contains several procedures for constructing and manipulating graded modules/matrices/resolutions. Basics about graded objects can be found in [DL]. Throughout this library graded objects are graded maps, that is, matrices with polynomials, together with grading weights for source and destination. Graded modules are implicitly given as coker of a graded map. Note that in special cases we may also consider submodules in  $S^r$  generated by columns of a graded polynomial matrix (or a graded map).

**Note:** set assumeLevel to positive integer value in order to auto-check all assumptions. We denote the current basering by S.

**References:**

[DL] Decker, W., Lossen, Ch.: Computing in Algebraic Geometry, Springer, 2006

**Procedures:**

#### D.15.5.1 grobj

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\]](#), page 7524).

**Usage:** `grobj(M, w[, d])`, matrix/ideal/module M, intvec w, d

**Return:** graded object with matrix presentation M, row weighting w [and total graded degrees d of columns]

**Purpose:** create a valid graded object with a given matrix presentation, weighting [and total graded degrees (in case of zero columns)]

**Example:**

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
def A = grobj( module([x+y, x, 0, 0], [0, x+y, y, 0]), intvec(0,0,0,1) );
grview(A);
↳ Graded homomorphism: r^3 + r(-1) <- r(-1)^2, given by a matrix, with degr\
ees:
↳      ..1 ..2 ....

```

```

↳      --- --- +...
↳    0 :  1  - |..1
↳    0 :  1  1 |..2
↳    0 :  -  1 |..3
↳    1 :  -  - |..4
↳      === ===
↳        1  1
def F = grobj( module([x,y,0]), intvec(1,1,5) );
grview(F);
↳ Graded homomorphism: r(-1)^2 + r(-5) <- r(-2), given by a matrix, with de\
grees:
↳      ..1 ....
↳      --- +...
↳    1 :  1 |..1
↳    1 :  1 |..2
↳    5 :  - |..3
↳      ===
↳        2
int d = 666; // zero can have any degree...
def Z = grobj( module([x,0], [0,0,0], [0, y]), intvec(1,2,3), intvec(2, d, 3) );
grview(Z);
↳ Graded homomorphism: r(-1) + r(-2) + r(-3) <- r(-2) + r(-666) + r(-3), gi\
ven by a square matrix, with degrees:
↳      ...1 ...2 ...3 .....
↳      ---- ---- ---- +....
↳    1 :  1  -  - |...1
↳    2 :  -  -  1 |...2
↳    3 :  -  -  - |...3
↳      =====
↳        2  666  3
print(Z);
↳ x,0,0,
↳ 0,0,y,
↳ 0,0,0
attrib(Z);
↳ attr:degHomog, type intvec
↳ attr:isHomog, type intvec
grrange(Z); // module weights
↳ 1,2,3
attrib(Z, "degHomog"); // total degrees
↳ 2,666,3
// Zero object:
matrix z[3][0]; grview( grobj( z, intvec(1,2,3) ) );
↳ Graded homomorphism: r(-1) + r(-2) + r(-3) <- 0, given by zero (3 x 0) ma\
trix.
grview( grobj( freemodule(0), intvec(1,2,3) ) );
↳ Graded homomorphism: r(-1) + r(-2) + r(-3) <- 0, given by zero (3 x 0) ma\
trix.
matrix z1[0][3]; grview( grobj( z1, 0:0, intvec(1,2,3) ) );
↳ Graded homomorphism: 0 <- r(-1) + r(-2) + r(-3), given by zero (0 x 3) ma\
trix.
grview( grobj( freemodule(0), 0:0, intvec(1,2,3) ) );
↳ Graded homomorphism: 0 <- r(-1) + r(-2) + r(-3), given by zero (0 x 3) ma\

```

```

    trix.
matrix z0[0][0]; grview( grobj( z0, 0:0 ) );
↳ Graded homomorphism: 0 <- 0, given by zero (0^2) matrix.
grview( grobj( freemodule(0), 0:0 ) );
↳ Graded homomorphism: 0 <- 0, given by zero (0^2) matrix.

```

### D.15.5.2 grtest

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\], page 7524](#)).

**Usage:** `grtest(M[,b])`, anything M, optionally int b

**Return:** 1 if M is a valid graded object, 0 otherwise

**Purpose:** validate a graded object. Print an invalid object message if b is not given

**Note:** M should be an ideal or module or matrix, with weighting attribute 'isHomog' and optionally total graded degrees attribute 'degHomog'. Attributes should be compatible with the presentation matrix.

**Example:**

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
// the following calls will fail due to tests in grtest:
grobj( module([x+y, x, 0, 0], [0, x+y, y, 0]), intvec(0,0,0,0) ); // enough row weight
↳ _[1]=x*gen(2)+x*gen(1)+y*gen(1)
↳ _[2]=x*gen(2)+y*gen(3)+y*gen(2)
// grobj( module([x+y, x, 0, 0], [0, x+y, y, 0]), intvec(0,0) ); // not enough row weight
// grobj( module([x,0], [0,0,0], [0, y]), intvec(1,2,3) ); // zero column needs other weight
grobj( module([x,0], [0,0,0], [0, y]), intvec(1,2,3), intvec(2, 10, 3) ); // compatible
↳ _[1]=x*gen(1)
↳ _[2]=0
↳ _[3]=y*gen(2)
// grobj( module([x,0], [0,0,0], [0, y]), intvec(1,2,3), intvec(2-1, 10, 3+1) ); // compatible

```

### D.15.5.3 grdeg

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\], page 7524](#)).

**Usage:** `grdeg(M)`, graded object M

**Return:** intvec of degrees

**Purpose:** graded degrees of columns (generators) of M, describing the source of M

**Assume:** M must be a graded object (matrix/module/ideal/mapping)

**Note:** if M has zero cols it should have `attrib(M,'degHomog')` set.

**Example:**

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module A = grobj( module([x+y, x, 0, 0], [0, x+y, y, 0]), intvec(0,0,0,1) );
grview(A);
↳ Graded homomorphism: r^3 + r(-1) <- r(-1)^2, given by a matrix, with degrees:
↳      ..1 ..2 ....
↳      --- --- +...

```

```

↳ 0 : 1 - |..1
↳ 0 : 1 1 |..2
↳ 0 : - 1 |..3
↳ 1 : - - |..4
↳      === ===
↳      1 1
module B = grobj( module([0,x,y]), intvec(15,1,1) );
grview(B);
↳ Graded homomorphism:  $r(-15) + r(-1)^2 \leftarrow r(-2)$ , given by a matrix, with d\
egrees:
↳      ..1 ....
↳      --- +...
↳ 15 : - |..1
↳ 1 : 1 |..2
↳ 1 : 1 |..3
↳      ===
↳      2
module D = grsum(
  grsum(grpower(A,2), grtwist(1,1)),
  grsum(grtwist(1,2), grpower(B,2))
);
grview(D);
↳ Graded homomorphism:
↳  $r^3 + r(-1) + r^3 + r(-1) + r(1) + r(2) + r(-15) + r(-1)^2 + r(-15) + r(-\
1)^2 \leftarrow$ 
↳  $r(-1)^4 + r(-2)^2$ , given by a matrix, with degrees:
↳      ..1 ..2 ..3 ..4 ..5 ..6 ....
↳      --- --- --- --- --- --- +...
↳ 0 : 1 - - - - - |..1
↳ 0 : 1 1 - - - - |..2
↳ 0 : - 1 - - - - |..3
↳ 1 : - - - - - |..4
↳ 0 : - - 1 - - - |..5
↳ 0 : - - 1 1 - - |..6
↳ 0 : - - - 1 - - |..7
↳ 1 : - - - - - |..8
↳ -1 : - - - - - |..9
↳ -2 : - - - - - |..10
↳ 15 : - - - - - |..11
↳ 1 : - - - - 1 - |..12
↳ 1 : - - - - 1 - |..13
↳ 15 : - - - - - |..14
↳ 1 : - - - - 1 |..15
↳ 1 : - - - - 1 |..16
↳      === === === === === ===
↳      1 1 1 1 2 2
grdeg(D);
↳ 1,1,1,1,2,2
def D10 = grshift(D, 10);
grview(D10);
↳ Graded homomorphism:
↳  $r(10)^3 + r(9) + r(10)^3 + r(9) + r(11) + r(12) + r(-5) + r(9)^2 + r(-5) \ \
+ r(9)^2 \leftarrow$ 

```

```

↳ r(9)^4 + r(8)^2, given by a matrix, with degrees:
↳      ...1 ...2 ...3 ...4 ...5 ...6 .....
↳      ---- ---- ---- ---- ---- ---- +....
↳ -10 :  1   -   -   -   -   -   |...1
↳ -10 :  1   1   -   -   -   -   |...2
↳ -10 :  -   1   -   -   -   -   |...3
↳  -9 :  -   -   -   -   -   -   |...4
↳ -10 :  -   -   1   -   -   -   |...5
↳ -10 :  -   -   1   1   -   -   |...6
↳ -10 :  -   -   -   1   -   -   |...7
↳  -9 :  -   -   -   -   -   -   |...8
↳ -11 :  -   -   -   -   -   -   |...9
↳ -12 :  -   -   -   -   -   -   |..10
↳   5 :  -   -   -   -   -   -   |..11
↳  -9 :  -   -   -   -   1   -   |..12
↳  -9 :  -   -   -   -   1   -   |..13
↳   5 :  -   -   -   -   -   -   |..14
↳  -9 :  -   -   -   -   -   1   |..15
↳  -9 :  -   -   -   -   -   1   |..16
↳      =====
↳      -9  -9  -9  -9  -8  -8
grdeg(D10);
↳ -9,-9,-9,-9,-8,-8

```

#### D.15.5.4 grview

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\], page 7524](#)).

**Usage:** `grview(M)`, graded object `M`

**Return:** nothing

**Purpose:** print the degree/grading data about the GRADED matrix/module/ideal/mapping object `M`

**Assume:** `M` must be graded

**Example:**

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module A = grobj( module([x+y, x, 0, 0], [0, x+y, y, 0]), intvec(0,0,0,1) );
grview(A);
↳ Graded homomorphism: r^3 + r(-1) <- r(-1)^2, given by a matrix, with degr\
ees:
↳      ..1 ..2 ....
↳      --- --- +...
↳  0 :  1   - |..1
↳  0 :  1   1 |..2
↳  0 :  -   1 |..3
↳  1 :  -   - |..4
↳      === ===
↳      1   1
module B = grobj( module([0,x,y]), intvec(15,1,1) );
grview(B);
↳ Graded homomorphism: r(-15) + r(-1)^2 <- r(-2), given by a matrix, with d\

```

```

egrees:
↳ ..1 ....
↳ --- +...
↳ 15 : - |..1
↳ 1 : 1 |..2
↳ 1 : 1 |..3
↳ ===
↳ 2
module D = grsum( grsum(grpower(A,2), grtwist(1,1)), grsum(grtwist(1,2), grpower(B,2),
grview(D);
↳ Graded homomorphism:
↳  $r^3 + r(-1) + r^3 + r(-1) + r(1) + r(2) + r(-15) + r(-1)^2 + r(-15) + r(-1)^2 <-$ 
↳  $r(-1)^4 + r(-2)^2$ , given by a matrix, with degrees:

### D.15.5.5 grshift

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\], page 7524](#)).

**Usage:** `grshift(A, d)`, graded objects  $A$ , int  $d$

**Return:** shifted graded object

**Purpose:** shift the grading on  $A$  by  $d$ :  $A(i) \rightarrow A(i+d)$

**Example:**

```
LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module A = grobj( module([x+y, x, 0, 0], [0, x+y, y, 0]), intvec(0,0,0,1) );
grview(A);
↳ Graded homomorphism: r^3 + r(-1) <- r(-1)^2, given by a matrix, with degr\
ees:
↳      ..1 ..2 ....
↳      --- --- +...
↳  0 :  1  - |..1
↳  0 :  1  1 |..2
↳  0 :  -  1 |..3
↳  1 :  -  - |..4
↳      === ===
↳      1  1
module S = grshift( A, 6);
grview(S);
↳ Graded homomorphism: r(6)^3 + r(5) <- r(5)^2, given by a matrix, with deg\
rees:
↳      ..1 ..2 ....
↳      --- --- +...
↳ -6 :  1  - |..1
↳ -6 :  1  1 |..2
↳ -6 :  -  1 |..3
↳ -5 :  -  - |..4
↳      === ===
↳      -5 -5
grview( grshift( grzero(), 100 ) ); // does nothing...
↳ !! Warning: shifting '0 <- 0' leaves it as it unchanged!
↳ Graded homomorphism: 0 <- 0, given by zero (0^2) matrix.
```

### D.15.5.6 grzero

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\], page 7524](#)).

**Usage:** `grzero()`

**Return:** graded object representing  $S(0)^1$

**Purpose:** compute presentation of  $S(0)^1$

**Example:**

```
LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
grview( grobj(freemodule(0), intvec(0:0), intvec(0:0)) );
↳ Graded homomorphism: 0 <- 0, given by zero (0^2) matrix.
grview( grobj(freemodule(0), intvec(0:0)) );
```

```

↳ Graded homomorphism:  $0 \leftarrow 0$ , given by zero ( $0^2$ ) matrix.
grview( grzero() );
↳ Graded homomorphism:  $0 \leftarrow 0$ , given by zero ( $0^2$ ) matrix.
// def M = grpower( grshift( grzero(), 3), 2 ); grview(M);

```

### D.15.5.7 grtwist

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\], page 7524](#)).

**Usage:** `grtwist(a,d)`, int a, d

**Return:** graded object representing  $S(d)^a$

**Purpose:** compute presentation of  $S(d)^a$

**Example:**

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
// grview(grpower( grshift(grzero(), 10), 5 ) );
grview( grtwist (5, 10) );
↳ Graded homomorphism:  $r(10)^5 \leftarrow 0$ , given by zero (5 x 0) matrix.

```

### D.15.5.8 grtwists

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\], page 7524](#)).

**Usage:** `grtwists(v)`, intvec v

**Return:** graded object representing  $S(v[1]) + \dots + S(v[\text{size}(v)])$

**Purpose:** compute presentation of  $S(v[1]) + \dots + S(v[\text{size}(v)])$

**Example:**

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
grview( grtwists ( intvec(-4, 1, 6) ) );
↳ Graded homomorphism:  $r(-4) + r(1) + r(6) \leftarrow 0$ , given by zero (3 x 0) matr\
ix.
grview( grtwists ( intvec(0:0) ) );
↳ Graded homomorphism:  $0 \leftarrow 0$ , given by zero ( $0^2$ ) matrix.

```

### D.15.5.9 grsum

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\], page 7524](#)).

**Usage:** `grsum(A, B)`, graded objects A and B

**Return:** graded direct sum of input objects

**Purpose:** compute the graded direct sum of A and B

**Example:**

```

LIB "gradedModules.lib";
// if( defined(assumeLevel) ){ int assumeLevel0 = assumeLevel; } else { int assumeLevel0 = 0; }
ring r=32003,(x,y,z),dp;
module A = grobj( module([x+y, x, 0, 0], [0, x+y, y, 0]), intvec(0,0,0,1) );
grview(A);
↳ Graded homomorphism:  $r^3 + r(-1) \leftarrow r(-1)^2$ , given by a matrix, with degr\

```

```

ees:
↳      ..1 ..2 ....
↳      --- --- +...
↳  0 :  1  -  |..1
↳  0 :  1  1  |..2
↳  0 :  -  1  |..3
↳  1 :  -  -  |..4

### D.15.5.10 grpowers

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\], page 7524](#)).

**Usage:** `grpowers(A, p)`, graded object  $A$ , int  $p > 0$

**Return:** graded direct power  $A^p$

**Purpose:** compute the graded direct power  $A^p$

**Note:** the power  $p$  must be positive

**Example:**

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module A = grobj( module([x+y, x, 0], [0, x+y, y]), intvec(1,1,1) );
grview(A);

### D.15.5.11 grtranspose

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\]](#), page 7524).

**Usage:** `grtranspose(M)`, graded object `M`

**Return:** graded object

**Purpose:** graded transpose of `M`

**Note:** no reordering is performed by this procedure

**Example:**

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module M = grtwists( intvec(-2, 0, 4, 4) ); grview(M);
↳ Graded homomorphism:  $r(-2) + r + r(4)^2 \leftarrow 0$ , given by zero (4 x 0) matrix.
module N = grsyz( grtranspose( M ) ); grview(N);
↳ Graded homomorphism:  $r(2) + r + r(-4)^2 \leftarrow r(2) + r + r(-4)^2$ , given by a diagonal matrix, with degrees:
↳ ..1 ..2 ..3 ..4 ....
↳ --- --- --- --- +...
↳ -2 : 0 - - - |..1
↳ 0 : - 0 - - |..2
↳ 4 : - - 0 - |..3
↳ 4 : - - - 0 |..4
↳ === === ===

```

```

↳      -2  0  4  4
module L = grtranspose(N); grview( L );
↳ Graded homomorphism: r(-2) + r + r(4)^2 <- r(-2) + r + r(4)^2, given by a\
  diagonal matrix, with degrees:
↳      ..1 ..2 ..3 ..4 ....
↳      --- --- --- --- +...
↳      2 :  0  -  -  - |..1
↳      0 :  -  0  -  - |..2
↳     -4 :  -  -  0  - |..3
↳     -4 :  -  -  -  0 |..4
↳      === === === ===
↳      2  0 -4 -4
module K = grsyz( L ); grview(K);
↳ Graded homomorphism: r(-2) + r + r(4)^2 <- 0, given by zero (4 x 0) matrix\
  x.
// Corner cases: 0 <- 0!
module Z = grzero(); grview(Z);
↳ Graded homomorphism: 0 <- 0, given by zero (0^2) matrix.
grview( grtranspose( Z ) );
↳ Graded homomorphism: 0 <- 0, given by zero (0^2) matrix.
// Corner cases: * <- 0
matrix M1[3][0];
module Z1 = grobj( M1, intvec(-1, 0, 1) ); grview(Z1);
↳ Graded homomorphism: r(1) + r + r(-1) <- 0, given by zero (3 x 0) matrix.
grview( grtranspose( Z1 ) );
↳ Graded homomorphism: 0 <- r(-1) + r + r(1), given by zero (0 x 3) matrix.
// Corner cases: 0 <- *
matrix M2[0][3];
module Z2 = grobj( M2, 0:0, intvec(-1, 0, 1) ); grview(Z2);
↳ Graded homomorphism: 0 <- r(1) + r + r(-1), given by zero (0 x 3) matrix.
grview( grtranspose( Z2 ) );
↳ Graded homomorphism: r(-1) + r + r(1) <- 0, given by zero (3 x 0) matrix.

```

### D.15.5.12 grgens

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\]](#), page 7524).

**Usage:** `grgens(M)`, graded object `M` (map)

**Return:** graded object

**Purpose:** try compute graded generators of `coker(M)` and return them as columns of a graded map.

**Note:** presentation of resulting generated submodule may be different to `M`!

**Example:**

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module M = grtwists( intvec(-2, 0, 4, 4) ); grview(M);
↳ Graded homomorphism: r(-2) + r + r(4)^2 <- 0, given by zero (4 x 0) matrix\
  x.
module N = grgens(M);
grview( N ); print(N); // fine == M
↳ Graded homomorphism: r(-2) + r + r(4)^2 <- r(-2) + r + r(4)^2, given by a\

```

```

    diagonal matrix, with degrees:
    ↪      ..1 ..2 ..3 ..4 ....
    ↪      --- --- --- --- +...

### D.15.5.14 grorder

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\]](#), page 7524).

**Usage:** `grorder(M)`, graded object or list M

**Return:** same as input

**Purpose:** reorder/transform graded object or chain complex M into block form

**Assume:** M must be a graded object or a list of graded objects

**Example:**

```

LIB "gradedModules.lib";
"Surface Name: 'rat.d10.g9.quart2' in P^4";
↳ Surface Name: 'rat.d10.g9.quart2' in P^4
int @p=31991; ring R = (@p), (x,y,z,u,v), dp;
ideal J = x3yu2-48/11x2y2u2-8356xy3u2+35/121y4u2+31/66x3zu2-54/83x2yzu2-61/18xy2zu2+
def I = grobj( groebner(J), intvec(0) ); // ASSUME: no zero entries in J!
ASSUME(0, grtest(I));
"Input degrees: "; grview(I);
↳ Input degrees:
↳ Graded homomorphism:  $R \leftarrow R(-4)^2 + R(-5)^6 + R(-6)$ , given by a matrix, with
  ith degrees:
↳      .1 .2 .3 .4 .5 .6 .7 .8 .9 ...
↳      -- -- -- -- -- -- -- -- -- +..
↳ 0 : 4  4  5  5  5  5  5  5  6 |.1

### D.15.5.15 grtranspose1

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\]](#), page 7524).

**Usage:** `grtranspose1(M)`, graded object or list M

**Return:** same as input

**Purpose:** graded transpose of graded object or chain complex M

**Assume:** M must be a graded object or a list of graded objects

**Example:**

```

LIB "gradedModules.lib";
"Surface Name: 'k3.d10.g9.quart2' in P^4";
↳ Surface Name: 'k3.d10.g9.quart2' in P^4

### D.15.5.16 TestGRRes

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\]](#), page 7524).

**Usage:** TestGRRes(name, I), string name, ideal I

**Return:** nothing

**Purpose:** compute/test/output/order/transpose a graded resolution of I

**Example:**

```

LIB "gradedModules.lib";
// if( defined(assumeLevel) ){ int assumeLevel0 = assumeLevel; } else { int assumeLevel0 = 0; }
// note: data from random generation 2
string Name = "castelnuovo"; int @p=31991; ring R = (@p),(x,y,z,u,v), dp; ideal I = 5;
↳ =====

### D.15.5.17 KeneshlouMatrixPresentation

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\], page 7524](#)).

**Usage:** `KeneshlouMatrixPresentation(intvec a), intvec a.`

**Return:** graded object

**Purpose:** matrix presentation for direct sum of  $\omega^a[i](i)$  in form of a graded object

**Example:**

```

LIB "gradedModules.lib";
ring r = 32003,(x(0..4)),dp;
def N1 = KeneshlouMatrixPresentation(intvec(2,0,0,0,0));
grview(N1);
↳ Graded homomorphism: r^2 <- 0, given by zero (2 x 0) matrix.
def N2 = KeneshlouMatrixPresentation(intvec(0,0,0,0,3));
grview(N2);
↳ Graded homomorphism: r(-1)^3 <- 0, given by zero (3 x 0) matrix.
def N = KeneshlouMatrixPresentation(intvec(2,0,0,0,3));
grview(N);
↳ Graded homomorphism: r^2 + r(-1)^3 <- 0, given by zero (5 x 0) matrix.
def M1 = KeneshlouMatrixPresentation(intvec(0,1,0,0,0));
grview(M1);
↳ Graded homomorphism: r(-1)^10 <- r(-2)^10, given by a square matrix, with\
degrees:
↳
..1 ..2 ..3 ..4 ..5 ..6 ..7 ..8 ..9 .10 ....
↳
--- --- --- --- --- --- --- --- --- --- +...

### D.15.5.18 grsyz

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\], page 7524](#)).

**Usage:** `grsyz(M)`, graded object `M`

**Return:** graded object

**Purpose:** compute graded syzygy of `M`

**Example:**

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module A = grgroebner( grobj( module([x+y, x, 0, 3], [0, x+y, y, 2], [y, y, z, 1]),
grview(A);
↳ Graded homomorphism: r^3 + r(-1) <- r(-1)^3 + r(-2) + r(-3), given by a m\
  atrix, with degrees:
↳      ..1 ..2 ..3 ..4 ..5 ....
↳      --- --- --- --- --- +...
↳ 0 : 1 1 1 2 - |..1
↳ 0 : 1 - 1 - - |..2
↳ 0 : 1 1 1 2 3 |..3
↳ 1 : 0 0 0 1 2 |..4
↳      === === === === ===
↳      1 1 1 2 3
grview(grsyz(A));
↳ Graded homomorphism: r(-1)^3 + r(-2) + r(-3) <- r(-2) + r(-3), given by a\
  matrix, with degrees:
↳      ..1 ..2 ....
↳      --- --- +...
↳ 1 : 1 - |..1
↳ 1 : 1 2 |..2
↳ 1 : 1 - |..3
↳ 2 : 0 1 |..4
↳ 3 : - 0 |..5
↳      === ===
↳      2 3
module X = grgroebner( grobj( module([x]), intvec(2) ) );
grview(X);
↳ Graded homomorphism: r(-2) <- r(-3), given by a diagonal matrix, with deg\
  rees:
↳      .1 ...
↳      -- +..
↳ 2 : 1 |.1
↳      ==
↳      3
// syzygy module should be zero!
grview(grsyz(X));
↳ Graded homomorphism: r(-3) <- 0, given by zero (1 x 0) matrix.

```

### D.15.5.19 grres

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\], page 7524](#)).

**Usage:** `grres(M, l[, b])`, graded object  $M$ , int  $l$ , int  $b$

**Return:** graded resolution = list of graded objects

**Purpose:** compute graded resolution of  $M$  (of length  $l$ ) and minimise it if  $b$  was given

**Example:**

```
LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module A = grobj( module([x+y, x, 0, 3], [0, x+y, y, 2], [y, y, z, 1]), intvec(0,0,0,0));
grview(A);
↳ Graded homomorphism:  $r^3 + r(-1) \leftarrow r(-1)^3$ , given by a matrix, with degrees:
  ees:
↳      ..1 ..2 ..3 ....
↳      --- --- --- +...
↳  0 :  1  -  1 |..1
↳  0 :  1  1  1 |..2
↳  0 :  -  1  1 |..3
↳  1 :  0  0  0 |..4
↳      === === ===
↳      1  1  1
module B = grgroebner(A);
grview(B);
↳ Graded homomorphism:  $r^3 + r(-1) \leftarrow r(-1)^3 + r(-2) + r(-3)$ , given by a matrix, with degrees:
↳      ..1 ..2 ..3 ..4 ..5 ....
↳      --- --- --- --- --- +...
↳  0 :  1  1  1  2  - |..1
↳  0 :  1  -  1  -  - |..2
↳  0 :  1  1  1  2  3 |..3
↳  1 :  0  0  0  1  2 |..4
↳      === === === === ===
↳      1  1  1  2  3
"graded resolution of B: "; def C = grres(B, 0); grview(C);
↳ graded resolution of B:
↳ Graded resolution:
↳  $r^3 + r(-1) \leftarrow d_1 --$ 
↳  $r(-1) + r(-2) + r(-1)^2 + r(-3) \leftarrow d_2 --$ 
↳  $r(-3) + r(-2) \leftarrow d_3 --$ 
↳ 0, given by maps:
↳  $d_1$  :
↳ Graded homomorphism:  $r^3 + r(-1) \leftarrow r(-1) + r(-2) + r(-1)^2 + r(-3)$ , given by a matrix, with degrees:
↳      ..1 ..2 ..3 ..4 ..5 ....
↳      --- --- --- --- --- +...
↳  0 :  1  2  1  1  - |..1
↳  0 :  -  -  1  1  - |..2
↳  0 :  1  2  1  1  3 |..3

↳ 3 2
↳ d_3 :
↳ Graded homomorphism:  $r(-3) + r(-2) \leftarrow 0$ , given by zero (2 x 0) matrix.
int i; int l = size(C);
"D^2 == 0: "; for (i = 1; i < l; i++) { i; grview( grprod(C[i], C[i+1]) ); }
↳ D^2 == 0:
↳ 1
↳ Graded homomorphism:  $r^3 + r(-1) \leftarrow r(-3) + r(-2)$ , given by zero (4 x 2) \
matrix.
↳ 2
↳ Graded homomorphism:  $r(-1) + r(-2) + r(-1)^2 + r(-3) \leftarrow 0$ , given by zero \
(5 x 0) matrix.

```

### D.15.5.20 grlift

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\]](#), page 7524).

**Usage:** `grlift(M, N)`, graded objects M and N

**Return:** transformation matrix (graded object???)

**Purpose:** compute graded matrix which the generators of submodule  $\text{Im}(N)$  in terms of  $\text{Im}(M)$ .

**Example:**

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module P=grobj(module([xy,0,xz]),intvec(0,1,0));
grview(P);
↳ Graded homomorphism:  $r + r(-1) + r \leftarrow r(-2)$ , given by a matrix, with degr\
ees:
↳
  ..1 ....
  --- +...
↳ 0 : 2 |..1
↳ 1 : - |..2
↳ 0 : 2 |..3
↳
  ===
↳ 2
module D=grobj(module([y,0,z],[x2+y2,z,0]),intvec(0,1,0));
grview(D);
↳ Graded homomorphism:  $r + r(-1) + r \leftarrow r(-1) + r(-2)$ , given by a matrix, w\
ith degrees:
↳
  ..1 ..2 ....
  --- --- +...
↳ 0 : 1 2 |..1

```

```

↳ 1 : - 1 |..2
↳ 0 : 1 - |..3
↳   === ===
↳   1 2
def G=grlift(D,P);
grview(G);
↳ Graded homomorphism: r(-1) + r(-2) <- r(-2), given by a matrix, with degr\
ees:
↳   ..1 ....
↳   --- +...
↳ 1 : 1 |..1
↳ 2 : - |..2
↳   ===
↳   2
ASSUME(0, grisegal( grprod(D, G), P ) );

```

### D.15.5.21 grprod

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\], page 7524](#)).

**Usage:** `grprod(M, N)`, graded objects M and N

**Return:** graded object

**Purpose:** compute graded product  $M * N$  (as composition of maps)

**Example:**

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module A = grobj( module([x+y, x, 0, 3], [0, x+y, y, 2], [y, y, z, 1]), intvec(0,0,0,0) );
grview(A);
↳ Graded homomorphism: r^3 + r(-1) <- r(-1)^3, given by a matrix, with degr\
ees:
↳   ..1 ..2 ..3 ....
↳   --- --- --- +...
↳ 0 : 1 - 1 |..1
↳ 0 : 1 1 1 |..2
↳ 0 : - 1 1 |..3
↳ 1 : 0 0 0 |..4
↳   === === ===
↳   1 1 1
A = grgroebner(A);
grview(A);
↳ Graded homomorphism: r^3 + r(-1) <- r(-1)^3 + r(-2) + r(-3), given by a m\
atrix, with degrees:
↳   ..1 ..2 ..3 ..4 ..5 ....
↳   --- --- --- --- --- +...
↳ 0 : 1 1 1 2 - |..1
↳ 0 : 1 - 1 - - |..2
↳ 0 : 1 1 1 2 3 |..3
↳ 1 : 0 0 0 1 2 |..4
↳   === === === === ===
↳   1 1 1 2 3
module B = grsyz(A);
grview(B);

```

```

⇒ Graded homomorphism:  $r(-1)^3 + r(-2) + r(-3) \leftarrow r(-2) + r(-3)$ , given by a \
  matrix, with degrees:
⇒      ..1 ..2 ....
⇒      --- --- +...
⇒  1 :  1  - |..1
⇒  1 :  1  2 |..2
⇒  1 :  1  - |..3
⇒  2 :  0  1 |..4
⇒  3 :  -  0 |..5
⇒      === ===
⇒      2   3
print(B);
⇒ x, 0,
⇒ -y,y2,
⇒ -y,0,
⇒ 1, -x-2y,
⇒ 0, 1
module D = grprod( A, B );
grview(D);
⇒ Graded homomorphism:  $r^3 + r(-1) \leftarrow r(-2) + r(-3)$ , given by zero (4 x 2) \
  matrix.
print(D); // must be all zeroes due to syzygy property!
⇒ 0,0,
⇒ 0,0,
⇒ 0,0,
⇒ 0,0
ASSUME(0, size(D) == 0);

```

### D.15.5.22 grgroebner

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\], page 7524](#)).

**Usage:** `grgroebner(M)`, graded object M

**Return:** graded object

**Purpose:** compute graded groebner basis of M

**Example:**

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module A = grobj( module([x+y, x, 0, 0], [0, x+y, y, 0]), intvec(0,0,0,1) );
grview(A);
⇒ Graded homomorphism:  $r^3 + r(-1) \leftarrow r(-1)^2$ , given by a matrix, with degr\
  ees:
⇒      ..1 ..2 ....
⇒      --- --- +...
⇒  0 :  1  - |..1
⇒  0 :  1  1 |..2
⇒  0 :  -  1 |..3
⇒  1 :  -  - |..4
⇒      === ===
⇒      1   1
module B = grgroebner(A);
grview(B);

```

```

↳ Graded homomorphism:  $r^3 + r(-1) \leftarrow r(-1)^2$ , given by a matrix, with degrees:
ees:
↳      ..1 ..2 ....
↳      --- --- +...
↳  0 :  1  -  |..1
↳  0 :  1  1  |..2
↳  0 :  1  1  |..3
↳  1 :  -  -  |..4
↳      === ===
↳      1  1

```

### D.15.5.23 grconcat

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\]](#), page 7524).

**Usage:** `grconcat(A, B)`, graded objects A and B,  $\text{dst}(A) == \text{dst}(B) =: \text{dst}$

**Return:** graded object

**Purpose:** construct  $\text{src}(A) + \text{src}(B) \longrightarrow \text{dst}$  given by  $(A|B)$

**Example:**

```

LIB "gradedModules.lib";
ring r;
module R=grobj(module([x,y,z]),intvec(0:3));
grview(R);
↳ Graded homomorphism:  $r^3 \leftarrow r(-1)$ , given by a matrix, with degrees:
↳      .1 ...
↳      -- +..
↳  0 :  1 |.1
↳  0 :  1 |.2
↳  0 :  1 |.3
↳      ==
↳      1
module S=grobj(module([x,0,y],[xy,zy+x2,0]),intvec(0:3));
grview(S);
↳ Graded homomorphism:  $r^3 \leftarrow r(-1) + r(-2)$ , given by a matrix, with degrees:
s:
↳      ..1 ..2 ....
↳      --- --- +...
↳  0 :  1  2 |..1
↳  0 :  -  2 |..2
↳  0 :  1  - |..3
↳      === ===
↳      1  2
def Q=grconcat(R,S);
grview(Q);
↳ Graded homomorphism:  $r^3 \leftarrow r(-1)^2 + r(-2)$ , given by a square matrix, with degrees:
↳      ..1 ..2 ..3 ....
↳      --- --- --- +...
↳  0 :  1  1  2 |..1
↳  0 :  1  -  2 |..2
↳  0 :  1  1  - |..3
↳      === === ===

```

```

↳      1  1  2

```

### D.15.5.24 grrndmat

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\], page 7524](#)).

**Usage:** `grrndmat(src,dst[,p,b]), intvec src, dst[, int p, b]`

**Return:** matrix of polynomials

**Purpose:** generate random matrix compatible with `src` and `dst` gradings

**Note:** optional arguments `p, b` are for 'sparsepoly' (by default: 75%, 30000).

**Todo:** this is experimental at the moment!

**Example:**

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
print( grrndmat( intvec(0, 1), intvec(1, 2, 3) ) );
↳ 6204y,                -7833,
↳ -12498xz+12773z2,    5664z,
↳ -10041x3-11973x2y-5644xy2,-7740xy-5361z2

```

### D.15.5.25 grrndmap

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\], page 7524](#)).

**Usage:** `grrndmap(S,D)`, graded objects `S` and `D`

**Return:** graded object

**Purpose:** construct a random 0-deg graded homomorphism `src(S) -> src(D)`

**Example:**

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module D=grobj(module([y,0,z],[x2+y2,z,0]),intvec(0,1,0));
grview(D);
↳ Graded homomorphism: r + r(-1) + r <- r(-1) + r(-2), given by a matrix, w\
ith degrees:
↳      ..1 ..2 ....
↳      --- --- +...
↳ 0 :  1  2 |..1
↳ 1 :  -  1 |..2
↳ 0 :  1  - |..3
↳      === ===
↳      1  2
module S=grobj(module([x,0,y],[xy,zy+x2,0]),intvec(0,0,0));
grview(S);
↳ Graded homomorphism: r^3 <- r(-1) + r(-2), given by a matrix, with degree\
s:
↳      ..1 ..2 ....
↳      --- --- +...
↳ 0 :  1  2 |..1
↳ 0 :  -  2 |..2
↳ 0 :  1  - |..3

```

```

↳      === ===
↳      1  2
def H=grrndmap(D,S);
grview(H);
↳ Graded homomorphism:  $r(-1) + r(-2) \leftarrow r(-1) + r(-2)$ , given by a square ma\
  trix, with degrees:
↳      ..1 ..2 ....
↳      --- --- +...
↳      1 :  0  1 |..1
↳      2 :  -  0 |..2
↳      === ===
↳      1  2

```

### D.15.5.26 grrndmap2

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\]](#), page 7524).

**Usage:** `grrndmap2(D,S)`, graded objects `S` and `D`

**Return:** graded object

**Purpose:** construct a random 0-deg graded homomorphism between target of `D` and `S`.

**Example:**

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module D=grobj(module([y,0,z],[x2+y2,z,0]),intvec(0,1,0));
grview(D);
↳ Graded homomorphism:  $r + r(-1) + r \leftarrow r(-1) + r(-2)$ , given by a matrix, w\
  ith degrees:
↳      ..1 ..2 ....
↳      --- --- +...
↳      0 :  1  2 |..1
↳      1 :  -  1 |..2
↳      0 :  1  - |..3
↳      === ===
↳      1  2
module S=grobj(module([x,0,y],[xy,zy+x2,0]),intvec(0,0,0));
grview(S);
↳ Graded homomorphism:  $r^3 \leftarrow r(-1) + r(-2)$ , given by a matrix, with degree\
  s:
↳      ..1 ..2 ....
↳      --- --- +...
↳      0 :  1  2 |..1
↳      0 :  -  2 |..2
↳      0 :  1  - |..3
↳      === ===
↳      1  2
def G=grrndmap2(D,S);
grview(G);
↳ Graded homomorphism:  $r^3 \leftarrow r + r(-1) + r$ , given by a square matrix, with\
  degrees:
↳      .1 .2 .3 ...
↳      -- -- -- +..
↳      0 :  0  1  0 |.1

```

```

↳ 0 : 0 1 0 |.2
↳ 0 : 0 1 0 |.3
↳      == == ==
↳      0 1 0

```

### D.15.5.27 grlifting

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\], page 7524](#)).

**Usage:** `grlifting(M,N)`, graded objects M and N

**Return:** map of chain complexes (as a list)

**Purpose:** construct a map of chain complexes between free resolutions of  $\text{Img}(M)$  and  $\text{Img}(N)$ .

**Example:**

```

LIB "gradedModules.lib";
/*
ring r=32003,(x,y,z),dp;
module P=grobj(module([xy,0,xz]),intvec(0,1,0));
grview(P);
module D=grobj(module([y,0,z],[x2+y2,z,0]),intvec(0,1,0));
grview(D);
def G=grlifting(D,P);
grview(G);
kill r;
ring r=32003,(x,y,z),dp;
module D=grobj(module([y,0,z],[x2+y2,z,0],[z3,xy,xy2]),intvec(0,1,0));
D = grgroebner(D);
grview( grres(D, 0));
def G=grlifting(D, D);
grview(G);
*/
ring S = 0, (x(0..3)), dp;
list kos = grres(grobj(maxideal(1), intvec(0)), 0);
print( betti(kos), "betti");
↳          0      1      2      3      4
↳ -----
↳ 0:      1      4      6      4      1
↳ -----
↳ total:   1      4      6      4      1
↳
grview(kos);
↳ Graded resolution:
↳ S <-- d_1 --
↳ S(-1)^4 <-- d_2 --
↳ S(-2)^6 <-- d_3 --
↳ S(-3)^4 <-- d_4 --
↳ S(-4) <-- d_5 --
↳ 0, given by maps:
↳ d_1 :
↳ Graded homomorphism: S <- S(-1)^4, given by a matrix, with degrees:
↳      .1 .2 .3 .4 ...
↳      -- -- -- -- +..
↳ 0 : 1 1 1 1 |.1

```

```

### D.15.5.28 grlifting2

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\]](#), page 7524).

**Usage:** `grlifting2(A,B)`, graded objects A and B (matrices defining maps)

**Return:** map of chain complexes (as a list)

**Purpose:** construct a map of chain complexes between free resolution of  $M=\text{coker}(A)$  and  $N=\text{coker}(B)$ .

**Example:**

```

LIB "gradedModules.lib";
ring r;
module P=grobj(module([xy,0,xz]),intvec(0,1,0));
grview(P);

```

```

⇒ Graded homomorphism:  $r + r(-1) + r \leftarrow r(-2)$ , given by a matrix, with degrees:
⇒      ..1 ....
⇒      --- +...
⇒  0 :  2 |..1
⇒  1 :  - |..2
⇒  0 :  2 |..3
⇒      ===
⇒      2
module D=grobj(module([y,0,z],[x2+y2,z,0]),intvec(0,1,0));
grview(D);
⇒ Graded homomorphism:  $r + r(-1) + r \leftarrow r(-1) + r(-2)$ , given by a matrix, with degrees:
⇒      ..1 ..2 ....
⇒      --- --- +...
⇒  0 :  1  2 |..1
⇒  1 :  -  1 |..2
⇒  0 :  1  - |..3
⇒      === ===
⇒      1  2
module PP = grpres(P);
grview(PP);
⇒ Graded homomorphism:  $r(-2) \leftarrow 0$ , given by zero (1 x 0) matrix.
module DD = grpres(D);
grview(DD);
⇒ Graded homomorphism:  $r(-1) + r(-2) \leftarrow 0$ , given by zero (2 x 0) matrix.
def T=grlifting2(DD,PP); T;
⇒ T[1]=0
⇒ T[2]=-5361*gen(1)
// def Z=grlifting2(P,D); Z; // WRONG!!!

```

### D.15.5.29 mappingcone

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\]](#), page 7524).

**Usage:** `mappingcone(M,N)`, M,N graded objects

**Return:** chain complex (as a list)

**Purpose:** construct a free resolution of the cokernel of a random map between  $\text{Img}(M)$ , and  $\text{Img}(N)$ .

**Example:**

```

LIB "gradedModules.lib";
ring r=32003, (x(0..4)),dp;
def A=KeneshlouMatrixPresentation(intvec(0,0,0,0,3));
def M=grgens(A);
grview(M);
⇒ Graded homomorphism:  $r(-1)^3 \leftarrow r(-1)^3$ , given by a diagonal matrix, with degrees:
⇒      ..1 ..2 ..3 ....
⇒      --- --- --- +...
⇒  1 :  0  -  - |..1
⇒  1 :  -  0  - |..2
⇒  1 :  -  -  0 |..3

```

```

### D.15.5.32 grrange

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\], page 7524](#)).

**Usage:** `grrange(M)`, graded object M

**Return:** `intvec`

**Purpose:** get weights of module units, thus describing the target of M

**Example:**

```

LIB "gradedModules.lib";
ring r=32003,(x,y,z),dp;
module Z = grobj(freemodule(0),intvec(0:0),intvec(0:0));
grrange(Z);
↳
grdeg(Z);
↳
grview(Z);
↳ Graded homomorphism: 0 <- 0, given by zero (0^2) matrix.
module P=grobj(module([xy,0,xz]),intvec(0,1,0));
grrange(P);
↳ 0,1,0
grdeg(P);
↳ 2
grview(P);
↳ Graded homomorphism: r + r(-1) + r <- r(-2), given by a matrix, with degr\
ees:
↳ ..1 ....
↳ --- +...
↳ 0 : 2 |..1
↳ 1 : - |..2
↳ 0 : 2 |..3
↳ ===
↳ 2

```

### D.15.5.33 grneg

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\], page 7524](#)).

**Usage:** `grneg(A)`, graded object A

**Return:** graded object

**Purpose:** graded map defined by  $-A$

**Example:**

```

LIB "gradedModules.lib";
ring r=0,(x,y,z),dp;
def A=grobj([x2,yz,xyz],intvec(1,1,0));

```

```

grview(A);
↳ Graded homomorphism:  $r(-1)^2 + r \leftarrow r(-3)$ , given by a matrix, with degree\
s:
↳      .1 ...
↳      -- +..
↳      1 : 2 |.1
↳      1 : 2 |.2
↳      0 : 3 |.3
↳      ==
↳      3
def F=grneg(A);
grview(F);
↳ Graded homomorphism:  $r(-1)^2 + r \leftarrow r(-3)$ , given by a matrix, with degree\
s:
↳      .1 ...
↳      -- +..
↳      1 : 2 |.1
↳      1 : 2 |.2
↳      0 : 3 |.3
↳      ==
↳      3

```

### D.15.5.34 matrixpres

Procedure from library `gradedModules.lib` (see [Section D.15.5 \[gradedModules.lib\], page 7524](#)).

**Usage:** `matrixpres(a), intvec a`

**Return:** graded object

**Purpose:** matrix presentation for direct sum of  $\omega^a[i](i)$  in form of a graded object

**Example:**

```

LIB "gradedModules.lib";
ring r = 32003,(x(0..4)),dp;
def R=matrixpres(intvec(1,4,0,0,0));
↳ // ** redefining j (      int j=size(a)-i;) gradedModules.lib::matrixpres\
:2480
grview(R);
↳ Graded homomorphism:  $r(-1)^{21} \leftarrow r(-2)^4$ , given by a matrix, with degrees\
:
↳      ..1 ..2 ..3 ..4 ....
↳      --- --- --- --- +...
↳      1 : - - - - |..1
↳      1 : 1 - - - |..2
↳      1 : 1 - - - |..3
↳      1 : 1 - - - |..4
↳      1 : 1 - - - |..5
↳      1 : 1 - - - |..6
↳      1 : - 1 - - |..7

### D.15.6 hodge.lib

**Library:** hodge.lib

**Purpose:** Algorithms for Hodge ideals

**Authors:** Guillem Blanco, email: guillem.blanco@kuleuven.be

**Overview:** A library for computing the Hodge ideals [MP19] of  $\mathbb{Q}$ -divisors associated to any reduced hypersurface  $finR$ .

The implemented algorithm [Bla21] is based on the characterization of the Hodge ideals in terms of the  $V$ -filtration of Malgrange and Kashiwara on  $R_f f^s$ , see [MP20].

As a consequence, this library provides also an algorithm to compute the multiplier ideals and the jumping numbers of any hypersurface, see [BS05].

#### References:

**Procedures:** See also: [Section 7.5.5 \[dmodapp\\_lib\]](#), page 414.

### D.15.6.1 Vfiltration

Procedure from library `hodge.lib` (see [Section D.15.6 \[hodge\\_lib\]](#), page 7599).

**Usage:** `Vfiltration(f, p [, eng]);`  $f$  a poly,  $p$  a non-negative integer, `eng` an optional integer.

**Return:** ring

**Purpose:** compute  $R$ -generators for the  $V$ -filtration on  $R_f f^s$  truncated up to degree  $p$  in  $\partial_t$ .

**Note:** activate the output ring with the `setring` command.

In the output ring, the list `Vfilt` contains the  $V$ -filtration.

The value of `eng` controls the algorithm used for Groebner basis computations.

See the `engine` procedure from [Section 7.5.5 \[dmodapp\\_lib\]](#), page 414 for the available algorithms.

**Display:** If `printlevel=1`, progress debug messages will be printed.

#### Example:

```
LIB "hodge.lib";
ring R = 0, (x,y), dp;
poly f = y^2-x^3;
def D = Vfiltration(f, 1);
setring D; Vfilt;

↳          [3]:
↳          1

```

### D.15.6.2 hodgeIdeals

Procedure from library `hodge.lib` (see [Section D.15.6 \[hodge.lib\], page 7599](#)).

**Usage:** `hodgeIdeals(f, p [, eng]);`  $f$  a reduced poly,  $p$  a non-negative integer, `eng` an optional integer.

**Return:** ring

**Purpose:** compute the Hodge ideals of  $f^\alpha$  up to level  $p$ , for a reduced hypersurface  $f$ .

**Note:** activate the output ring with the `setring` command.

In the output ring, the list of ideals `hodge` contains the Hodge ideals of  $f$ .

The value of `eng` controls the algorithm used for Groebner basis computations.

See the `engine` procedure from [Section 7.5.5 \[dmodapp.lib\], page 414](#) for the available algorithms.

**Display:** If `printlevel=1`, progress debug messages will be printed.

**Example:**

```

LIB "hodge.lib";
ring R = 0, (x,y), dp;
poly f = y^2-x^3;
def Ra = hodgeIdeals(f, 2);
setring Ra; hodge;
↳ [1]:
↳ [1]:

↳      _[2]=x
↳      [3]:
↳      _[1]=y^2
↳      _[2]=x*y
↳      _[3]=x^3
↳      [2]:
↳      1/6
↳      [3]:
↳      1
↳      [2]:
↳      [1]:
↳      [1]:
↳      _[1]=1
↳      [2]:
↳      _[1]=y
↳      _[2]=x^2
↳      [3]:
↳      _[1]=y^3
↳      _[2]=x*y^2
↳      _[3]=x^2*y
↳      _[4]=x^3+(2*a+1)*y^2
↳      [2]:
↳      5/6
↳      [3]:
↳      1
↳      [3]:
↳      [1]:
↳      [1]:
↳      _[1]=y
↳      _[2]=x
↳      [2]:
↳      _[1]=y^2
↳      _[2]=x*y
↳      _[3]=x^3
↳      [3]:
↳      _[1]=y^3
↳      _[2]=x^2*y^2
↳      _[3]=x^3*y
↳      _[4]=x^4+(2*a+1)*x*y^2
↳      [2]:
↳      1
↳      [3]:
↳      1

```

### D.15.6.3 multIdeals

Procedure from library `hodge.lib` (see [Section D.15.6 \[hodge.lib\]](#), page 7599).

**Usage:** `multIdeals(f, [, eng]);`  $f$  a reduced poly, `eng` an optional integer.

**Return:** list

**Purpose:** compute the multiplier ideals of a hypersurface  $f \in R$ .

**Note:** The value of `eng` controls the algorithm used for Groebner basis computations. See the `engine` procedure from [Section 7.5.5 \[dmodapp\\_lib\]](#), page 414 for the available algorithms.

**Display:** If `printlevel=1`, progress debug messages will be printed.

**Example:**

```
LIB "hodge.lib";
ring R = 0,(x,y),dp;
poly f = y^2-x^3;
multIdeals(f);
↳ [1]:
↳   [1]:
↳     _[1]=1
↳   [2]:
↳     5/6
↳   [3]:
↳     1
↳ [2]:
↳   [1]:
↳     _[1]=y
↳     _[2]=x
↳   [2]:
↳     1
↳   [3]:
↳     1
```

#### D.15.6.4 nextHodgeIdeal

Procedure from library `hodge.lib` (see [Section D.15.6 \[hodge\\_lib\]](#), page 7599).

**Usage:** `nextHodgeIdeal(f, I, p)`;  $f$  a poly,  $I$  an ideal,  $p$  a non-negative integer

**Return:** ideal

**Purpose:** given the  $p$ -th Hodge ideal  $I$  of  $f^\alpha$  compute the  $p+1$ -th Hodge ideal assuming that the Hodge filtration of the underlying mixed Hodge module is generated at level less than or equal to  $p$ .

**Example:**

```
LIB "hodge.lib";
ring R = 0,(x,y),dp;
poly f = y^2-x^3;
def Ra = hodgeIdeals(f, 2);
setring(Ra);
int p = 1;
nextHodgeIdeal(y^2-x^3, hodge[3][1][p+1], p);
↳ _[1]=x^2*y^2
↳ _[2]=y^3
↳ _[3]=x^3*y
↳ _[4]=x^4+(2*a+1)*x*y^2
```

#### D.15.7 lrcalc\_lib

**Library:** `lrcalc.lib`

**Purpose:** An interface to the Littlewood-Richardson Calculator by Anders Buch

**Author:** Oleksandr Iena, o.g.yena@gmail.com

**Overview:** An interface to the documented functions of the Littlewood-Richardson Calculator by Anders Buch is implemented.  
The library requires the Littlewood-Richardson Calculator by Anders Buch, which is available at <http://math.rutgers.edu/~asbuch/lrcalc/>

**References:**  
[1] <http://math.rutgers.edu/~asbuch/lrcalc/>  
<http://math.rutgers.edu/~asbuch/lrcalc/lrcalc-1.2/README>

**Procedures:**

### D.15.7.1 LRinstall

Procedure from library `lrcalc.lib` (see [Section D.15.7 \[lrcalc.lib\]](#), page 7603).

**Usage:** `LRinstall();`

**Return:** `int` (exit status of the shell)

**Purpose:** installs the Littlewood-Richardson Calculator

**Note:**

**Example:**

```
LIB "lrcalc.lib";
// In order to install the Littlewood-Richardson Calculator
// type "LRinstall();"
// This will execute the following commands:
// wget math.rutgers.edu/~asbuch/lrcalc/lrcalc-1.2.tar.gz
// tar zxvf lrcalc-1.2.tar.gz
// cd lrcalc-1.2
// ./configure
// make
// sudo make install
```

### D.15.7.2 LRcoef

Procedure from library `lrcalc.lib` (see [Section D.15.7 \[lrcalc.lib\]](#), page 7603).

**Usage:** `LRcoef(z, x, y);` `z, x, y` lists of integers (partitions)

**Return:** `bigint`

**Purpose:** computes the Littlewood-Richardson coefficient  $c^z_{x,y}$

**Note:**

**Example:**

```
LIB "lrcalc.lib";
// Compute the Littlewood-Richardson coefficient  $c^z_{x,y}$ 
// for  $z=(3, 2, 1)$ ,  $x=(2, 1)$ ,  $y=(2, 1)$ 
list z = 3, 2, 1;
list x = 2, 1;
list y = 2, 1;
LRcoef(z, x, y);
↪ 2
```

### D.15.7.3 LRskew

Procedure from library `lrcalc.lib` (see [Section D.15.7 \[lrcalc.lib\]](#), page 7603).

**Usage:** `LRskew(z, x [,s, r])`; `z, x` lists of integers (partitions) `s` string equal to 'r', `r` non-negative integer

**Return:** list of lists

**Purpose:** computes the partitions `y` for which the Littlewood-Richardson coefficient  $c^z_{x,y}$  is non-zero together with that coefficient; only partitions up to length `r` are computed if the optional parameters `age` given

**Note:**

**Example:**

```
LIB "lrcalc.lib";
// Compute the partitions y for which the Littlewood-Richardson coefficient
// c^z_{x,y} is non-zero together with that coefficient
// for z= (3, 2, 1), x=(2, 1)
list z = 3, 2, 1;
list x = 2, 1;
LRskew(z, x);
↳ [1]:
↳   [1]:
↳     2
↳   [2]:
↳     [1]:
↳       2
↳     [2]:
↳       1
↳ [2]:
↳   [1]:
↳     1
↳   [2]:
↳     [1]:
↳       1
↳     [2]:
↳       1
↳     [3]:
↳       1
↳ [3]:
↳   [1]:
↳     1
↳   [2]:
↳     [1]:
↳       3
// Now compute only the partitions with at most 2 entries
LRskew(z, x, "r", 2);
↳ [1]:
↳   [1]:
↳     2
↳   [2]:
↳     [1]:
↳       2
```

```

↳      [2]:
↳      1
↳ [2]:
↳      [1]:
↳      1
↳      [2]:
↳      [1]:
↳      3

```

#### D.15.7.4 LRmult

Procedure from library `lrcalc.lib` (see [Section D.15.7 \[lrcalc.lib\]](#), page 7603).

**Usage:** LRmult(x, y); x, y lists of integers (partitions)  
 LRmult(x, y [, s, r]); x, y lists of integers (partitions), s string equal to 'r', r integer  
 LRmult(x, y [, s, m, k]); x, y lists of integers (partitions), s string equal to 'q' or 'f',  
 m, k integers

**Return:** list of lists

**Purpose:** computes the partitions z for which the Littlewood-Richardson coefficient  $c^z_{x,y}$  is non-zero together with that coefficient; partitions up to length r

**Note:**

**Example:**

```

LIB "lrcalc.lib";
// Compute the partitions z for which the Littlewood-Richardson coefficient
// c^z_{x,y} is non-zero together with that coefficient
// for x= (2, 1), y=(2, 1)
list x = 2, 1;
list y = 2, 1;
LRmult(x, y);

### D.15.7.5 LRcoprod

Procedure from library `lrcalc.lib` (see [Section D.15.7 \[lrcalc.lib\]](#), page 7603).

**Usage:** LRcoprod(z); z list of integers (partition)

**Return:** list of lists

**Purpose:** computes the pairs of partitions x and y for which the Littlewood-Richardson coefficient  $c^z_{x,y}$  is non-zero together with that coefficient

**Note:**

**Example:**

```
LIB "lrcalc.lib";
// Compute the pairs of partitions x and y for which the Littlewood-Richardson
// coefficient  $c^z_{x,y}$  is non-zero together with that coefficient
// for z= (3, 2, 1)
list z = 3, 2, 1;
LRcoprod(z);

### D.15.7.6 LRschubmult

Procedure from library `lrcalc.lib` (see [Section D.15.7 \[lrcalc.lib\]](#), page 7603).

**Usage:** LRschubmult(x, y); x, y lists of integers

**Return:** list of lists

**Purpose:** computes the expansion of a product  
of two Schubert polynomials in the basis of Schubert polynomials

**Note:**

**Example:**

```

LIB "lrcalc.lib";
// Compute the expansion of a square of the Schubert polynomial
// corresponding to (1 3 2) in the basis of Schubert polynomials
list x = 1, 3, 2;
LRschubmult(x, x);

### D.15.8 maxlike.lib

**Library:** maxlike.lib

**Purpose:** Procedures to compute maximum likelihood estimates

**Author:** Adrian Koch (kocha at rhrk.uni-kl.de)

**References:**

Lior Pachter, Bernd Sturmfels; Algebraic Statistics for Computational Biology; published by Cambridge University Press

**Procedures:**

#### D.15.8.1 likeIdeal

Procedure from library maxlike.lib (see [Section D.15.8 \[maxlike.lib\]](#), page 7613).

**Usage:** likeIdeal(I,u); ideal I, intvec u  
I represents the algebraic statistical model and u is the data vector under consideration.

**Return:** ideal: the likelihood ideal with respect to I and u

**Example:**

```

LIB "maxlike.lib";
ring r = 0, (x,y), dp;
poly pA = -10x+2y+25;
poly pC = 8x-y+25;
poly pG = 11x-2y+25;
poly pT = -9x+y+25;
intvec u = 10,14,15,10;
ideal I = pA,pC,pG,pT;
ideal L = likeIdeal(I,u); L;
↳ L[1]=2744y2+13003050x-2116125y-6290625
↳ L[2]=9114xy-98y2+5828550x-891375y-2833125
↳ L[3]=847602x2-98y2+89716875x-12967425y-43985625

```

#### D.15.8.2 logHessian

Procedure from library maxlike.lib (see [Section D.15.8 \[maxlike.lib\]](#), page 7613).

**Usage:** logHessian(I,u); ideal I, intvec u  
I represents the algebraic statistical model and u is the data vector under consideration.

**Return:** matrix: a modified version of the Hessian matrix of the loglikelihood function defined by  $u$  and (the given generators of)  $I$ .

**Note:** This matrix has the following property: if it is negative definite at a point, then the actual Hessian is also negative definite at that point. The same holds for positive definiteness.

**Example:**

```
LIB "maxlike.lib";
ring r = 0,(x,y),dp;
poly pA = -10x+2y+25;
poly pC = 8x-y+25;
poly pG = 11x-2y+25;
poly pT = -9x+y+25;
intvec u = 10,14,15,10;
ideal I = pA,pC,pG,pT;
matrix H = logHessian(I,u); H;
↪ H[1,1]=-689040x3+314898x2y-44808xy2+1974y3+9619350x2-2949075xy+240975y2+6\
151875x-1072500y-70640625
↪ H[1,2]=110880x3-51936x2y+7596xy2-348y3-1489200x2+431400xy-33450y2-1072500\
x+176250y+11437500
↪ H[2,1]=110880x3-51936x2y+7596xy2-348y3-1489200x2+431400xy-33450y2-1072500\
x+176250y+11437500
↪ H[2,2]=-16580x3+7972x2y-1192xy2+56y3+243150x2-66800xy+4900y2+176250x-2750\
0y-1937500
```

### D.15.8.3 getMaxPoints

Procedure from library `maxlike.lib` (see [Section D.15.8 \[maxlike.lib\]](#), page 7613).

**Usage:** `getMaxPoints(Iu, H, prec [, "nodisplay"])`; ideal  $Iu$ , matrix  $H$ , int  $prec$ , int  $k$   $Iu$  the likelihood ideal,  $H$  the (modified) Hessian of the considered algebraic statistical model,  $prec$  the precision with which to compute the maximum likelihood estimates

**Return:** ring: a complex ring  $R$  in which you can find the following two lists: - `MPOINTS`, points in which the loglikelihood function has a local maximum, and - `LHESSIANS`, the (modified) Hessians at those points  
also prints out the points in `MPOINTS`, unless a fourth argument is given

**Note:** it is assumed that the likelihood ideal is 0-dimensional

**Example:**

```
LIB "maxlike.lib";
ring r = 0,(x,y),dp;
poly pA = -10x+2y+25;
poly pC = 8x-y+25;
poly pG = 11x-2y+25;
poly pT = -9x+y+25;
intvec u = 10,14,15,10;
ideal I = pA,pC,pG,pT;
ideal L = likeIdeal(I,u);
matrix H = logHessian(I,u);
def R = getMaxPoints(L, H, 50);

#### D.15.8.4 maxPoints

Procedure from library `maxlike.lib` (see [Section D.15.8 \[maxlike.lib\]](#), page 7613).

**Usage:** `maxPoints(I,u,prec [, "nodisplay"])`; ideal `I`, intvec `u`, int `prec` `I` represents the algebraic statistical model, `u` is the data vector under consideration, and `prec` is the precision to be used in the computations

**Return:** ring: a complex ring `R` in which you can find the following two lists: - `MPOINTS`, points in which the loglikelihood function has a local maximum, and - `LHESSIANS`, the (modified) Hessians at those points  
also prints out the points in `MPOINTS`, unless a fourth argument is given

**Note:** Just uses `likeideal`, `loghessian` and `getmaxpoints`.

**Example:**

```

LIB "maxlike.lib";
ring r = 0,(x,y),dp;
poly pA = -10x+2y+25;
poly pC = 8x-y+25;
poly pG = 11x-2y+25;
poly pT = -9x+y+25;
intvec u = 10,14,15,10;
ideal I = pA,pC,pG,pT;
def R = maxPoints(I, u, 50);

### D.15.8.5 maxPointsProb

Procedure from library `maxlike.lib` (see [Section D.15.8 \[maxlike.lib\]](#), page 7613).

**Usage:** `maxPointsProb(I,u,prec [, "nodisplay"])`; ideal `I`, intvec `u`, int `prec` `I` represents the algebraic statistical model, `u` is the data vector under consideration, and `prec` is the precision to be used in the computations

**Return:** ring: a complex ring `R` in which you can find the following two lists: - `MPOINTS`, points in which the loglikelihood function has a local maximum, - `LHESSIANS`, the (modified) Hessians at those points, and - `VALS`, the resulting probability distributions (that is, the values of the polynomials given by `I` at the points in `MPOINTS`). Also prints out the points in `MPOINTS`, unless a fourth argument is given.

**Note:** Does not compute the likelihood ideal via elimination, but rather computes the critical points by projection.

**Example:**

```

LIB "maxlike.lib";
ring r = 0,(x,y),dp;
poly pA = -10x+2y+25;
poly pC = 8x-y+25;
poly pG = 11x-2y+25;
poly pT = -9x+y+25;
intvec u = 10,14,15,10;
ideal I = pA,pC,pG,pT;
def R = maxPointsProb(I, u, 50);
⇒ [1]:
⇒ [1]:

### D.15.9 modwalk\_lib

**Library:** modwalk.lib

**Purpose:** Groebner basis conversion

**Authors:** S. Oberfranz oberfran@mathematik.uni-kl.de

**Overview:** A library for converting Groebner bases of an ideal in the polynomial ring over the rational numbers using modular methods. The procedures are inspired by the following paper:

Elizabeth A. Arnold: Modular algorithms for computing Groebner bases. *Journal of Symbolic Computation* 35, 403-419 (2003).

**Procedures:** See also: [Section D.4.10 \[grwalk\\_lib\], page 1081](#); [Section D.15.14 \[rwalk\\_lib\], page 7713](#); [Section D.15.17 \[swalk\\_lib\], page 7724](#).

#### D.15.9.1 modWalk

Procedure from library modwalk.lib (see [Section D.15.9 \[modwalk\\_lib\], page 7617](#)).

**Return:** a standard basis of I

**Note:** The procedure computes a standard basis of I (over the rational numbers) by using modular methods.

**Example:**

```

LIB "modwalk.lib";
ring R1 = 0, (x,y,z,t), dp;

```

```

ideal I = 3x3+x2+1, 11y5+y3+2, 5z4+z2+4;
I = std(I);
ring R2 = 0, (x,y,z,t), lp;
ideal I = fetch(R1, I);
ideal J = modWalk(I);
J;
↪ J[1]=x3+1/3x2+1/3
↪ J[2]=z4+1/5z2+4/5
↪ J[3]=y5+1/11y3+2/11
ring S1 = 0, (a,b,c,d), Dp;

See also: [Section D.2.6.1 \[modular\]](#), page 877.

### D.15.9.2 modrWalk

Procedure from library `modwalk.lib` (see [Section D.15.9 \[modwalk.lib\]](#), page 7617).

**Return:** a standard basis of  $I$

**Note:** The procedure computes a standard basis of  $I$  (over the rational numbers) by using modular methods.

**Example:**

```

LIB "modwalk.lib";
ring R1 = 0, (x,y,z,t), dp;
ideal I = 3x3+x2+1, 11y5+y3+2, 5z4+z2+4;
I = std(I);
ring R2 = 0, (x,y,z,t), lp;
ideal I = fetch(R1, I);
int radius = 2;
ideal J = modrWalk(I,radius);
J;
↳ J[1]=x3+1/3x2+1/3
↳ J[2]=z4+1/5z2+4/5
↳ J[3]=y5+1/11y3+2/11
ring S1 = 0, (a,b,c,d), Dp;
ideal I = 5b2, ac2+9d3+3a2+5b, 2a2c+7abd+bcd+4a2, 2ad2+6b2d+7c3+8ad+4c;
I = std(I);
ring S2 = 0, (c,d,b,a), lp;
ideal I = fetch(S1,I);
// I is assumed to be a Dp-Groebner basis.
// We compute a lp-Groebner basis.
ideal J = modrWalk(I,radius,"Dp");

See also: [Section D.2.6.1 \[modular\]](#), page 877.

### D.15.9.3 modfWalk

Procedure from library `modwalk.lib` (see [Section D.15.9 \[modwalk.lib\]](#), page 7617).

**Return:** a standard basis of  $I$

**Note:** The procedure computes a standard basis of  $I$  (over the rational numbers) by using modular methods.

**Example:**

```

LIB "modwalk.lib";
ring R1 = 0, (x,y,z,t), dp;
ideal I = 3x3+x2+1, 11y5+y3+2, 5z4+z2+4;
I = std(I);
ring R2 = 0, (x,y,z,t), lp;
ideal I = fetch(R1, I);
ideal J = modfWalk(I);

```

```

J;
↳ J[1]=z4+1/5z2+4/5
↳ J[2]=y5+1/11y3+2/11
↳ J[3]=x3+1/3x2+1/3
ring S1 = 0, (a,b,c,d), Dp;
ideal I = 5b2, ac2+9d3+3a2+5b, 2a2c+7abd+bcd+4a2, 2ad2+6b2d+7c3+8ad+4c;
I = std(I);
ring S2 = 0, (c,d,b,a), lp;
ideal I = fetch(S1,I);
// I is assumed to be a Dp-Groebner basis.
// We compute a lp-Groebner basis.
ideal J = modfWalk(I,"Dp");

### D.15.9.4 modfrWalk

Procedure from library `modwalk.lib` (see [Section D.15.9 \[modwalk.lib\]](#), page 7617).

**Return:** a standard basis of  $I$

**Note:** The procedure computes a standard basis of  $I$  (over the rational numbers) by using modular methods.

**Example:**

```

LIB "modwalk.lib";
ring R1 = 0, (x,y,z,t), dp;
ideal I = 3x3+x2+1, 11y5+y3+2, 5z4+z2+4;
I = std(I);
ring R2 = 0, (x,y,z,t), lp;
ideal I = fetch(R1, I);
int radius = 2;
ideal J = modfrWalk(I,radius);
J;

## D.15.10 multigrading\_lib

Todos/Issues:

See <http://code.google.com/p/convex-singular/wiki/Multigrading>

**Library:** multigrading.lib

**Purpose:** Multigraded Rings

**Authors:** Benjamin Bechtold, [benjamin.bechtold@gmail.com](mailto:benjamin.bechtold@gmail.com)  
Rene Birkner, [rbirkner@math.fu-berlin.de](mailto:rbirkner@math.fu-berlin.de)  
Lars Kastner, [lkastner@math.fu-berlin.de](mailto:lkastner@math.fu-berlin.de)  
Simon Keicher, [keicher@mail.mathematik.uni-tuebingen.de](mailto:keicher@mail.mathematik.uni-tuebingen.de)  
Oleksandr Motsak, U@D, where U={motsak}, D={mathematik.uni-kl.de}  
Anna-Lena Winz, [anna-lena.winz@math.fu-berlin.de](mailto:anna-lena.winz@math.fu-berlin.de)

**Overview:** This library allows one to virtually add multigradings to Singular: grade multi-variate polynomial rings with arbitrary (fin. gen. Abelian) groups. For more see <http://code.google.com/p/convex-singular/wiki/Multigrading> For theoretical references see:

E. Miller, B. Sturmfels: 'Combinatorial Commutative Algebra' and  
M. Kreuzer, L. Robbiano: 'Computational Commutative Algebra'.

**Note:** 'multiDegBasis' relies on 4ti2 for computing Hilbert Bases. All groups are finitely generated Abelian

**Procedures:**

### D.15.10.1 setBaseMultigrading

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `setBaseMultigrading(M[, G]);` M is an integer matrix, G is a group (or lattice)

**Purpose:** attaches weights of variables and grading group to the basering.

**Note:** M encodes the weights of variables column-wise.

**Return:** nothing

**Example:**

```

LIB "multigrading.lib";
ring R = 0, (x, y, z), dp;
// Weights of variables
intmat M[3][3] =
1, 0, 0,
0, 1, 0,

```

```

0, 0, 1;
// GradingGroup:
intmat L[3][2] =
1, 1,
1, 3,
1, 5;
// attaches M & L to R (==basing):
setBaseMultigrading(M, L); // Grading: Z^3/L
// Weights are accessible via "getVariableWeights()":
getVariableWeights();
⇒ 1,0,0,
⇒ 0,1,0,
⇒ 0,0,1
// Test all possible usages:
(getVariableWeights() == M) && (getVariableWeights(R) == M) && (getVariableWeights(b
⇒ 1
// Grading group is accessible via "getLattice()":
getLattice();
⇒ 1,1,
⇒ 1,3,
⇒ 1,5
// Test all possible usages:
(getLattice() == L) && (getLattice(R) == L) && (getLattice(basing) == L);
⇒ 1
// And its hermite NF via getLattice("hermite"):
getLattice("hermite");
⇒ 1,0,
⇒ 1,2,
⇒ 1,4
// Test all possible usages:
intmat H = hermiteNormalForm(L);
(getLattice("hermite") == H) && (getLattice(R, "hermite") == H) && (getLattice(baser
⇒ 1
kill L, M;
// ----- isomorphic multigrading ----- //
// Weights of variables
intmat M[2][3] =
1, -2, 1,
1, 1, 0;
// Torsion:
intmat L[2][1] =
0,
2;
// attaches M & L to R (==basing):
setBaseMultigrading(M, L); // Grading: Z + (Z/2Z)
// Weights are accessible via "getVariableWeights()":
getVariableWeights() == M;
⇒ 1
// Torsion is accessible via "getLattice()":
getLattice() == L;
⇒ 1
kill L, M;
// ----- extreme case ----- //

```

```

// Weights of variables
intmat M[1][3] =
1, -1, 10;
// Torsion:
intmat L[1][1] =
0;
// attaches M & L to R (==basing):
setBaseMultigrading(M); // Grading: Z^3
// Weights are accessible via "getVariableWeights()":
getVariableWeights() == M;
↳ 1
// Torsion is accessible via "getLattice()":
getLattice() == L;
↳ 1

```

### D.15.10.2 getVariableWeights

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `getVariableWeights([R])`

**Purpose:** get associated multigrading matrix for the basering [or R]

**Return:** intmat, matrix of multidegrees of variables

**Example:**

```

LIB "multigrading.lib";
ring R = 0, (x, y, z), dp;
// Weights of variables
intmat M[3][3] =
1, 0, 0,
0, 1, 0,
0, 0, 1;
// Grading group:
intmat L[3][2] =
1, 1,
1, 3,
1, 5;
// attaches M & L to R (==basing):
setBaseMultigrading(M, L); // Grading: Z^3/L
// Weights are accessible via "getVariableWeights()":
getVariableWeights() == M;
↳ 1
kill L, M;
// ----- isomorphic multigrading ----- //
// Weights of variables
intmat M[2][3] =
1, -2, 1,
1, 1, 0;
// Grading group:
intmat L[2][1] =
0,
2;
// attaches M & L to R (==basing):
setBaseMultigrading(M, L); // Grading: Z + (Z/2Z)

```

```

// Weights are accessible via "getVariableWeights()":
getVariableWeights() == M;
↳ 1
kill L, M;
// ----- extreme case ----- //
// Weights of variables
intmat M[1][3] =
1, -1, 10;
// Grading group:
intmat L[1][1] =
0;
// attaches M & L to R (==basing):
setBaseMultigrading(M); // Grading: Z^3
// Weights are accessible via "getVariableWeights()":
getVariableWeights() == M;
↳ 1

```

### D.15.10.3 getGradingGroup

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `getGradingGroup([R])`

**Purpose:** get associated grading group

**Return:** group, the grading group

**Example:**

```

LIB "multigrading.lib";
ring R = 0, (x, y, z), dp;
// Weights of variables
intmat M[3][3] =
1, 0, 0,
0, 1, 0,
0, 0, 1;
// Torsion:
intmat L[3][2] =
1, 1,
1, 3,
1, 5;
// attaches M & L to R (==basing):
setBaseMultigrading(M, L); // Grading: Z^3/L
def G = getGradingGroup();
printGroup( G );
↳ Generators:
↳      1      0      0
↳      0      1      0
↳      0      0      1
↳ Relations:
↳      1      1
↳      1      3
↳      1      5
G[1] == M; G[2] == L;
↳ 1
↳ 1

```

```

kill L, M, G;
// ----- isomorphic multigrading ----- //
// Weights of variables
intmat M[2][3] =
1, -2, 1,
1, 1, 0;
// Torsion:
intmat L[2][1] =
0,
2;
// attaches M & L to R (==basing):
setBaseMultigrading(M, L); // Grading: Z + (Z/2Z)
def G = getGradingGroup();
printGroup( G );
↳ Generators:
↳      1   -2   1
↳      1    1   0
↳ Relations:
↳      0
↳      2
G[1] == M; G[2] == L;
↳ 1
↳ 1
kill L, M, G;
// ----- extreme case ----- //
// Weights of variables
intmat M[1][3] =
1, -1, 10;
// Torsion:
intmat L[1][1] =
0;
// attaches M & L to R (==basing):
setBaseMultigrading(M); // Grading: Z^3
def G = getGradingGroup();
printGroup( G );
↳ Generators:
↳      1   -1   10
↳ Relations:
↳      0
G[1] == M; G[2] == L;
↳ 1
↳ 1
kill L, M, G;

```

#### D.15.10.4 getLattice

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `getLattice([R[,opt]])`

**Purpose:** get associated grading group matrix, i.e. generators (cols) of the grading group

**Return:** intmat, the grading group matrix, or  
its hermite normal form if an optional argument ("hermiteNormalForm") is given or  
smith normal form if an optional argument ("smith") is given

**Example:**

```

LIB "multigrading.lib";
ring R = 0, (x, y, z), dp;
// Weights of variables
intmat M[3][3] =
1, 0, 0,
0, 1, 0,
0, 0, 1;
// Torsion:
intmat L[3][2] =
1, 1,
1, 3,
1, 5;
// attaches M & L to R (==basing):
setBaseMultigrading(M, L); // Grading: Z^3/L
// Torsion is accessible via "getLattice()":
getLattice() == L;
↳ 1
// its hermite NF:
print(getLattice("hermite"));
↳      1      0
↳      1      2
↳      1      4
kill L, M;
// ----- isomorphic multigrading ----- //
// Weights of variables
intmat M[2][3] =
1, -2, 1,
1, 1, 0;
// Torsion:
intmat L[2][1] =
0,
2;
// attaches M & L to R (==basing):
setBaseMultigrading(M, L); // Grading: Z + (Z/2Z)
// Torsion is accessible via "getLattice()":
getLattice() == L;
↳ 1
// its hermite NF:
print(getLattice("hermite"));
↳      0
↳      2
kill L, M;
// ----- extreme case ----- //
// Weights of variables
intmat M[1][3] =
1, -1, 10;
// Torsion:
intmat L[1][1] =
0;
// attaches M & L to R (==basing):
setBaseMultigrading(M); // Grading: Z^3
// Torsion is accessible via "getLattice()":

```

```

getLattice() == L;
↳ 1
// its hermite NF:
print(getLattice("hermite"));
↳ 0

```

### D.15.10.5 createGroup

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `createGroup(S, L)`; S, L are integer matrices

**Purpose:** create the group of the form  $(S+L)/L$ , i.e.  
S specifies generators, L specifies relations.

**Return:** group

**Example:**

```

LIB "multigrading.lib";
intmat S[3][3] =
1, 0, 0,
0, 1, 0,
0, 0, 1;
intmat L[3][2] =
1, 1,
1, 3,
1, 5;
def G = createGroup(S, L); // (S+L)/L
printGroup(G);
↳ Generators:
↳ 1 0 0
↳ 0 1 0
↳ 0 0 1
↳ Relations:
↳ 1 1
↳ 1 3
↳ 1 5
kill S, L, G;
////////////////////////////////////
intmat S[2][3] =
1, -2, 1,
1, 1, 0;
intmat L[2][1] =
0,
2;
def G = createGroup(S, L); // (S+L)/L
printGroup(G);
↳ Generators:
↳ 1 -2 1
↳ 1 1 0
↳ Relations:
↳ 0
↳ 2
kill S, L, G;
// ----- extreme case ----- //

```

```

intmat S[1][3] =
1, -1, 10;
// Torsion:
intmat L[1][1] =
0;
def G = createGroup(S, L); // (S+L)/L
printGroup(G);
↳ Generators:
↳      1   -1   10
↳ Relations:
↳      0

```

### D.15.10.6 createQuotientGroup

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `createGroup(L)`; L is an integer matrix

**Purpose:** create the group of the form  $(I+L)/L$ ,  
where I is the square identity matrix of size `nrows(L)` x `nrows(L)`

**Note:** L specifies relations between free generators of  $Z^{\text{nrows}(L)}$

**Return:** group

**Example:**

```

LIB "multigrading.lib";
intmat I[3][3] =
1, 0, 0,
0, 1, 0,
0, 0, 1;
intmat L[3][2] =
1, 1,
1, 3,
1, 5;
// The group  $Z^3 / L$  can be constructed as follows:
// shortcut:
def G = createQuotientGroup(L);
printGroup(G);
↳ Generators:
↳      1   0   0
↳      0   1   0
↳      0   0   1
↳ Relations:
↳      1   1
↳      1   3
↳      1   5
// the general way:
def GG = createGroup(I, L); // (I+L)/L
printGroup(GG);
↳ Generators:
↳      1   0   0
↳      0   1   0
↳      0   0   1
↳ Relations:

```

```

↳      1      1
↳      1      3
↳      1      5

```

### D.15.10.7 createTorsionFreeGroup

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `createTorsionFreeGroup(S)`; S is an integer matrix

**Purpose:** create the free subgroup generated by S within the free Abelian group of rank `nrows(S)`

**Return:** group

**Example:**

```

LIB "multigrading.lib";
// ----- extreme case ----- //
intmat S[1][3] =
1, -1, 10;
// Torsion:
intmat L[1][1] =
0;
// The free subgroup generated by elements of S within Z^1
// can be constructed as follows:
// shortcut:
def G = createTorsionFreeGroup(S);
printGroup(G);
↳ Generators:
↳      1      -1      10
↳ Relations:
↳      0
// the general way:
def GG = createGroup(S, L); // (S+L)/L
printGroup(GG);
↳ Generators:
↳      1      -1      10
↳ Relations:
↳      0

```

### D.15.10.8 printGroup

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `printGroup(G)`; G is a group

**Purpose:** prints the group G

**Return:** nothing

**Example:**

```

LIB "multigrading.lib";
intmat S[3][3] =
1, 0, 0,
0, 1, 0,
0, 0, 1;
intmat L[3][2] =

```

```

1, 1,
1, 3,
1, 5;
def G = createGroup(S, L); // (S+L)/L
printGroup(G);
↳ Generators:
↳      1    0    0
↳      0    1    0
↳      0    0    1
↳ Relations:
↳      1    1
↳      1    3
↳      1    5

```

### D.15.10.9 isGroup

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `isGroup(G)`; G a list

**Purpose:** checks whether G is a valid group

**Note:** G should be created by `createGroup`  
(or `createQuotientGroup`, `createTorsionFreeGroup`)

**Return:** int, 1 if G is a valid group and 0 otherwise

**Example:**

```

LIB "multigrading.lib";
intmat S[3][3] =
1, 0, 0,
0, 1, 0,
0, 0, 1;
intmat L[3][2] =
1, 1,
1, 3,
1, 5;
def G = createGroup(S, L); // (S+L)/L
isGroup(G);
↳ 1
printGroup(G);
↳ Generators:
↳      1    0    0
↳      0    1    0
↳      0    0    1
↳ Relations:
↳      1    1
↳      1    3
↳      1    5

```

### D.15.10.10 isGroupHomomorphism

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `isGroupHomomorphism(L1,L2,A)`; L1 and L2 are groups, A is an integer matrix

**Purpose:** checks whether A defines a group homomorphism  $\phi: L1 \rightarrow L2$

**Return:** int, 1 if A defines the homomorphism and 0 otherwise

**Example:**

```
LIB "multigrading.lib";
intmat L1[4][1]=
0,
0,
0,
2;
intmat L2[3][2]=
0, 0,
2, 0,
0, 3;
intmat A[3][4] =
1, 2, 3, 0,
7, 0, 0, 0,
1, 2, 0, 3;
print( A );
↪      1      2      3      0
↪      7      0      0      0
↪      1      2      0      3
isGroupHomomorphism(L1, L2, A);
↪ 1
intmat B[3][4] =
1, 2, 3, 0,
7, 0, 0, 0,
1, 2, 0, 2;
print( B );
↪      1      2      3      0
↪      7      0      0      0
↪      1      2      0      2
isGroupHomomorphism(L1, L2, B); // Not a homomorphism!
↪ 0
```

### D.15.10.11 isGradedRingHomomorphism

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `isGradedRingHomomorphism(R, f, A)`; ring R, ideal f, group homomorphism A

**Purpose:** test a multigraded group ring homomorphism defined by a ring map from R to the current ring, given by generators images f and a group homomorphism A between grading groups

**Return:** int, 1 for TRUE, 0 otherwise

**Example:**

```
LIB "multigrading.lib";
ring r = 0, (x, y, z), dp;
intmat S1[3][3] =
1, 0, 0,
0, 1, 0,
0, 0, 1;
```

```

intmat L1[3][1] =
0,
0,
0;
def G1 = createGroup(S1, L1); // (S1 + L1)/L1
printGroup(G1);
↳ Generators:
↳      1    0    0
↳      0    1    0
↳      0    0    1
↳ Relations:
↳      0
↳      0
↳      0
setBaseMultigrading(S1, L1); // to change...
ring R = 0, (a, b, c), dp;
intmat S2[2][3] =
1, 0,
0, 1;
intmat L2[2][1] =
0,
2;
def G2 = createGroup(S2, L2);
printGroup(G2);
↳ Generators:
↳      1    0    0
↳      1    0    0
↳ Relations:
↳      0
↳      2
setBaseMultigrading(S2, L2); // to change...
map F = r, a, b, c;
intmat A[nrows(L2)][nrows(L1)] =
1, 0, 0,
3, 2, -6;
// graded ring homomorphism is given by (compatible):
print(F);
↳ F[1]=a
↳ F[2]=b
↳ F[3]=c
print(A);
↳      1    0    0
↳      3    2   -6
isGradedRingHomomorphism(r, ideal(F), A);
↳ 1
def h = createGradedRingHomomorphism(r, ideal(F), A);
print(h);
↳ [1]:
↳ // coefficients: QQ
↳ // number of vars : 3
↳ //      block 1 : ordering dp
↳ //      : names x y z
↳ //      block 2 : ordering C

```

```

↳ [2]:
↳   _[1]=a
↳   _[2]=b
↳   _[3]=c
↳ [3]:
↳   1,0,0,
↳   3,2,-6
// not a homo..
intmat B[nrows(L2)][nrows(L1)] =
1, 1, 1,
0, 0, 0;
print(B);
↳       1      1      1
↳       0      0      0
isGradedRingHomomorphism(r, ideal(F), B); // FALSE: there is no such homomorphism!
↳ 0
// Therefore: the following command should return an error
// createGradedRingHomomorphism(r, ideal(F), B);

```

#### D.15.10.12 createGradedRingHomomorphism

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `createGradedRingHomomorphism(R, f, A)`; ring R, ideal f, group homomorphism A

**Purpose:** create a multigraded group ring homomorphism defined by a ring map from R to the current ring, given by generators images f and a group homomorphism A between grading groups

**Return:** graded ring homomorphism

**Example:**

```

LIB "multigrading.lib";
ring r = 0, (x, y, z), dp;
intmat S1[3][3] =
1, 0, 0,
0, 1, 0,
0, 0, 1;
intmat L1[3][1] =
0,
0,
0;
def G1 = createGroup(S1, L1); // (S1 + L1)/L1
printGroup(G1);
↳ Generators:
↳       1      0      0
↳       0      1      0
↳       0      0      1
↳ Relations:
↳       0
↳       0
↳       0
setBaseMultigrading(S1, L1); // to change...
ring R = 0, (a, b, c), dp;
intmat S2[2][3] =

```

```

1, 0,
0, 1;
intmat L2[2][1] =
0,
2;
def G2 = createGroup(S2, L2);
printGroup(G2);
↳ Generators:
↳      1      0      0
↳      1      0      0
↳ Relations:
↳      0
↳      2
setBaseMultigrading(S2, L2); // to change...
map F = r, a, b, c;
intmat A[nrows(L2)][nrows(L1)] =
1, 0, 0,
3, 2, -6;
// graded ring homomorphism is given by (compatible):
print(F);
↳ F[1]=a
↳ F[2]=b
↳ F[3]=c
print(A);
↳      1      0      0
↳      3      2     -6
isGradedRingHomomorphism(r, ideal(F), A);
↳ 1
def h = createGradedRingHomomorphism(r, ideal(F), A);
print(h);
↳ [1]:
↳ // coefficients: QQ
↳ // number of vars : 3
↳ //      block  1 : ordering dp
↳ //      : names   x y z
↳ //      block  2 : ordering C
↳ [2]:
↳  _[1]=a
↳  _[2]=b
↳  _[3]=c
↳ [3]:
↳  1,0,0,
↳  3,2,-6

```

### D.15.10.13 setModuleGrading

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `setModuleGrading(m, G)`, `m` module/vector, `G` intmat

**Purpose:** attaches the multiweights of free module generators to 'm'

**Warning:** The method does not verify whether the multigrading makes the module/vector homogeneous. One can do that using `isHomogeneous(m)`.

**Example:**

```

LIB "multigrading.lib";
ring R = 0, (x,y), dp;
intmat M[2][2]=
1, 1,
0, 2;
intmat T[2][5]=
1, 2, 3, 4, 0,
0, 10, 20, 30, 1;
setBaseMultigrading(M, T);
ideal I = x, y, xy^5;
intmat V = multiDeg(I);
// V == M; modulo T
print(V);
↳      1      1      10
↳      0      2      10
module S = syz(I);
S = setModuleGrading(S, V);
getModuleGrading(S) == V;
↳ 1
print(S);
↳ -y, x4y5,
↳ x, 0,
↳ 0, -1
vector v = getGradedGenerator(S, 1);
getModuleGrading(v) == V;
↳ 1
print( multiDeg(v) );
↳ 2,
↳ 2
isHomogeneous(S);
↳ 1
print( multiDeg(S) );
↳      2      10
↳      2      10

```

**D.15.10.14 getModuleGrading**

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `getModuleGrading(m)`, 'm' module/vector

**Return:** integer matrix of the multiweights of free module generators attached to 'm'

**Example:**

```

LIB "multigrading.lib";
ring R = 0, (x,y), dp;
intmat M[2][2]=
1, 1,
0, 2;
intmat T[2][5]=
1, 2, 3, 4, 0,
0, 10, 20, 30, 1;
setBaseMultigrading(M, T);

```

```

ideal I = x, y, xy^5;
isHomogeneous(I);
↳ 1
intmat V = multiDeg(I); print(V);
↳      1      1      10
↳      0      2      10
module S = syz(I); print(S);
↳ -y, x4y5,
↳ x, 0,
↳ 0, -1
S = setModuleGrading(S, V);
getModuleGrading(S) == V;
↳ 1
vector v = getGradedGenerator(S, 1);
getModuleGrading(v) == V;
↳ 1
isHomogeneous(v);
↳ 1
print( multiDeg(v) );
↳ 2,
↳ 2
isHomogeneous(S);
↳ 1
print( multiDeg(S) );
↳      2      10
↳      2      10

```

### D.15.10.15 isSublattice

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `isSublattice(L, S)`; L, S are of type `intmat`

**Purpose:** checks whether the lattice created by L is a sublattice of the lattice created by S.  
The procedure checks whether each generator of L is contained in S.

**Return:** integer, 0 if false, 1 if true

**Example:**

```

LIB "multigrading.lib";
//ring R = 0,(x,y),dp;
intmat S2[3][3]=
0, 2, 3,
0, 1, 1,
3, 0, 2;
intmat S1[3][2]=
0, 6,
0, 2,
3, 4;
isSublattice(S1,S2); // Yes!
↳ 1
intmat S3[3][1] =
0,

```

```

0,
1;
not(isSublattice(S3,S2)); // Yes!
↳ 1

```

### D.15.10.16 imageLattice

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `imageLattice(Q,L)`; Q and L are of type `intmat`

**Purpose:** compute an integral basis for the image of the lattice L under the homomorphism of lattices Q.

**Return:** `intmat`

**Example:**

```

LIB "multigrading.lib";
intmat Q[2][3] =
1,2,3,
3,2,1;
intmat L[3][2] =
1,4,
2,5,
3,6;
// should be a 2x2 matrix with columns
// [2,-14], [0,36]
imageLattice(Q,L);
↳ 2,0,
↳ 22,36

```

### D.15.10.17 intRank

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `intRank(A)`; `intmat A`

**Purpose:** compute the rank of the integral matrix A by computing a hermite normalform.

**Returns:** `int`

**Example:**

```

LIB "multigrading.lib";
intmat A[3][4] =
1,0,1,0,
1,2,0,0,
0,0,0,0;
int r = intRank(A);
print(A);
↳      1      0      1      0
↳      1      2      0      0
↳      0      0      0      0
print(r); // Should be 2
↳ 2
// another example

```

```

intmat B[2][2] =
1,2,
1,2;
int d = intRank(B);
print(B);
↳      1      2
↳      1      2
print(d); // Should be 1
↳ 1
kill A, B, r, d;

```

### D.15.10.18 kernelLattice

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `kernelLattice(P); intmat P`

**Purpose:** compute a integral basis for the kernel of the homomorphism of lattices defined by the intmat P.

**Returns:** intmat

**Example:**

```

LIB "multigrading.lib";
intmat LL[3][4] =
1,4,7,10,
2,5,8,11,
3,6,9,12;
// should be a 4x2 matrix whose columns
// generate the same lattice as [-1,2,-1,0], [2,-3,0,1]
intmat B = kernelLattice(LL);
print(B);
↳      -1      2
↳       2     -3
↳      -1      0
↳       0      1
// another example
intmat C[2][4] =
1,0,2,0,
0,1,2,0;
// should result in a matrix whose
// columns create the same lattice as
// [-2,-2,1,0], [0,0,0,1]
intmat D = kernelLattice(C);
print(D);
↳      -2      0
↳      -2      0
↳       1      0
↳       0      1
kill B;

```

### D.15.10.19 latticeBasis

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `latticeBasis(B); intmat B`

**Purpose:** compute an integral basis for the lattice defined by the columns of B.

**Returns:** intmat

**Example:**

```
LIB "multigrading.lib";
intmat L[3][3] =
1,4,8,
2,5,10,
3,6,12;
intmat B = latticeBasis(L);
print(B); // should result in a matrix whose columns generate the same lattice as [
↳      1      0
↳      2      3
↳      3      6
// another example
intmat C[2][4] =
1,1,2,0,
2,3,4,0;
// should result in a matrix whose
// columns create the same lattice as
// [0,1],[1,0]
intmat D = latticeBasis(C);
print(D);
↳      1      0
↳      0      1
kill B,L;
```

### D.15.10.20 preimageLattice

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `preimageLattice(P, B);` intmat P, intmat B

**Purpose:** compute an integral basis for the preimage of B under the homomorphism of lattices defined by the intmat P.

**Returns:** intmat

**Example:**

```
LIB "multigrading.lib";
intmat P[2][3] =
2,6,10,
4,8,12;
intmat B[2][1] =
1,
0;
// should be a (3x2)-matrix with columns e.g. [1,1,-1] and [0,3,-2] (the generated lattice)
print(preimageLattice(P,B));
↳      1      0
↳      1      3
↳     -1     -2
// another example
intmat W[3][3] =
1,0,0,
0,1,1,
```

```

0,2,0;
intmat Z[3][2] =
1,0,
0,1,
0,0;
// should be a (3x2)-matrix with columns e.g. [1,0,0] and [0,0,-1] (the generated lattice)
print(preimageLattice(W,Z));
↳      1      0
↳      0      0
↳      0      1

```

### D.15.10.21 projectLattice

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `projectLattice(B); intmat B`

**Purpose:** A set of vectors in  $\mathbb{Z}\mathbb{Z}^m$  is given as the columns of B. Then this function provides a linear map  $\mathbb{Z}\mathbb{Z}^m \rightarrow \mathbb{Z}\mathbb{Z}^n$  having the primitive span of B its kernel.

**Returns:** `intmat`

**Example:**

```

LIB "multigrading.lib";
intmat B[4][2] =
1,5,
2,6,
3,7,
4,8;
// should result in a (2x4)-matrix such that the corresponding lattice is created by
// [-1, 2], [-2, 3], [-1, 0] and [0, 1]
print(projectLattice(B));
↳      -1      2      -1      0
↳      2      -3      0      1
// another example
intmat BB[4][2] =
1,0,
0,1,
0,0,
0,0;
// should result in a (2x4)-matrix such that the corresponding lattice is created by
// [0,0], [0,0], [1,0], [0,1]
print(projectLattice(BB));
↳      0      0      1      0
↳      0      0      0      1
// another example
intmat BBB[3][4] =
1,0,1,2,
1,1,0,0,
3,0,0,3;
// should result in the (1x3)-matrix that consists of just zeros
print(projectLattice(BBB));
↳      0      0      0

```

**D.15.10.22 intersectLattices**

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\], page 7637](#)).

**Usage:** `intersectLattices(A, B);` intmat A, intmat B

**Purpose:** compute an integral basis for the intersection of the lattices A and B.

**Returns:** intmat

**Example:**

```
LIB "multigrading.lib";
intmat A[3][2] =
1,4,
2,5,
3,6;
intmat B[3][2] =
6,9,
7,10,
8,11;
// should result in a (3x2)-matrix with columns
// e.g. [0, 3, 6], [-3, 0, 3] (the lattice should be the same)
print(intersectLattices(A,B));
↪      3      0
↪      0      3
↪     -3      6
// another example
intmat C[2][3] =
1,0,0,
3,2,5;
intmat D[2][3] =
4,5,0,
0,5,0;
// should result in a (3x2)-matrix whose columns generate the
// same lattice as [1,5], [0, 20]
print(intersectLattices(C,D));
↪      1      0
↪      5     20
```

**D.15.10.23 isIntegralSurjective**

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\], page 7637](#)).

**Purpose:** test whether the given linear map P of lattices is surjective.

**Returns:** int, where 0 is false and 1 is true.

**Example:**

```
LIB "multigrading.lib";
intmat A[2][3] =
1,3,5,
2,4,6;
// should be 0
int b = isIntegralSurjective(A);
print(b);
```

```

↳ 0
// another example
intmat B[2][3] =
1,1,5,
2,3,6;
// should be 1
int c = isIntegralSurjective(B);
print(c);
↳ 1
kill A, b, B, c;

```

#### D.15.10.24 isPrimitiveSublattice

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\], page 7637](#)).

**Purpose:** check whether the given set of integral vectors in  $\mathbb{Z}\mathbb{Z}^m$ , i.e. the columns of  $A$ , generate a primitive sublattice in  $\mathbb{Z}\mathbb{Z}^m$  (a direct summand of  $\mathbb{Z}\mathbb{Z}^m$ ).

**Returns:** int, where 0 is false and 1 is true.

**Example:**

```

LIB "multigrading.lib";
intmat A[3][2] =
1,4,
2,5,
3,6;
// should be 0
int b = isPrimitiveSublattice(A);
print(b);
↳ 0
// another example
intmat B[2][2] =
1,0,
0,1;
// should be 1
int c = isPrimitiveSublattice(B);
print(c);
↳ 1
kill A, b, B, c;

```

#### D.15.10.25 intInverse

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\], page 7637](#)).

**Purpose:** compute the integral inverse of the intmat  $A$ .  
If  $\det(A)$  is neither 1 nor -1 an error is returned.

**Returns:** intmat

**Example:**

```

LIB "multigrading.lib";
intmat A[3][3] =
1,1,3,
3,2,0,
0,0,1;

```

```

intmat B = intInverse(A);
// should be the unit matrix
print(A * B);
↳      1      0      0
↳      0      1      0
↳      0      0      1
// another example
intmat C[2][2] =
2,1,
3,2;
intmat D = intInverse(C);
// should be the unit matrix
print(C * D);
↳      1      0
↳      0      1
kill A, B, C, D;

```

### D.15.10.26 integralSection

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Purpose:** for a given linear surjective map  $P$  of lattices  
this procedure returns an integral section of  $P$ .

**Returns:** intmat

**Example:**

```

LIB "multigrading.lib";
intmat P[2][4] =
1,3,4,6,
2,4,5,7;
// should be a matrix with two columns
// for example: [-2, 1, 0, 0], [3, -3, 0, 1]
intmat U = integralSection(P);
print(U);
↳      -1      1
↳      -2      1
↳      2      -1
↳      0      0
print(P * U);
↳      1      0
↳      0      1
kill U;

```

### D.15.10.27 primitiveSpan

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Purpose:** compute an integral basis for the minimal primitive  
sublattice that contains the given vectors, i.e. the columns of  $V$ .

**Returns:** int, where 0 is false and 1 is true.

**Example:**

```

LIB "multigrading.lib";
intmat V[3][2] =
1,4,
2,5,
3,6;
// should return a (3x2)-matrix whose columns
// generate the same lattice as [1, 2, 3] and [0, 1, 2]
intmat R = primitiveSpan(V);
print(R);
↪      1      0
↪      2      1
↪      3      2
// another example
intmat W[2][2] =
1,0,
0,1;
// should return a (2x2)-matrix whose columns
// generate the same lattice as [1, 0] and [0, 1]
intmat S = primitiveSpan(W);
print(S);
↪      1      0
↪      0      1
kill V, R, S, W;

```

### D.15.10.28 factorgroup

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\], page 7637](#)).

**Usage:** `factorgroup(G,H);` list G, list H

**Purpose:** returns a representation of the factor group  $G \bmod H$  using the first isomorphism thm

**Returns:** list

**Example:**

```

LIB "multigrading.lib";
intmat S1[2][2] =
1,0,
0,1;
intmat L1[2][1] =
2,
0;
intmat S2[2][1] =
1,
0;
intmat L2[2][1] =
2,
0;
list G = createGroup(S1,L1);
list H = createGroup(S2,L2);
list N = factorgroup(G,H);
print(N);
↪ [1]:
↪  1,0,
↪  0,1

```

```

↳ [2] :
↳ 2,1,
↳ 0,0
kill G,H,N,S1,L1,S2,L2;

```

### D.15.10.29 productgroup

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `productgroup(G,H);` list G, list H

**Purpose:** Returns a representation of the group  $G \times H$

**Returns:** list

**Example:**

```

LIB "multigrading.lib";
intmat S1[2][2] =
1,0,
0,1;
intmat L1[2][1] =
2,
0;
intmat S2[2][2] =
1,0,
0,2;
intmat L2[2][1] =
0,
3;
list G = createGroup(S1,L1);
list H = createGroup(S2,L2);
list N = productgroup(G,H);
print(N);
↳ [1] :
↳ 1,0,0,0,
↳ 0,1,0,0,
↳ 0,0,1,0,
↳ 0,0,0,2
↳ [2] :
↳ 2,0,
↳ 0,0,
↳ 0,0,
↳ 0,3
kill G,H,N,S1,L1,S2,L2;

```

### D.15.10.30 multiDeg

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `multiDeg(A);` polynomial/vector/ideal/module A

**Purpose:** compute multidegree

**Example:**

```

LIB "multigrading.lib";
ring r = 0,(x, y), dp;

```

```

intmat A[2][2] = 1, 0, 0, 1;
print(A);
↳      1      0
↳      0      1
intmat Ta[2][1] = 0, 3;
print(Ta);
↳      0
↳      3
//  attrib(A, "gradingGroup", Ta); // to think about
//  "poly:";
setBaseMultigrading(A);
multiDeg( x*x, A );
↳ 2,0
multiDeg( y*y*y, A );
↳ 0,3
setBaseMultigrading(A, Ta);
multiDeg( x*x*y );
↳ 2,1
multiDeg( y*y*y*x );
↳ 1,3
multiDeg( x*y + x + 1 );
↳ 1,1
multiDegPartition(x*y + x + 1);
↳ _[1]=xy
↳ _[2]=x
↳ _[3]=1
print ( multiDeg(0) );
↳ 0,
↳ 0
poly zero = 0;
print ( multiDeg(zero) );
↳ 0,
↳ 0
//  "ideal:";
ideal I = y*x*x, x*y*y*y;
print( multiDeg(I) );
↳      2      1
↳      1      3
print ( multiDeg(ideal(0)) );
↳ 0,
↳ 0
print ( multiDeg(ideal(0,0,0)) );
↳      0      0      0
↳      0      0      0
//  "vectors:";
intmat B[2][2] = 0, 1, 1, 0;
print(B);
↳      0      1
↳      1      0
multiDeg( setModuleGrading(y*y*y*gen(2), B ));
↳ 1,3
multiDeg( setModuleGrading(x*x*gen(1), B ));
↳ 2,1

```

```

vector V = x*gen(1) + y*gen(2);
V = setModuleGrading(V, B);
multiDeg( V );
↳ 1,1
vector v1 = setModuleGrading([0, 0, 0], B);
print( multiDeg( v1 ) );
↳ 0,
↳ 0
vector v2 = setModuleGrading([0], B);
print( multiDeg( v2 ) );
↳ 0,
↳ 0
// "module:";
module D = x*gen(1), y*gen(2);
D;
↳ D[1]=x*gen(1)
↳ D[2]=y*gen(2)
D = setModuleGrading(D, B);
print( multiDeg( D ) );
↳      1      1
↳      1      1
module DD = [0, 0],[0, 0, 0];
DD = setModuleGrading(DD, B);
print( multiDeg( DD ) );
↳      0      0
↳      0      0
module DDD = [0, 0];
DDD = setModuleGrading(DDD, B);
print( multiDeg( DDD ) );
↳ 0,
↳ 0

```

### D.15.10.31 multiDegBasis

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `multiDegBasis(d)`, `multidegree: intvec d`

**Assume:** current ring is multigraded, monomial ordering is global

**Purpose:** compute all monomials of multidegree `d`

**Example:**

```

LIB "multigrading.lib";
ring R = 0, (x, y), dp;

### D.15.10.32 multiDegPartition

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `multiDegPartition(def p), p` polynomial/vector

**Returns:** an ideal/module consisting of multigraded-homogeneous parts of `p`

**Example:**

```

LIB "multigrading.lib";
ring r = 0, (x,y,z), dp;
intmat g[2][3]=
1,0,1,
0,1,1;
intmat t[2][1]=
-2,
1;
setBaseMultigrading(g,t);
poly f = x10yz+x8y2z-x4z2+y5+x2y2-z2+x17z3-y6;
multiDegPartition(f);
↳ _[1]=x17z3
↳ _[2]=x10yz+x8y2z
↳ _[3]=-y6
↳ _[4]=-x4z2+y5
↳ _[5]=x2y2-z2
vector v = xy*gen(1)-x3y2*gen(2)+x4y*gen(3);
intmat B[2][3]=1,-1,-2,0,0,1;
v = setModuleGrading(v,B);
getModuleGrading(v);
↳ 1,-1,-2,
↳ 0,0,1
multiDegPartition(v, B);
↳ _[1]=x4y*gen(3)-x3y2*gen(2)
↳ _[2]=xy*gen(1)

```

### D.15.10.33 isTorsionFree

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `isTorsionFree()`

**Purpose:** Determines whether the multigrading attached to the current ring is free.

**Return:** boolean, the result of the test

**Example:**

```

LIB "multigrading.lib";
ring R = 0,(x,y),dp;
intmat M[2][2]=
1,0,
0,1;
intmat T[2][5]=
1, 2, 3, 4, 0,
0,10,20,30, 1;
setBaseMultigrading(M,T);
// Is the resulting group free?
isTorsionFree();
↳ 1
kill R, M, T;
////////////////////////////////////
ring R=0,(x,y,z),dp;
intmat A[3][3] =
1,0,0,
0,1,0,
0,0,1;
intmat B[3][4]=
3,3,3,3,
2,1,3,0,
1,2,0,3;
setBaseMultigrading(A,B);
// Is the resulting group free?
isTorsionFree();
↳ 0
kill R, A, B;

```

**D.15.10.34 isPositive**

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `isPositive()`

**Purpose:** Computes whether the multigrading of the ring is positive. For computation theorem 8.6 of the Miller/Sturmfels book is used.

**Returns:** true if the multigrading is positive

**Example:**

```

LIB "multigrading.lib";
printlevel = 3;
ring r = 0,(x,y),dp;
intmat A[1][2]=-1,1;
setBaseMultigrading(A);
isPositive();
↳ 0
intmat B[1][2]=1,1;
setBaseMultigrading(B);
isPositive(B);
↳ 1

```

**D.15.10.35 isZeroElement**

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `isZeroElement(d, [T]);` intvec `d`, group `T`

**Purpose:** For a integer vector 'd' representing the multidegree of some polynomial or vector this method computes if the multidegree is contained in the grading group group (either set globally or given as an optional argument), i.e. if it is zero in the multigrading.

**Example:**

```
LIB "multigrading.lib";
ring r = 0, (x,y,z), dp;
intmat g[2][3]=
1,0,1,
0,1,1;
intmat t[2][1]=
-2,
1;
intmat tt[2][1]=
1,
-1;
setBaseMultigrading(g,t);
poly a = x10yz;
poly b = x8y2z;
poly c = x4z2;
poly d = y5;
poly e = x2y2;
poly f = z2;
intvec v1 = multiDeg(a) - multiDeg(b);
v1;
↳ 2,-1
isZeroElement(v1);
↳ 1
isZeroElement(v1, tt);
↳ 0
intvec v2 = multiDeg(a) - multiDeg(c);
v2;
↳ 5,0
isZeroElement(v2);
↳ 0
isZeroElement(v2, tt);
↳ 0
intvec v3 = multiDeg(e) - multiDeg(f);
v3;
↳ 0,0
isZeroElement(v3);
↳ 1
isZeroElement(v3, tt);
↳ 1
intvec v4 = multiDeg(c) - multiDeg(d);
v4;
↳ 6,-3
isZeroElement(v4);
```

```

↳ 1
isZeroElement(v4, tt);
↳ 0

```

### D.15.10.36 areZeroElements

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\], page 7637](#)).

**Usage:** `areZeroElements(D, [T]);` intmat D, group T

**Purpose:** For a integer matrix D, considered column-wise as a set of integer vecors representing the multidegree of some polynomial or vector this method checks whether all these multidegrees are contained in the grading group (either set globally or given as an optional argument), i.e. if they all are zero in the multigrading.

**Example:**

```

LIB "multigrading.lib";
ring r = 0, (x,y,z), dp;
intmat S[2][3]=
1,0,1,
0,1,1;
intmat L[2][1]=
2,
2;
setBaseMultigrading(S,L);
poly a = 1;
poly b = xyz;
ideal I = a, b;
print(multiDeg(I));
↳ 0 2
↳ 0 2
intmat m[5][2]=multiDeg(a),multiDeg(b); m=transpose(m);
print(multiDeg(a));
↳ 0,
↳ 0
print(multiDeg(b));
↳ 2,
↳ 2
print(m);
↳ 0 2 0 0 0
↳ 0 2 0 0 0
areZeroElements(m);
↳ 1
intmat LL[2][1]=
1,
-1;
areZeroElements(m,LL);
↳ 0

```

### D.15.10.37 isHomogeneous

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\], page 7637](#)).

**Usage:** `isHomogeneous(a[, f]);` a polynomial/vector/ideal/module

**Return:** boolean, TRUE if a is (multi)homogeneous, and FALSE otherwise

**Example:**

```
LIB "multigrading.lib";
ring r = 0,(x,y,z),dp;
//Grading and Torsion matrices:
intmat M[3][3] =
1,0,0,
0,1,0,
0,0,1;
intmat T[3][1] =
1,2,3;
setBaseMultigrading(M,T);
attrib(r);
⇒ attr:cf_class, type int
⇒ attr:global, type int
⇒ attr:maxExp, type int
⇒ attr:ring_cf, type int
⇒ attr:isLetterplaceRing, type int
⇒ attr:gradingGroup, type list
⇒ attr:mgrad, type intmat

### D.15.10.38 equalMultiDeg

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `equalMultiDeg(exp1, exp2[, V]);` intvec exp1, exp2, intmat V

**Purpose:** Tests if the exponent vectors of two monomials (given by exp1 and exp2) represent the same multidegree.

**Note:** the integer matrix V encodes multidegrees of module components, if module component is present in exp1 and exp2

**Example:**

```

LIB "multigrading.lib";
printlevel=3;
ring r = 0, (x,y,z), dp;
intmat g[2][3]=
1,0,1,
0,1,1;
intmat t[2][1]=
-2,
1;
setBaseMultigrading(g,t);
poly a = x10yz;
poly b = x8y2z;
poly c = x4z2;
poly d = y5;
poly e = x2y2;
poly f = z2;

↳ 0
equalMultiDeg(leadexp(e), leadexp(f));
↳ 1

```

### D.15.10.39 multiDegGroebner

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\], page 7637](#)).

**Usage:** `multiDegGroebner(I)`; I is a poly/vector/ideal/module

**Purpose:** computes the multigraded standard/groebner basis of I

**Note:** I must be multigraded homogeneous

**Returns:** ideal/module, the computed basis

**Example:**

```

LIB "multigrading.lib";
ring r = 0,(x,y,z,w),dp;
intmat MM[2][4]=
1,1,1,1,
0,1,3,4;
setBaseMultigrading(MM);
module M = ideal( xw-yz, x2z-y3, xz2-y2w, yw2-z3);
intmat v[2][nrows(M)]=
1,
0;
M = setModuleGrading(M, v);
////////////////////////////////////
// GB:
M = multiDegGroebner(M); M;
↳ M[1]=yz*gen(1)-xw*gen(1)
↳ M[2]=z3*gen(1)-yw2*gen(1)
↳ M[3]=xz2*gen(1)-y2w*gen(1)
↳ M[4]=y3*gen(1)-x2z*gen(1)
"Module Units Multigrading: "; print( getModuleGrading(M) );
↳ Module Units Multigrading:
↳ 1
↳ 0
"Multidegrees: "; print(multiDeg(M));
↳ Multidegrees:
↳ 3 4 4 4
↳ 4 9 6 3
isHomogeneous(M);
↳ 1
////////////////////////////////////
// Let's compute Syzygy!

↳ Multidegrees:
↳      5      5      5      5      6      7      7      7      7
↳      9     10      7      6     10     15     12     12     9
isHomogeneous(S);
↳ 1

```

#### D.15.10.40 multiDegSyzygy

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `multiDegSyzygy(I)`; I is a ideal or a module

**Purpose:** computes the multigraded syzygy module of I

**Returns:** module, the syzygy module of I

**Note:** generators of I must be multigraded homogeneous

**Example:**

```

LIB "multigrading.lib";
ring r = 0,(x,y,z,w),dp;
intmat MM[2][4]=
1,1,1,1,
0,1,3,4;

```

```

setBaseMultigrading(MM);
module M = ideal( xw-yz, x2z-y3, xz2-y2w, yw2-z3);
intmat v[2][nrows(M)]=
1,
0;
M = setModuleGrading(M, v);
isHomogeneous(M);
↳ 1
"Multidegrees: "; print(multiDeg(M));
↳ Multidegrees:
↳      3      4      4      4
↳      4      3      6      9
// Let's compute syzygies!
def S = multiDegSyzygy(M); S;
↳ S[1]=yw*gen(1)-x*gen(4)-z*gen(3)
↳ S[2]=z2*gen(1)-y*gen(4)-w*gen(3)
↳ S[3]=xz*gen(1)+y*gen(3)-w*gen(2)
↳ S[4]=y2*gen(1)+x*gen(3)-z*gen(2)
"Module Units Multigrading: "; print( getModuleGrading(S) );
↳ Module Units Multigrading:
↳      3      4      4      4
↳      4      3      6      9
"Multidegrees: "; print(multiDeg(S));
↳ Multidegrees:
↳      5      5      5      5
↳      9     10      7      6
isHomogeneous(S);
↳ 1

```

#### D.15.10.41 multiDegModulo

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `multiDegModulo(I);` I, J are ideals or modules

**Purpose:** computes the multigraded 'modulo' module of I and J

**Returns:** module, see 'modulo' command

**Note:** I and J should have the same multigrading, and their generators must be multigraded homogeneous

**Example:**

```

LIB "multigrading.lib";
ring r = 0,(x,y,z),dp;
intmat MM[2][3]=
-1,1,1,
0,1,3;
setBaseMultigrading(MM);
ideal h1 = x, y, z;
ideal h2 = x;
"Multidegrees: "; print(multiDeg(h1));
↳ Multidegrees:
↳      -1      1      1
↳      0      1      3

```

```

// Let's compute modulo(h1, h2):
def K = multiDegModulo(h1, h2); K;
↳ K[1]=gen(1)
↳ K[2]=y*gen(3)-z*gen(2)

#### D.15.10.42 multiDegResolution

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `multiDegResolution(I,l,[f]);` I is poly/vector/ideal/module; l,f are integers

**Purpose:** computes the multigraded resolution of I of the length l, or the whole resolution if l is zero. Returns minimal resolution if an optional argument 1 is supplied

**Note:** input must have multigraded-homogeneous generators.  
The returned list is truncated beginning with the first zero differential.

**Returns:** list, the computed resolution

**Example:**

```

LIB "multigrading.lib";
ring r = 0,(x,y,z,w),dp;
intmat M[2][4]=
1,1,1,1,
0,1,3,4;
setBaseMultigrading(M);
module m= ideal( xw-yz, x2z-y3, xz2-y2w, yw2-z3);
isHomogeneous(ideal( xw-yz, x2z-y3, xz2-y2w, yw2-z3), "checkGens");
↳ 1
ideal A = xw-yz, x2z-y3, xz2-y2w, yw2-z3;
int j;
for(j=1; j<=ncols(A); j++)
{
multiDegPartition(A[j]);
}
↳ _[1]=-yz+xw
↳ _[1]=-y3+x2z
↳ _[1]=xz2-y2w
↳ _[1]=-z3+yw2
intmat v[2][1]=
1,
0;
m = setModuleGrading(m, v);

```

```

#### D.15.10.43 multiDegTensor

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `multiDegTensor(m, n)`,  $m, n$  modules or matrices.

**Purpose:** Computes the multigraded tensor product of to multigraded modules.

**Return:** A module.

**Example:**

```

LIB "multigrading.lib";
ring r = 0,(x),dp;
intmat g[2][1]=1,1;
setBaseMultigrading(g);
matrix m[5][3]=1,2,3,4,5,6,7,8,9,10,11,12,13,14,15;
matrix n[3][2]=x,x2,x3,x4,x5,x6;
module mm = m;
module nn = n;
intmat gm[2][5]=1,2,3,4,5,0,0,0,0,0;
intmat gn[2][3]=0,0,0,1,2,3;
mm = setModuleGrading(mm, gm);
nn = setModuleGrading(nn, gn);
module mmtnn = multiDegTensor(mm, nn);

```

#### D.15.10.44 multiDegTor

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

#### D.15.10.45 defineHomogeneous

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `defineHomogeneous(f[, G]);` polynomial  $f$ , integer matrix  $G$

**Purpose:** Yields a matrix which has to be appended to the grading group matrix to make the polynomial  $f$  homogeneous in the grading by `grad`.

**Example:**

```

LIB "multigrading.lib";
ring r =0,(x,y,z),dp;
intmat grad[2][3] =
1,0,1,
0,1,1;
setBaseMultigrading(grad);
poly f = x2y3-z5+x-3zx;
intmat M = defineHomogeneous(f);
M;
↳ 3,0,-1,
↳ 2,-2,-3
defineHomogeneous(f, grad) == M;
↳ 1
isHomogeneous(f);
↳ 0
setBaseMultigrading(grad, M);
isHomogeneous(f);
↳ 1

```

#### D.15.10.46 pushForward

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `pushForward(f);`

**Purpose:** Computes the finest grading of the image ring which makes the map  $f$  a map of graded rings. The group map between the two grading groups is given by `transpose( (Id, 0) )`. Pay attention that the group spanned by the columns of the grading group matrix may not be a subgroup of the grading group. Still all columns are needed to find the correct image of the preimage gradings.

**Example:**

```

LIB "multigrading.lib";
ring r = 0,(x,y,z),dp;
// Setting degrees for preimage ring.;
intmat grad[3][3] =
1,0,0,
0,1,0,
0,0,1;
setBaseMultigrading(grad);
// grading on r:
getVariableWeights();
⇒ 1,0,0,
⇒ 0,1,0,
⇒ 0,0,1
getLattice();
⇒ 0,0,0
// only for the purpose of this example
if( voice > 1 ){ /*keeping(r);*/ export(r); }
ring R = 0,(a,b),dp;
ideal i = a2-b2+a6-b5+ab3,a7b+b15-ab6+a6b6;
// The quotient ring by this ideal will become our image ring.;
qring Q = std(i);
listvar();
⇒ // Q [0] *ring
⇒ // R [0] ring
⇒ // grad [0] intmat 3 x 3
⇒ // r [0] ring
map f = r,-a2b6+b5+a3b+a2+ab,-a2b7-3a2b5+b4+a,a6-b6-b3+a2; f;
⇒ f[1]=-a2b6+b5+a3b+a2+ab
⇒ f[2]=-a2b7-3a2b5+b4+a
⇒ f[3]=a6-b6-b3+a2
// TODO: Unfortunately this is not a very spectacular example...:
// Pushing forward f:
pushForward(f);
// due to pushForward we have got new grading on Q
getVariableWeights();
⇒ 0,0,
⇒ 0,0,
⇒ 0,0,
⇒ 1,0,
⇒ 0,1
getLattice();
⇒ 1,0,0,0,0,
⇒ 0,1,0,0,0,
⇒ 0,0,1,0,0,
⇒ 1,1,1,1,0,
⇒ 1,1,1,1,1
// only for the purpose of this example
if( voice > 1 ){ kill r; }

```

#### D.15.10.47 gradiator

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Purpose:** coarsens the grading of the basering until the polynom or ideal `h` becomes homogeneous.

**Example:**

```

LIB "multigrading.lib";
ring r = 0,(x,y,z),dp;
intmat g[2][3] = 1,0,1,0,1,1;
intmat l[2][1] = 3,0;
setBaseMultigrading(g,l);
getLattice();
↳ 3,0
ideal i = -y5+x4,
y6+xz,
x2y;
gradiator(i);
↳ 1
getLattice();
↳ 3,4,2,
↳ 0,-5,-5
isHomogeneous(i);
↳ 1

```

**D.15.10.48 hermiteNormalForm**

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `hermiteNormalForm( A );`

**Purpose:** Computes the (lower triangular) Hermite Normal Form of the matrix A by column operations.

**Return:** `intmat`, the Hermite Normal Form of A

**Example:**

```

LIB "multigrading.lib";
intmat M[2][5] =
1, 2, 3, 4, 0,
0,10,20,30, 1;
// Hermite Normal Form of M:
print(hermiteNormalForm(M));
↳      1      0      0      0      0
↳      0      1      0      0      0
intmat T[3][4] =
3,3,3,3,
2,1,3,0,
1,2,0,3;
// Hermite Normal Form of T:
print(hermiteNormalForm(T));
↳      3      0      0      0
↳      0      1      0      0
↳      3     -1      0      0
intmat A[4][5] =
1,2,3,2,2,
1,2,3,4,0,
0,5,4,2,1,
3,2,4,0,2;
// Hermite Normal Form of A:
print(hermiteNormalForm(A));

```

```

↳      1      0      0      0      0
↳      1      2      0      0      0
↳      0      0      1      0      0
↳      0      1      0      1      0

```

### D.15.10.49 smithNormalForm

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `smithNormalForm(A[,opt]); intmat A`

**Purpose:** Computes the Smith Normal Form of A

**Return:** if no optional argument is given: `intmat`, the Smith Normal Form of A, otherwise: a list of 3 integer matrices P, D Q, such that  $D == P*A*Q$ .

**Example:**

```

LIB "multigrading.lib";
intmat A[5][7] =
1,0,1,0,-2,9,-71,
0,-24,248,-32,-96,448,-3496,
0,4,-42,4,-8,30,-260,
0,0,0,18,-90,408,-3168,
0,0,0,-32,224,-1008,7872;
print( smithNormalForm(A) );
↳      1      0      0      0      0      0      0
↳      0      2      2      6     12      0      0
↳      0      0      2      0      0      0      0
↳      0      0      0      8      0      0      0
↳      0      0      0      0     48      0      0
list l = smithNormalForm(A, 5);
l;
↳ [1]:
↳      1,0,0,0,0,
↳      0,0,1,0,0,
↳      0,-1,4,-1,0,

```

### D.15.10.50 hilbertSeries

Procedure from library `multigrading.lib` (see [Section D.15.10 \[multigrading.lib\]](#), page 7637).

**Usage:** `hilbertSeries(I)`; I is poly/vector/ideal/module

**Purpose:** computes the multigraded Hilbert Series of I

**Note:** input must have multigraded-homogeneous generators.  
Multigrading should be positive.

**Returns:** a ring in variables  $t_{(i)}$ ,  $s_{(i)}$ , with polynomials  
numerator1 and denominator1 and mutually prime numerator2 and denominator2, quo-  
tients of which give the series.

**Example:**

```

LIB "multigrading.lib";
ring r = 0,(x,y,z,w),dp;
intmat g[2][4]=
1,1,1,1,
0,1,3,4;
setBaseMultigrading(g);
module M = ideal(xw-yz, x2z-y3, xz2-y2w, yw2-z3);

**D.15.11** **pfd.lib**

**Library:** `pfd.lib`

**Purpose:** Multivariate Partial Fraction Decomposition

**Author:** Marcel Wittmann, e-mail: [mwittman@mathematik.uni-kl.de](mailto:mwittman@mathematik.uni-kl.de)

**Overview:** This Library implements an algorithm based on the work of E. K. Leinartas to write rational functions in mutiple variables as a sum of functions with "smaller" numerators and denominators.

This can be used to shorten the IBP reduction coefficients of multi-loop Feynman integrals. For this application, we also provide a procedure that applies the algorithm to all entries of a matrix of rational functions given as one (possibly very big) txt-file. If you use the library `pfd.lib`, please cite the corresponding paper [J. Boehm, M. Wittmann, Z. Wu, Y. Xu, Y. Zhang: 'IBP reduction coefficients made simple' (preprint 2020)].

**Procedures:**

### D.15.11.1 pfd

Procedure from library `pfd.lib` (see [Section D.15.11 \[pfd.lib\]](#), page 7696).

**Usage:** `pfd(f,g[,debug]);` `f,g` poly, `debug` int  
`pfd(f,g[,debug]);` `f` poly, `g` list, `debug` int  
`pfd(arguments[, parallelize]);` `arguments` list, `parallelize` int

**Return:** a partial fraction decomposition of  $f/g$  as a list `l` where `l[1]` is an ideal generated by irreducible polynomials and `l[2]` is a list of fractions. Each fraction is represented by a list of

- 1) the numerator polynomial
- 2) an intvec of indices `i` for which `l[1][i]` occurs as a factor in the denominator
- 3) an intvec containing the exponents of those irreducible factors.

Setting `debug` to a positive integer measures runtimes and creates a log file (default: `debug=0`).

The denominator `g` can also be given in factorized form as a list of an ideal of irreducible non constant polynomials and an intvec of exponents. This can save time since the first step in the algorithm is to factorize `g`. (A list of the zero-ideal and an empty intvec represents a denominator of 1.)

If instead of `f` and `g`, the input is a single list (or even a list of lists) containing elements of the form `list(f,g[,debug])` (`f,g,debug` as above), the algorithm is applied to all entries in parallel (using [Section D.2.7 \[parallel.lib\]](#), page 878), if `parallelize=1` (default) and in sequence if `parallelize=0`. A list (or list of lists) of the results is returned.

**Note:** The result depends on the monomial ordering. For "small" results use `dp`.

**Example:**

```
LIB "pfd.lib";
ring R = 0, (x,y), dp;
poly f = x^3+3*x^2*y+2*y^2-x^2+4*x*y;
poly g = x^2*y*(x-1)*(x-y)^2;
list dec = pfd(f,g);
  => (2) / (q3*q4)
  => + (-2) / (q1*q4)
  => + (-6) / (q3*q4^2)
  => + (1) / (q2*q4^2)
  => + (9) / (q1*q4^2)
  => + (2) / (q3^2*q4)
  => where
  => q1 = x-1
  => q2 = y
  => q3 = x
  => q4 = x-y
  => (6 terms)
  =>
displaypfd_long(dec); // display result
  => (2)/((x)*(x-y))
  => + (-2)/((x-1)*(x-y))
  => + (-6)/((x)*(x-y)^2)
  => + (1)/((y)*(x-y)^2)
  => + (9)/((x-1)*(x-y)^2)
  => + (2)/((x)^2*(x-y))
```

```

### D.15.11.2 checkpfd

Procedure from library `pfd.lib` (see [Section D.15.11 \[pfd.lib\]](#), page 7696).

**Usage:** `checkpfd(list(f,g),dec[,N,C]);` f,g poly, dec list, N,C int

**Return:** 0 or 1

**Purpose:** test for (mathematical) equality of  $f/g$  and a partial fraction decomposition `dec`. The list `dec` has to have the same structure as the output of [Section D.15.11.1 \[pfd\]](#), page 7697.

The denominator  $g$  can also be given in factorized form as a list of an ideal of irreducible non constant polynomials and an intvec of exponents. This can save time since the first step in the algorithm is to factorize  $g$ . (a list of the zero-ideal and an empty intvec represents a denominator of 1.)

By default the test is done (exactly) by bringing all terms of the decomposition on the same denominator and comparing to  $f/g$ .

If additional parameters  $N$  [,  $C$ ] are given and if  $N > 0$ , a probabilistic method is chosen: evaluation at  $N$  random points with coordinates between  $-C$  and  $C$ . This may be faster for big polynomials.

**Example:**

```
LIB "pfd.lib";
ring R = 0,(x,y),dp;
poly f = x^3+3*x^2*y+2*y^2-x^2+4*x*y;
poly g = x^2*y*(x-1)*(x-y)^2;
// partial fraction decomposition of f/g:
list dec = pfd(f,g);

### D.15.11.3 evaluatepfd

Procedure from library `pfd.lib` (see [Section D.15.11 \[pfd.lib\]](#), page 7696).

**Usage:** `evaluatepfd(dec, values[, mode]);` dec list, values ideal, mode int

**Return:** the number gotten by substituting the numbers generating the ideal `values` for the variables in the partial fraction decomposition `dec`. The list `dec` has to have the same structure as the output of [Section D.15.11.1 \[pfd\]](#), page 7697.  
`mode=1`: raise Error in case of division by 0 (default)  
`mode=2`: return a second integer which is 1 if the denominator becomes 0, and 0 otherwise.

**Example:**

```

LIB "pfd.lib";
ring R = 0,(x,y),dp;
poly f = x+2*y;
poly g = x^2-y^2;
// partial fraction decomposition of f/g:
list dec = pfd(f,g);
↳ (-1/2) / (q2)
↳ + (3/2) / (q1)

```

```

↳ (2 terms)
↳
// evaluation at x=2, y=1:
ideal values = 2,1;
evaluatepfd(dec,values);
↳ 4/3
// compare: f(2,1)/g(2,1) = (2+2*1)/(2^2-1^1) = 4/3

```

See also: [Section D.15.11.1 \[pfd\]](#), page 7697.

#### D.15.11.4 displaypfd

Procedure from library `pfd.lib` (see [Section D.15.11 \[pfd.lib\]](#), page 7696).

**Usage:** `displaypfd(dec);` dec list

**Purpose:** print a partial fraction decomposition `dec` in a readable way. The list `dec` has to have the same structure as the output of [Section D.15.11.1 \[pfd\]](#), page 7697.

**Example:**

```

LIB "pfd.lib";
ring R = 0, (x,y), dp;
poly f = x^3+3*x^2*y+2*y^2-x^2+4*x*y;
poly g = x^2*y*(x-1)*(x-y)^2;
list dec = pfd(f,g);
↳ (2) / (q3*q4)
↳ + (-2) / (q1*q4)
↳ + (-6) / (q3*q4^2)
↳ + (1) / (q2*q4^2)
↳ + (9) / (q1*q4^2)
↳ + (2) / (q3^2*q4)
↳ where
↳ q1 = x-1
↳ q2 = y
↳ q3 = x
↳ q4 = x-y
↳ (6 terms)
↳
displaypfd(dec);
↳ (2) / (q3*q4)
↳ + (-2) / (q1*q4)
↳ + (-6) / (q3*q4^2)
↳ + (1) / (q2*q4^2)
↳ + (9) / (q1*q4^2)
↳ + (2) / (q3^2*q4)
↳ where
↳ q1 = x-1

```

```

↳ q2 = y
↳ q3 = x
↳ q4 = x-y
↳ (6 terms)
↳

```

See also: [Section D.15.11.5 \[displaypfd\\_long\]](#), page 7704; [Section D.15.11.6 \[getStringpfd\]](#), page 7704; [Section D.15.11.7 \[getStringpfd\\_indexed\]](#), page 7705; [Section D.15.11.1 \[pfd\]](#), page 7697.

### D.15.11.5 displaypfd\_long

Procedure from library `pfd.lib` (see [Section D.15.11 \[pfd\\_lib\]](#), page 7696).

**Usage:** `displaypfd_long(dec);` dec list

**Purpose:** like [Section D.15.11.4 \[displaypfd\]](#), page 7703, but denominators are written out, not indexed.

**Example:**

```

LIB "pfd.lib";
ring R = 0, (x,y), dp;
poly f = x^3+3*x^2*y+2*y^2-x^2+4*x*y;
poly g = x^2*y*(x-1)*(x-y)^2;
list dec = pfd(f,g);
↳ (2) / (q3*q4)
↳ + (-2) / (q1*q4)
↳ + (-6) / (q3*q4^2)
↳ + (1) / (q2*q4^2)
↳ + (9) / (q1*q4^2)
↳ + (2) / (q3^2*q4)
↳ where
↳ q1 = x-1
↳ q2 = y
↳ q3 = x
↳ q4 = x-y
↳ (6 terms)
↳
displaypfd_long(dec);
↳ (2)/((x)*(x-y))
↳ + (-2)/((x-1)*(x-y))
↳ + (-6)/((x)*(x-y)^2)
↳ + (1)/((y)*(x-y)^2)
↳ + (9)/((x-1)*(x-y)^2)
↳ + (2)/((x)^2*(x-y))
↳ (6 terms)
↳

```

See also: [Section D.15.11.4 \[displaypfd\]](#), page 7703; [Section D.15.11.6 \[getStringpfd\]](#), page 7704; [Section D.15.11.7 \[getStringpfd\\_indexed\]](#), page 7705; [Section D.15.11.1 \[pfd\]](#), page 7697.

### D.15.11.6 getStringpfd

Procedure from library `pfd.lib` (see [Section D.15.11 \[pfd\\_lib\]](#), page 7696).

**Usage:** `getStringpfd(dec);` dec list

**Purpose:** turn a partial fraction decomposition `dec` into one string. The list `dec` has to have the same structure as the output of [Section D.15.11.1 \[pfd\]](#), page 7697.

**Example:**

```
LIB "pfd.lib";
ring R = 0, (x,y), dp;
poly f = x^3+3*x^2*y+2*y^2-x^2+4*x*y;
poly g = x^2*y*(x-1)*(x-y)^2;
list dec = pfd(f,g);
↳ (2) / (q3*q4)
↳ + (-2) / (q1*q4)
↳ + (-6) / (q3*q4^2)
↳ + (1) / (q2*q4^2)
↳ + (9) / (q1*q4^2)
↳ + (2) / (q3^2*q4)
↳ where
↳ q1 = x-1
↳ q2 = y
↳ q3 = x
↳ q4 = x-y
↳ (6 terms)
↳
displaypfd_long(dec);
↳ (2)/((x)*(x-y))
↳ + (-2)/((x-1)*(x-y))
↳ + (-6)/((x)*(x-y)^2)
↳ + (1)/((y)*(x-y)^2)
↳ + (9)/((x-1)*(x-y)^2)
↳ + (2)/((x)^2*(x-y))
↳ (6 terms)
↳
getStringpfd(dec);
↳ (2)/((x)*(x-y)) + (-2)/((x-1)*(x-y)) + (-6)/((x)*(x-y)^2) + (1)/((y)*(x-y)\
  )^2) + (9)/((x-1)*(x-y)^2) + (2)/((x)^2*(x-y))
```

See also: [Section D.15.11.4 \[displaypfd\]](#), page 7703; [Section D.15.11.5 \[displaypfd\\_long\]](#), page 7704; [Section D.15.11.7 \[getStringpfd\\_indexed\]](#), page 7705; [Section D.15.11.1 \[pfd\]](#), page 7697.

### D.15.11.7 getStringpfd\_indexed

Procedure from library `pfd.lib` (see [Section D.15.11 \[pfd\\_lib\]](#), page 7696).

**Usage:** `getStringpfd_indexed(dec); dec list`

**Purpose:** turn a partial fraction decomposition `dec` into one string, writing the denominator factors just as `q1,q2,...`. The list `dec` has to have the same structure as the output of [Section D.15.11.1 \[pfd\]](#), page 7697.

**Example:**

```
LIB "pfd.lib";
ring R = 0, (x,y), dp;
poly f = x^3+3*x^2*y+2*y^2-x^2+4*x*y;
poly g = x^2*y*(x-1)*(x-y)^2;
list dec = pfd(f,g);
↳ (2) / (q3*q4)
```

```

↳ + (-2) / (q1*q4)
↳ + (-6) / (q3*q4^2)
↳ + (1) / (q2*q4^2)
↳ + (9) / (q1*q4^2)
↳ + (2) / (q3^2*q4)
↳ where
↳ q1 = x-1
↳ q2 = y
↳ q3 = x
↳ q4 = x-y
↳ (6 terms)
↳
displaypfd(dec);
↳ (2) / (q3*q4)
↳ + (-2) / (q1*q4)
↳ + (-6) / (q3*q4^2)
↳ + (1) / (q2*q4^2)
↳ + (9) / (q1*q4^2)
↳ + (2) / (q3^2*q4)
↳ where
↳ q1 = x-1
↳ q2 = y
↳ q3 = x
↳ q4 = x-y
↳ (6 terms)
↳
getStringpfd_indexed(dec);
↳ (2)/(q3*q4) + (-2)/(q1*q4) + (-6)/(q3*q4^2) + (1)/(q2*q4^2) + (9)/(q1*q4^2)
↳ + (2)/(q3^2*q4)

```

See also: [Section D.15.11.4 \[displaypfd\], page 7703](#); [Section D.15.11.5 \[displaypfd\\_long\], page 7704](#); [Section D.15.11.6 \[getStringpfd\], page 7704](#); [Section D.15.11.1 \[pfd\], page 7697](#).

### D.15.11.8 readInputTXT

Procedure from library `pfd.lib` (see [Section D.15.11 \[pfd.lib\], page 7696](#)).

**Usage:** `readInputTXT(file[, mode])`, file string, mode int  
`readInputTXT(filelist[, mode])`, filelist list, mode int

**Purpose:** read matrix of rational functions from a txt-file and turn it into a matrix (i.e. a list of lists) of pairs of polynomials (numerators and denominators). The string `file` should be the [directory +] name of the file in the form "`<path-to-file>/<filename>.txt`". The input file should be a list of lists separated by the characters "{", "}" and ",". Example:

```
"{{(x+y)/(x^2-x*y), -(x^2*y+1)/(y), x^2}, {(x+1)/y, y/x, 0}}"
```

Each rational function has to be an expression of the form "a", "(a)/(b)", "(b)^(-n)" or "(a)\*(b)^(-n)" where "a", "b" stand for polynomials (i.e. strings, that can be parsed as a polynomial with the `execute` command) and "n" stands for a positive integer. A minus sign "-" followed by such an expression is also allowed.

**IMPORTANT:** The strings "a", "b" must NOT contain the symbol "/". (So in case the coefficient field is the rationals, all denominators in the coefficients of numerator and denominator polynomials should be cleared.)

The file should contain less than  $2^{31}$  characters (filesize < 2 GB). For bigger files the

matrix should be split row-wise into multiple matrices and saved in different files (each smaller than 2 GB). A list of the filenames (in the right order) can then be given as first argument instead.

Also the basering has to match the variable names used in the input file(s).

`mode=1` (default): save result to an ssi-file of the same name

`mode=2`: return result

`mode=3`: save to ssi-file AND return result

See also: [Section D.15.11.9 \[pfdMat\], page 7707](#).

### D.15.11.9 pfdMat

Procedure from library `pfd.lib` (see [Section D.15.11 \[pfd.lib\], page 7696](#)).

**Usage:** `pfdMat(file[, dotest, ignore_nonlin, output_mode, parallelize]);` file string, dotest, ignore\_nonlin, output\_mode, parallelize int

**Purpose:** apply `pfd` to all entries of a matrix of rational functions saved in a txt-file. The string `file` should be the [directory +] name of the file.

The input file can either be a txt-file or an ssi-file created with `readInputTXT`. In case of a txt-file, the base ring has to match and the matrix has to be in the same format specified in [Section D.15.11.8 \[readInputTXT\], page 7706](#). Also, txt-files that are bigger than 2 GB should be split as described for `readInputTXT` and a list of the filenames can be given as first argument instead.

The result is saved in multiple txt- (and ssi-) files (see below) within the directory of the input file.

Also a logfile is created, which protocols the memory used and the runtimes of `pfd` for each matrix entry in real-time.

There are also 4 optional arguments:

If `dotest` is nonzero, test the results with `checkpfd`:

`dotest<0` (default): exact test (may be slow),

`dotest>0`: do this amount of probabilistic tests for each entry (see [Section D.15.11.2 \[checkpfd\], page 7701](#)).

If `ignore_nonlin` is nonzero (default), for each denominator, the nonlinear factors in the factorization are removed before applying `pfd` (and added back in in the output files).

If `parallelize` is nonzero (default), the decompositions are calculated in parallel using [Section D.2.7 \[parallel.lib\], page 878](#).

The parameter `output_mode` controls the output files created:

`output_mode=1` (default): The result consists of two files: `<filename>_pfd_indexed.txt` contains the matrix of all decompositions (as list of lists separated by the characters "{", "}" and ",") where all the denominators are written in factorized form depending on irreducible factors `q1, q2, ...`. The file `<filename>_denominator_factors.txt` lists all the polynomials `q1, q2, ...`.

`output_mode=2`: Additionally to mode 1, the file `<filename>_pfd.txt` is created, which also contains the matrix of decompositions but the factors in the denominators are written out.

`output_mode=3`: Additionally to mode 2, the result and some intermediate results are saved as SINGULAR objects in ssi-files:

`<filename>.ssi`: contains the result of `readInputTXT` in case a txt-file was given as input.

`<filename>_factorized_denominators.ssi`: like the first file, but the denominators are saved in factorized form, that is as a list of an ideal of irreducible non constant polynomials and an intvec of exponents.

`<filename>_linear_part.ssi` (only if `ignore_nonlin` is nonzero): like the previous file, but all the irreducible denominator factors are removed

`<filename>_non_linear_factors.ssi` (only if `ignore_nonlin` is nonzero): a list of an ideal  $p$  generated by irreducible polynomials and a matrix (list of lists) of the nonlinear denominator factors of each entry of the input matrix. These are represented as lists of an intvec of indices  $i$  for which  $p[i]$  occurs as a (nonlinear) factor in the denominator and an intvec containing the exponents of those factors.

`<filename>_pfd.ssi`: a list, where the first entry is an ideal  $q$  of denominator factors and the second entry is a matrix (as list of lists) containing the decompositions, each of which is a list of terms, where a term is represented as in the result of [Section D.15.11.1 \[pfd\], page 7697](#) by a list containing

1) the numerator polynomial

2) an intvec of indices  $i$  for which  $q[i]$  occurs as a factor in the denominator

3) an intvec containing the exponents of those irreducible factors.

IMPORTANT: If `ignore_nonlin` is nonzero, this file contains the decompositions of the entries of the matrix in `<filename>_linear_part.ssi`. Thus the nonlinear factors, are NOT contained in this file.

`output_mode=4`: Additionally to mode 3, the direct output of each call of `pfd` is saved in separate ssi-files called `pfd_results_i_j.ssi` where  $i, j$  are the matrix indices. This creates a lot of files, but may be useful in case the algorithm does not terminate in time for every matrix entry. Other than the files created in mode 1-3, these files are saved in the current directory, rather than the directory of the input file.

See also: [Section D.15.11.2 \[checkpfd\], page 7701](#); [Section D.15.11.10 \[checkpfdMat\], page 7708](#); [Section D.15.11.1 \[pfd\], page 7697](#); [Section D.15.11.8 \[readInputTXT\], page 7706](#).

### D.15.11.10 checkpfdMat

Procedure from library `pfd.lib` (see [Section D.15.11 \[pfd\\_lib\], page 7696](#)).

**Usage:** `checkpfdMat(input, output, denomFactors[, N, parallelize]);` `input, output, denomFactors` string, `N, parallelize` int

**Purpose:** test the output files of `pfdMat` for correctness. Input and output (indexed) txt-files have to be given as strings in the form "`<path-to-file>/<filename>.txt`". The output should be indexed (that is the output file ending in `..._pfd_indexed.txt`) and `denomFactors` has to be the file containing the denominator factors  $q_1, q_2, \dots$  (the txt-file ending in `..._denominator_factors.txt`).

As for `readInputTXT` and `pfdMat`, the basering has to match the variable names used in the input file, which has to be in the same format specified in [Section D.15.11.8 \[readInputTXT\], page 7706](#). Also, files bigger than 2 GB have to be split as described for `readInputTXT` and a list of filenames can be given as first argument instead.

If a positive integer  $N$  is given, the test is done probabilistically by evaluation at  $N$  random points for each entry of the matrix. If  $N$  is nonpositive (default), the fractions in the decompositions will be expanded symbolically and compared to the input (may

be slower).

If `parallelize` is nonzero (default), the tests are run in parallel using [Section D.2.7 \[parallel\\_lib\]](#), page 878.

The result is printed and as in `pfdMat` a logfile is created showing the results for each matrix entry.

See also: [Section D.15.11.2 \[checkpfd\]](#), page 7701; [Section D.15.11.1 \[pfd\]](#), page 7697; [Section D.15.11.9 \[pfdMat\]](#), page 7707; [Section D.15.11.8 \[readInputTXT\]](#), page 7706.

## D.15.12 polyclass\_lib

**Library:** `polyclass.lib`

**Purpose:** Data types for normal form equations

**Authors:** Janko Boehm, email: [boehm@mathematik.uni-kl.de](mailto:boehm@mathematik.uni-kl.de)  
Magdaleen Marais, email: [magdaleen.marais@up.ac.za](mailto:magdaleen.marais@up.ac.za)  
Gerhard Pfister, email: [pfister@mathematik.uni-kl.de](mailto:pfister@mathematik.uni-kl.de)

**Overview:** This library implements a ring independent polynomial type used for the return value in `classify2.lib` and `realclassify.lib`. You can use `+`, `*` and `==` for addition, multiplication and comparison. The key `over` contains the base ring of the polynomial, the key `value` its value as a polynomial of type `poly`. The constructor can be called by assigning a polynomial of type `poly` to a polynomial of type `Poly` via `=`.

Moreover the library implements a class `NormalFormEquation` consisting out of a string type, an integer `milnorNumber`, a `Poly` `normalFormEquation`, and integer modality, a list of numbers `parameters`, a list `variables`, an integer `corank`, in the real case, an integer `inertiaIndex`, a list of open intervals represented as lists consisting out of two rationals used to select a real root of the minimal polynomial (which is stored in the variable `minpoly` of the polynomial ring containing `normalFormEquation`, that is, in `normalFormEquation.in`), or if no minimal polynomial is defined then an interval containing the rational parameter value.

**Acknowledgements:** This research was supported by the Staff Exchange Bursary Programme of the University of Pretoria, DFG SPP 1489, DFG TRR 195. **Procedures:** See also: [Section D.6.5 \[classify2\\_lib\]](#), page 1639; [Section D.6.19 \[realclassify\\_lib\]](#), page 1731.

### D.15.12.1 makePoly

Procedure from library `polyclass.lib` (see [Section D.15.12 \[polyclass\\_lib\]](#), page 7709).

**Usage:** `makePoly(f); f poly`

**Return:** make a ring independent `Poly` from a `poly` in the basering

**Example:**

```
LIB "polyclass.lib";
ring R=0,(x,y),dp;
Poly f=3*x^2+x*y+1;
Poly g=2*x+y^3;
```

```

f*g;
↳ 3x2y3+xy4+6x3+2x2y+y3+2x
↳
f+g;
↳ y3+3x2+xy+2x+1
↳
f^3;
↳ 27x6+27x5y+9x4y2+x3y3+27x4+18x3y+3x2y2+9x2+3xy+1
↳

```

### D.15.12.2 printPoly

Procedure from library `polyclass.lib` (see [Section D.15.12 \[polyclass.lib\]](#), page 7709).

### D.15.12.3 printNormalFormEquation

Procedure from library `polyclass.lib` (see [Section D.15.12 \[polyclass.lib\]](#), page 7709).

**Usage:** `printNormalFormEquation(F);` F NormalFormEquation

**Return:** print a normal form equation

**Example:**

```

LIB "polyclass.lib";
ring R=(0,a),(x,y,z,w),ds;
minpoly = a^2-2;
Poly f=x^4+x^2*y^2+a*y^8+z^2-w^2;
NormalFormEquation F;
F.vars = ringlist(R)[2];
F.realCase = 1;
F.normalFormEquation = f;
F.modality = 1;
F.corank = 2;
F.inertiaIndex = 1;
F.determinacy = 8;
F.milnorNumber = milnor(f.value);
F.parameters = list(list(a*y^8,list(0,2)));
F.singularityType = "X[13]";
F;
↳ Corank = 2
↳ Inertia index = 1
↳ Normalform equation of type = X[13]
↳ Normalform equation = z2-w2+x4+x2y2+(a)*y8
↳ Milnor number = 13
↳ Modality = 1
↳ Parameter term = (a)*y8
↳ Minimal polynomial = (a2-2)
↳ Interval = [0, 2]
↳ Determinacy <= 8
↳
ring R=(0),(x,y,z,w),ds;
↳ // ** redefining R (ring R=(0),(x,y,z,w),ds;) ./examples/printNormalFormE\
  quation.sing:17
Poly f=x^4+x^2*y^2+7*y^8+z^2-w^2;

```

```

↳ // ** redefining f (Poly f=x^4+x^2*y^2+7*y^8+z^2-w^2;) ./examples/printNo\
  rmalFormEquation.sing:18
NormalFormEquation F;
↳ // ** redefining F (NormalFormEquation F;) ./examples/printNormalFormEqua\
  tion.sing:19
F.vars = ringlist(R)[2];
F.realCase = 1;
F.normalFormEquation = f;
F.modality = 1;
F.corank = 2;
F.inertiaIndex = 1;
F.determinacy = 8;
F.milnorNumber = milnor(f.value);
F.parameters = list(list(7*y^8,list(-6,8)));
F.singularityType = "X[13]";
F;
↳ Corank = 2
↳ Inertia index = 1
↳ Normalform equation of type = X[13]
↳ Normalform equation = z2-w2+x4+x2y2+7y8
↳ Milnor number = 13
↳ Modality = 1
↳ Parameter term = 7y8
↳ Determinacy <= 8
↳

```

### D.15.13 ringgb\_lib

**Library:** ringgb.lib

**Purpose:** Functions for coefficient rings

**Author:** Oliver Wienand, email: wienand@mathematik.uni-kl.de

**Procedures:**

#### D.15.13.1 findZeroPoly

Procedure from library ringgb.lib (see [Section D.15.13 \[ringgb.lib\]](#), page 7711).

**Usage:** findZeroPoly(f); f - a polynomial

**Return:** zero polynomial with the same leading term as f if exists, otherwise 0

**Example:**

```

LIB "ringgb.lib";
ring r = (integer, 65536), (y,x), dp;
poly f = 1024*x^8*y^2+11264*x^8*y+28672*x^8+45056*x^7*y^2+36864*x^7*y+16384*x^7+40960*x^6*y^2+
findZeroPoly(f);
↳ 1024y2x8+36864y2x7+64512yx8+2048y2x6+28672yx7+24576y2x5+63488yx6+50176y2x\
  4+40960yx5+53248y2x3+15360yx4+12288y2x2+12288yx3+16384y2x+53248yx2+49152y\
  x

```

### D.15.13.2 zeroReduce

Procedure from library `ringgb.lib` (see [Section D.15.13 \[ringgb.lib\], page 7711](#)).

**Usage:** `zeroReduce(f, [i = 0]);`  $f$  - a polynomial,  $i$  - noise level (if  $i \neq 0$  prints all steps)

**Return:** reduced normal form of  $f$  modulo zero polynomials

**Example:**

```
LIB "ringgb.lib";
ring r = (integer, 65536), (y,x), dp;
poly f = 1024*x^8*y^2+11264*x^8*y+28672*x^8+45056*x^7*y^2+36864*x^7*y+16384*x^7+4096;
zeroReduce(f);
↳ 0
kill r;
ring r = (integer, 2, 32), (x,y,z), dp;
// Polynomial 1:
poly p1 = 3795162112*x^3+587202566*x^2*y+2936012853*x*y*z+2281701376*x+548767119*y^3-
// Polynomial 2:
poly p2 = 1647678464*x^3+587202566*x^2*y+2936012853*x*y*z+134217728*x+548767119*y^3+
zeroReduce(p1-p2);
↳ 0
```

### D.15.13.3 testZero

Procedure from library `ringgb.lib` (see [Section D.15.13 \[ringgb.lib\], page 7711](#)).

**Usage:** `testZero(f);`  $f$  - a polynomial

**Return:** returns 1 if  $f$  is zero as a function and otherwise a counterexample as a list  $[f(x_1, \dots, x_n), x_1, \dots, x_n]$

**Example:**

```
LIB "ringgb.lib";
ring r = (integer, 12), (y,x), dp;

#### D.15.13.4 noElements

Procedure from library `ringgb.lib` (see [Section D.15.13 \[ringgb.lib\]](#), page 7711).

**Usage:** `noElements(r)`; `r` - a ring with a finite coefficient ring of type integer

**Return:** returns the number of elements of the coefficient ring of `r`

**Example:**

```

LIB "ringgb.lib";
ring r = (integer, 233,6), (y,x), dp;
noElements(r);
↳ 160005726539569

```

#### D.15.14 rwalk\_lib

**Library:** `rwalk.lib`

**Purpose:** Groebner Walk Conversion Algorithms

**Author:** Stephan Oberfranz

**Procedures:** See also: [Section D.4.10 \[grwalk.lib\]](#), page 1081; [Section D.15.17 \[swalk.lib\]](#), page 7724.

##### D.15.14.1 prwalk

Procedure from library `rwalk.lib` (see [Section D.15.14 \[rwalk.lib\]](#), page 7713).

**Syntax:** `rwalk(ideal i, int radius)`;  
if `size(#)>0` then `rwalk(ideal i, int radius, intvec v, intvec w)`;

**Type:** ideal

**Purpose:** compute the standard basis of the ideal, calculated via the Random Perturbation Walk algorithm from the ordering "`(a(v),lp)`", "`dp`", "`Dp`" or "`M`" to the ordering "`(a(w),lp)`", "`(a(1,0,...,0),lp)`" or "`M`".

**Example:**

```

LIB "rwalk.lib";
// compute a Groebner basis of I w.r.t. lp.
ring r = 32003,(z,y,x), lp;
ideal I = y3+xyz+y2z+xz3, 3+xy+x2y+y2z;
int radius = 1;
int o_perturb_deg = 2;
int t_perturb_deg = 2;
prwalk(I,radius,o_perturb_deg,t_perturb_deg);
↳ _[1]=y9-y7x2-y7x-y6x3-y6x2-3y6-3y5x-y3x7-3y3x6-3y3x5-y3x4-9y2x5-18y2x4-9y\
2x3-27yx3-27yx2-27x

```

```

↳ _[2]=zx+8297y8x2+8297y8x+3556y7-8297y6x4+15409y6x3-8297y6x2-8297y5x5+1540\

x9-1185y2x8+14224y2x7-1185y2x6-8297y2x5-14223yx7-10666yx6-10666yx5-14223y\
x4+x5+2x4+x3
↳ _[3]=zy2+yx2+yx+3

```

See also: [Section D.4.10.3 \[awalk1\]](#), page 1082; [Section D.4.10.4 \[awalk2\]](#), page 1083; [Section D.4.10.1 \[fwalk\]](#), page 1081; [Section 5.1.53 \[groebner\]](#), page 188; [Section D.4.10.6 \[gwalk\]](#), page 1084; [Section D.4.10.5 \[pwalk\]](#), page 1083; [Section 5.1.149 \[std\]](#), page 265; [Section 5.1.150 \[stdfglm\]](#), page 266; [Section D.4.10.2 \[twalk\]](#), page 1082.

### D.15.14.2 rwalk

Procedure from library `rwalk.lib` (see [Section D.15.14 \[rwalk.lib\]](#), page 7713).

**Syntax:** `rwalk(ideal i, int radius);`  
if `size(#)>0` then `rwalk(ideal i, int radius, intvec v, intvec w);` intermediate Groebner bases are not reduced if `reduction = 0`

**Type:** ideal

**Purpose:** compute the standard basis of the ideal, calculated via the Random walk algorithm from the ordering `"(a(v),lp)"`, `"dp"`, `"Dp"` or `"M"` to the ordering `"(a(w),lp)"`, `"(a(1,0,...,0),lp)"` or `"M"`.

**Example:**

```

LIB "rwalk.lib";
// compute a Groebner basis of I w.r.t. lp.
ring r = 32003,(z,y,x), lp;
ideal I = y3+xyz+y2z+xz3, 3+xy+x2y+y2z;
int radius = 1;
int perturb_deg = 2;
rwalk(I,radius,perturb_deg);
↳ _[1]=y9-y7x2-y7x-y6x3-y6x2-3y6-3y5x-y3x7-3y3x6-3y3x5-y3x4-9y2x5-18y2x4-9y\
2x3-27yx3-27yx2-27x
↳ _[2]=zx+8297y8x2+8297y8x+3556y7-8297y6x4+15409y6x3-8297y6x2-8297y5x5+1540\
9y5x4-8297y5x3+3556y5x2+3556y5x+3556y4x3+3556y4x2-10668y4-10668y3x-8297y2\
x9-1185y2x8+14224y2x7-1185y2x6-8297y2x5-14223yx7-10666yx6-10666yx5-14223y\
x4+x5+2x4+x3
↳ _[3]=zy2+yx2+yx+3

```

See also: [Section D.4.10.3 \[awalk1\]](#), page 1082; [Section D.4.10.4 \[awalk2\]](#), page 1083; [Section D.4.10.1 \[fwalk\]](#), page 1081; [Section 5.1.53 \[groebner\]](#), page 188; [Section D.4.10.6 \[gwalk\]](#), page 1084; [Section D.4.10.5 \[pwalk\]](#), page 1083; [Section 5.1.149 \[std\]](#), page 265; [Section 5.1.150 \[stdfglm\]](#), page 266; [Section D.4.10.2 \[twalk\]](#), page 1082.

### D.15.14.3 frandwalk

Procedure from library `rwalk.lib` (see [Section D.15.14 \[rwalk.lib\]](#), page 7713).

**Syntax:** `frandwalk(ideal i, int radius);`  
`frandwalk(ideal i, int radius, intvec v, intvec w);`

**Type:** ideal

**Purpose:** compute the standard basis of the ideal w.r.t. the lexicographical ordering or a weighted-lex ordering, calculated via the Random Fractal walk algorithm.

**Example:**

```
LIB "rwalk.lib";
ring r = 0, (z,y,x), lp;
ideal I = y3+xyz+y2z+xz3, 3+xy+x2y+y2z;
int reduction = 0;
frandwalk(I,2);
↪ _[1]=y9-y7x2-y7x-y6x3-y6x2-3y6-3y5x-y3x7-3y3x6-3y3x5-y3x4-9y2x5-18y2x4-9y\
2x3-27yx3-27yx2-27x
↪ _[2]=zx-2/27y8x2-2/27y8x+1/9y7+2/27y6x4+4/27y6x3+2/27y6x2+2/27y5x5+4/27y5\
x4+2/27y5x3+1/9y5x2+1/9y5x+1/9y4x3+1/9y4x2-1/3y4-1/3y3x+2/27y2x9+8/27y2x8\
+4/9y2x7+8/27y2x6+2/27y2x5+5/9yx7+5/3yx6+5/3yx5+5/9yx4+x5+2x4+x3
↪ _[3]=zy2+yx2+yx+3
```

See also: [Section D.4.10.3 \[awalk1\], page 1082](#); [Section D.4.10.4 \[awalk2\], page 1083](#); [Section 5.1.53 \[groebner\], page 188](#); [Section D.4.10.6 \[gwalk\], page 1084](#); [Section D.4.10.5 \[pwalk\], page 1083](#); [Section 5.1.149 \[std\], page 265](#); [Section 5.1.150 \[stdfglm\], page 266](#); [Section D.4.10.2 \[twalk\], page 1082](#).

## D.15.15 sagbigrob\_lib

**Library:** sagbigrob.lib

**Purpose:** Compute Sagbi-Groebner basis of an ideal of a subalgebra

**Authors:** Nazish Kanwal, Lecturer of Mathematics, School of Mathematics and Computer Science, Institute of Business Administration, Karachi, Pakistan  
Junaid Alam Khan, Associate Professor of Mathematics, School of Mathematics and Computer Science, Institute of Business Administration, Karachi, Pakistan

**Procedures:** See also: [Section D.4.34 \[sagbi\\_lib\], page 1362](#).

### D.15.15.1 LTGS

Procedure from library `sagbigrob.lib` (see [Section D.15.15 \[sagbigrob\\_lib\], page 7715](#)).

**Usage:** LTGS(I,A); I ideal of subalgebra A, A subalgebra (which is a finite sagbi basis).

**Return:** a module M.

**Example:**

```
LIB "sagbigrob.lib";
// Example 1:
ring r=ZZ, (x,y), Dp;
ideal A=2x2+xy,2y2,3xy;
ideal I=4x2y2+2xy3,18x2y4,36xy5;
LTGS(I,A);
↪ _[1]=9y2*gen(1)-2*gen(2)
↪ _[2]=9y4*gen(1)-xy*gen(3)
↪ _[3]=-xy*gen(3)+2y2*gen(2)
↪ _[4]=xy3*gen(1)
↪ _[5]=-18xy3*gen(1)+2x2*gen(3)+xy*gen(3)
// Example 2:
```

```

ring r2=QQ, (x,y), Dp;
ideal A=x2,xy;
ideal I=x3y+x2,x4+x2y2,-x3y3-x2y2;
LTGS(I,A);
↳ _[1]=x2*gen(1)-xy*gen(2)
↳ _[2]=-x2y2*gen(1)-x2*gen(3)
↳ _[3]=-x3y3*gen(2)-x4*gen(3)

```

### D.15.15.2 SGNF

Procedure from library `sagbigrob.lib` (see [Section D.15.15 \[sagbigrob\\_lib\]](#), page 7715).

**Usage:** SGNF(f,I,A); f polynomial, I ideal of subalgebra A, A ideal (which is a finite Sagbi bases).

**Return:** a polynomial h: the normalform of f wrt. I in A

**Example:**

```

LIB "sagbigrob.lib";
ring r=0, (x,y), Dp;
ideal A=x2,xy;
ideal I=x3y+x2,x4+x2y2,-x3y3-x2y2;
poly f=x6y6+x2;
poly g=x12+x6y6-x8+x5y;
SGNF(f,I,A);
↳ x2y2+x2
SGNF(g,I,A);
↳ 0

```

### D.15.15.3 SPOLY

Procedure from library `sagbigrob.lib` (see [Section D.15.15 \[sagbigrob\\_lib\]](#), page 7715).

**Usage:** SPOLY(I,A); I ideal of subalgebra A, A subalgebra (which is a finite sagbi basis).

**Return:** an ideal S: S-polynomials of ideal I

**Example:**

```

LIB "sagbigrob.lib";
// Example 1:
ring r=ZZ, (x,y), Dp;
ideal A=2x2+xy,2y2,3xy;
ideal I=4x2y2+2xy3,18x2y4;
SPOLY(I,A);
↳ _[1]=18xy5
↳ _[2]=4x3y5+2x2y6
// Example 2:
ring r2=QQ, (x,y), Dp;
ideal A=x2,xy;
ideal I=x3y+x2,x4+x2y2,-x3y3-x2y2;
SPOLY(I,A);
↳ _[1]=-x3y3+x4
↳ _[2]=-x5y5+x6y2

```

### D.15.15.4 SGB

Procedure from library `sagbigrob.lib` (see [Section D.15.15 \[sagbigrob.lib\]](#), page 7715).

**Usage:** `SGB(I,A)`; I ideal of subalgebra A, A subalgebra (which is a finite sagbi basis).

**Return:** an ideal SB.

**Example:**

```
LIB "sagbigrob.lib";
// Example 1:
ring r=ZZ,(x,y),Dp;
ideal A=2x2+xy,2y2,3xy;
ideal I=4x2y2+2xy3,18x2y4;
SGB(I,A);
↳ 18xy5
↳ 0
↳ 0
↳ -2x2y6+8xy7
↳ 0
↳ 0
↳ 0
↳ _[1]=4x2y2+2xy3
↳ _[2]=18x2y4
↳ _[3]=18xy5
↳ _[4]=-2x2y6+8xy7
// Example 2:
ring r2=QQ,(w,x,y,z),lp;
ideal A=wxy+2z2, y2-4z, x+3y;
ideal I= wxy-y2+2z2+4z, x+y2+3y-4z, x2+6xy+9y2;
SGB(I,A);
↳ 0
↳ -y6+12y4z-48y2z2+64z3
↳ 0
↳ _[1]=wxy-y2+2z2+4z
↳ _[2]=x+y2+3y-4z
↳ _[3]=x2+6xy+9y2
↳ _[4]=-y6+12y4z-48y2z2+64z3
```

### D.15.16 stanleyreisner\_lib

**Library:** `stanleyreisner.lib`

**Purpose:** Deformations of Stanley-Reiser ideals

**Authors:**

**Overview:** Firstly, we implement the graded pieces has certain degree of cotangent modules  $T_1$  and  $T_2$  for a general Stanley-Reiser ring. And the graded pieces of homomorphisms are represented by lists of integers.

**Types:** Homomorphism class of homomorphisms

**Procedures:**

### D.15.16.1 T1

Procedure from library `stanleyreisner.lib` (see [Section D.15.16 \[stanleyreisner\\_lib\]](#), page 7717).

**Usage:** T1(h); h = ideal.

**Assume:** I is the ideal generated by the monomials w.r.t. faces.

**Return:** first order deformation on ideal I.

**Theory:** The procedure will compute the first order deformation.

**Example:**

```
LIB "stanleyreisner.lib";
ring R=0,(x(1..4)),lp;
ideal i=x(1),x(2),x(3),x(4),x(1)*x(4),x(2)*x(4),x(1)*x(3),x(2)*x(3);

### D.15.16.2 T2

Procedure from library `stanleyreisner.lib` (see [Section D.15.16 \[stanleyreisner.lib\]](#), page 7717).

**Usage:** T2(h); h = ideal.

**Assume:** I is the ideal generated by the monomials w.r.t. faces.

**Return:** second order deformation on ideal I.

**Theory:** The procedure will compute the second order deformation.

**Example:**

```

LIB "stanleyreisner.lib";
ring R=0,(x(1..4)),lp;
ideal i=x(1),x(2),x(3),x(4),x(1)*x(4),x(2)*x(4),x(1)*x(3),x(2)*x(3);
list L=T2(i);

```

### D.15.16.3 makeQPoly

Procedure from library `stanleyreisner.lib` (see [Section D.15.16 \[stanleyreisner\\_lib\]](#), page 7717).

**Usage:** `makeQPoly(p)`;  $p$  = polynomial.

**Assume:**  $p$  is a polynomial in basering.

**Return:** a QPoly which is in a quotient ring.

**Theory:** The procedure will convert a polynomial in basering to a polynomial in a quotient ring.

**Example:**

```
LIB "stanleyreisner.lib";
ring r=0,(x,y,z),lp;
ideal i=xy;
qring Q=std(i);
poly p=x*y+z;
QPoly q=makeQPoly(p);
q.over;
↪ // coefficients: QQ
↪ // number of vars : 3
↪ //          block 1 : ordering lp
↪ //          : names  x y z
↪ //          block 2 : ordering C
↪ // quotient ring from ideal
↪ _[1]=xy
q.value;
↪ z
```

#### D.15.16.4 fPiece

Procedure from library `stanleyreisner.lib` (see [Section D.15.16 \[stanleyreisner.lib\]](#), page 7717).

**Usage:** `fPiece(I,a,b)`;  $I$  = ideal,  $a$  = poly,  $b$  = poly.

**Assume:**  $I$  is the ideal generated by the monomials w.r.t. faces,  $a-b$  is the degree of the graded piece.

**Return:** graded piece (of degree  $a-b$ ) of first order deformation on ideal  $I$ .

**Theory:** The procedure will compute the graded pieces of the first order deformation which has degree  $a-b$ .

**Example:**

```
LIB "stanleyreisner.lib";
ring R=0,(x(1..4)),lp;
ideal i=x(1),x(2),x(3),x(4),x(1)*x(4),x(2)*x(4),x(1)*x(3),x(2)*x(3);
FirstOrderDeformation phi=fPiece(i,x(4)^2,x(1)*x(2));
phi;
↪ x(1),x(2),x(3),x(4),x(1)*x(4),x(2)*x(4),x(1)*x(3),x(2)*x(3) -> 1
↪ phi.source -> phi.over / phi.source
↪
```

#### D.15.16.5 sPiece

Procedure from library `stanleyreisner.lib` (see [Section D.15.16 \[stanleyreisner.lib\]](#), page 7717).

**Assume:**  $I$  is the ideal generated by the monomials w.r.t. faces,  $a-b$  is the degree of the graded piece.

**Return:** graded piece (of degree  $a-b$ ) of second order deformation on ideal  $I$ .

**Theory:** The procedure will compute the graded pieces of the second order deformation which has degree  $(a-b)$ .

**Example:**

```

LIB "stanleyreisner.lib";
ring R=0,(x(1..4)),lp;
ideal i=x(1),x(2),x(3),x(4),x(1)*x(4),x(2)*x(4),x(1)*x(3),x(2)*x(3);
SecondOrderDeformation psi=sPiece(i,x(4)^2,x(1)*x(2));
psi;
↳ phi.relations -> phi.over/phi.source
↳

```

### D.15.16.6 makeLinks

Procedure from library `stanleyreisner.lib` (see [Section D.15.16 \[stanleyreisner\\_lib\], page 7717](#)).

**Usage:** `makeLinks(I,p,q)`;  $I$  = ideal,  $p$  = poly,  $p=poly$ .

**Assume:**  $I$  is the ideal generated by the monomials w.r.t. faces.

**Return:** links of  $p$ , graded pieces of first and second order deformation of links on ideal  $I$ .

**Example:**

```

LIB "stanleyreisner.lib";
ring R=0,(x(1..4)),lp;
ideal i=x(1),x(2),x(3),x(4),x(1)*x(4),x(2)*x(4),x(1)*x(3),x(2)*x(3);
LinksDeformation L=makeLinks(i,x(4)^2,x(1)*x(2));
L;
↳ The links of  $x(4)^2$  is :
↳  $_[1]=x(1)$ 
↳  $_[2]=x(2)$ 
↳ The first order deformation of the links is :
↳  $x(1),x(2)$  -> 10
↳  $phi.source$  ->  $phi.over / phi.source$ 
↳
↳ The second order deformation of the links is :
↳  $phi.relations$  ->  $phi.over/phi.source$ 
↳
↳

```

### D.15.17 swalk\_lib

**Library:** `swalk.lib`

**Purpose:** Sagbi Walk Conversion Algorithm

**Author:** Junaid Alam Khan [junaidalamkhan@gmail.com](mailto:junaidalamkhan@gmail.com)

**Overview:** A library for computing the Sagbi basis of subalgebra through Sagbi walk algorithm.

**Theory:** The concept of SAGBI (Subalgebra Analog to Groebner Basis for Ideals) is defined in [L. Robbiano, M. Sweedler: Subalgebra Bases, volume 42, volume 1430 of Lectures Note in Mathematics series, Springer-Verlag (1988),61-87]. The Sagbi Walk algorithm is the subalgebra analogue to the Groebner Walk algorithm which has been proposed in [S. Collart, M. Kalkbrener and D.Mall: Converting bases with the Grobner Walk. J. Symbolic Computation 24 (1997), 465-469].

**Procedures:** See also: [Section D.4.10 \[grwalk\\_lib\], page 1081](#); [Section D.15.14 \[rwalk\\_lib\], page 7713](#).

### D.15.17.1 swalk

Procedure from library `swalk.lib` (see [Section D.15.17 \[swalk.lib\]](#), page 7724).

**Usage:** `swalk(i[,v,w]);`  $i$  ideal,  $v,w$  int vectors

**Return:** The sagbi basis of the subalgebra defined by the generators of  $i$ , calculated via the Sagbi walk algorithm from the ordering  $dp$  to  $lp$  if  $v,w$  are not given (resp. from the ordering  $(a(v),lp)$  to the ordering  $(a(w),lp)$  if  $v$  and  $w$  are given).

**Example:**

```
LIB "swalk.lib";
ring r = 0, (x,y), lp;
ideal I =x2,y2,xy+y,2xy2+y3;
swalk(I);
↪ _[1]=x2
↪ _[2]=y2
↪ _[3]=xy+y
↪ _[4]=xy2
↪ _[5]=y3
```

### D.15.17.2 rswalk

Procedure from library `swalk.lib` (see [Section D.15.17 \[swalk.lib\]](#), page 7724).

**Usage:** `rswalk(i,weight_rad,p_deg[,v,w]);`  $i$  ideal,  $v,w$  int vectors

**Return:** The sagbi basis of the subalgebra defined by the generators of  $i$ , calculated via the Sagbi walk algorithm from the ordering  $dp$  to  $lp$  if  $v,w$  are not given (resp. from the ordering  $(a(v),lp)$  to the ordering  $(a(w),lp)$  if  $v$  and  $w$  are given).

**Example:**

```
LIB "swalk.lib";
ring r = 0, (x,y), lp;
ideal I =x2,y2,xy+y,2xy2+y3;
rswalk(I,2,2);
↪ _[1]=x2
↪ _[2]=y2
↪ _[3]=xy+y
↪ _[4]=xy2
↪ _[5]=y3
```

### D.15.18 systhreads.lib

**Library:** `systhreads.lib`

**Purpose:** Primitives for Singular's multi-threaded objects

**Author:** Reimer Behrends

**Overview:** This library implements basic functionality for shared objects in a multi-threaded system, such as channels, shared tables & lists, and synchronization variables.

### D.15.19 tateProdCplxNegGrad\_lib

**Library:** tateProdCplxNegGrad.lib

**Purpose:** for computing sheaf cohomology on product of projective spaces

**Author:** Clara Petroll (petroll@mathematik.uni-kl.de)

**Overview:** In this library, we use Tate resolutions for computing sheaf cohomology of coherent sheaves on products of projective spaces. The algorithms can be used for arbitrary products. We work over the multigraded Cox ring and the corresponding exterior algebra. Multigraded complexes are realized as the newstruct `multigradedcomplex`.

The main algorithm is the one for computing subquotient complexes of a Tate resolution. It allows to compute cohomology tables, respectively hash table of the dimensions of sheaf cohomology groups.

**References:**

- [1] Eisenbud, Erman, Schreyer: Tate Resolutions for Products of Projective Spaces, Acta Mathematica Vietnamica (2015) [2] Eisenbud, Erman, Schreyer: Tate Resolutions on Products of Projective Spaces: Cohomology and Direct Image Complexes (2019)

**Procedures:**

#### D.15.19.1 productOfProjectiveSpaces

Procedure from library `tateProdCplxNegGrad.lib` (see [Section D.15.19 \[tateProdCplxNegGrad\\_lib\]](#), page 7726).

**Usage:** `productOfProjectiveSpaces(c); c intvec`

**Purpose:** creates two rings  $S$  and  $E$  corresponding to the product of projective spaces  $P^{\{c_1\}} \times \dots \times P^{\{c_t\}}$

**Assume:** input are two integers or an intvec

**Return:** two rings  $S, E$  (homogeneous coordinate ring and the exterior algebra of  $P^{\{c_1\}} \times P^{\{c_2\}} \times \dots$ )

**Example:**

```
LIB "tateProdCplxNegGrad.lib";
intvec c = 1,2;
def (S,E) = productOfProjectiveSpaces(c);
print(S);
↳ polynomial ring, over a field, global ordering
↳ // coefficients: QQ

```

### D.15.19.2 truncateM

Procedure from library `tateProdCplxNegGrad.lib` (see [Section D.15.19 \[tateProdCplxNegGrad.lib\]](#), page 7726).

**Usage:** `truncateM(M,c)`; M module, c intvec

**Purpose:** truncate M at c

**Assume:** M is multigraded S-module with S multigraded ring, c is an intvec of the right length

**Return:** module, the truncated module  $M_{\geq c}$

**Note:** Output is the truncated module (multigraded, grading is not shifted), works for arbitrary products

**Example:**

```

LIB "tateProdCplxNegGrad.lib";
intvec c = 1,1,1;
def(S,E) = productOfProjectiveSpaces(c);
setring(S);
intmat grading[3][2] = 0,0,0,0,0,0;
module te = freemodule(2);
te = setModuleGrading(te,grading);
intvec c = 1,1,1;
⇒ // ** redefining c (intvec c = 1,1,1;) ./examples/truncateM.sing:8
module Mtrunc = truncateM(te,c);
Mtrunc;
⇒ Mtrunc[1]=x(0)(1)*x(1)(1)*x(2)(1)*gen(1)
⇒ Mtrunc[2]=x(0)(0)*x(1)(1)*x(2)(1)*gen(1)
⇒ Mtrunc[3]=x(0)(1)*x(1)(0)*x(2)(1)*gen(1)
⇒ Mtrunc[4]=x(0)(0)*x(1)(0)*x(2)(1)*gen(1)
⇒ Mtrunc[5]=x(0)(1)*x(1)(1)*x(2)(0)*gen(1)
⇒ Mtrunc[6]=x(0)(0)*x(1)(1)*x(2)(0)*gen(1)
⇒ Mtrunc[7]=x(0)(1)*x(1)(0)*x(2)(0)*gen(1)
⇒ Mtrunc[8]=x(0)(0)*x(1)(0)*x(2)(0)*gen(1)

```

```

intmat grading2[2][1] = 0,0;
M2 = setModuleGrading(M2,grading2);
truncateCoker(M2,c2);
↳ _[1]=x(0)(1)*gen(2)-x(0)(0)*gen(1)
↳ _[2]=x(1)(1)*gen(3)-x(1)(0)*gen(1)
↳ _[3]=x(1)(1)*gen(4)-x(1)(0)*gen(2)
↳ _[4]=x(0)(1)*gen(4)-x(0)(0)*gen(3)

```

#### D.15.19.4 symExt

Procedure from library `tateProdCplxNegGrad.lib` (see [Section D.15.19 \[tateProdCplxNegGrad.lib\]](#), page 7726).

**Usage:** `symExt(m)`; `m` matrix

**Purpose:** computes differential  $R(M_0) \rightarrow R(M_1)$  for the module `M` over `S` corresponding to the linear presentation matrix `m`, however, in order to get the result, `m` has to be fetched to the exterior algebra `E`

**Assume:** `m` a matrix, linear presentation matrix over `S`; Note: also works for nonlinear matrices, but makes no sense to use it in this case

**Return:** matrix `B` representing  $R(M_0) \rightarrow R(M_1)$

**Note:** output lives in `S` (not as in Macaulay2 in the ring `E`, to get the same result, just fetch the matrix to `E`)

**Example:**

```

LIB "tateProdCplxNegGrad.lib";
intvec c = 1,2;
def (S,E) = productOfProjectiveSpaces(c);
setring(S);
matrix m[4][2] = x(0)(0), x(1)(0),x(0)(1),0,0,x(1)(1), 0,x(1)(2);
matrix A = symExt(m);
print(A);
↳ 0,          x(0)(0),0,          0,
↳ 0,          0,          x(0)(0), 0,
↳ 0,          0,          0,          x(0)(0),
↳ x(0)(1), 0,          0,          0,
↳ -x(0)(0),x(0)(1),0,          0,
↳ 0,          0,          x(0)(1), 0,
↳ 0,          0,          0,          x(0)(1),
↳ 0,          x(1)(0),0,          0,
↳ 0,          0,          x(1)(0), 0,
↳ 0,          0,          0,          x(1)(0),
↳ x(1)(1), 0,          0,          0,
↳ 0,          x(1)(1),0,          0,
↳ -x(1)(0),0,          x(1)(1), 0,
↳ 0,          0,          0,          x(1)(1),
↳ x(1)(2), 0,          0,          0,
↳ 0,          x(1)(2),0,          0,
↳ 0,          0,          x(1)(2), 0,
↳ 0,          0,          -x(1)(1),x(1)(2)
setring(E);
print(fetch(S,A));
↳ 0,          e(0)(0),0,          0,

```

```

↳ 0,      0,      e(0)(0), 0,
↳ 0,      0,      0,      e(0)(0),
↳ e(0)(1), 0,      0,      0,
↳ -e(0)(0), e(0)(1), 0,      0,
↳ 0,      0,      e(0)(1), 0,
↳ 0,      0,      0,      e(0)(1),
↳ 0,      e(1)(0), 0,      0,
↳ 0,      0,      e(1)(0), 0,
↳ 0,      0,      0,      e(1)(0),
↳ e(1)(1), 0,      0,      0,
↳ 0,      e(1)(1), 0,      0,
↳ -e(1)(0), 0,      e(1)(1), 0,
↳ 0,      0,      0,      e(1)(1),
↳ e(1)(2), 0,      0,      0,
↳ 0,      e(1)(2), 0,      0,
↳ 0,      0,      e(1)(2), 0,
↳ 0,      0,      -e(1)(1), e(1)(2)

```

### D.15.19.5 sufficientlyPositiveMultidegree

Procedure from library `tateProdCplxNegGrad.lib` (see [Section D.15.19 \[tateProdCplxNegGrad.lib\]](#), page 7726).

**Usage:** `sufficientlyPositiveMultidegree(M)`; M module

**Purpose:** computes a sufficiently positive multidegree for `coker(M)`

**Assume:** M is multigraded S-module

**Return:** `intvec` that is sufficiently positive for M

**Example:**

```

LIB "tateProdCplxNegGrad.lib";
// example 1
intvec c1 = 1,2;
def (S1,E1) = productOfProjectiveSpaces(c1);
setring(S1);
module M1 = x(0)(0),x(1)(0)^3 + x(1)(1)^3 +x(1)(2)^3;
intmat grading1[2][1] = 0,0;
M1 = setModuleGrading(M1,grading1);
sufficientlyPositiveMultidegree(M1);
↳ 1,3
// example 2
intvec c2 = 1,1;
def (S2,E2) = productOfProjectiveSpaces(c2);
setring(S2);
intmat grading2[2][1] = -1,-1;
module M2 = 0;
M2 = setModuleGrading(M2,grading2);
sufficientlyPositiveMultidegree(M2);
↳ -1,-1
// example 3
intvec c3 = 1,1,1;
def (S3,E3) = productOfProjectiveSpaces(c3);
setring(S3);

```

```

module M3 = 0;
intmat grading3[3][1] = -1,-1,-1;
M3 = setModuleGrading(M3,grading3);
sufficientlyPositiveMultidegree(M3);
↳ -1,-1,-1

```

### D.15.19.6 tateResolution

Procedure from library `tateProdCplxNegGrad.lib` (see [Section D.15.19 \[tateProdCplxNegGrad.lib\]](#), page 7726).

**Usage:** `tateResolution(M,low,high)`; M module, L list, low intvec, high intvec

**Purpose:** compute tate resolution of `coker(M)` where M is  $Z^t$ -graded S-module

**Assume:** M a module over multigraded ring S

**Return:**  $(E,tate)$ , tate a multigradedcomplex, E the ring in which tate has to be viewed, however note that tate is not ring dependent

**Example:**

```

LIB "tateProdCplxNegGrad.lib";
// example 1
intvec c1 = 1,1,1;
intvec low1 = 0,0,0;
intvec high1 = 0,1,0;
def (S1,E1) = productOfProjectiveSpaces(c1);
setring(S1);
module M1 = 0;
intmat grading1[3][1] = -1,-1,-1;
M1 = setModuleGrading(M1,grading1);
multigradedcomplex tate1;
(E1,tate1) = tateResolution(M1,low1,high1);
setring(E1);

### D.15.19.7 cohomologyMatrix

Procedure from library `tateProdCplxNegGrad.lib` (see [Section D.15.19 \[tateProdCplxNegGrad.lib\]](#), page 7726).

**Usage:** `cohomologyMatrix(M,L,low,high)`; M module, L list, low intvec, high intvec

**Purpose:** computes the cohomology matrix of the sheaf corresponding to `coker(M)`

**Assume:** M module over S, L list of two rings S and E (e.g. result of `productOfProjectiveSpaces`) first entry `L[1] = S` and `L[2] = E`, integer vectors `low <= high`

**Return:** ring  $Z$  in which cohomology matrix lives, it is exported in the variable `cohomologymat`, `cohomologymat` covers all cohomology groups of twists in the range between `low` and `high`

**Example:**

```
LIB "tateProdCplxNegGrad.lib";
// example 1
intvec c1 = 1,1;
def (S1,E1) = productOfProjectiveSpaces(c1);
intvec low1 = -3,-3;
intvec high1 = 3,3;
setring(S1);
module M1 = 0;
intmat grading1[2][1] = -1,-1;
M1 = setModuleGrading(M1,grading1);
ring Z1 = cohomologyMatrix(M1,low1,high1);
setring(Z1);
print(cohomologymat);
↳ 5h,0,5,10,15,20,25,
↳ 4h,0,4,8, 12,16,20,
↳ 3h,0,3,6, 9, 12,15,
↳ 2h,0,2,4, 6, 8, 10,
↳ h, 0,1,2, 3, 4, 5,
↳ 0, 0,0,0, 0, 0, 0,
↳ h2,0,h,2h,3h,4h,5h
// example 2
intvec c2 = 1,2;
def (S2,E2) = productOfProjectiveSpaces(c2);
intvec low2 = -3,-3;
intvec high2 = 0,0;
setring(S2);
module M2 = 0;
intmat grading2[2][1] = 0,0;
M2 = setModuleGrading(M2,grading2);
ring Z2 = cohomologyMatrix(M2,low2,high2);
setring(Z2);
print(cohomologymat);
↳ 2h, h, 0,1,
↳ 0, 0, 0,0,
↳ 0, 0, 0,0,
↳ 2h3,h3,0,h2
// example 3
setring(S2);
module M3 = x(0)(0),x(1)(0)^3 + x(1)(1)^3 +x(1)(2)^3;
intmat grading3[2][1] = 0,0;
M3 = setModuleGrading(M3,grading3);
ring Z3 = cohomologyMatrix(M3,low2,high2);
setring(Z3);
print(cohomologymat);
↳ h+1,h+1,h+1,h+1,
↳ 3h, 3h, 3h, 3h,
↳ 6h, 6h, 6h, 6h,
↳ 9h, 9h, 9h, 9h
```

### D.15.19.8 cohomologyMatrixFromResolution

Procedure from library `tateProdCplxNegGrad.lib` (see [Section D.15.19 \[tateProdCplxNegGrad.lib\]](#), page 7726).

**Usage:** `cohomologyMatrixFromResolution(T,low,high)`; `T` multigradedcomplex, `low` intvec, `high` intvec

**Purpose:** computes the cohomology matrix corresponding to the multigraded complex `T` (part of a Tate resolution)

**Assume:** `T` is a multigraded complex representing a part of a Tate resolution (for example output of `tateResolution`), basering is `E`

**Return:** ring `Z` in which cohomology matrix lives, it is exported in the variable `cohomologymat`, `cohomologymat` stores information in the range between `low` and `high`

**Example:**

```
LIB "tateProdCplxNegGrad.lib";
intvec c = 1,1;
def (S,E) = productOfProjectiveSpaces(c);
intvec low = -3,-3;
intvec high = 3,3;
setring(S);
module M = 0;
intmat grading[2][1] = -1,-1;
M = setModuleGrading(M,grading);
multigradedcomplex tate;
(E,tate) = tateResolution(M,low,high);
setring(E);
ring Z = cohomologyMatrixFromResolution(tate,low,high);
setring(Z);
print(cohomologymat);
↳ 5h,0,5,10,15,20,25,
↳ 4h,0,4,8, 12,16,20,
↳ 3h,0,3,6, 9, 12,15,
↳ 2h,0,2,4, 6, 8, 10,
↳ h, 0,1,2, 3, 4, 5,
↳ 0, 0,0,0, 0, 0, 0,
↳ h2,0,h,2h,3h,4h,5h
```

### D.15.19.9 eulerPolynomialTable

Procedure from library `tateProdCplxNegGrad.lib` (see [Section D.15.19 \[tateProdCplxNegGrad.lib\]](#), page 7726).

**Usage:** `eulerPolynomialTable(M,low,high)`; `M` module, `L` list, `low` intvec, `high` intvec

**Purpose:** computes hash table of euler polynomials of twists of `coker(M)` in the range between `low` and `high`

**Assume:** `M` module, note that at the moment `M` is a module over `S`,

**Return:** `(Z,eulerpolynomialtable)`, where `eulerpolynomialtable` is a hash table with entries in the ring `Z = ZZ[h]`

**Note:** this function works for arbitrary products  $P^{\{n_1\}} \times \dots \times P^{\{n_t\}}$  and corresponding  $Z^t$ -gradings, entries can be accessed via `eulerpolynomialtable*(a_1,...,a_t)` where  $a=(a_1,...,a_t)$  is a multidegree between low and high

**Example:**

```
LIB "tateProdCplxNegGrad.lib";
// example 1
intvec c1 = 1,1;
def (S1,E1) = productOfProjectiveSpaces(c1);
intvec low1 = -3,-3;
intvec high1 = 3,3;
setring(S1);
module M1 = 0;
intmat grading1[2][1] = -1,-1;
M1 = setModuleGrading(M1,grading1);
def (Z1,eulerTable1) = eulerPolynomialTable(M1,low1,high1);
setring(Z1);
print(eulerTable1);

#### D.15.19.10 cohomologyHashTable

Procedure from library `tateProdCplxNegGrad.lib` (see [Section D.15.19 \[tateProdCplxNegGrad.lib\]](#), page 7726).

**Usage:** `cohomologyHashTable(M,L,low,high);` M module, low intvec, high intvec

- Purpose:** computes hashtable of sheaf cohomology groups of twists in the range between between low and high corresponding to  $\text{coker}(M)$
- Assume:**  $M$  module representing a sheaf  $F$  on the product of  $t$  projective spaces, note that at the moment  $M$  is a module over  $S$ ,
- Return:** cohomologytable where cohomologytable is a hash table with integer vectors in  $\mathbb{Z}^{t+1}$  as keys, entries can be accessed via  $\text{cohomologytable}^*(c_1, \dots, c_t, i) = \dim(H^i(F(c_1, \dots, c_t)))$
- Note:** this function works for arbitrary products  $P^{\{n_1\}} \times \dots \times P^{\{n_t\}}$  and corresponding  $\mathbb{Z}^t$ -gradings

**Example:**

```
LIB "tateProdCplxNegGrad.lib";
intvec c = 1,1;
def (S,E) = productOfProjectiveSpaces(c);
intvec low = -3,-3;
intvec high = 3,3;
setring(S);
module M = 0;
intmat grading[2][1] = -1,-1;
M = setModuleGrading(M,grading);
def cohomologytable = cohomologyHashTable(M,low,high);
print(cohomologytable);

### D.15.19.11 twist

Procedure from library `tateProdCplxNegGrad.lib` (see [Section D.15.19 \[tateProdCplxNegGrad.lib\]](#), page 7726).

**Usage:** `twist(M,c)`; M module, c intvec

**Purpose:** twists the module M by c

**Assume:** M is a multigraded module

**Return:** M with the new grading

**Example:**

```

LIB "tateProdCplxNegGrad.lib";
intvec c = 1,1;
def (S,E) = productOfProjectiveSpaces(c);
setring(S);
module M = freemodule(2);
intmat gradeM[2][2] = 0,1,0,1;
M = setModuleGrading(M,gradeM);
getModuleGrading(M);
↳ 0,1,
↳ 0,1
intvec c = 2,2;
↳ // ** redefining c (intvec c = 2,2;) ./examples/twist.sing:9
module Mtwist = twist(M,c);
getModuleGrading(Mtwist);
↳ -2,-1,
↳ -2,-1

```

### D.15.19.12 beilinsonWindow

Procedure from library `tateProdCplxNegGrad.lib` (see [Section D.15.19 \[tateProdCplxNegGrad.lib\]](#), page 7726).

**Usage:** `beilinsonWindow(T)`; T multigradedcomplex

**Purpose:** compute the subquotient complex of T consisting of summands generated in degrees  $0 \leq a \leq n$

**Assume:** T is a multigraded complex of free E-modules

**Return:** multigradedcomplex, the Beilinson window of T

**Note:** The returned summands are the only ones that contribute to the Beilinson monad.

**Example:**

```

LIB "tateProdCplxNegGrad.lib";
intvec f = 1,1;
def (S,E) = productOfProjectiveSpaces(f);
intvec low = -3,-3;
intvec high = 3,3;
setring(S);
module M = 0;
intmat MGrading[2][1] = -1,-1;
M = setModuleGrading(M,MGrading);
multigradedcomplex tate;
(E,tate) = tateResolution(M,low,high);
setring(E);
multigradedcomplex W = beilinsonWindow(tate);
W;
↳ 0 <-- E^4 <-- E^4 <-- E^1 <-- 0
↳ -1 0 1 2 3
↳
intvec c = 1,1,1;
intvec low2 = 0,0,0;
intvec high2 = 0,1,0;
def (S2,E2) = productOfProjectiveSpaces(c);
setring(S2);
module M2 = 0;
intmat gradeM[3][1] = -1,-1,-1;
M2 = setModuleGrading(M2,gradeM);
multigradedcomplex tate2;
(E2,tate2) = tateResolution(M2,low2,high2);
setring(E2);
multigradedcomplex W2 = beilinsonWindow(tate2);
W2;
↳ 0 <-- E^8
↳ -1 0
↳

```

### D.15.19.13 regionComplex

Procedure from library `tateProdCplxNegGrad.lib` (see [Section D.15.19 \[tateProdCplxNegGrad.lib\]](#), page 7726).

**Usage:** `regionComplex(T,d,I,J,K)`; T multigradedcomplex, d intvec, I intvec, J intvec, K intvec

**Purpose:** compute the region complex of T w.r.t. the sets I,J,K and the vector d

**Assume:** I,J,K are intvecs representing disjoint subsets of  $\{1,\dots,t\}$ , T is a complex in ring E, zero represents the empty set

**Return:** multigraded complex which is the region complex  $T_d(I,J,K)$  of T

**Example:**

```

LIB "tateProdCplxNegGrad.lib";
intvec f = 1,1;
def (S,E) = productOfProjectiveSpaces(f);
intvec low = -3,-3;
intvec high = 3,3;
setring(S);

```

```

module M = 0;
intmat MGrading[2][1] = -1,-1;
M = setModuleGrading(M,MGrading);
multigradedcomplex tate;
(E,tate) = tateResolution(M,low,high);
setring(E);
tate;
↳ E^25 <-- E^40 <-- E^46 <-- E^44 <-- E^35 <-- E^30 <-- E^38 <\
   -- E^56 <-- E^81 <-- E^110 <-- E^141 <-- E^174 <-- E^210
↳ -6      -5      -4      -3      -2      -1      0      \
   1      2      3      4      5      6
↳
ring Z = cohomologyMatrixFromResolution(tate,low,high);
setring(Z);
print(cohomologymat);
↳ 5h,0,5,10,15,20,25,
↳ 4h,0,4,8, 12,16,20,
↳ 3h,0,3,6, 9, 12,15,
↳ 2h,0,2,4, 6, 8, 10,
↳ h, 0,1,2, 3, 4, 5,
↳ 0, 0,0,0, 0, 0, 0,
↳ h2,0,h,2h,3h,4h,5h
setring(E);
intvec c= 0,-3;
intvec I = 0;
intvec J = 0,1;
intvec K = 0,2;
multigradedcomplex U = regionComplex(tate,c,I,J,K);
U;
↳ 0 <-- E^10 <-- E^8 <-- E^6 <-- E^4 <-- E^2 <-- E^2 <-- 0
↳ -4      -3      -2      -1      0      1      2      3
↳
Z = cohomologyMatrixFromResolution(U,low,high);
setring(Z);
print(cohomologymat);
↳ 0,0,0,10,0,0,0,
↳ 0,0,0,8, 0,0,0,
↳ 0,0,0,6, 0,0,0,
↳ 0,0,0,4, 0,0,0,
↳ 0,0,0,2, 0,0,0,
↳ 0,0,0,0, 0,0,0,
↳ 0,0,0,2h,0,0,0
setring(E);
multigradedcomplex V = regionComplex(tate,c,I,J,J);
↳ ? I,J,K have to be disjoint.
↳ ? leaving tateProdCplxNegGrad.lib::regionComplex (0)

```

### D.15.19.14 strand

Procedure from library `tateProdCplxNegGrad.lib` (see [Section D.15.19 \[tateProdCplxNegGrad.lib\]](#), page 7726).

**Usage:** `strand(T,c,J)`

**Purpose:** compute the strand of T w.r.t. the set J and the vector c

**Return:** subquotient complex of T which is the strand of T

**Example:**

```
LIB "tateProdCplxNegGrad.lib";
intvec f = 1,1;
def (S,E) = productOfProjectiveSpaces(f);
intvec low = -3,-3;
intvec high = 3,3;
setring(S);
module M = 0;
intmat MGrading[2][1] = -1,-1;
M = setModuleGrading(M,MGrading);
multigradedcomplex tate;
(E,tate) = tateResolution(M,low,high);
setring(E);
ring Z = cohomologyMatrixFromResolution(tate,low,high);
setring(Z);
print(cohomologymat);
↳ 5h,0,5,10,15,20,25,
↳ 4h,0,4,8, 12,16,20,
↳ 3h,0,3,6, 9, 12,15,
↳ 2h,0,2,4, 6, 8, 10,
↳ h, 0,1,2, 3, 4, 5,
↳ 0, 0,0,0, 0, 0, 0,
↳ h2,0,h,2h,3h,4h,5h
setring(E);
intvec c= 0,-3;
intvec J = 1;
multigradedcomplex U = strand(tate,c,J);
U;
↳ 0 <-- E^10 <-- E^8 <-- E^6 <-- E^4 <-- E^2 <-- E^2 <-- E^4 \
    <-- E^6 <-- E^8 <-- E^10
↳ -4    -3    -2    -1    0    1    2    3 \
      4    5    6
↳
Z = cohomologyMatrixFromResolution(U,low,high);
setring(Z);
print(cohomologymat);
↳ 0,0,0,10,0,0,0,
↳ 0,0,0,8, 0,0,0,
↳ 0,0,0,6, 0,0,0,
↳ 0,0,0,4, 0,0,0,
↳ 0,0,0,2, 0,0,0,
↳ 0,0,0,0, 0,0,0,
↳ 0,0,0,2h,0,0,0
```

### D.15.19.15 firstQuadrantComplex

Procedure from library `tateProdCplxNegGrad.lib` (see [Section D.15.19 \[tateProdCplxNegGrad.lib\]](#), page 7726).

**Usage:** `firstQuadrantComplex(T,c)`; T multigradedcomplex, c intvec

**Purpose:** compute the first quadrant complex of  $T$  w.r.t. the set  $J$  and the vector  $c$

**Return:** subquotient complex of  $T$  which is the first quadrant complex of  $T$

### D.15.19.16 lastQuadrantComplex

Procedure from library `tateProdCplxNegGrad.lib` (see [Section D.15.19 \[tateProdCplxNegGrad.lib\]](#), page 7726).

**Usage:** `lastQuadrantComplex(T,c);`  $T$  multigradedcomplex,  $c$  intvec

**Purpose:** compute the last quadrant complex of  $T$  w.r.t. the set  $J$  and the vector  $c$

**Return:** subquotient complex of  $T$  which is the strand of  $T$

### D.15.20 VecField.lib

**Library:** `VecField.lib`

**Purpose:** vector fields, with algorithms for jordan and diagonal forms

**Authors:** Adrian Rettich, [rettich@mathematik.uni-kl.de](mailto:rettich@mathematik.uni-kl.de)  
Raul Epure, [epure@mathematik.uni-kl.de](mailto:epure@mathematik.uni-kl.de)

**References:**

[1] Kyoji Saito, Quasihomogene isolierte Singularitaeten von Hyperflaechen, 1971

**Overview:** Implements a class `VecField`, represented by a vector. For example, `'VecField V = [x3,xy]'` declares the vector field  $v = x^3 dx + xy dy$ . Instead of a vector, an  $n \times 1$  matrix is also accepted. The vector can be recovered as `V.vec`.

Supports coordinate transformations (via maps), which are represented by tracking a map `'V.coordinates'` which maps the standard coordinates to those in which  $V$  is currently represented. `V.dimension` stores the vector field's dimension, which is just `nvars(basering)`, and `V.lin` yields the linear part of  $V$ . You may set an additional parameter `V.precision`, which dictates the degree to which operations on the vector field should be exact.

The default precision is 1. Precision is preserved across transformations, additions, and all other manipulations of vector fields.

**Procedures:**

#### D.15.20.1 applyVecField

Procedure from library `VecField.lib` (see [Section D.15.20 \[VecField.lib\]](#), page 7746).

**Usage:** `applyVecField(VecField V, poly/ideal p [,int n])`

**Return:** if  $p$  is a polynomial, return a polynomial  $V(p)$ , if  $p$  is an ideal, the ideal  $V(p)$ . If an optional  $n$  is given, only the parts of  $V$  up to and including degree  $n$  are applied to  $p$ .

**Example:**

```
LIB "VecField.lib";
int oldp = printlevel;
printlevel = 1;
ring r = 0, (x, y, z), ds;
vector v = [-1,-1,-1];
VecField V = v;
```

```

poly f = x3+2y3+xz2;
poly g = V*f;
ideal I = (x2,y);
ideal J = V*I;
printlevel = oldp;

```

### D.15.20.2 changeCoordinates

Procedure from library `VecField.lib` (see [Section D.15.20 \[VecField.lib\], page 7746](#)).

**Usage:** `changeCoordinates(vecField V, map psi)`, where `psi` is an algebra morphism  $k[x_1, \dots, x_n] \rightarrow k[y_1, \dots, y_m]$  expressing the new basis in terms of the old.

**Return:** A new vecfield in the new coordinates.

**Note:** the coordinate change necessitates inverting `psi`.  
The inversion will be correct up to the precision of `V`.

**Example:**

```

LIB "VecField.lib";
ring r = 0, (x, y, z), ds;
vector v = [-1,-1,-1];
VecField V = v;
V.precision = 4;
map phi = r, x-2y2+z3, 2y+y3+z, z;
VecField W = changeCoordinates(V, phi);

```

### D.15.20.3 jordanVecField

Procedure from library `VecField.lib` (see [Section D.15.20 \[VecField.lib\], page 7746](#)).

**Usage:** `jordanVecField(VecField V)`

**Return:** new vecfield `W` in coordinates s.t. `W.lin` is in Jordan normal form.

**Assume:** eigenvalues of `V.lin` in basefield.

**Example:**

```

LIB "VecField.lib";
ring r = 0, (x, y, z), ds;
vector v = [-1,-1,-1];
VecField V = v;
V.precision = 4;
map phi = r, x-2y2+z3, 2y+y3+z, z;
VecField W = changeCoordinates(V, phi);
VecField X = jordanVecField(W);

```

### D.15.20.4 diagonalizeVecFieldLin

Procedure from library `VecField.lib` (see [Section D.15.20 \[VecField.lib\], page 7746](#)).

**Usage:** `diagonalizeVecFieldLin(list l)`, where `l` is a list of VecFields

**Return:** list `W` of the same VecFields in new coords s.t. the linear parts are diagonal, all in the same coordinates

**Assume:** All linear parts of the entries of `l` are simultaneously diagonalizable.

**Example:**

```
LIB "VecField.lib";
ring r = 0, (x, y, z), ds;
vector v = [-1,-1,-1];
VecField V = v;
V.precision = 4;
map phi = r, x-2y2+z3, 2y+y3+z, z;
VecField W = changeCoordinates(V, phi);
VecField X = [-2,1,0];
list d = diagonalizeVecFieldLin(W,X);
```

**D.15.20.5 SaitoBase**

Procedure from library `VecField.lib` (see [Section D.15.20 \[VecField.lib\]](#), page 7746).

**Usage:** `SaitoBase(VecField V)`

**Return:** new `VecField W` in the base from [1] thm. 3.1, where semisimple and nilpotent components are easily read off.

**Note:** the algorithm requires inversions of algebra morphisms. These will be exact to the precision of `V`. Warning: The algorithm assumes standard coordinates. If `V` is not given in standard coordinates, it will be converted to standard coordinates, but not converted back at the end, so the resulting transformation is from standard coordinates to the Saito coordinates. If you want the entire transformation from your original coordinates to the Saito ones, add the inverse of your original coordinate transformation manually. Note that weight vectors only take `Int64`, making the algorithm fail for very large entries in `V.vec`.

**Example:**

```
LIB "VecField.lib";
ring r = 0, (x, y, z), ds;
vector v = [-1,-1,-1];
VecField V = v;
V.precision = 4;
map phi = r, x-2y2+z3, 2y+y3+z, z;
VecField W = changeCoordinates(V, phi);
VecField WS = SaitoBase(W);
```

**D.15.20.6 diagonalizeVecField**

Procedure from library `VecField.lib` (see [Section D.15.20 \[VecField.lib\]](#), page 7746).

**Usage:** `diagonalizeVecField(list l)`, `l` a list of `VecFields`

**Return:** list of `VecFields W` such that they are all simultaneously diagonal.

**Assume:** all input `VecFields` have to be simultaneously diagonalizable.

**Note:** the algorithm requires inversions of algebra morphisms. These will be exact to the precision of `l[1]`. Warning: The algorithm assumes standard coordinates. If `V` is not given in standard coordinates, it will be converted to standard coordinates, but not converted back at the end, so the resulting transformation is from standard coordinates to the Saito coordinates. If you want the entire transformation from your original coordinates to the Saito ones, add the inverse of your original coordinate transformation manually.

Note that weight vectors only take Int64,  
making the algorithm fail for very large entries in `V.vec`.

**Example:**

```
LIB "VecField.lib";
int oldp = printlevel;
printlevel = 1;
ring r = 0, (x, y, z), ds;
vector v = [-1,-1,-1];
VecField V = v;
V.precision = 4;
map phi = r, x-2y2+z3, 2y+y3+z, z;
VecField W = changeCoordinates(V, phi);
VecField X = [-2, 1, 0];
VecField WS = diagonalizeVecField(W, X);
↳ ? error in diagonalizeVecField: no solutions found
↳ ? leaving VecField.lib::diagonalizeVecField (0)
printlevel = oldp;
```

**D.15.20.7 vecFieldToMatrix**

Procedure from library `VecField.lib` (see [Section D.15.20 \[VecField.lib\], page 7746](#)).

**Usage:** `vecFieldToMatrix(VecField V, ideal W)`

**Return:** the matrix representation of `V` restricted to `span(W)`, in the basis specified by `W`.

**Example:**

```
LIB "VecField.lib";
int oldp = printlevel;
printlevel = 1;
ring r = 0, (x, y, z), ds;
vector v = [-1,-1,-1];
VecField V = v;
V.precision = 4;
map phi = r, x-2y2+z3, 2y+y3+z, z;
VecField W = changeCoordinates(V, phi);
matrix m = vecFieldToMatrix(W, maxideal(2));
printlevel = oldp;
```

**D.15.20.8 decomposeVecField**

Procedure from library `VecField.lib` (see [Section D.15.20 \[VecField.lib\], page 7746](#)).

**Usage:** `decomposeVecField(VecField V)` or `decomposeVecField(list s)`, `s` a list of `VecFields`

**Return:** list `l` containing two `VecFields`, where `l[1]` is the semisimple part of `V`, `l[2]` the nilpotent part. If called with a list, `l[2n-1]` is the semisimple part of the `n`-th `VecField`, `l[2n]` its nilpotent part.

**Assume:** The algorithm assumes standard coordinates. If `V` is not given in standard coordinates, it will be converted to standard coordinates, but not converted back at the end, so the resulting transformation is from standard coordinates to the new coordinates. If you want the entire transformation from your original coordinates to the new ones, add the inverse of your original coordinate transformation manually.

**Example:**

```
LIB "VecField.lib";
ring r = 0, (x, y, z), ds;
vector v = [-1,-1,-1];
VecField V = v;
V.precision = 4;
map phi = r, x-2y2+z3, 2y+y3+z, z;
VecField W = changeCoordinates(V, phi);
list l = decomposeVecField(W);
```

**D.15.20.9 diagonalizeMatrixSimul**

Procedure from library `VecField.lib` (see [Section D.15.20 \[VecField.lib\]](#), page 7746).

**Usage:** `diagonalizeMatrixSimul(list l)`, where `l` is a list of quadratic matrices of same dimensions

**Return:** trafo matrix `U` s.t.  $U \cdot A \cdot \text{inv}(U)$  is diagonal for each `A` in `l`

**Assume:** matrices are simultaneously diagonalizable, `nvars(basering) >= dimension of the matrices`

**Example:**

```
LIB "VecField.lib";
ring r = 0, (x(1), x(2), x(3), x(4)), dp;
matrix a[4][4] = 2, 0, 0, 0, 0, 3, 0, 0, 0, 0, 3, 0, 0, 0, 0, 5 ;
matrix b[4][4] = 6, 0, 0, 0, 0, 6, 0, 0, 0, 0, 2, 0, 0, 0, 0, 7 ;
matrix trafo[4][4] = 3, 3, 0, 0, 0, 1, 3, 0, 2, 0, 1, 0, 0, 2, 2, 3;
matrix invtrafo = inverse(trafo);
matrix at = invtrafo * a * trafo;
matrix bt = invtrafo * b * trafo;
list l;
l = insert(l, at);
l = insert(l, bt);
matrix diagtrafo = diagonalizeMatrixSimul(l);
```

**D.15.20.10 invertAlgebraMorphism**

Procedure from library `VecField.lib` (see [Section D.15.20 \[VecField.lib\]](#), page 7746).

**Usage:** `invertAlgebraMorphism(map p, int n)`, where `p` is an algebra morphism  $k[x_1, \dots, x_n] \rightarrow k[y_1, \dots, y_m]$ ,  
or `invertAlgebraMorphism(ideal p, int n)` if you represent the map as an ideal

**Return:** the inverse of `p` mod  $(\text{maxideal})^n$ .  
If `n=-1`, try for infinite precision. If input was an ideal, return an ideal.

**Note:** the algorithm used is described in [1], chapter 3.2

**Example:**

```
LIB "VecField.lib";
ring r = 0, (x, y, z), ds;
vector v = [-1,-1,-1];
VecField V = v;
V.precision = 4;
map phi = r, x-2y2+z3, 2y+y3+z, z;
map phiinv = invertAlgebraMorphism(phi, 4);
```

## 8 Release Notes

### 8.1 News and changes

## NEWS in SINGULAR 4.2.1p2

### News for version 4.2.1p2

New libraries:

sagbigrob.lib: Sagbi-Groebner basis of an ideal of a subalgebra ([Section D.15.15 \[sagbigrob.lib\]](#), [page 7715](#))

Changes in the kernel/build system:

ABI change: all number routines (`n_...`) have only `coeffs` as last argument, functions with `ring` as last argument are removed

`PATH` is not changed for `system("sh", ..)` (use [undefined \[system, SingularBin\]](#), [page undefined](#))

`hilb` avoids int overflow (also in `degree`, `stdhilb`)

`liftstd` (with 2 arguments) improved ([Section 5.1.81 \[liftstd\]](#), [page 208](#))

`noether` improved ([Section 5.3.5 \[noether\]](#), [page 298](#))

letterplace routines improved ([Section 7.7 \[LETTERPLACE\]](#), [page 610](#))

info file is now `singular.info` instead of `singular.hlp`

update for using FLINT 2.8.x

### News for version 4-2-1

New commands:

Letterplace: `dim`, `rightStd` for `qrings` ([Section 7.7 \[LETTERPLACE\]](#), [page 610](#))

Letterplace: `map`, `fetch`, `imap` ([Section 4.11 \[map\]](#), [page 103](#), [Section 5.1.38 \[fetch\]](#), [page 178](#), [Section 5.1.59 \[imap\]](#), [page 194](#))

New libraries:

`decomp.lib`: functional decomposition of polynomials ([Section D.4.6 \[decomp.lib\]](#), [page 1045](#))

`hodge.lib`: algorithms for Hodge ideals ([Section D.15.6 \[hodge.lib\]](#), [page 7599](#))

`tateProdCplxNegGrad.lib`: sheaf cohomology on product of projective spaces ([Section D.15.19 \[tateProdCplxNegGrad.lib\]](#), [page 7726](#))

Changes in the kernel/build system:

`liftstd` (with 2 arguments) improved ([Section 5.1.81 \[liftstd\]](#), [page 208](#))

building on Cygwin with shared libraries

building the manual via `--enable-doc-build`

## News for version 4-2-0

Syntax changes:

renamed `poly.lib` to `polylib.lib` ([Section D.2.8 \[polylib.lib\]](#), page 881)

New libraries:

`interval.lib`: interval arithmetic ([Section D.8.2 \[interval.lib\]](#), page 1810)

`maxlike.lib`: algebraic statistics ([Section D.15.8 \[maxlike.lib\]](#), page 7613)

`nchilbert.lib`: Hilbert series for LetterPlace algebras ([Section 7.5.13 \[nchilbert.lib\]](#), page 511)

`polyclass.lib`: class of polynomials ([Section D.15.12 \[polyclass.lib\]](#), page 7709)

`recover.lib`: Hybrid numerical/symbolical algorithms ([Section D.8.7 \[recover.lib\]](#), page 1847)

`redcgs.lib`: Reduced Comprehensive Groebner Systems ([Section D.2.9 \[redcgs.lib\]](#), page 891)

`ringgb.lib`: coefficient rings ([Section D.15.13 \[ringgb.lib\]](#), page 7711)

`sets.lib`: Sets ([Section D.14.8 \[sets.lib\]](#), page 7414)

`stanleyreisner.lib`: T1 and T2 for a general Stanley-Reisner ring ([Section D.15.16 \[stanleyreisner.lib\]](#), page 7717)

`systhreads.lib`: multi-threaded objects ([Section D.15.18 \[systhreads.lib\]](#), page 7725)

Changed libraries:

`classify_aeq.lib`: new procedure `classSpaceCurve` ([Section D.6.6 \[classify\\_aeq.lib\]](#), page 1641)

`grobcov.lib`: new version ([Section D.2.4 \[grobcov.lib\]](#), page 811)

`modular.lib`: parallel version for verification via `system("verifyGB", I)`

New commands:

`system("verifyGB", I)`: test, if I is a Groebner basis (using parallel processes)

Letterplace: `modulo`, `syz`, `lift`, `liftstd`, `rightStd` ([Section 7.7 \[LETTERPLACE\]](#), page 610)

Changes in the kernel/build system:

update for using FLINT 2.6.x and for FLINT 2.7.0

Singular can be build with NTL or FLINT or both (if non is available, `factroize` and `gcd` will not work.)

## News for version 4-1-3

New libraries:

`invar.lib`: Invariant theory [Section D.7.4 \[invar.lib\]](#), page 1798

`moddiq.lib`: ideal quotient and saturation [Section D.4.15 \[moddiq.lib\]](#), page 1113

`ncModslimgb.lib`: modular Groebner bases for G-algebras [Section 7.5.18 \[ncModslimgb.lib\]](#), page 547

Changed libraries:

`chern.lib`: new version ([Section D.5.2 \[chern.lib\]](#), page 1376)

`grobcov.lib`: new version ([Section D.2.4 \[grobcov.lib\]](#), page 811), new functions [Section D.2.4.22 \[ConsLevels\]](#), page 863, [Section D.2.4.23 \[Levels\]](#), page 864, [Section D.2.4.24 \[Grob1Levels\]](#), page 866, [Section D.2.4.25 \[DifConsLCSets\]](#), page 869

Changes in the kernel/build system:

improved `gcd` and multiplication via FLINT

improved lift (and related)  
 port to polymake 3.5.x  
 rational functions via flint (Section 5.1.44 [flintQ], page 182)  
 free algebra over  $\mathbb{Z}$  (Section 7.7 [LETTERPLACE], page 610)  
 adaptations/functions for Singular.jl(<https://github.com/oscar-system/Singular.jl>)

## News for version 4-1-2

New libraries:

arnoldclassify.lib: Arnol'd Classifier of Singularities (Section D.6.3 [arnoldclassify\_lib], page 1625)  
 difform.lib: Procedures for differential forms (Section D.15.2 [difform\_lib], page 7470)  
 dmodideal.lib: Algorithms for Bernstein-Sato ideals of morphisms (Section 7.5.6 [dmodideal\_lib], page 440)  
 fpalgebras.lib: Generation of various algebras in the letterplace case (Section 7.10.2 [fpalgebras\_lib], page 639)  
 ncrat.lib: non-commutative rational functions (Section 7.10.6 [ncrat\_lib], page 669)

Changed libraries:

freegb.lib: lpDivision, lpPrint (Section 7.10.4 [freegb\_lib], page 659)  
 fpadim.lib (Section 7.10.1 [fpadim\_lib], page 633)  
 schreyer.lib: deprecated  
 goettsche.lib: new, extended version (The Nakajima-Yoshioka formula up to n-th degree, Poincaré Polynomial of the punctual Quot-scheme of rank r on n planar points, Betti numbers of the punctual Quot-scheme of rank r on n planar points) (Section D.5.5 [goettsche\_lib], page 1423)  
 grobcov.lib: small bug fix (Section D.2.4 [grobcov\_lib], page 811)

Changes in the kernel/build system:

integrated xalloc into omalloc: (./configure --disable-omalloc)  
 improved heuristic for det (Section 5.1.23 [det], page 169)  
 improved reading of long polynomials  
 improved groebner bases over  $\mathbb{Z}$  coefficients  
 code for free algebras (letterplace rings) rewritten (using now the standard +, -, \*, ^, std, ...) (Section 7.7 [LETTERPLACE], page 610)  
 new commands `rightstd` (Section 7.8.10 [rightstd (letterplace)], page 626)  
 extended `twostd` to LETTERPLACE (Section 7.8.14 [twostd (letterplace)], page 628, Section 7.3.29 [twostd (plural)], page 357)  
 pseudo type `polyBucket`  
 new type `smatrix`: sparse matrix (experimental) (Section 4.20 [smatrix], page 127).  
 extended `coef` to ideals (Section 5.1.11 [coef], page 161).  
 error and signal handling in `libSingular` (Section 8.3 [libSingular], page 7760).  
 updated `gfanlib` to version 0.6.2  
 port to NTL 11 (needs C++11: gcc6 or -std=c++11), which does not conflict with polymake (needs C++14)

## News for version 4-1-1

### New syntax:

`alias`: may be used as a prefix to a variable declaration. Can only be used in procedure headings. ([Section 3.5.1 \[General command syntax\]](#), page 41).

### New command:

`fres`: improved version of `sres`: computes a (not necessarily minimal) free resolution of the input ideal/module, using Schreyer's algorithm. ([Section 5.1.48 \[fres\]](#), page 185, [Section 5.1.147 \[sres\]](#), page 263).

### Extended commands:

pseudo ordering `L` allows setting of limits for exponents in polynomials ([Section B.2.9 \[Pseudo ordering L\]](#), page 767, [Section 5.1.2 \[attrib\]](#), page 153 for `maxExp`)

`%,mod`: also for poly operands ([Section 4.16.3 \[poly operations\]](#), page 119).

`delete`: extended to `intvec`, `ideal`, `module` ([Section 5.1.21 \[delete\]](#), page 168).

`syz` ([Section 5.1.154 \[syz\]](#), page 274), `lift` ([Section 5.1.80 \[lift\]](#), page 207), `liftstd` ([Section 5.1.81 \[liftstd\]](#), page 208), `intersect` ([Section 5.1.65 \[intersect\]](#), page 198): with a specified GB algorithm

### New libraries:

`classify2.lib`: Classification of isolated singularities of corank  $\leq 2$  and modality  $\leq$  wrt. right equivalence over the complex numbers according to Arnold's list. ([Section D.6.5 \[classify2.lib\]](#), page 1639)

`goettsche.lib`: Goettsche's formula for the Betti numbers of the Hilbert scheme of points on a surface, Macdonald's formula for the symmetric product ([Section D.5.5 \[goettsche.lib\]](#), page 1423)

`combinat.lib`, `modules.lib`, `methods.lib`, `nets.lib`: a more mathematical view of modules ([Section D.14.2 \[combinat.lib\]](#), page 7378: combinatorics), ([Section D.14.4 \[methods.lib\]](#), page 7385: construct procedures), ([Section D.4.17 \[modules.lib\]](#), page 1116: free resolutions), ([Section D.14.5 \[nets.lib\]](#), page 7385: pretty printing)

`ncHilb.lib`: Hilbert series of non-commutative monomial algebras ([Section 7.10.5 \[ncHilb.lib\]](#), page 666)

`realclassify.lib`: Classification of real singularities ([Section D.6.19 \[realclassify.lib\]](#), page 1731)

`rootisolation.lib`: real root isolation using interval arithmetic ([Section D.8.8 \[rootisolation.lib\]](#), page 1875)

`rstandard.lib`: Janet bases and border bases for ideals ([Section D.4.33 \[rstandard.lib\]](#), page 1251)

### Changed libraries:

`chern.lib`: new version ([Section D.5.2 \[chern.lib\]](#), page 1376)

`gitfan.lib`: new (incompatible) version ([Section D.13.3 \[gitfan.lib\]](#), page 2074)

`grobcov.lib`: new version ([Section D.2.4 \[grobcov.lib\]](#), page 811)

### Changes in the kernel/build system:

port to polymake 3.x.x

port to NTL 10 with threads (needs also C++11: gcc6 or -std=c++11)

`p_Invers` is only a helper for `p_Series`: now static

`p_Divide` is now `p_MDivide`, `pDivide/p_Divide` is a new routine

## News for version 4-1-0

### Syntax changes:

- new (additional) form of ring definitions: (for example `ring R=QQ[x,y,z];`) ([Section 3.3.2 \[General syntax of a ring declaration\]](#), page 32)
- new (additional) form of multi-indices: (for example `i(1,2,3,4,5)`) ([Section 3.5.3 \[Names\]](#), page 44)
- changed behaviour of `charstr` ([Section 5.1.7 \[charstr\]](#), page 159)
- new data type `cring` to describe the coefficient rings, to be used for the new definitions for (polynomial) rings ([Section 3.3.2 \[General syntax of a ring declaration\]](#), page 32)
- new command `ring_list` to access the parts used to construct polynomial rings ([Section 5.1.136 \[ring\\_list\]](#), page 251, [Section 5.1.135 \[ringlist\]](#), page 249)
- extended polynomial ring construction: also from lists produced by `ring_list`
- new attribute `ring_cf` for `ring` ([Section 5.1.2 \[attrib\]](#), page 153)
- printing of rings changed to match `cring` names ([Section 5.1.7 \[charstr\]](#), page 159)

### New libraries:

- new library: `classifyMapGerms.lib`: standard basis of the tangent space at the orbit of an algebraic group action ([Section D.6.9 \[classifyMapGerms.lib\]](#), page 1648)
- new library: `ffmodstd.lib`: Groebner bases of ideals in polynomial rings over algebraic function fields ([Section D.4.9 \[ffmodstd.lib\]](#), page 1074)
- new library: `nfmodsyz.lib`: syzygy modules of submodules of free modules over algebraic number fields ([Section D.4.23 \[nfmodsyz.lib\]](#), page 1171)
- new library: `curveInv.lib`: invariants of curves ([Section D.4.5 \[curveInv.lib\]](#), page 1042)
- new library: `gfan.lib`: interface to `gfanlib` ([Section D.13.2 \[gfan.lib\]](#), page 2034)
- extended library: interface to `polymake` merged into [Section D.13.4 \[polymake.lib\]](#), page 7270
- new library: `tropicalNewton.lib`: Newton polygon methods in tropical geometry ([Section D.13.7 \[tropicalNewton.lib\]](#), page 7341)
- new library: `schubert.lib`: some procedures for intersection theory ([Section D.5.17 \[schubert.lib\]](#), page 1571)

### Changed libraries:

- `classify_aeq.lib`: new procedures ([Section D.6.6 \[classify\\_aeq.lib\]](#), page 1641)
- `grobcov.lib`: new version ([Section D.2.4 \[grobcov.lib\]](#), page 811)
- `ncfactor.lib`: factorization in some noncommutative algebras ([Section 7.5.12 \[ncfactor.lib\]](#), page 480) with new routine `ncfactor` ([Section 7.5.12.1 \[ncfactor\]](#), page 480)
- `primdec.lib`: new option "subsystem" ([Section D.4.28 \[primdec.lib\]](#), page 1225)

### Changes in the kernel:

- improved mapping of polynomials/ideals/...
- port to gcc 6
- port to `gfanlib` 0.6 (requires C++11, i.e. `gcc >=4.3`)
- port to NTL 10
- port to `polymake` 3.0
- port to `readline` 7

[Section 5.1.138 \[sba\]](#), page 253 works for global orderings, also for coefficient types  $Z$  and  $Z/m$

[Section 5.1.149 \[std\], page 265](#) works for all orderings, also for coefficient types  $Z$  and  $Z/m$  with local/mixed orderings

[Section 5.1.36 \[factorize\], page 177](#) works for polynomial rings over  $\mathbb{Z}$

Experimental stuff:

module [Section D.14.3 \[customstd.lib\], page 7383](#): modify `std` ([Section D.14.3.2 \[satstd\], page 7384](#))

## News for version 4-0-3

New libraries:

new library: `brillnoether.lib`: Riemann-Roch spaces of divisors on curves ([Section D.5.1 \[brillnoether.lib\], page 1375](#))

new library: `chern.lib`: Chern classes ([Section D.5.2 \[chern.lib\], page 1376](#))

new library: `ffmodstd.lib`: Groebner bases of ideals in polynomial rings over algebraic function fields ([Section D.4.9 \[ffmodstd.lib\], page 1074](#))

new library: `GND.lib`: General Neron Desingularization ([Section D.15.4 \[GND.lib\], page 7520](#))

new library: `graal.lib`: localization at prime ideals ([Section D.5.6 \[graal.lib\], page 1429](#))

new library: `hess.lib`: Riemann-Roch space of divisors ([Section D.5.7 \[hess.lib\], page 1434](#))

Changed libraries:

renamed `algeomdstd.lib` to [Section D.4.22 \[nfmmodstd.lib\], page 1168](#), extended to module

renamed `derham.lib` to [Section D.5.3 \[deRham.lib\], page 1412](#)

`grobcov.lib` (`grobcovK`): Groebner Cover for parametric ideals ([Section D.2.4 \[grobcov.lib\], page 811](#)) with new routine `ConsLevels` ([Section D.2.4.22 \[ConsLevels\], page 863](#)), removed `AddCons` `AddConsP`.

## News for version 4-0-2

New commands:

`align` ([Section 5.1.1 \[align\], page 153](#))

`branchTo` ([Section 4.17.3 \[procs with different argument types\], page 122](#))

`->` ([Section 4.17.2 \[proc expression\], page 122](#))

Change in ring handling:

`typeof( qring )` returns `"ring"`

New libraries:

`algeomdstd.lib`: Groebner bases of ideals in polynomial rings over algebraic number fields (renamed to [Section D.4.22 \[nfmmodstd.lib\], page 1168](#))

`arr.lib`: arrangements of hyperplanes ([Section D.14.1 \[arr.lib\], page 7350](#))

`brillnoether.lib`: Riemann-Roch spaces of divisors on curve ([Section D.5.1 \[brillnoether.lib\], page 1375](#))

`hess.lib`: Riemann-Roch space of divisors on function fields and curves ([Section D.5.7 \[hess.lib\], page 1434](#))

`gradedModules.lib`: graded modules/matrices/resolutions ([Section D.15.5 \[gradedModules.lib\], page 7524](#))

Changed libraries:

revised polymake interface (polymake.so)  
 revised gfanlib interface (gfanlib.so)  
 Presolve::findvars (Section D.8.3.6 [findvars], page 1819, Section 5.1.164 [variables], page 279)  
 Ring::addvarsTo (Section D.2.12.26 [addvarsTo], page 950)  
 Ring::addNvarsTo (Section D.2.12.27 [addNvarsTo], page 951)  
 Ring::hasAlgExtensionCoefficient (Section D.2.12.21 [hasAlgExtensionCoefficient], page 949)  
 Schreyer::s\_res (**s\_res**)  
 grobcov.lib (grobcovK) (Section D.2.4 [grobcov\_lib], page 811) with new routines AddCons  
 AddConsP.  
 normaliz.lib (for normaliz >=2.8) (Section D.4.26 [normaliz\_lib], page 1200)  
 renamed groebnerFan to groebnerFanP in polymake.lib (Section D.13.4 [polymake\_lib],  
 page 7270)  
 renamed fVector to fVectorP in polymake.lib (Section D.13.4 [polymake\_lib],  
 page 7270, polymakeInterface\_lib)

## News for version 4-0-1

Version 4-0-1 is a bug fix release.

New feature: attribute `ring_cf` for `ring` (Section 5.1.2 [attrib], page 153)

## News for version 4-0-0

Version 4-0-0 is a milestone release of Singular. The new release series 4 aims for an entirely modularized architecture simplifying connectivity with other systems and paving the way for parallel computations. As a first step in modularization, the new release features an internal structural separation of coefficient rings and polynomial rings. This allows for a flexible integration of new coefficient rings.

SINGULAR 4-0-0's list of new functionality and significant improvements further extends that of the 3-1-6/7 prerelease series.

New functionality

de Rham cohomology of complements of algebraic varieties (Section D.5.3 [deRham\_lib],  
 page 1412)  
 Gromov-Witten numbers of elliptic curves (Section D.4.8 [ellipticcovers\_lib], page 1061)  
 classification of isolated complete intersection singularities in characteristic 0 (Section D.6.8  
 [classifyci\_lib], page 1646)  
 parametrization of orbits of unipotent actions (Section D.5.10 [orbitparam\_lib], page 1444)  
 F5-like Groebner basis algorithm (Section 5.1.138 [sba], page 253)  
 element-wise application of functions to data structures (Section 5.2.1 [apply], page 284)  
 support for debugging libraries (Section 3.9.1 [ASSUME], page 67)

Improved functionality

Groebner cover for parametric ideals (Section D.2.4 [grobcov\_lib], page 811)  
 normalization of affine rings (Section D.4.25 [normal\_lib], page 1177)  
 classification of real singularities (Section D.6.19 [realclassify\_lib], page 1731)  
 GIT-fans (Section D.13.3 [gitfan\_lib], page 2074)

algebraic/transcendental field extensions

[Chapter 7 \[Non-commutative subsystem\]](#), page 311

an abstraction layer for parallel computations ([Section D.2.7 \[parallel\\_lib\]](#), page 878)

run-time loading of supplementary kernel code ([Section A.1.9 \[Dynamic modules\]](#), page 702)

interpreter language support for name spaces ([Section 4.15 \[package\]](#), page 117)

Availability

SINGULAR is available as source code and for Linux, Mac OS X, Windows, FreeBSD and SunOS-5.

## 8.2 Singular 3 and Singular 4

The purpose of this section is to describe new features and changes between Singular 3-1-7 and Singular 4.\* (formerly known as Spielwiese) both for developers and Singular users. In what follows we will refer to the systems as Singular 3 and Singular 4.

### 8.2.1 Version schema for Singular

SINGULAR version is of the form `a.b.c.d` which may also be written as `a-b-c-d` where `a,b,c` and `d` are numbers:

`a` is changed with major, incompatible changes

`b` is changed with incompatible changes (of some commands/libraries)

`c` is changed with compatible changes (i.e. new commands, extended options, new algorithms, etc.)

`d` is changed with each release (i.e. with bug fixes, etc.)

SINGULAR does also have "unofficial" build originating from a code version between "official" version: such builds display "Development version `a.b.c`" in the header while "official" versions show "version `a.b.c`". Also the manual describes version `a-b-c`. To get the complete version number, use `system("version");` or use `SINGULAR_VERSION` in C.

### 8.2.2 Notes for Singular users

#### Coefficient rings

To allow for easy integration of new coefficient rings into Singular, the the way coefficient rings are being handled has been redesigned.

In general, the user syntax has not changed, however there are some changes in the behaviour of Singular:

- setting `minpoly` results in changing the current coefficient domain and clears all previously defined variables of that ring
- Minor changes in the output of coefficient ring description. Moreover the output of elements of certain rings has been improved (for example, reals).
- Algebraic and transcendental extensions of rationals and finite fields have been reimplemented. In particular, the heuristics for clearing denominators and factoring out content have been changed. In some cases this leads to a different, mathematically equivalent results of Groebner bases and related computations. For example a Groebner basis element may differ by a unit.
- Most notably, due to the redesign of the coefficient rings, if the user sets the minimal polynomial all variables dependent on the current ring are deleted.

## Ring-dependent options

Formally global Singular [Section 5.1.110 \[option\]](#), [page 229](#) now belong to individual polynomial rings. This includes:

- `intStrategy`
- `redTail`
- `redThrough`

Also the following settings now belong to individual (currently active) polynomial rings:

- `short`
- `minpoly`
- `noether`

Hence setting these options only affects the current ring. Be aware of this when switching between different rings, since the options affect the result of various computations (in particular Groebner bases).

## Path names

- The tree structure of the binary Singular distribution has been changed. The typical tree now looks as show at <https://github.com/Singular/Singular/wiki/Sw-tree>
- Accordingly Singular search paths (where Singular searches for libraries, dynamic modules, etc.) have been changed. You can display them by calling Singular by `Singular -v`.
- currently, multi-arch installations of Singular 4 aere not possible.

## Library versioning

Due to switching from Subversion to GIT revision control system for the Singular source code, library version variables (displayed when loading a library) have changed.

## New orderings for modules

The now can assign weights to module components, when defining a monomial ordering. For example

```
ring R = 0, (x,y,z), (am(1,2,3, 10,20,30,40), dp, C);
deg(x*gen(1));
↳ 11
```

will assign weights 1,2,3 to x,y,z respectively, and weights 10,20,30,40,0,0,... to components of any free module defined over R. This ordering will first sort by this weighted degree, then by dp on the ring monomials and then will give priority to the large component index.

## Future benefits of Singular 4

The redesign of Singular will allow us to provide new features in the future, for example:

- Interpreter type for coefficient rings.
- User defined coefficient rings.
- Improved syntax for defining polynomial rings.

### 8.2.3 Notes for developers

There has been an extensive process of refactoring, redesign and modularization of Singular to facilitate easier maintenance and future development:

- Build System : automake, libfac has been integrated into Factory
- Removed MP (Multi protocol) in favor of SSI links.
- Separation/modularization into libraries and packages
- For easy integration of new coefficient rings, we defined a generic interface for coefficient rings and a supporting framework for making them accessible to the user.

In particular we have separated everything related to coefficient rings into a separate library `libcoeffs`. Dependency tree between restructured packages is show at <https://www.singular.uni-kl.de/dox/singular.png>

In order to use `libSingular` as a C++ library, see [Section 8.3 \[libSingular\]](#), page 7760.

### 8.2.4 Building Singular

The user can build and install Singular with the following standard UNIX-like procedure:

- Download and extract the latest official source package (.tar.gz).
- Run the configure script, for instance, `./configure`.
- Build Singular by running `make`.
- Install Singular by running `make install`.

In contrast to Singular 3, there are now many more configuration options.

All possible options for configure can be seen by running the configure script with option `--help`. On a multicore compute consider running `make` with the option `-j [cores]`.

### 8.2.5 Side-by-side installation

Due to choosing paths according to FS standards it is no longer possible to have a side-by-side installation of different Singular versions or versions for different architectures.

## 8.3 libSingular

`libSingular` is the C++-library version of SINGULAR.

`Singular/libsingular.h` is the main include file, `-lSingular` the link parameter, `lib/pkgconfig/Singular.pc` provides all parameters in the `pkconfig` format.

It contains all parts of SINGULAR with the following exceptions:

1. memory allocation functions for GMP (see `mmInit` in `Singular/testths.cc`)
2. signal handlers (see `init_signals` in `Singular/cntrlc.cc`).  
At least a handler for `SIGCHLD` must be installed for the commands [Section 5.1.168 \[waitfirst\]](#), page 281, [Section 5.1.167 \[waitall\]](#), page 280 and the routines from [Section D.2.7 \[parallel\\_lib\]](#), page 878, [Section D.4.18 \[modstd\\_lib\]](#), page 1140, [Section D.4.16 \[modnormal\\_lib\]](#), page 1115, [Section D.2.13 \[tasks\\_lib\]](#), page 952.  
If the child was started by `libSingular` the handler has to call `sig_chld_hdl` from `Singular/links/ssiLink.cc` or implement something similar (call `s1Close(1)` for ssi links).
3. error handlers for factory, NTL (see `init_signals` in `Singular/cntrlc.cc`).

## 8.4 Download instructions

SINGULAR is available as source and binary program for most common hard- and software platforms. Instructions to download and install SINGULAR can be found at

<https://www.singular.uni-kl.de/index.php/singular-download.html>.

Release versions of SINGULAR are also available from our FTP site

<ftp://jim.mathematik.uni-kl.de/pub/Math/Singular/src/4-1-2/>.

## 8.5 Used environment variables

SINGULAR needs to find some files (dynamic modules, libraries, help files). Usually they are found relative to the location of the (main) executable (after following symlinks). This can be changed by setting the following environment variables.

**SINGULAR\_EXECUTABLE** (should usually not be set)

the complete filename of the main executable, usually derived from the command line (inspecting also PATH, following symlinks).

If SINGULAR\_EXECUTABLE cannot be found, \$prefix/bin/Singular is assumed.

For libSingular: SINGULAR\_EXECUTABLE is set to the argument of siInit (it must exist).

**SINGULAR\_BIN\_DIR**

the directory of the main executable, usually derived from \$SINGULAR\_EXECUTABLE

**SINGULAR\_ROOT\_DIR**

the root of the singular tree, default: \$SINGULAR\_BIN\_DIR/..

**SINGULAR\_DATA\_DIR**

the root of the singular data files, default: \$SINGULAR\_BIN\_DIR/./share

**SINGULARPATH**

the directories for libraries and optional dynamic modules (separated by ;), default:

\$SINGULAR\_DATA\_DIR/singular/LIB

\$SINGULAR\_ROOT\_DIR/share/singular/LIB

\$SINGULAR\_BIN\_DIR/./share/singular/LIB

\$SINGULAR\_DATA\_DIR/factory

\$SINGULAR\_ROOT\_DIR/share/factory

\$SINGULAR\_BIN\_DIR/LIB

\$SINGULAR\_BIN\_DIR/./factory

\$SINGULAR\_BIN\_DIR/MOD

\$SINGULAR\_ROOT\_DIR/lib/singular/MOD

\$SINGULAR\_ROOT\_DIR/libexec/singular/MOD

\$prefix/lib/singular/MOD

\$prefix/libexec/singular/MOD

\$SINGULAR\_BIN\_DIR

**SINGULAR\_PROCS\_DIR**

the directories for dynamic modules (separated by ;), default:

\$SINGULAR\_BIN\_DIR/MOD

\$SINGULAR\_ROOT\_DIR/lib/singular/MOD

\$SINGULAR\_ROOT\_DIR/libexec/singular/MOD

```

    $prefix/lib/singular/MOD
    $prefix/libexec/singular/MOD
SINGULAR_INFO_FILE
singular.info, default: $SINGULAR_DATA_DIR/info/singular.info
SINGULAR_IDX_FILE
the help index, default: $SINGULAR_DATA_DIR/singular/singular.idx
SINGULAR_HTML_DIR
the directory of the manual as html files, default: $SINGULAR_DATA_DIR/singular/html
SINGULAR_URL
the URL of the manual, default: https://www.singular.uni-kl.de/Manual/

```

The effective list of directories/files can be printed by `Singular -v`, see [Section 3.1.6 \[Command line options\]](#), page 19.

Depending on the used functions, these environment variables apply also to `libSingular`.

## 8.6 Unix installation instructions

Install binaries: <https://www.singular.uni-kl.de/index.php/singular-download/install-linuxunix>  
or build it yourself:

Install the necessary packages:

```

libtool
gnu make
gcc, g++
libreadline
gmp, mpfr
ntl
libcdd

```

```

Install flint 2.5 (or newer): ./configure --with-gmp=/usr --prefix=$HOME/tmp
make && make install

```

```

Install Singular ./configure --with-flint=$HOME/tmp --enable-gfanlib --
prefix=$HOME/Singular4
make && make install

```

(\$prefix/bin/Singular is the main executble)

(optional) install 4ti2

(optional) install surf/surfer

(optional) install normaliz 2.8 (or newer)

See also <https://github.com/Singular/Singular/wiki/Step-by-Step-Installation-Instructions-for-Singular> which includes instructions adapted for debian and fedora based systems.

## 8.7 Windows installation instructions

Singular relies on Cygwin as its environment under Windows. There is a 32bit and a 64bit version of Cygwin.

<https://www.singular.uni-kl.de/index.php/singular-download/install-windows.html>

## 8.8 Macintosh installation instructions

**Installation of the provided binaries** <https://www.singular.uni-kl.de/index.php/singular-download/install-os-x.html>

If your Mac refuses to open Singular because of an "unidentified developer": Open System Preferences. Go to the Security & Privacy tab. Click on the lock and enter your password so you can make changes. Change the setting for 'Allow apps downloaded from' to 'App Store and identified developers'.

You may also check <https://support.apple.com/en-en/guide/mac-help/mh40616/mac>
